- Monitoring power System data in Real-time.
- Exchanging power System data in Real-time.
- ~~Alarming – Applications or methods that e~~Emitting Real-time visible and audible signals to alert System Operators to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor (e.g., watchdog).
- ~~Telemetry – Applications and methods that provide status and analog values in Real-time or near-Real-time operation.~~
- ~~Network analysis – Applications and methods to be used for determining the current state of the system~~
- Determining the current state of the BES.
- ~~and simulating~~Evaluating the impact of 'what if' ~~system~~ events on the current or

future state of the ~~system~~BES.

~~Develop a standard(s) to require that responsible entities meet identified performance metrics for the above listed functionalities including but not limited to the consideration of:~~

- ~~Availability~~
- ~~Quality~~

~~Those entities shall also have procedures for the above listed functionalities including but not limited to the consideration of:~~

- ~~Change management~~
- ~~Maintenance coordination~~
- ~~Failure notification~~

~~Revise the Glossary definition of Real-time given that the acquisition and dissemination of operating data has inherent time delays. The current definition of Real-time is: Current time, as opposed to future time.~~

•

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
X	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
X	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
X	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
X	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
X	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
X	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
X	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
X	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
X	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Comment Form for 2nd Draft of SAR for Real-time Reliability Monitoring and Analysis Capabilities (Project 2009-02)

Please DO NOT use this form. Please use the electronic form located at the link below to submit comments on the 2nd draft of the standards for Real-time Reliability Monitoring and Analysis Capabilities (Project 2009-02). Comments must be submitted by **February 18, 2010**. If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

http://www.nerc.com/filez/standards/Project2009-02_Real_Time_Tools.html

Background Information:

The Real-time Reliability Monitoring and Analysis Capabilities SAR Drafting Team (RTT SARDT) has made changes to the first posting of the SAR based on comments received from the industry. Major changes included:

- Changing the name of the project to more clearly indicate the intent of the SAR.
- Emphasizing that the SAR is about functionality and not about specific tools.

The Real-time Reliability Monitoring and Analysis Capabilities SAR Drafting Team would like to receive industry comments on this standard. Accordingly, we request that you include your comments on the electronic comment form located at the link above by **February 18, 2010**.

1. The Real-time Reliability Monitoring and Analysis Capabilities SAR DT has attempted to clarify the wording of the SAR to show that this SAR is focused on functionality and not on specific tools. In other words, this SAR addresses 'what' vs. 'how'. Do you agree that the revised SAR adequately allays industry concerns on being too prescriptive as to how the functionality will be addressed? If not, please provide recommended wording changes.

   ☐ Yes

   ☐ No

   Comments:

2. In the first set of questions, several entities suggested that this functionality should and could be handled through certification. The SAR DT has researched the issue and has compiled the following information:

   Certification is a one time process. New certification criteria do not apply to entities that have already been certified. There is no re-certification process nor are there any plans that the SAR DT is aware of to expand the certification process to include re-certification. Certification only proves that an entity had the functionality at a single point in time. There is no operational history associated with certification; therefore, certification criteria that deal with Real-time operations or data are only evaluated by the certification team to determine if the entity has adequate functionality to go operational. Certification relies on the Compliance Monitoring and Enforcement Program (CMEP) to prove compliance for this functionality on an on-going basis. However, CMEP can only evaluate compliance to requirements defined in the Reliability Standards. Therefore, the SAR is necessary to allow the creation of standard requirements to address the issues raised in the SAR so they will be evaluated by CMEP.

   Furthermore, there are 2 directives in FERC Order 693 relating to tool capability that need to be addressed. The existing projects that would have handled these issues (Project 2006-02 for IRO-002 and Project 2007-03 for TOP-006) have clearly indicated that they expect this SAR (Project 2009-02) to address the issues raised by FERC. It is difficult to perceive how any additions or changes to the certification process could come up with a solution that would satisfy and sustain a mandatory and enforceable status for those directives. Therefore, this SAR needs to move forward or the existing projects need to take back the responsibility for addressing the directives.

   Given this information, do you believe that the issues addressed in the proposed SAR belong in the certification process? If you respond 'Yes', please provide details as to how the goals of the proposed SAR (including the Order 693 directives) could be accomplished within the certification process given that there is no re-certification process to ensure that the goals of the proposed SAR will be met by all applicable entities including those already certified.

   ☐ Yes

   ☐ No

   Comments:

3. The approach taken by the Standards Development Program is not to write new requirements that assess basic capabilities used to achieve performance measured through other requirements within the Reliability Standards. The SAR DT has researched the standards and concluded that other requirements do not presently exist

to adequately cover the issues raised in the SAR. Do you agree with this position? If not, please identify existing standard requirements that would apply and explain how these requirements accomplish the goals of the proposed SAR (including the Order 693 directives).

☐ Yes

☐ No

Comments:

4. Does the revised Detailed Description of the SAR provide sufficient details for the eventual Standard Drafting Team to execute the SAR? If not, please identify areas of insufficient detail and provide suggested wording for increased clarity.

☐ Yes

☐ No

Standards Announcement

Comment Period Open
January 19-February 18, 2010

Now available at: http://www.nerc.com/filez/standards/Project2009-02_Real-Time_Monitoring_Analysis_Capabilities.html

Project 2009-02: Real-time Reliability Monitoring and Analysis Capabilities
A second draft of the standard authorization request (SAR) has been posted by the Real-time Reliability Monitoring and Analysis Capabilities SAR Drafting Team. The team is seeking comments on the SAR **until 8 p.m. EDT on February 18, 2010**. The drafting team has also posted its consideration of industry comments received for the first draft of the SAR.

Instructions
Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at Lauren.Koller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: http://www.nerc.com/filez/standards/Project2009-02_Real-Time_Monitoring_Analysis_Capabilities.html

Next Steps
The drafting team will draft and post responses to comments received during this period.

Project Background
The purpose of this project is to draft new or revised standard(s) that will establish requirements for the functionality, performance, and change management of real-time capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable system operations.

The SAR addresses selected recommendations in the RTBPTF Report http://www.nerc.com/filez/rtbptf.html as determined by the Real-time Best Practices Standards Study Group (the group that initiated the work on this project) as well as directives identified in Federal Energy Regulatory Commission (FERC) Order 693.

Applicability (as listed in the SAR)
Reliability Coordinator
Balancing Authority
Transmission Operator
Generator Operator

Standards Development Process
The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Shaun Streeter at shaun.streeter@nerc.net or at 609.452.8060.

The current draft of the SAR indicates the applicability to be intended to extend to RCs, BAs, TOPs, and GOPs. It also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading because: 1) The "tools" issues related to the August 14 Blackout were restricted to the TOP and RC functions and there was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) "ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator" and "The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below." As referenced in the "Related Standards" section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. There isn't an industry need for this project, and would create re-work in the TOP and IRO Standards that are currently in-process. The industry must work diligently to eliminate such inefficiencies in the Process. The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Based on this recent decision, the BOT has signaled its intention to move any items from Standards and Requirements that dictate "capabilities" (as proposed), and focus on "outcome."
See the response to Question 1 above. In a Results/Performance Based standard this is not a vaild point. Without the necessary tools (whatever those have been determined to be), Standard Requirements will be violated. An IROL will be violated, failure to recover from a Reportable Event will result in a DCS violation, etc.
No

The purpose of the SAR was to implement the issues not covered by Projects 2006-02 and 2007-03, namely the FERC Order 693 directive pertaining to IRO-002 and TOP-006. That being said the Commission clearly indicated that the standards need to be modified to require a "minimum set of tools that must be available to the reliability coordinator" to perform its functions. The SAR should be very clear on that point to avoid unnecessary complexity. Furthermore the Commission ordered that a provision was needed for minimum set of analytic tools [minimum capabilities] "that are necessary to enable operators to deal with real-time situations…" This was further clarified as "(1) includes a new requirement related to the provision of minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System and (2) clarifies the meaning of "appropriate technical information" concerning protective relays." The language of the SAR needs to include this specific guidance.
No
The Commission was very clear that the modification it was requesting for TOP-006 could involve new capabilities for the Balancing Authority, the Transmission Operators and possibly the Reliability Coordinator.
Yes
No
The SAR needs to incorporate the language from Order 693. The scope should be limited to the modification of respective standards.

SERC OC Standards Review Group
Jim Case
Yes
Yes
Some of the requirements (to have a certain capability or if we are forced there by FERC, a certain type of tool) best belong in certification. However, we agree that a requirement to have greater than a minimum certain 12 month-ending availability of an analytical capability and a requirement to have greater than a certain minimum quality of solution as measured on a 12 month-ending basis could better be addressed as a Reliability Standard. That is, the existence of a capability belongs in certification. Operational attributes of this capability belong in Reliability Standards. A demonstration of the functionality should be in the certification process, however once an entity is certified then compliance to performance metrics, availability parameters, etc could be in a standard. If an entity meets the performance metrics then obviously they must have the tools.
No
COM-002 R1 states "…voice and data links" shall be "…available for addressing a real-time emergency condition". The SDT should consider clarifying this point in relation to the performance

metrics, availability parameters, etc as outlined in this SAR.
No
Bullet 5 of the Detailed Description references: "…future state of the BES". The SDT needs to be cautious in defining what this means or remove that language altogether. The other bullets clearly spell out "Real-time" which defined by the NERC Glossary is "Present time as opposed to future time". Bullet 5 appears to contradict the other bullets in its timeframe scope. "The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

Changing the proposed Standard Title to Real-time Reliability Monitoring and Analysis Capabilities from Real-time Tools does capture the context of the Standard better, but the SAR's purpose still does not shed enough light on what the SAR is trying to accomplish. Suggested change to Purpose: The new or revised standard(s) will establish the minimum (see note 1) requirements for the real time monitoring (see note 2), analysis (see note 3) and their procedural administration (see note 4) on the Interconnected Bulk Electric System for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. Suggested change to Brief Description: The scope of the SAR is to establish the minimum requirements for alarming and telemetry and the administration procedures of System Analysis provided to System Operators and used to support Real-time System Operations. The SAR addresses availability parameters, performance studies (see note 5), and procedures for failure notification, maintenance coordination, and procedural changes. The intent is to describe 'what' needs to be done but not 'how' to do it. Using the statement "minimum requirements' should alleviate industry concerns about this requirement being too prescriptive and the statement makes the SAR more coincident with FERC Order 693 directive. NOTES 1. Minimum – this word is used to more closely comply with FERC order 693, paragraph 905. Also inserting "minimum" doesn't imply major change. 2. Real Time Monitoring – details specific function, whereas "functionally" is vague and open to interpretation. 3. Analysis – Another specific function is detailed, whereas "functionally" is vague and open to interpretation. 4. Procedural Administration – more clearly indicates that monitoring and analysis polices will be detailed in the SAR as opposed to "Change Management". 5. Metrics – prefer studies. Using the statement "minimum requirements' should alleviate industry concerns about this requirement being too prescriptive and the statement makes the SAR coincident with FERC Order 693 directive.
Yes
Though the introduction of a new standard is not welcome, this appears to be the only way to ensure measurable and enforceable goals.
Yes
As much as we desire NOT to see a new standard, by examining the SAR and related FERC Order 693, the following goals: Based on the SARS Detailed Description, the following goals are: • describe capability characteristics • availability parameters • performance metrics • failure notification • maintenance coordination • change management • independent process monitor (watchdog) • monitoring power system data in real time • exchanging power system date in real time and from

FERC 693 905 - RC has minimum set of tools 906 – Identify minimum capabilities and not tools (tools become obsolete) 1660 – Minimum set of analytical tools (not specific tools) would require modification of requirements from quite a few different Standards.
Yes
Very tangible details such as telemetry, alarming, Network Analysis terms were removed from the SAR and replaced with vague terms such as: • describe capability characteristics • availability parameters • performance metrics • failure notification • maintenance coordination • change management • independent process monitor (watchdog) • monitoring power system data in real time • exchanging power system date in real time If it wasn't for the SAR redline copy (that contained telemetry, alarming, Network Analysis) the above terminology would be difficult to assess. 1. Capability characteristics of what, analytical tools, alarms, telemetry, all these items? 2. Availability parameters of what, analytical tools, alarms, telemetry, all these items? 3. Failure notification of what, analytical tools, alarms, telemetry, all these items? 4. Maintenance coordination of what, analytical tools, alarms, telemetry, all these items? 5. Change Management (See note 4 in question 1) of what, analytical tools, alarms, telemetry, all these items? 6. Under which of the above SAR details could you assume FERC order 693 "minimum set of analytical tools" falls under? 7. What does "Independent process monitor (watchdog)" mean is that an analytical tool or is that an RC? 8. Exchanging and monitoring power system date in real time, isn't that covered in TOP-005 1.1, "Attachment 1 — TOP-005-1.1"?
Individual

Duke Energy
Yes
No
Yes
However the Standards Drafting Team must be careful not to duplicate existing requirements in other standards, and until we see a draft it's difficult to say there won't be any duplication. For example, the Detailed Description of the SAR has a bullet "Evaluating the impact of 'what if' events on the current or future state of the BES." This could duplicate TOP-002-2 Requirement R6 which states that "Each Balancing Authority and Transmission Operator shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 Contingency planning) in accordance with NERC, Regional Reliability Organization, subregional, and local reliability requirements.

As referenced in the "Related Standards" section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. We do not believe there is an industry need for this project and, to the contrary, would create re-work in the TOP and IRO Standards that are currently in-process. We must work diligently as an industry to eliminate such inefficiencies in the Process. Of final note, the NERC BOT recently approved the pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to move any from Standards and Requirements that dictate "capabilities" (as proposed) and focus on "outcome."
See answer to #1 above. Also, in a Results/Performance Based standards world, this is a moot point. If you do not have the necessary tools, whatever your company has determined that those may be, you will violation Standard Requirements. You will, for example, violate an IROL, fail to recover from a Reportable Event, etc.
No

AEP appreciates the SDT's efforts to re-align the SAR to focus on the "what" rather than the "how."
No
Given the limitations described, it seems appropriate to proceed with the standards development process to resolve these reliability issues as advocated by the SDT. AEP is hopeful that efforts will continue on the certification front to meet the reliability concerns expressed in this SAR as well. Ultimately, we believe that the NERC certification process of functional entities to ensure that the right tool set is in place and operating correctly is preferable to allowing, by administrative registration alone, to begin operating and then, afterwards, trying to invoke standards to address operating issues that could have been avoided up-front.
No
AEP believes that elements identified in the detailed description portion of the SAR are largely covered in the existing standards, including those shown below (Table 1). The roll-up of SAR

functions from SAR version 1 to a higher level descriptor in SAR version 2 does not seem to limit the relevance of all of the listed standards that AEP has researched. We are concerned that repetition of requirements across multiple standards may create ambiguity if alternative requirements or methods are defined from one to the other. The repetition also establishes the possibility of compounding violations for a single infraction. To the extent that new requirements are needed to address operational gaps, we believe that these should be made in the next revision of the applicable existing standards. TABLE I - Existing NERC Reliability Standards addressing Alarming, Telemetry, Network Analysis, Related Performance Metrics (Availability and Quality), and Processes and Procedures supporting Real-Time Tools (Change Mgt., Maintenance Coordination, and Failure Notification) : Alarming COM-001-1.1, does have some language related to the alarming of vital telecommunications facilities for voice and data. TOP-006-2 stress the importance of monitoring equipment to be used to 'alarm' or bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action. IRO-002-2, gives direction on the alarming management and awareness systems that need to be in place for the RC. Telemetry BAL-001-0, dealing with the ACE equation along with Control Performance Standards (CPS1 and CPS2) BAL-004-0, addressing Time Error Corrections BAL-005-0.1b, focuses on the telemetry components necessary for calculating the ACE equation BAL-006-1.1, tasks the Balancing Authorities to calculate and record hourly Inadvertent Interchange IRO-004-1, details the information that needs to be sent to the RC for reliability studies to be performed IRO-005-3, breaks down most of the parameters that a RC would need to receive for monitoring the BES TOP-002-2, highlights that changes in transmission facility status, along with ratings should be monitored and conveyed to the RC and BA TOP-005-2 is the Operational Reliability Information standard that lays out all of the data that needs to be updated at least every ten minutes TOP-006-2 is another standard focused on monitoring system conditions. VAR-001-1 also is offering details on what data should be pipelined back to the operating control centers from the BES. Network Analysis IRO-004-1, discusses the ability for the RC, TO, and BA to conduct next-day reliability analyses to ensure that the BES can be operated reliably. TOP-002-2, looks at the performance of current-day, next-day, and studies operational studies in conjunction with neighboring BA(s) and TO(s). TOP-002-2, also address the thermal and voltage contingency analysis that needs to be performed. IRO-002-2, details the analysis that needs to take place via state estimation and other visualization tools. Performance Metrics for Availability and Quality Availability BAL-005-0.1b, R8 looks at SCADA availability to gather data and calculate ACE. This requirement also addresses the availability of Frequency Metering equipment (99.95%). COM-001-1.1, stresses the diversity and redundancy of communication paths for the available exchange of Interconnection and operating information, internally and externally to AEP. EOP-008-0, emphasizes the development of a plan to ensure the monitoring and control of transmission, distribution and generation assets even with the loss of the Control Center. Quality BAL-005-0.1b, R17 breaks down the accuracy of the metering devices for time error and frequency measurements BAL-006-1.1, requires adjacent balancing authorities to have common megawatt-hour meters at the interconnection point. IRO-005-3, discusses the importance of operating to the most limiting element if there is a discrepancy between various entities monitoring the same facilities. TOP-006-2 generically states that sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions. Processes and Procedures supporting Real-Time Tools: Change Mgt., Maintenance Coordination, and Failure Notification Change Management FAC-009-1, obligates the communication to RC(s), PA(s), TP(s), and TO(s) for new facility ratings on the Bulk Electric System. TOP-002-2, implies that there should be a facility change notification system in place for neighboring entities to use uniform line identifiers when referring to interconnected facilities. BAL-004-0, addressing Time Error Corrections Maintenance Coordination FAC-009-1, it is implied that these changes will be applied to the real time computer model with alterations to facility ratings on the Bulk Electric System. TOP-002-2, talks about each BA and TO maintaining accurate computer models for analyzing and planning system operations. Failure Notification IRO-005-3, highlights the responsibility to identify significant issues with ACE that can attribute to other errors, such as frequency error and Time error. As the SDT has described, the directives in Order 693 relate to IRO-002 and TOP-006 and indicate a desire for a minimum set of capabilities. If the present SDTs for the referenced projects do not currently have these reliability issues in their scope, it would seem appropriate for NERC to slate these improvements for the next version of these respective standards.

No
While better, more focus on performance based requirements needs to be included in the standard.
No
Certification is a process that says the entity has the capability to meet the requirments applicable to them, but this does not mean that the entity will meet the requirements. The two are different and need to be kept that way. One time certification is fine, the region could ask for re-certification if they find defeciencies with the entity in their performance.
No comment.
Group
E.ON U.S.
Brent Ingerigtson
Yes
Though generally supportive of the approach, E.ON U.S. believes it is incumbent upon the SDT to draft requirements that provide sufficient notice to registered entities of what it is they should or should not do to become or remain compliant.
Yes
A demonstration of the functionality should be in the certification process, however once an entity is certified then compliance to performance metrics, availability parameters, etc could be in a standard. If an entity meets the performance metrics then obviously they must have the tools.
Yes
COM-002 R1 states "…voice and data links" shall be "…available for addressing a real-time emergency condition". The SDT should consider clarifying this point in relation to the performance metrics, availability parameters, etc as outlined in this SAR.
No
Bullet 5 of the Detailed Description references "…future state of the BES". The SDT needs to be

cautious in defining what this means or remove that language altogether. The other bullets clearly spell out "Real-time" which defined by the NERC Glossary is "Present time as opposed to future time". Bullet 5 appears to contradict the other bullets in its timeframe.

BAL-005 R8, R14, and R16 define the BAs requirments for monitoring real-time data for the operation of AGC. The new standard should not confict with these requirements.
No
There are some terms used in the SAR that need to be clarified, such as "watch dog". Better define what is meant by "independent process monitor". Is the group specifying how the system should function or specific tool that should be used.
Group
FirstEnergy
Sam Ciccone
No
While we agree the SAR DT has improved the SAR, we suggest further improvement by revising the purpose statement (Pg. 2) as follows to ensure the scope is limited to aspects related to the reliability of the BES: "The new or revised standard(s) will establish requirements for the functionality, performance, and change management of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable Bulk Electric System operation." In addition, the following bullet points under the detailed description (Pg. 3) should be revised as follows to ensure proper focus of the standard. • Monitoring Bulk Electric System reliability-related data in Real-time. • Exchanging Bulk Electric System reliability-related data in Real-time.
No
While we agree the changes proposed in this SAR are not suited to the organization certification process, we are unclear as to why the Project 2007-03 SDT feels this project cannot be combined with theirs. Part of their responsibility appears to be managing the rules for the use of the System Operator tools. This SAR proposes to require a set of tool capability and performance. It would seem logical to expect the team responsible for specifying the use of system operator tools would have the skill set to determine the tool set make up and the performance needed from to those tools to produce an outcome consistent with the reliability of the BES. If left as separate projects, a high degree of coordination seems necessary to ensure the tools required and the use of those tools are sufficiently covered by the standards.
Yes
No
See comments provided in item 1 above. Also, on Pg. 2 of the SAR it would be more helpful if it specifically stated the following regarding FERC directives: 1. "In Par. 905 of Order 693 '... the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe that this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. Further, as noted by Dominion, such a requirement promotes a more proactive approach to maintaining reliability'." 2. "In Par. 1660 of Order 693, FERC directed modifications to TOP-006-1 1660 '... related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System. In response to APPA that the inclusion of specific analytical tools is counterproductive because the tools will become obsolete, we note that we are not seeking specific analytical tools, but rather minimum capabilities'." Also, it should be noted that the SDTs currently working on IRO-

002 and TOP-006, Project 2006-06 and 2007-03, respectively, are proposing to retire both of these standards. Therefore, the eventual SDT for this Project 2009-02 will have to determine the appropriate standards to include new requirements for Real-time monitoring and analysis capabilities.

Western Electricity Coordinating Council
Linda Perez
Yes
No
We agree that certification should be a one-time process and that the compliance audits of entities every 3 years should adequately address the issue of capabilities without recertification.
No
We believe the current requirements in the standards are adequate to address the basic capabilities required of the RCs. However, the requirements applicable to RCs are more specific in many cases than the requirements applicable to other entities.
No
We are not certain we understand the meaning of the reference to a watch dog. This functionality shall include an independent process monitor (e.g., watchdog). The IRO standards cover the items listed in the detailed description, so the STD should not be duplicative of the IRO standards.
Individual
Jeff Hackman
Ameren
No
While the new language partially allays the concern, it still does not differentiate that these capabilites are a collection of defense-in-depth capabilities and that no one capability is critical to BES reliability.
Yes
First of all, the team asserts in this question that FERC Order 693 requires the team to address "tool capability". Yet it disingenously has renamed itself to talk about capabilites and NOT tools. It therefore begs the question, "Why would this SAR be better to address 693's "tools". Just because recertification is not currently in the process does not mean it could not be added, especially in cases where fundamental qualifications change.

The SAR proposes to address an area that is already covered by the standards themselves. Current

NERC standards mandate performance compliance. There is no need to create a standard to also mandate how to achieve that level of perfomance. Further the GOP should not be considered as an applicable entity because the GOP has no monitoring or analysis obligations.
Yes
Performance based reliability standards will ensure compliance. There is no need for measuring the physical performance of the tools used to meet those reliability performance requirements.

The change in words and the explanation given does not change what this is. This is a project to develop additional mandatory requirements for entities to follow when there are already to many existing requirements. There should be a separate certification process for obtaining and maintaining certification. This process should include capability requirements. Spending industry resource time on this capability SAR at this time takes away resources from the most important NERC project, the project to revise the entire set of standards to result in only the necessary risk-informed, performance-based requirements. Requiring specific capability is not prescribing what tool to use to achieve the capability. However, it is prescribing what capabilities to have and what performance, availability, and maintenance requirements to follow for these capabilities. That is still being prescriptive. A Reliability Standard requirement should be a requirement to provide for reliable operation of the bulk-power system including requirements for the operation of existing bulk-power system facilities and the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system. It should not be a requirement to provide for reliable operation, functionality, performance, availability, and maintenance of a capability (a tool) used for reliable operation of the bulk-power system and facilities. The industry and the tool vendors should determine what tools and functionality are needed to provide for reliable operation of the bulk-power system in terms of their own system and the scope of their responsibilities and what is needed for reliable tools operation and maintenance. Capability requirements should not be in a mandatory reliability standard. The project to determine risk-informed, performance-based requirements should not include requirements for capabilities. See the response to no. 2 regarding a certification process.
Yes
Yes, the issues addressed in the proposed SAR belong in a certification process. Why, because there is no adequate certification process today, should a certification issue be turned into a Reliability Standard issue? Having certain capabilities is a certification issue and should be addressed by fixing the certification process. Certification processes should apply criteria to entities that have already been certified. Certification should not be a one time process. There should be a certification and re-certification process. There was no operational history associated with mandatory reliability standards before June 2007. Such an operational history is being built now. After developing and putting in place an adequate certification program, then there will be an operational history associated with certification and re-certification. Certification criteria that deal with real-time operations or data should be evaluated by a certification team to determine if the entity has

adequate functionality to be certified. Certification should not rely on the Compliance Monitoring and Enforcement Program (CMEP) to prove adequate functionality when there are violations of standards or on an on-going basis. There should be a separate certification (or capability verification) program to prove that. The issues raised by FERC should be addressed by first revamping all NERC requirements to risk-informed, performance-based requirements and developing a capability verification (certification) program. Then with a new slate of comprehensive, measurable, and auditable requirements and with a capability verification program, the original issues of FERC would be addressed. It is easy to perceive how having these things could eliminate the root problems and therefore the need to come up with solutions. That should satisfy and sustain a mandatory and enforceable status for those FERC directives. This SAR does not need to move forward to address the FERC directives.
No
The best use of NERC's and the industry's thinly stretched resources is to work on the project to revise the entire set of standards to result in only the necessary risk-informed, performance-based requirements. Then there should be no gap of requirements. The approach taken by the Standards Development Program, to not write new requirements that assess basic capabilities used to achieve performance measured through other requirements within the Reliability Standards, would result in no need for this SAR because all necessary performance (of the bulk power system) requirements would then be in the Reliability Standards. Rather than adding more requirements, NERC should eliminate unnecessary requirements to a number of important performance-based requirements. Resources are being stretched thinner and thinner. Resources spend time complying with the letter of unnecessary, poorly worded requirements rather than complying with the spirit of what should be required and the translation of that spirit into literal performance-based requirements. Much time is also spent reviewing, commenting, and voting on all of the other existing NERC projects. If it came to a choice of performing only the project to revise the standards to result in only the necessary risk-informed, performance-based requirements or performing all of the other projects in NERC's 3 year plan, it would do more good for reliability and for compliance enforcement to accomplish only that one performance-based project. In fact, rather than doing all of the projects, it would be best for the sake of the limited amount of resources to put a hold on most (if not all) of the other projects and to work only on this one comprehensive project. The "staffing" and content of the ongoing and existing projects should be reorganized to be merged into and organized around the comprehensive results-based project and not around the existing very many separate projects that sprang up at different times with different objectives and perspectives. Performing this project first would likely correct the issues or problems which lead to the creation of many of the existing projects. Many of the other projects could be cancelled.

Additional Comments: Would be helpful if Directives were put into the Reference information. BPA supports having watchdog timers. BPA is uncertain about what wide area (Situational Awareness) is common to all TOP/BA that would be acceptable to all auditors. BPA would like clarity regarding what "procedure for failure notification" means (report to RC if link is down between TOP and RC or between station RTU and TOP ???) It appears that this SAR will add more documentation requirements.

No
The SAR should be further clarified to specify that the standard should provide performance

standards rather than tools themselves. The SAR language still contains elements of "how," such as specifying audio and visual signals.
Yes
Yes, tools and tool capabilities are better handled within a certification process, that is, a certification that the entity has tools that are needed to meet the requirements of a standard. The certification process could be conducted initially and as a periodic re-certification if that is deemed necessary.
No
Monitoring is difficult to describe in a standard. The SAR has the potential to result in a standard that creates an undue administrative burden that is highly subjective, especially in the context of a compliance audit. Also, the subject matter of the SAR appears to be applicable to tasks necessarily performed by transmission operators but not necessary for generator operators. GOP should be eliminated from the applicable entities.

As expressed in our previous comments, we believe that these capability requirements are best stipulated in the Organization Certification Requirements. The absence of a re-certification process is not a convincing reason for not pursuing this alternative since: a. The requirements to continuously maintain or periodically demonstrate the capability can be added to the certification process; or b. A proposal can be made to develop a re-certification process or certificate maintenance process which in many commenters' view is needed not just for this set of requirements but also for other "capability" type of requirements. That said, we would agree that in the essence of time to meet Order 693's directives, developing a standard to house these requirements may be an acceptable interim approach before a workable certification process is developed, for so long as the requirements focus on the "what's" but not the "how's".

The SAR indicates the applicability to be extended to RCs, BAs, TOPs, and GOPs. It also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading, because: 1) The "tools" issues related to the August 14 Blackout were restricted to the TOP and RC functions and there was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) "ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator" and "The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below." As referenced in the "Related Standards" section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. We believe there is an industry need for this project but the project should involve revising the TOP and IRO Standards that are currently in-process, or better still, adding the necessary requirements to the Organization Certification Requirements for these entities. If the industry should support the need to develop similar capability requirements for the Balancing Authority, where justified, then we would suggest that such requirements be added to the Organization Certification Requirements for the BA as well. We do not believe the GOP needs to acquire similar capabilities in view of its scope of operation

which we believe falls outside of the intent of the FERC Order.
As expressed in our previous comments, we believe that these capability requirements are best stipulated in the Organization Certification Requirements. The absence of a re-certification process is not a convincing reason for not pursuing this alternative since: a. The requirements to continuously maintain or periodically demonstrate the capability can be added to the certification process; or b. A proposal can be made to develop a re-certification process or certificate maintenance process which in many commenters' view is needed not just for this set of requirements but also for other "capability" type of requirements. That said, we would agree that in the essence of time to meet Order 693's directives, developing a standard to house these requirements may be an acceptable interim approach before a workable certification process is developed, for so long as the requirements focus on the "what's" but not the "how's". In addition, we suggest the SDT to present to the Standards Committee and the Compliance and Certification Committee our recommendation for putting these requirements into the Organization Certification Requirements, and to revisit the re-certification process to ensure periodic verification of the certified capability.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on 2nd Draft of SAR for Real-time Reliability Monitoring and Analysis Capabilities (Project 2009-02)

The Real-time Reliability Monitoring Analysis Capabilities SAR Drafting Team thanks all commenters who submitted comments on the 2nd draft of the standards for Real-time Reliability Monitoring and Analysis Capabilities (Project 2009-02). These standards were posted for a 30-day public comment period from January 19, 2010 through February 18, 2010. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 30 sets of comments, including comments from more than 80 different people from over 40 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Project2009-02_Real-Time_Monitoring_Analysis_Capabilities.html

The SAR DT has made a few clarifying changes to the text of the SAR in response to industry comments and now feels that the project is ready for approval by the Standards Committee to move forward to the standards development stage.

Several entities indicated that the proposed project does not support the "results-based" approach to developing standards and the SAR DT disagrees. The report generated by the Results-based Ad Hoc Team includes the following description of the types of requirements recommended for results-based standards:

> To achieve an adequate level of reliability, the team recommended a blended approach be used comprising of three types of requirements:
>
> **Performance-based** — defines a particular reliability objective or outcome to be achieved. In its simplest form, a performance-based standard has four components: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome*?
>
> **Risk-based** — preventive requirements to reduce the risks of failure to acceptable levels. A risk-based reliability standard should be framed as: *who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome that reduces a stated risk to the reliability of the bulk power system?*
>
> **Competency-based** — defines a minimum set of capabilities an entity needs to have to demonstrate it is able to perform its designated reliability functions.

The proposed requirements are "Competency-based" as they define a set of capabilities needed to support reliable operations.

Some stakeholders are still stating that the items cited in the SAR should be part of a revised certification process accompanied by a new re-certification process. The SAR DT has no control over the certification/re-certification process and is working under the existing rules and procedures to fill a reliability gap.

Several comments were raised on the applicability of the Generator Operator. The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator.

1. The Real-time Reliability Monitoring and Analysis Capabilities SAR DT has attempted to clarify the wording of the SAR to show that this SAR is focused on functionality and not on specific tools. In other words, this SAR addresses 'what' vs. 'how'. Do you agree that the revised SAR adequately allays industry concerns on being too prescriptive as to how the functionality will be addressed? If not, please provide recommended wording changes.

Summary Consideration: A majority of the commenters agree with the SAR DT's approach.

The SAR DT has made slight clarifying changes to the Purpose statement and the Detailed Description based on industry comments.

There were several commenters who are still expressing the opinion that certification/re-certification is the correct method to use. The SAR DT has no control over the certification/re-certification process and is working under the existing rules and procedures to fill a reliability gap.

The SAR DT does not see any point of conflict between the proposed results-based reliability standards effort and the proposed content of any eventual standard(s) or changes to existing standard(s) that this SAR might generate. Indeed, the SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort.

Several comments were raised on the applicability of the Generator Operator. The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator.

Purpose statement: The new or revised standard(s) will establish requirements for the functionality, performance, and maintenance of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations.

Detailed description: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process) of functionality for:

- Monitoring power System data in Real-time.
- Exchanging power System data in Real-time.
- Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor.
- Determining the current state of the BES.

- Evaluating the impact of 'what if' events on the current state of the BES.

Organization	Yes or No	Question 1 Comment
Manitoba Hydro		Changing the proposed Standard Title to Real-time Reliability Monitoring and Analysis Capabilities from Real-time Tools does capture the context of the Standard better, but the SAR's purpose still does not shed enough light on what the SAR is trying to accomplish. Suggested change to Purpose: The new or revised standard(s) will establish the minimum (see note 1) requirements for the real time monitoring (see note 2), analysis (see note 3) and their procedural administration (see note 4) on the Interconnected Bulk Electric System for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. Suggested change to Brief Description: The scope of the SAR is to establish the minimum requirements for alarming and telemetry and the administration procedures of System Analysis provided to System Operators and used to support Real-time System Operations. The SAR addresses availability parameters, performance studies (see note 5), and procedures for failure notification, maintenance coordination, and procedural changes. The intent is to describe 'what' needs to be done but not 'how' to do it. Using the statement "minimum requirements' should alleviate industry concerns about this requirement being too prescriptive and the statement makes the SAR more coincident with FERC Order 693 directive. NOTES 1. Minimum - this word is used to more closely comply with FERC order 693, paragraph 905. Also inserting "minimum" doesn't imply major change. 2. Real Time Monitoring - details specific function, whereas "functionally" is vague and open to interpretation. 3. Analysis - Another specific function is detailed, whereas "functionally" is vague and open to interpretation. 4. Procedural Administration - more clearly indicates that monitoring and analysis polices will be detailed in the SAR as opposed to "Change Management". 5. Metrics - prefer studies. Using the statement "minimum requirements' should alleviate industry concerns about this requirement being too prescriptive and the statement makes the SAR coincident with FERC Order 693 directive.
Response: The SAR DT has made a change to the Purpose statement based on your comment and those of others but does not believe that a change to		

Organization	Yes or No	Question 1 Comment
'procedural administration' is the right phrasing or in line with the new results-based standards effort. 'Minimum' was not utilized as it is often interpreted to mean a least common denominator approach. The SAR DT has deleted 'change management' as suggested and replaced it with 'maintenance' which is what the intent of the statement was. **Purpose statement**: The new or revised standard(s) will establish requirements for the functionality, performance, and maintenance of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. The SAR DT believes that 'monitoring and analysis' is more appropriate for the SAR as opposed to 'alarming and telemetry'. The SAR DT does not believe that 'administration procedures' or 'procedural changes' is the right phrasing or in line with the new results-based standards effort. 'Minimum' was not utilized as it implies a least common denominator approach which is not allowed. The SAR DT believes that 'metrics' is the correct terminology and in line with results-based standards. No change made.		
Dominion	No	Despite SDTs response to comments concerning inclusion of Generator Operator, we remain unconvinced of the need to add this entity. In the Industry Need section the SDT cites the following, none of which indicates a need to include Generator Operators; Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations FERC Order 693 - paragraphs 905, 906 & 1660
Response: The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. For example, the Generator Operator would not be expected to perform network analysis. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator. No change made.		
Georgia System Operations Corporation	No	The change in words and the explanation given does not change what this is. This is a project to develop additional mandatory requirements for entities to follow when there are already to many existing requirements. There should be a separate certification process for obtaining and maintaining certification. This process should include capability requirements. Spending industry resource time on this capability SAR at this time takes away resources from the most important NERC project, the project to revise the entire set of standards to result in only the necessary risk-informed, performance-based requirements. Requiring specific capability is not prescribing what tool to use to achieve the capability. However, it is prescribing what capabilities to have and what performance, availability, and maintenance requirements to follow for these capabilities. That is still being prescriptive. A Reliability Standard requirement should be a requirement to provide for reliable operation of the bulk-power system including requirements for the operation of existing bulk-power system facilities and the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system. It should not be a requirement to provide for reliable operation, functionality, performance, availability, and maintenance of a capability (a tool) used for reliable

Organization	Yes or No	Question 1 Comment
		operation of the bulk-power system and facilities. The industry and the tool vendors should determine what tools and functionality are needed to provide for reliable operation of the bulk-power system in terms of their own system and the scope of their responsibilities and what is needed for reliable tools operation and maintenance. Capability requirements should not be in a mandatory reliability standard. The project to determine risk-informed, performance-based requirements should not include requirements for capabilities. See the response to no. 2 regarding a certification process.
Response: The existing certification process (which is standard-driven) or any future re-certification effort is outside the scope of the SAR DT. The SAR DT can only react to the certification/re-certification issue as it exists today. The SAR DT believes that this indicates that a standard(s) or changes to existing standard(s) is required to achieve desired reliability objectives. No change made. This SAR does not prevent an entity or its vendor from selecting a particular tool to use to provide the necessary capabilities. No change made. The SAR DT does not see any point of conflict between the proposed results-based reliability standards effort and the proposed content of any eventual standard(s) or changes to existing standard(s) that this SAR might generate. Indeed, the SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort. No change made. Please see response to #2.		
Hydro-Québec TransEnergie (HQT)	No	The current draft of the SAR indicates the applicability to be intended to extend to RCs, BAs, TOPs, and GOPs. It also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading, because: 1) The “tools” issues related to the August 14 Blackout were restricted to the TOP and RC functions and there was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) “ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator” and “The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below.” As referenced in the “Related Standards” section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed

Organization	Yes or No	Question 1 Comment
		through the Certification Process of the RC and TOP. We do not believe there is an industry need for this project and, to the contrary, would create re-work in the TOP and IRO Standards that are currently in-process. We must work diligently as an industry to eliminate such inefficiencies in the Process. The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to move any from Standards and Requirements that dictate “capabilities” (as proposed) and focus on “outcome.”
ISO New England Inc	No	The current draft of the SAR indicates the applicability to be intended to extend to RCs, BAs, TOPs, and GOPs. If also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading, because: 1) The “tools” issues related to the August 14 Blackout were restricted to the TOP and RC functions and there was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) “ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator” and “The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below.” As referenced in the “Related Standards” section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. We do not believe there is an industry need for this project and, to the contrary, would create re-work in the TOP and IRO Standards that are currently in-process. We must work diligently as an industry to eliminate such inefficiencies in the Process. Of final note, the NERC BOT recently approved the pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to move any from Standards and Requirements that dictate “capabilities” (as proposed) and focus on “outcome.”
Northeast Power Coordinating Council	No	The current draft of the SAR indicates the applicability to be intended to extend to RCs, BAs, TOPs, and GOPs. It also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading because: 1) The “tools” issues related to the August 14 Blackout were restricted to the TOP and RC functions and there

Organization	Yes or No	Question 1 Comment
		was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) “ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator” and “The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below.” As referenced in the “Related Standards” section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. There isn't an industry need for this project, and would create re-work in the TOP and IRO Standards that are currently in-process. The industry must work diligently to eliminate such inefficiencies in the Process. The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Based on this recent decision, the BOT has signaled its intention to move any items from Standards and Requirements that dictate “capabilities” (as proposed), and focus on “outcome.”
Response: Recommendation 22 of the Blackout Report specifically cited the Reliability Coordinator and operators. The use of the term operators brings in the other entities cited in the SAR. No change made. As pointed out in the first posting comment response, the SDTs working on the revisions of the IRO (Project 2006-06) & TOP (Project 2007-03) standards disagree with your position as stated in the most recent project implementation plans. They have passed on the capability related requirements to this SAR DT. No change made. The existing certification process (which is standard-driven) or any future re-certification effort is outside the scope of the SAR DT. The SAR DT can only react to the certification/re-certification issue as it exists today. The SAR DT believes that this indicates that a standard(s) or changes to existing standard(s) is required to achieve desired reliability objectives. No change made. The SAR DT does not see any point of conflict between the proposed results-based reliability standards effort and the proposed content of any eventual standard(s) or changes to existing standard(s) that this SAR might generate. Indeed, the SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort. No change made.		
IRC Standards Review Committee	No	The SAR indicates the applicability to be extended to RCs, BAs, TOPs, and GOPs. It also indicates the industry need was identified through the August 14 Blackout report and references FERC Order 693. This is misleading, because: 1) The “tools” issues related to the August 14 Blackout were restricted to the TOP and RC functions and there

Organization	Yes or No	Question 1 Comment
		was no indication that the BA or GOP tools were lacking in any respect. 2) FERC Order 693 stipulated (a) “ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator” and “The Commission approves TOP-006-1 as mandatory and enforceable. In addition, the Commission directs the ERO to develop modifications to TOP-006-1 through the Reliability Standards development process, as discussed below.” As referenced in the “Related Standards” section, this endeavor is best suited under the responsibility of existing drafting teams working on the RC and TOP Standards sets. Or, in the alternative, as was commented in the first round of posting, these could be easily addressed through the Certification Process of the RC and TOP. We believe there is an industry need for this project but the project should involve revising the TOP and IRO Standards that are currently in-process, or better still, adding the necessary requirements to the Organization Certification Requirements for these entities. If the industry should support the need to develop similar capability requirements for the Balancing Authority, where justified, then we would suggest that such requirements be added to the Organization Certification Requirements for the BA as well. We do not believe the GOP needs to acquire similar capabilities in view of its scope of operation which we believe falls outside of the intent of the FERC Order.
Response: Recommendation 22 of the Blackout Report specifically cited the Reliability Coordinator and operators. The use of the term operators brings in the other entities cited in the SAR. No change made. As pointed out in the first posting comment response, the SDT’s working on the revisions of the IRO (Project 2006-06) & TOP (Project 2007-03) standards disagree with your position as stated in the most recent project implementation plans. They have passed on the capability related requirements to this SAR DT. No change made. The existing certification process (which is standard-driven) or any future re-certification effort is outside the scope of the SAR DT. The SAR DT can only react to the certification/re-certification issue as it exists today. The SAR DT believes that this indicates that a standard(s) or changes to existing standard(s) is required to achieve desired reliability objectives. No change made. The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. For example, the Generator Operator would not be expected to perform network analysis. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator. No change made.		
Midwest ISO	No	The Midwest ISO believes that a basic set of tools should be prescribed in the Reliability Standards for

Organization	Yes or No	Question 1 Comment
		Reliability Coordinators.
Response: FERC Order 693 specifically cites minimum capabilities for Reliability Coordinators in paragraph 1660 as opposed to a set of tools. The SAR DT agrees with the position espoused in Order 693 and has emphasized functionality accordingly. No change made.		
US Bureau of Reclamation	No	The purpose of the SAR was to implement the issues not covered by Projects 2006-02 and 2007-03, namely the FERC Order 693 directive pertaining to IRO-002 and TOP-006. That being said the Commission clearly indicated that the standards need to be modified to require a “minimum set of tools that must be available to the reliability coordinator” to perform its functions. The SAR should be very clear on that point to avoid unnecessary complexity. Furthermore the Commission ordered that a provision was needed for minimum set of analytic tools [minimum capabilities] “that are necessary to enable operators to deal with real-time situations...” This was further clarified as “(1) includes a new requirement related to the provision of minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System and (2) clarifies the meaning of “appropriate technical information” concerning protective relays.” The language of the SAR needs to include this specific guidance.
Response: The SAR DT does not agree with the commenter’s statement on the Purpose of the SAR. The Purpose as stated in the SAR goes beyond that stated by the commenter by describing what the standard action will achieve in support of bulk power system reliability: “The new or revised standard(s) will establish requirements for the functionality, performance, and change management of Real-time capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations.” No change made. FERC Order 693 specifically cites minimum capabilities in paragraph 1660 as opposed to a set of tools. The SAR DT agrees with the position espoused in Order 693 and has emphasized functionality accordingly. No change made. “Appropriate technical information” for protective relays is a FERC comment on TOP-006 and is not pertinent to this SAR. No change made.		
Pepco Holdings, Inc.	No	The SAR proposes to address an area that is already covered by the standards themselves. Current NERC standards mandate performance compliance. There is no need to create a standard to also mandate how to achieve that level of performance. Further the GOP should not be considered as an applicable entity because the GOP has no monitoring or analysis obligations.
Response: The SAR DT believes that the current standards do not address all levels of needed performance hence the effort to fill a reliability gap with this SAR. The SAR addresses items not presently covered in any existing or proposed reliability standard. The SAR DT envisions that standards developed or revised as a result of this SAR will address reliability gaps in terms of performance, risk, and competency. No change made.		

Organization	Yes or No	Question 1 Comment
The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. For example, the Generator Operator would not be expected to perform network analysis. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator. No change made.		
Public Service Enterprise Group Companies	No	The SAR should be further clarified to specify that the standard should provide performance standards rather than tools themselves. The SAR language still contains elements of "how," such as specifying audio and visual signals.
Response: The SAR DT has changed the wording in the 3rd bullet of the Detailed Description to accommodate your concerns. **Detailed description**: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for: • Monitoring power System data in Real-time. • Exchanging power System data in Real-time. • Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor. • Determining the current state of the BES. • Evaluating the impact of 'what if' events on the current state of the BES.		
ODEC	No	While better, more focus on performance based requirements needs to be included in the standard.
Response: This is a SAR and not a standard. There are no requirements at this point in time, just a reference for the future SDT. If this SAR is approved by the Standards Committee, it would move forward as a results-based standards effort. No change made.		
Ameren	No	While the new language partially allays the concern, it still does not differentiate that these capabilites are a collection of defense-in-depth capabilities and that no one capability is critical to BES reliability.
Response: This SAR deals with capabilities and concepts and does not attempt to define criticality. No change made.		
FirstEnergy	No	While we agree the SAR DT has improved the SAR, we suggest further improvement by revising the purpose statement (Pg. 2) as follows to ensure the scope is limited to aspects related to the reliability of the BES: "The new or revised standard(s) will establish requirements for the functionality, performance, and change management of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission

Organization	Yes or No	Question 1 Comment
		Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable Bulk Electric System operation. "In addition, the following bullet points under the detailed description (Pg. 3) should be revised as follows to ensure proper focus of the standard. o Monitoring Bulk Electric System reliability-related data in Real-time. o Exchanging Bulk Electric System reliability-related data in Real-time.
Response: The SAR DT has added the suggested wording to the Purpose statement as it lines up the purpose of the SAR with the name of the project. **Purpose statement**: The new or revised standard(s) will establish requirements for the functionality, performance, and maintenance of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. The SAR DT believes that the bullets need to be read in context with the lead-in paragraph. Once that is done, the changes suggested are not necessary as it should be clear that the SAR is not citing what data needs to be supplied but the performance characteristics of the functions employed. No change made.		
Bonneville Power Administration	Yes	Additional Comments: Would be helpful if Directives were put into the Reference information. BPA supports having watchdog timers. BPA is uncertain about what wide area (Situational Awareness) is common to all TOP/BA that would be acceptable to all auditors. BPA would like clarity regarding what "procedure for failure notification" means (report to RC if link is down between TOP and RC or between station RTU and TOP ???) It appears that this SAR will add more documentation requirements.
Response: The SAR DT has included the paragraph numbers of the pertinent paragraphs in Order 693 and feels that this is sufficient as no other commenters have cited this as a problem. No change made. The SAR DT thanks you for your comment, however several entities objected to use of the term “watchdog” and this was removed from the revised SAR. The focus on capabilities such as situational awareness is different for the various reliability entities and the eventual SDT will need to define that focus. No change made. The SAR DT intended failure notification to mean something local to the affected entity, e.g., notification that a particular capability is not working as intended. No change made. There is almost certainly going to be some documentation requirements in the eventual standard(s) or revisions although the movement to results-based		

Organization	Yes or No	Question 1 Comment
standards should minimize this. However, the SAR DT has deleted the words '… procedures for…' in the failure notification phrasing as the intent is not a documented procedure but a notification. **Detailed description**: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for: • Monitoring power System data in Real-time. • Exchanging power System data in Real-time. • Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor. • Determining the current state of the BES. • Evaluating the impact of 'what if' events on the current state of the BES.		
E.ON U.S.	Yes	Though generally supportive of the approach, E.ON U.S. believes it is incumbent upon the SDT to draft requirements that provide sufficient notice to registered entities of what it is they should or should not do to become or remain compliant.
Response: This is still a SAR and the eventual SDT will take up the implementation plan for any new or revised standard(s). A sufficient lead time with stakeholder input would be part of their considerations. No change made.

NERC Standards Review Subcommittee	Yes	N/A
Response: Thank you for your support.		

2. In the first set of questions, several entities suggested that this functionality should and could be handled through certification. The SAR DT has researched the issue and has compiled the following information:

Certification is a one time process. New certification criteria do not apply to entities that have already been certified. There is no re-certification process nor are there any plans that the SAR DT is aware of to expand the certification process to include re-certification. Certification only proves that an entity had the functionality at a single point in time. There is no operational history associated with certification; therefore, certification criteria that deal with Real-time operations or data are only evaluated by the certification team to determine if the entity has adequate functionality to go operational. Certification relies on the Compliance Monitoring and Enforcement Program (CMEP) to prove compliance for this functionality on an on-going basis. However, CMEP can only evaluate compliance to requirements defined in the Reliability Standards. Therefore, the SAR is necessary to allow the creation of standard requirements to address the issues raised in the SAR so they will be evaluated by CMEP.

Furthermore, there are 2 directives in FERC Order 693 relating to tool capability that need to be addressed. The existing projects that would have handled these issues (Project 2006-02 for IRO-002 and Project 2007-03 for TOP-006) have clearly indicated that they expect this SAR (Project 2009-02) to address the issues raised by FERC. It is difficult to perceive how any additions or changes to the certification process could come up with a solution that would satisfy and sustain a mandatory and enforceable status for those directives. Therefore, this SAR needs to move forward or the existing projects need to take back the responsibility for addressing the directives.

Given this information, do you believe that the issues addressed in the proposed SAR belong in the certification process? If you respond 'Yes', please provide details as to how the goals of the proposed SAR (including the Order 693 directives) could be accomplished within the certification process given that there is no re-certification process to ensure that the goals of the proposed SAR will be met by all applicable entities including those already certified.

Summary Consideration: The majority of commenters agreed with the SAR DT's position. No changes were made to the SAR based on comments to this question.

There are a few commenters still suggesting that certification can be changed to accommodate the types of issues raised in the SAR. Those commenters have been directed to make their suggestions for changes to the certification process and/or institution of a re-certification process to the proper forum.

Organization	Yes or No	Question 2 Comment
IRC Standards Review Committee		As expressed in our previous comments, we believe that these capability requirements are best stipulated in the Organization Certification Requirements. The absence of a re-certification process is not a convincing

Organization	Yes or No	Question 2 Comment
		reason for not pursuing this alternative since: a. The requirements to continuously maintain or periodically demonstrate the capability can be added to the certification process; or b. A proposal can be made to develop a re-certification process or certificate maintenance process which in many commenters' view is needed not just for this set of requirements but also for other "capability" type of requirements. That said, we would agree that in the essence of time to meet Order 693's directives, developing a standard to house these requirements may be an acceptable interim approach before a workable certification process is developed, for so long as the requirements focus on the "what's" but not the "how's". In addition, we suggest the SDT to present to the Standards Committee and the Compliance and Certification Committee our recommendation for putting these requirements into the Organization Certification Requirements, and to revisit the re-certification process to ensure periodic verification of the certified capability.
Response: A standard can always be deleted if future changes to certification would make the requirements moot. It is outside the scope of the SAR DT to suggest changes to the certification process. Nor is it a Standards Committee item. In order to make the arguments for certification heard in the proper forum, industry representatives should forward the changes proposed to the NERC Compliance and Certification Committee. The SAR DT appreciates the support indicated for proceeding with the standards effort at this time.		
Independent Electricity System Operator	Yes	As expressed in our previous comments, we believe that these capability requirements are best stipulated in the Organization Certification Requirements. The absence of a re-certification process is not a convincing reason for not pursuing this alternative since: a. The requirements to continuously maintain or periodically demonstrate the capability can be added to the certification process; or b. A proposal can be made to develop a re-certification process or certificate maintenance process which in many commenters' view is needed not just for this set of requirements but also for other "capability" type of requirements. That said, we would agree that in the essence of time to meet Order 693's directives, developing a standard to house these requirements may be an acceptable interim approach before a workable certification process is developed, for so long as the requirements focus on the "what's" but not the "how's".
Response: A standard can always be deleted if future changes to certification would make the requirements moot. The SAR DT appreciates the support indicated for proceeding with the standards effort at this time. No change made.		

Organization	Yes or No	Question 2 Comment
ISO New England Inc		See answer to #1 above. Also, in a Results/Performance Based standards world, this is a moot point. If you do not have the necessary tools, whatever your company has determined that those may be, you will violation Standard Requirements. You will, for example, violate an IROL, fail to recover from a Reportable Event, etc.
Hydro-Québec TransEnergie (HQT)		See the response question 1 above. In a Results/Performance Based standards world, this is not a valid point. Without the necessary tools, whatever those have been determined to be, Standard Requirements will be violated. An IROL will be violated, failure to recover from a Reportable Event will result in a DCS violation, etc.
Northeast Power Coordinating Council		See the response to Question 1 above. In a Results/Performance Based standard this is not a vaild point. Without the necessary tools (whatever those have been determined to be), Standard Requirements will be violated. An IROL will be violated, failure to recover from a Reportable Event will result in a DCS violation, etc.
Response: See response to #1 above. The SAR DT does not see any point of conflict between the proposed results-based reliability standards effort and the proposed content of any eventual standard(s) or changes to existing standard(s) that this SAR might generate. Indeed, the SAR DT believes that the SAR directly addresses the risk-based element of the proposed results-based reliability standard effort. In the presentation to the NERC Board of Trustees (Proposal to Develop Results-Based Reliability Standards), the following example was quoted: “The analogy in airline safety would be a performance based requirement to avoid plane crashes. The cost of failure is too high to rely solely on enforcing compliance after such a failure. Like airline safety, bulk power system reliability requires additional, preventive requirements to reduce the risks of failure to acceptable tolerance levels.” No change made.		
AECI System Operations	No	
American Transmission Company	No	
Bonneville Power Administration	No	
Dominion	No	
Duke Energy	No	

Organization	Yes or No	Question 2 Comment
Hydro One Networks Inc.	No	
PacifiCorp	No	
South Carolina Electric and Gas	No	
ODEC	No	Certification is a process that says the entity has the capability to meet the requirments applicable to them, but this does not mean that the entity will meet the requirements. The two are different and need to be kept that way. One time certification is fine, the region could ask for re-certification if they find defeciencies with the entity in their performance.
US Bureau of Reclamation	No	The Commission was very clear that the modification it was requesting for TOP-006 could involve new capabilities for the Balancing Authority, the Transmission Operators and possibly the Reliability Coordinator.
Midwest ISO	No	The Midwest ISO believes a basic set of tools should be required for Reliability Coordinators. We believe they should part of the Reliability Standards so they will be part of the three-year audit cycle to ensure that the Reliability Coordinators maintain this basic tool set.
Western Electricity Coordinating Council	No	We agree that certification should be a one-time process and that the compliance audits of entities every 3 years should adequately address the issue of capabilities without recertification.
Xcel Energy	No	Given that there is no re-certification process, the proposed SAR should address the tools required by entities to address the real time monitoring issues.
Response: Thank you for your comment.		
American Electric Power	No	Given the limitations described, it seems appropriate to proceed with the standards development process to resolve these reliability issues as advocated by the SDT. AEP is hopeful that efforts will continue on the certification front to meet the reliability concerns expressed in this SAR as well. Ultimately, we believe that the NERC certification process of functional entities to ensure that the right tool set is in place and operating correctly is preferable to allowing, by administrative registration alone, to begin operating and then, afterwards, trying to invoke standards to address operating issues that could have been avoided up-front.
Response: In order to make the arguments for certification heard in the proper forum, industry representatives should forward the changes proposed to the NERC		

Organization	Yes or No	Question 2 Comment
Compliance and Certification Committee. The SAR DT appreciates the support indicated for proceeding with the standards effort at this time.		
FirstEnergy	No	While we agree the changes proposed in this SAR are not suited to the organization certification process, we are unclear as to why the Project 2007-03 SDT feels this project cannot be combined with theirs. Part of their responsibility appears to be managing the rules for the use of the System Operator tools. This SAR proposes to require a set of tool capability and performance. It would seem logical to expect the team responsible for specifying the use of system operator tools would have the skill set to determine the tool set make up and the performance needed from to those tools to produce an outcome consistent with the reliability of the BES. If left as separate projects, a high degree of coordination seems necessary to ensure the tools required and the use of those tools are sufficiently covered by the standards.
Response: The Project 2007-03 SDT thought it best to restrict the TOP family of standards to operating issues as opposed to mixing in capability requirements. Since the SAR for this project had been posted during the Project 2007-03 deliberations, the Project 2007-03 SDT saw an opportunity to achieve their goal of cleaning up the TOP family of standards to include only operating requirements. Both projects have the same NERC staff coordinator so coordination should not be a problem.		
MRO NERC Standards Review Subcommittee	No	Wouldn't this be covered by NERC BOT approved PER-005-1 as a reliability related task?
Response: No - Training operators on capabilities, as described in PER-005-1, does not address the items covered in this SAR such as performance metrics of those capabilities. No change made.		
Entergy Services	Yes	
SERC OC Standards Review Group	Yes	Some of the requirements (to have a certain capability or if we are forced there by FERC, a certain type of tool) best belong in certification. However, we agree that a requirement to have greater than a minimum certain 12 month-ending availability of an analytical capability and a requirement to have greater than a certain minimum quality of solution as measured on a 12 month-ending basis could better be addressed as a Reliability Standard. That is, the existence of a capability belongs in certification. Operational attributes of this capability belong in Reliability Standards. A demonstration of the functionality should be in the certification process, however once an entity is certified then compliance to performance metrics, availability parameters, etc could be in a standard. If an entity meets the performance metrics then obviously they must have the tools.
E.ON U.S.	Yes	A demonstration of the functionality should be in the certification process, however once an entity is certified then compliance to performance metrics, availability parameters, etc could be in a standard. If an entity

Organization	Yes or No	Question 2 Comment
		meets the performance metrics then obviously they must have the tools.
Response: Thank you for your support of moving forward with the standards process for performance metrics et al.		
Ameren	Yes	First of all, the team asserts in this question that FERC Order 693 requires the team to address "tool capability". Yet it disingenuously has renamed itself to talk about capabilites and NOT tools. It therefore begs the question, "Why would this SAR be better to address 693's "tools". Just because recertification is not currently in the process does not mean it could not be added, especially in cases where fundamental qualifications change.
Response: The SAR DT is dealing directly with Order 693 in stating capabilities as cited in paragraph 1660: "…note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System". Note that the use of minimum here does not imply a least common denominator approach as shown in paragraph 906: "We do not believe that the identification of minimum capabilities translates to "lowest common denominator". No change made. It is outside the scope of the SAR DT to suggest changes to the certification process. In order to make the arguments for certification heard in the proper forum, industry representatives should forward the changes proposed to the NERC Compliance and Certification Committee.		
Pepco Holdings, Inc.	Yes	Performance based reliability standards will ensure compliance. There is no need for measuring the physical performance of the tools used to meet those reliability performance requirements.
Response: The SAR DT does not believe that performance-based reliability standards, in and of themselves, ensure compliance. The SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort. In the presentation to the NERC Board of Trustees (Proposal to Develop Results-Based Reliability Standards), the following example was quoted: "The analogy in airline safety would be a performance based requirement to avoid plane crashes. The cost of failure is too high to rely solely on enforcing compliance after such a failure. Like airline safety, bulk power system reliability requires additional, preventive requirements to reduce the risks of failure to acceptable tolerance levels." No change made.		
Manitoba Hydro	Yes	Though the introduction of a new standard is not welcome, this appears to be the only way to ensure measurable and enforceable goals.
Response: Thank you for your support.		
Georgia System Operations Corporation	Yes	Yes, the issues addressed in the proposed SAR belong in a certification process. Why, because there is no adequate certification process today, should a certification issue be turned into a Reliability Standard issue? Having certain capabilities is a certification issue and should be addressed by fixing the certification process. Certification processes should apply criteria to entities that have already been certified. Certification should

Organization	Yes or No	Question 2 Comment
		not be a one time process. There should be a certification and re-certification process. There was no operational history associated with mandatory reliability standards before June 2007. Such an operational history is being built now. After developing and putting in place an adequate certification program, then there will be an operational history associated with certification and re-certification. Certification criteria that deal with real-time operations or data should be evaluated by a certification team to determine if the entity has adequate functionality to be certified. Certification should not rely on the Compliance Monitoring and Enforcement Program (CMEP) to prove adequate functionality when there are violations of standards or on an on-going basis. There should be a separate certification (or capability verification) program to prove that. The issues raised by FERC should be addressed by first revamping all NERC requirements to risk-informed, performance-based requirements and developing a capability verification (certification) program. Then with a new slate of comprehensive, measurable, and auditable requirements and with a capability verification program, the original issues of FERC would be addressed. It is easy to perceive how having these things could eliminate the root problems and therefore the need to come up with solutions. That should satisfy and sustain a mandatory and enforceable status for those FERC directives. This SAR does not need to move forward to address the FERC directives.
Response: It is outside the scope of the SAR DT to suggest changes to the certification process. In order to make the arguments for certification heard in the proper forum, industry representatives should forward the changes proposed to the NERC Compliance and Certification Committee. The SAR DT does not believe that performance-based reliability standards, in and of themselves, ensure compliance. The SAR DT believes that the SAR directly addresses the risk-based element of the proposed results-based reliability standard effort. In the presentation to the NERC Board of Trustees (Proposal to Develop Results-Based Reliability Standards), the following example was quoted: "The analogy in airline safety would be a performance based requirement to avoid plane crashes. The cost of failure is too high to rely solely on enforcing compliance after such a failure. Like airline safety, bulk power system reliability requires additional, preventive requirements to reduce the risks of failure to acceptable tolerance levels." The SAR DT has no control over the certification process and is working under the existing rules and procedures to fill a reliability gap. No change made.		
Public Service Enterprise Group Companies	Yes	Yes, tools and tool capabilities are better handled within a certification process, that is, a certification that the entity has tools that are needed to meet the requirements of a standard. The certification process could be conducted initially and as a periodic re-certification if that is deemed necessary.
Response: It is outside the scope of the SAR DT to suggest changes to the certification process. In order to make the arguments for certification heard in the proper forum, industry representatives should forward the changes proposed to the NERC Compliance and Certification Committee. No change made.		

3. The approach taken by the Standards Development Program is not to write new requirements that assess basic capabilities used to achieve performance measured through other requirements within the Reliability Standards. The SAR DT has researched the standards and concluded that other requirements do not presently exist to adequately cover the issues raised in the SAR. Do you agree with this position? If not, please identify existing standard requirements that would apply and explain how these requirements accomplish the goals of the proposed SAR (including the Order 693 directives).

Summary Consideration: The majority of the commenters agreed with the SAR DT's position. However, based on industry comments, the SAR DT has added the BAL family of standards to the list of applicable standards to be reviewed.

The SAR DT agrees with commenters who pointed out that duplication or conflict of requirements is to be avoided. Including the TOP, IRO, BAL, and COM-001 standards to the list of standards that the eventual SDT must review should obviate any concerns on duplication or conflict of requirements.

Organization	Yes or No	Question 3 Comment
Ameren	No	
Response: Without specific comments as to your reason for the 'No' comment, the SDT can't respond.		
American Electric Power	No	AEP believes that elements identified in the detailed description portion of the SAR are largely covered in the existing standards, including those shown below (Table 1). The roll-up of SAR functions from SAR version 1 to a higher level descriptor in SAR version 2 does not seem to limit the relevance of all of the listed standards that AEP has researched. We are concerned that repetition of requirements across multiple standards may create ambiguity if alternative requirements or methods are defined from one to the other. The repetition also establishes the possibility of compounding violations for a single infraction. To the extent that new requirements are needed to address operational gaps, we believe that these should be made in the next revision of the applicable existing standards. TABLE I - Existing NERC Reliability Standards addressing Alarming, Telemetry, Network Analysis, Related Performance Metrics (Availability and Quality), and Processes and Procedures supporting Real-Time Tools (Change Mgt., Maintenance Coordination, and Failure Notification) : Alarming COM-001-1.1 does have some language related to the alarming of vital telecommunications facilities for voice and data.

Organization	Yes or No	Question 3 Comment
		TOP-006-2 stress the importance of monitoring equipment to be used to 'alarm' or bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action. IRO-002-2, gives direction on the alarming management and awareness systems that need to be in place for the RC. Telemetry BAL-001-0, dealing with the ACE equation along with Control Performance Standards (CPS1 and CPS2) BAL-004-0, addressing Time Error Corrections BAL-005-0.1b, focuses on the telemetry components necessary for calculating the ACE equation BAL-006-1.1, tasks the Balancing Authorities to calculate and record hourly Inadvertent Interchange IRO-004-1, details the information that needs to be sent to the RC for reliability studies to be performed IRO-005-3, breaks down most of the parameters that a RC would need to receive for monitoring the BES TOP-002-2, highlights that changes in transmission facility status, along with ratings should be monitored and conveyed to the RC and BA TOP-005-2 is the Operational Reliability Information standard that lays out all of the data that needs to be updated at least every ten minutes TOP-006-2 is another standard focused on monitoring system conditions. VAR-001-1 also is offering details on what data should be pipelined back to the operating control centers from the BES. Network Analysis IRO-004-1, discusses the ability for the RC, TO, and BA to conduct next-day reliability analyses to ensure that the BES can be operated reliably TOP-002-2, looks at the performance of current-day, next-day, and studies operational studies in conjunction with neighboring BA(s) and TO(s). TOP-002-2, also address the thermal and voltage contingency analysis that needs to be performed. IRO-002-2, details the analysis that needs to take place via state estimation and other visualization tools. Performance Metrics for Availability and Quality Availability

Organization	Yes or No	Question 3 Comment
		BAL-005-0.1b, R8 looks at SCADA availability to gather data and calculate ACE. This requirement also addresses the availability of Frequency Metering equipment (99.95%). COM-001-1.1, stresses the diversity and redundancy of communication paths for the available exchange of Interconnection and operating information, internally and externally to AEP. EOP-008-0, emphasizes the development of a plan to ensure the monitoring and control of transmission, distribution and generation assets even with the loss of the Control Center. Quality BAL-005-0.1b, R17 breaks down the accuracy of the metering devices for time error and frequency measurements BAL-006-1.1 requires adjacent balancing authorities to have common megawatt-hour meters at the interconnection point. IRO-005-3, discusses the importance of operating to the most limiting element if there is a discrepancy between various entities monitoring the same facilities. TOP-006-2 generically states that sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions. Processes and Procedures supporting Real-Time Tools: Change Mgt., Maintenance Coordination, and Failure Notification Change Management FAC-009-1, obligates the communication to RC(s), PA(s), TP(s), and TO(s) for new facility ratings on the Bulk Electric System. TOP-002-2, implies that there should be a facility change notification system in place for neighboring entities to use uniform line identifiers when referring to interconnected facilities. BAL-004-0, addressing Time Error Corrections Maintenance Coordination FAC-009-1, it is implied that these changes will be applied to the real time computer model with alterations to facility ratings on the Bulk Electric System. TOP-002-2, talks about each BA and TO maintaining accurate computer models for analyzing and planning system operations. Failure Notification IRO-005-3, highlights the responsibility to identify significant issues with ACE that can attribute to other errors, such as frequency error and Time error. As the SDT has described, the directives in Order 693 relate to IRO-002 and TOP-006 and indicate a desire

Organization	Yes or No	Question 3 Comment
		for a minimum set of capabilities. If the present SDTs for the referenced projects do not currently have these reliability issues in their scope, it would seem appropriate for NERC to slate these improvements for the next version of these respective standards.
Response: The SAR DT revised the SAR in the second posting to include the possibility of revising existing standards based on your research and comments. However, the SAR DT only included TOP, IRO, and COM standards. Upon further review, the SAR DT agrees that the BAL family of standards should be included in the list of applicable standards since they deal with reliability-based data. The other standards cited do not currently contain requirements addressing the capabilities envisioned in the SAR. The eventual SDT will have the ability to create new standards or revise existing standards. If they create new standards or revise existing standards, one of their responsibilities is to ensure that there will be no conflicting or redundant requirements in other standards. If one were to wait until the individual standards were to come up for revision, there would be a major coordination problem as some standards would be revised prior to others. In addition, there could be a lengthy period of time before these standards come up for revision again and the reliability gap from lack of requirements in this area will be open for that period of time. No change made.		
South Carolina Electric and Gas	No	BAL-005 R8, R14, and R16 define the BAs requirments for monitoring real-time data for the operation of AGC. The new standard should not confict with these requirements.
Response: The SAR DT agrees that the BAL family of standards should be included in the list of applicable standards since they deal with reliability-based data.		
SERC OC Standards Review Group	No	COM-002 R1 states "...voice and data links" shall be "...available for addressing a real-time emergency condition". The SDT should consider clarifying this point in relation to the performance metrics, availability parameters, etc as outlined in this SAR.
E.ON U.S.	Yes	COM-002 R1 states "...voice and data links" shall be "...available for addressing a real-time emergency condition". The SDT should consider clarifying this point in relation to the performance metrics, availability parameters, etc as outlined in this SAR.
Response: The SAR DT does not see the applicability of this standard to the concepts expressed in the SAR. COM-002 is describing physical assets and the SAR is dealing with performance issues. No change made.		
ISO New England Inc	No	See answer to #1 above. Also, in a Results/Performance Based standards world, this is a moot point. If you do not have the necessary tools, whatever your company has determined that those may be, you will violation Standard Requirements. You will, for example, violate an IROL, fail to recover from a Reportable Event, etc.
Hydro-Québec TransEnergie	No	See the response to question 1 above.

Organization	Yes or No	Question 3 Comment
(HQT)		In a Results/Performance Based standards world, this is not a valid point. Without the necessary tools, whatever those have been determined to be, Standard Requirements will be violated. An IROL will be violated, failure to recover from a Reportable Event will result in a DCS violation, etc.
Northeast Power Coordinating Council	No	See the response to Question 1 above. In a Results/Performance Based standard this is not a valid point. Without the necessary tools (whatever those have been determined to be), Standard Requirements will be violated. An IROL will be violated, failure to recover from a Reportable Event will result in a DCS violation, etc.
Response: See response to #1 above. The SAR DT does not see any point of conflict between the proposed results-based reliability standards effort and the proposed content of any eventual standard(s) or changes to existing standard(s) that this SAR might generate. Indeed, the SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort. In the presentation to the NERC Board of Trustees (Proposal to Develop Results-Based Reliability Standards), the following example was quoted: “The analogy in airline safety would be a performance based requirement to avoid plane crashes. The cost of failure is too high to rely solely on enforcing compliance after such a failure. Like airline safety, bulk power system reliability requires additional, preventive requirements to reduce the risks of failure to acceptable tolerance levels.” No change made.		
IRC Standards Review Committee	No	See comment under Q1 and Q2, above.
Pepco Holdings, Inc.	No	See response to Q1 and Q2
Response: See responses to Q1 & Q2 above.		
Georgia System Operations Corporation	No	The best use of NERC’s and the industry’s thinly stretched resources is to work on the project to revise the entire set of standards to result in only the necessary risk-informed, performance-based requirements. Then there should be no gap of requirements. The approach taken by the Standards Development Program, to not write new requirements that assess basic capabilities used to achieve performance measured through other requirements within the Reliability Standards, would result in no need for this SAR because all necessary performance (of the bulk power system) requirements would then be in the Reliability Standards. Rather than adding more requirements, NERC should eliminate unnecessary requirements to a number of important performance-based requirements. Resources are being stretched thinner and thinner. Resources spend time complying with the letter of unnecessary, poorly worded requirements rather than complying with the spirit of what should be required and the translation of that spirit into literal performance-based requirements. Much time is also spent reviewing, commenting, and voting on all of the other existing NERC projects. If it came to a

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 3 Comment</th></tr>
<tr><td></td><td></td><td>choice of performing only the project to revise the standards to result in only the necessary risk-informed, performance-based requirements or performing all of the other projects in NERC’s 3 year plan, it would do more good for reliability and for compliance enforcement to accomplish only that one performance-based project. In fact, rather than doing all of the projects, it would be best for the sake of the limited amount of resources to put a hold on most (if not all) of the other projects and to work only on this one comprehensive project. The “staffing” and content of the ongoing and existing projects should be reorganized to be merged into and organized around the comprehensive results-based project and not around the existing very many separate projects that sprang up at different times with different objectives and perspectives. Performing this project first would likely correct the issues or problems which lead to the creation of many of the existing projects. Many of the other projects could be cancelled.</td></tr>
<tr><td colspan="3">Response: The Standards Committee sets the priority as to what projects are worked on. That is not within the scope of the SAR DT. If the Standards Committee decides that this SAR is not worthy of continuing, they will take the appropriate steps to curtail it.

The SAR DT believes that the SAR directly addresses the competency element of the proposed results-based reliability standard effort. No change made.</td></tr>
<tr><td>Western Electricity Coordinating Council</td><td>No</td><td>We believe the current requirements in the standards are adequate to address the basic capabilities required of the RCs. However, the requirements applicable to RCs are more specific in many cases than the requirements applicable to other entities.</td></tr>
<tr><td colspan="3">Response: Order 693 directs the ERO to make changes to the standards to address identified reliability gaps in the IRO and TOP standards. This undermines the basis for the statement made by WECC. The SAR DT believes that the existing requirements for the Reliability Coordinator do not address the aspects of performance, maintenance, and capability that are the subject of this SAR and as pointed out do not apply to other functional entities. No change made.</td></tr>
<tr><td>Duke Energy</td><td>Yes</td><td>However the Standards Drafting Team must be careful not to duplicate existing requirements in other standards, and until we see a draft it’s difficult to say there won’t be any duplication. For example, the Detailed Description of the SAR has a bullet “Evaluating the impact of ‘what if’ events on the current or future state of the BES.” This could duplicate TOP-002-2 Requirement R6 which states that “Each Balancing Authority and Transmission Operator shall plan to meet unscheduled changes in system configuration and generation dispatch (at a minimum N-1 Contingency planning) in accordance with NERC, Regional Reliability Organization, subregional, and local reliability requirements.</td></tr>
<tr><td colspan="3">Response: The SAR DT agrees that duplication must be avoided. The eventual SDT will have the ability to create new standards or revise existing standards. If they create new standards or revise existing standards, one of their responsibilities is to ensure that there will be no conflicting or redundant requirements in other standards as identified in the SAR including the TOP standards. No change made.</td></tr>
</table>

Organization	Yes or No	Question 3 Comment
Manitoba Hydro	Yes	As much as we desire NOT to see a new standard, by examining the SAR and related FERC Order 693, the following goals: Based on the SARS Detailed Description, the following goals are: o describe capability characteristics o availability parameters o performance metrics o failure notification o maintenance coordination o change management o independent process monitor (watchdog) o monitoring power system data in real time o exchanging power system date in real time and from FERC 693 905 - RC has minimum set of tools 906 - Identify minimum capabilities and not tools (tools become obsolete) 1660 - Minimum set of analytical tools (not specific tools)would require modification of requirements from quite a few different Standards.
Response: The SAR DT does not see that the changes suggested add any clarity to the Detailed Description. No change made.		
AECI System Operations	Yes	
American Transmission Company	Yes	
Bonneville Power Administration	Yes	
Dominion	Yes

NERC Standards Review Subcommittee	Yes	N/A
Response: Thank you for your support.		

4. Does the revised Detailed Description of the SAR provide sufficient details for the eventual Standard Drafting Team to execute the SAR? If not, please identify areas of insufficient detail and provide suggested wording for increased clarity.

Summary Consideration: The majority of commenters agree that sufficient details have been provided. Two small clarifying changes have been made to the SAR based on suggestions made in response to this question.

Detailed description: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for:

- Monitoring power System data in Real-time.
- Exchanging power System data in Real-time.
- Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor.
- Determining the current state of the BES.
- Evaluating the impact of 'what if' events on the current state of the BES.

Organization	Yes or No	Question 4 Comment
ISO New England Inc		See answer to #1 above.
Northeast Power Coordinating Council		See the response to Question 1 above.
Ameren	No	see general comment in 1
Hydro-Québec TransEnergie (HQT)	No	See the response to question 1 above.
Response: See response to #1 above.		
PacifiCorp	No	

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 4 Comment</th></tr>
<tr><td colspan="3">Response: Without a specific comment, the SDT is unable to respond.</td></tr>
<tr><td>E.ON U.S.</td><td>No</td><td>Bullet 5 of the Detailed Description references “...future state of the BES”. The SDT needs to be cautious in defining what this means or remove that language altogether. The other bullets clearly spell out “Real-time” which defined by the NERC Glossary is “Present time as opposed to future time”. Bullet 5 appears to contradict the other bullets in its timeframe.</td></tr>
<tr><td>SERC OC Standards Review Group</td><td>No</td><td>Bullet 5 of the Detailed Description references: “...future state of the BES”. The SDT needs to be cautious in defining what this means or remove that language altogether. The other bullets clearly spell out “Real-time” which defined by the NERC Glossary is “Present time as opposed to future time”. Bullet 5 appears to contradict the other bullets in its timeframe scope. “The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”</td></tr>
<tr><td colspan="3">Response: The SAR DT agrees that ‘future’ is not needed for Real-time Monitoring and Analysis Capabilities and has deleted that term from the SAR language.
Detailed description: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for:
• Monitoring power System data in Real-time.
• Exchanging power System data in Real-time.
• Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor.
• Determining the current state of the BES.
• Evaluating the impact of ‘what if’ events on the current state of the BES.</td></tr>
<tr><td>Public Service Enterprise Group Companies</td><td>No</td><td>Monitoring is difficult to describe in a standard. The SAR has the potential to result in a standard that creates an undue administrative burden that is highly subjective, especially in the context of a compliance audit.
Also, the subject matter of the SAR appears to be applicable to tasks necessarily performed by transmission operators but not necessary for generator operators. GOP should be eliminated from the applicable entities.</td></tr>
<tr><td colspan="3">Response: The SAR DT understands your concern. However, this is just a SAR at this point and the rather generic language would seem to be appropriate here. There is almost certainly going to be some documentation requirements in the eventual standard(s) or revisions although the movement to results-based standards should minimize this. The eventual SDT will specify any Requirements and Measures needed and vet them with the industry through the comment and ballot</td></tr>
</table>

Organization	Yes or No	Question 4 Comment
periods. No change made. The Generator Operator is included here because it owns reliability data that is essential to the Transmission Operators and Balancing Authorities and the quality of that data is of concern. The focus on capabilities is different for the various reliability entities and the eventual SDT will need to define that focus. For example, the Generator Operator would not be expected to perform network analysis. The SAR DT continues to believe that the eventual SDT needs to have the flexibility to include or not include the Generator Operator. No change made.		
FirstEnergy	No	See comments provided in item 1 above. Also, on Pg. 2 of the SAR it would be more helpful if it specifically stated the following regarding FERC directives: 1. "In Par. 905 of Order 693 '... the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe that this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. Further, as noted by Dominion, such a requirement promotes a more proactive approach to maintaining reliability'."2. "In Par. 1660 of Order 693, FERC directed modifications to TOP-006-1 1660 '... related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System. In response to APPA that the inclusion of specific analytical tools is counterproductive because the tools will become obsolete, we note that we are not seeking specific analytical tools, but rather minimum capabilities'." Also, it should be noted that the SDTs currently working on IRO-002 and TOP-006, Project 2006-06 and 2007-03, respectively, are proposing to retire both of these standards. Therefore, the eventual SDT for this Project 2009-02 will have to determine the appropriate standards to include new requirements for Real-time monitoring and analysis capabilities.
Response: See response to #1 above. The present wording of the SAR contains a reference to the appropriate paragraphs of Order 693 and the SAR DT feels that this is sufficient. No change made. The SAR DT agrees that the eventual SDT should have the capability to create or revise standards as deemed appropriate and be required to respond to all FERC directives on these issues. The language of the SAR assures that these obligations will be passed on to the eventual SDT. No change made.		
US Bureau of Reclamation	No	The SAR needs to incorporate the language from Order 693. The scope should be limited to the modification of respective standards.
Response: The present wording of the SAR contains a reference to the appropriate paragraphs of Order 693 and the SAR DT feels that this is sufficient. No change made. TOP-006 and IRO-002 are not the only standards that address the topics in the SAR. As pointed out by other industry commenters, BAL and COM-001 need to be		

Organization	Yes or No	Question 4 Comment
reviewed as well. In addition, the eventual SDT needs the flexibility to create new standards if they determine that all of the topics in the SAR can not be addressed by modifications to existing standards. No change made.		
South Carolina Electric and Gas	No	There are some terms used in the SAR that need to be clarified, such as "watch dog". Better define what is meant by "independent process monitor". Is the group specifying how the system should function or specific tool that should be used.
Response: The term 'watch dog' is only cited as a possible example and the SAR DT agrees that it is not needed in a SAR and has deleted the terminology. **Detailed description**: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for: • Monitoring power System data in Real-time. • Exchanging power System data in Real-time. • Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor. • Determining the current state of the BES. • Evaluating the impact of 'what if' events on the current state of the BES. 'Independent process monitor' is a well understood term and implies a process that is separate from what is being monitored. No change made.		
Western Electricity Coordinating Council	No	We are not certain we understand the meaning of the reference to a watch dog. This functionality shall include an independent process monitor (e.g., watchdog). The IRO standards cover the items listed in the detailed description, so the STD should not be duplicative of the IRO standards.
Response: The term 'watch dog' is only cited as a possible example and the SAR DT agrees that it is not needed in a SAR and has deleted the terminology. **Detailed description**: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for: • Monitoring power System data in Real-time. • Exchanging power System data in Real-time. • Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an		

Organization	Yes or No	Question 4 Comment
independent process monitor. • Determining the current state of the BES. • Evaluating the impact of 'what if' events on the current state of the BES. The SAR DT agrees that duplication must be avoided. The eventual SDT will have the ability to create new standards or revise existing standards. If they create new standards or revise existing standards, one of their responsibilities is to ensure that there will be no conflicting or redundant requirements in other standards as identified in the SAR including the IRO standards. No change made.		
Manitoba Hydro	Yes	Very tangible details such as telemetry, alarming, Network Analysis terms were removed from the SAR and replaced with vague terms such as: o describe capability characteristics o availability parameters o performance metrics o failure notification o maintenance coordination o change management o independent process monitor (watchdog) o monitoring power system data in real time o exchanging power system date in real time. If it wasn't for the SAR redline copy (that contained telemetry, alarming, Network Analysis) the above terminology would be difficult to assess. 1. Capability characteristics of what, analytical tools, alarms, telemetry, all these items? 2. Availability parameters of what, analytical tools, alarms, telemetry, all these items? 3. Failure notification of what, analytical tools, alarms, telemetry, all these items? 4. Maintenance coordination of what, analytical tools, alarms, telemetry, all these items? 5. Change Management (See note 4 in question 1) of what, analytical tools, alarms, telemetry, all these items? 6. Under which of the above SAR details could you assume FERC order 693 "minimum set of analytical tools" falls under? 7. What does "Independent process monitor (watchdog)" mean is that an analytical tool or is that an RC? 8. Exchanging and monitoring power system date in real time, isn't that covered in TOP-005 1.1, "Attachment 1 - TOP-005-1.1"?
Response: 1. through 4. The SAR DT was responding to a majority of industry comments and the FERC directives in changing the specific terminology in the first posting of the SAR. The capability characteristics, etc. refer to the subsequent bullets in the Detailed Description section of the SAR. No change made. 5. The term 'change management' has been deleted based on earlier comments. 6. In Order 693 where it seems to call for a minimum set of analytical tools, this is clarified later as capabilities in paragraph 1660. No change made.		

Organization	Yes or No	Question 4 Comment
7. The term 'watch dog' is only cited as a possible example and the SAR DT agrees that it is not needed in a SAR and has deleted the terminology. **Detailed description**: Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for: • Monitoring power System data in Real-time. • Exchanging power System data in Real-time. • Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor. • Determining the current state of the BES. • Evaluating the impact of 'what if' events on the current state of the BES. 'Independent process monitor' is a well understood term and implies a process that is separate from what is being monitored. No change made 8. The SAR DT agrees that duplication must be avoided. The eventual SDT will have the ability to create new standards or revise existing standards. If they create new standards or revise existing standards, one of their responsibilities is to ensure that there will be no conflicting or redundant requirements in other standards as identified in the SAR including the TOP standards. No change made.

Standard Authorization Request Form

Title of Proposed Standard: Project 2009-02: Real-time Reliability Monitoring and Analysis Capabilities
Original Request Date: June 4, 2009
Revised Date: January 15, 2010
Revised Date: March 31, 2010

SAR Requester Information		**SAR Type** (*Check a box for each one that applies.*)	
Name:	Jack Kerr	X	New Standard(s)
Primary Contact:	Dominion Virginia Power	X	Revision to existing Standard
Telephone: Fax:	1.804.273.3393 1.804.273.2405	☐	Withdrawal of existing Standard
E-mail:	jack.kerr@dom.com	☐	Urgent Action

Purpose (Describe what the standard action will achieve in support of bulk power system reliability.)

The new or revised standard(s) will establish requirements for the functionality, performance, and maintenance of Real-time Monitoring and Analysis capabilities for Reliability Coordinators, Transmission Operators, Generator Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations.

Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)

According to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations,* dated April 2004, a principal cause of the August 14 blackout was a lack of situational awareness, which was in turn the result of inadequate reliability tools. In addition, the failure of control computers and alarm systems, incomplete tool sets, and the failure to supply network analysis tools with correct System data on August 14 contributed directly to this lack of situational awareness. Also, the need for improved visualization capabilities over a wide geographic area has been a recurrent theme in blackout investigations.

Recommendation 22 of the Blackout Report states "Evaluate and adopt better real-time tools for operators and reliability coordinators." NERC's Operating Committee formed the Real-time Tools Best Practices Task Force (RTBPTF) to evaluate real-time tools and their usage within the industry. The Task Force produced a report "*Real-Time Tools Survey*

Analysis and Recommendations", dated March 13, 2008 that included recommendations for the functionality, performance, and management of Real-time tools.

There are 2 directives in FERC Order 693 relating to minimum tool capabilities that need to be addressed. One directive pertains to IRO-002 and is described in paragraphs 905 & 906 of Order 693. The second directive pertains to TOP-006 and is described in paragraph 1660. These directives clearly indicate the desire for a minimum set of capabilities as opposed to specific tools. The existing projects that would have handled these issues (Project 2006-02 for IRO-002 and Project 2007-03 for TOP-006) have clearly indicated that they expect this SAR (Project 2009-02) to address the issues raised by FERC.

This SAR addresses selected recommendations in the RTBPTF Report as determined by the Real-time Best Practices Standards Study Group: Project 2009-02 and addresses the directives in Order 693 referenced above.

Brief Description (Provide a paragraph that describes the scope of this standard action.)

The scope of the SAR is to establish requirements for the monitoring and analysis capabilities provided to System Operators and used to support Real-time System Operations. The SAR addresses availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management. The intent is to describe 'what' needs to be done but not 'how' to do it.

Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR.)

Develop or revise standard(s) to describe the capability characteristics, such as availability parameters, performance metrics, failure notification, and maintenance (vetted by the industry through the Reliability Standards comment process)of functionality for:

- Monitoring power System data in Real-time.
- Exchanging power System data in Real-time.
- Alerting System Operators in Real-time to events and conditions affecting the state of the Bulk Electric System (BES). This functionality shall include an independent process monitor.
- Determining the current state of the BES.
- Evaluating the impact of 'what if' events on the current state of the BES.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
X	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
X	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
X	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
X	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
X	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
X	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
X	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
X	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
X	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Related Standards

Standard No.	Explanation
TOP-xxx	The TOP family of standards is undergoing revision. The eventual SDT should have the flexibility to revise these standards or write new standards as best fits the task.

Concept White Paper

Concepts for Proposed Content of Eventual Standard(s) for Project 2009-02: Real-Time Monitoring and Analysis Capabilities

Real-time Monitoring and Analysis Capabilities
Standard Drafting Team
February 15, 2011

1.0 INTRODUCTION

FERC Order 693 indicates the need for a minimum set of capabilities to be available for System Operators to assist in making Real-time decisions. The work done by the Real-time Tools Best Practices Task Force (RTBPTF), which was formed by NERC in response to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations,* is the basis for the Real-time Monitoring and Analysis Capabilities SAR that was approved by the Standards Committee in April 2010 and the subsequent appointment by NERC of a Standard Drafting Team (RMACSDT) to develop a standard to satisfy the proposed issues described in the SAR utilizing the results-based standards methodology.

This White Paper is a description of the present thinking of the RMACSDT regarding standard requirements for Real-time monitoring and analysis capabilities. The paper consists of four sections that describe the major areas proposed to be addressed by the eventual standard(s). These areas are:

- Section 2 - Monitoring
- Section 3 - Data exchange
- Section 4 - Alarming
- Section 5 – Analysis

The SDT will also be crafting an Implementation Plan for any eventual standard(s) that will be vetted by the industry through comments and that will allow for sufficient time for applicable entities to bring their systems into compliance with any new requirements.

2.0 MONITORING

Monitoring is the first component in the process of establishing situational awareness for the System Operators so that they can rapidly assess the state of the Bulk Electric System (BES). In the context of this standard, "monitoring" implies System Operators viewing data in a manner that allows them to determine the state of the BES in Real-time and to take corrective and preventive actions when necessary. The types of data to be considered by the standard are:

- Real-time analog and status
  - Scanned
  - Calculated

For purposes of monitoring as described in this paper, this is data scanned by a central system from Data Collection Units (DCU) such as Remote Terminal Units (RTUs).

Calculated values are treated the same as scanned values in this paper.

It is proposed that requirements for monitoring will be applicable to Reliability Coordinators, Transmission Operators, and Balancing Authorities.

The following requirements are proposed for monitoring of Real-time data. These requirements assume that the Responsible Entity is utilizing an Energy Management System (EMS) and/or Supervisory Control and Data Acquisition (SCADA) system to collect the Real-time data.

2.1 PERFORMANCE

A performance parameter is proposed for each category of data collected and the data displayed to the operator.

2.1.1 Status Data

Status data shall be collected at a scan rate not to exceed 4 seconds.

2.1.2 Analog Data

In many systems analog data is collected at multiple scan rates depending on the applications in which the data is being used. It is proposed that all analog data, except the data identified in the BAL standards, is scanned at a rate not to exceed 10 seconds - the rate suggested in the RTBPTF report.

2.1.3 Data Display

All active displays utilized for visualization of the data discussed above shall update by the end of the next status or analog scan cycle, as stated above, following the scan in which the data was received by the central system. For example, status data should be updated within 4 seconds following the receipt of the scan by the central system.

2.2 AVAILABILITY

The SDT proposes two requirements for availability:

- A demonstrable procedure shall be developed describing the alternate plans and/or mitigating measures entities have in place when the data used to monitor BES or perform analyses on BES (see Section 5) becomes unavailable

- For each DCU, availability shall be calculated by dividing the number of “good” scans received at the central system by the number of scans scheduled to be received in a calendar month. (A ‘good’ scan is a complete packet of requested data returned to the central system.) The ratio of scans received to scans scheduled shall exceed 99% for a calendar month. This calculation can include alternate or backup data sources that provide data when the primary DCU is unavailable.

2.3 FAILURE NOTIFICATION

‘Failure’ is assumed to occur when a scan is not completed for any reason and it shall be notified after the 9th consecutive ‘failure’ occurs. The System Operator shall be notified of such failure within 60 seconds of the 9th consecutive ‘failure’.

2.4 MAINTENANCE

Each Responsible Entity shall provide the System Operator with approval authority for planned maintenance that impact monitoring capabilities.

3.0 DATA EXCHANGE

Data exchange, as discussed in this paper, refers to electronic exchange of data between two computer based control systems (EMS and/or SCADA) whether they are internal or external to each other. It is assumed that the data links discussed will utilize ICCP or an equivalent protocol. Data exchange, in this context, does not include RTUs or other similar types of DCUs. Required data sets to be exchanged are covered in proposed IRO-010-2 and TOP-003-2.

ICCP is the Inter-Control Center Communications Protocol (ICCP or IEC 60870-6/TASE.2 or latest release). It is an international standard used by utility organizations to provide data exchange over wide area networks (WANs) between utility control centers, utilities, power pools, regional control centers, and Non-Utility Generators.

Collecting and exchanging real-time data on power system status is one of the elementary steps in the complex process of developing the information that System Operators need to maintain situational awareness. Real-time reliability tools such as the state estimator and contingency analysis can only provide results that accurately represent current and potential reliability problems if these tools have Real-time analog and status data. The accuracy of the information that Real-time reliability tools provide depends on the accuracy of the data supplied to the tools. The quality of the results that Real-time reliability tools produce is also influenced by the breadth and depth of the portion of the BES for which Real-time data are collected, relative to the breadth and depth of the relevant Reliability Entity’s area of responsibility.

It is proposed that requirements for data exchange will be applicable to the Reliability Coordinator, Transmission Operator, Balancing Authority, and Generation Operator.

The following requirements are proposed for data exchange of Real-time data. These requirements assume that the Responsible Entity is utilizing an EMS and/or SCADA system utilizing ICCP or an equivalent protocol to exchange data.

3.1 PERFORMANCE

The SDT proposes the following requirements for data exchange performance:

- ICCP (or equivalent) data exchange must be redundant and the redundancy must be supplied through diverse routing.

- Entities shall develop data exchange agreements and comply with data specifications.

- Data exchange agreements must include the following:
    - Interoperability of ICCP and equivalent systems
    - Data access restrictions
    - Data naming conventions
    - Data management and coordination including data quality
    - Joint testing and data checkout
    - Monitoring of availability
    - Responsibility for failures
    - Restoration process

3.2 AVAILABILITY

The SDT proposes the following requirements for data exchange availability:

- Establish procedure for actions to be taken if some or all of the data exchanged is not available for a 30 minute timeframe.

3.3 FAILURE NOTIFICATION

Notification of link failure must be made to the System Operator within 60 seconds of when link failure occurred. Failure is identified as the inability to receive a complete data set regardless of reason.

3.4 MAINTENANCE

Each functional entity shall provide System Operators with approval authority for planned maintenance of its data exchange capabilities. Coordination with affected entities is required.

4.0 ALARMING

Alarms must be generated to alert System Operators in Real-time to events and conditions affecting the state of the BES. Alarms can be audible and/or visual. Alarms must be generated for the following reasons:

- Limit violations (for any defined limits including multiple limits on a single point)
- Uncommanded status changes
- DCU unavailability
- Data exchange link unavailability

Alarms are important to the safe and secure operation of the BES. System Operators depend on alarms to identify problems occurring or about to occur. All values measured or calculated by the EMS and/or SCADA must be subject to processing to determine either change of state or limit violations. If either of these conditions occurs, an alarm must be generated.

It is proposed that requirements for alarming will be applicable to Reliability Coordinators, Transmission Operators, and Balancing Authorities.

The following requirements are proposed for alarming of measured and calculated data.

4.1 PERFORMANCE

Performance issues such as volume and throughput of alarms are recognized as potential concerns but are generally handled in initial EMS/SCADA vendor specifications. It would be difficult if not impossible to measure in a production system. Therefore, no performance requirement is anticipated as part of this project.

4.2 AVAILABILITY

The SDT proposes the following requirements for alarming availability:

- No specific numeric value will be proposed for alarming availability.

- Establish a procedure for actions to be taken when the alarming functionality is unavailable for 10 consecutive minutes (see RTBPTF report, page 117, paragraph 4). For example, the Reliability Coordinator 'backs up' the Transmission Operator/Balancing Authority and vice versa and entities inform each other of failure of their alarming capability.

4.3 FAILURE NOTIFICATION

Notification of failure of the alarm processing function must be made to the System Operator within 60 seconds of when failure is detected. Notification of failure of alarming capability must be accomplished through independent failure notification where the system creating and presenting the notification is independent of the alarming functionality.

4.4 MAINTENANCE

Each functional entity shall provide System Operators with approval authority for planned maintenance of its alarming capabilities.

5.0 ANALYSIS

The intent of analysis in the context of this white paper is to focus on determining the current condition or state of the BES and evaluate the impact of ‘what if’ events on the state of the BES. The meanings of “current” and “what-if” are:

- Current - The current system condition or state is a function of the most recent system bus voltages, system topology, frequency, and line flows.

- ‘What if’ - Analyze the impact on the security of the current power system state of specific Contingencies or simulated outages of the BES such as lines, generators, or other equipment. This analysis should also include other system condition changes that would affect the BES such as Load. The analysis identifies problems such as line overloads or voltage violations that will occur if the system event or Contingency takes place.

The capability to determine the current state of the BES is critical for the System Operator to determine violations of reliability criteria in their area. By accurately determining the current state of the BES, the System Operator is thus capable of evaluating various ‘what if’ scenarios. Having the results of the ‘what if’ events before they happen allows System Operators to take the appropriate actions to prevent violations or have plans ready if such Contingencies were to occur.

It is proposed that requirements for analysis will be applicable to the Reliability Coordinator and Transmission Operator.

The following requirements are proposed for analysis of the current and “what-if” states of the BES.

5.1 PERFORMANCE

The requirements for Performance will address periodicity and quality.

5.1.1 Periodicity

The current and "what-if" analyses shall run based on the following conditions:

- Current analysis - Automated program required that runs periodically at no more than a 5 minute interval to determine the system's current condition or state. The analysis may be either a program that runs on the Reliability Coordinator's or Transmission Operator's EMS or through contracted services (3rd party, Reliability Coordinator, or other Transmission Operator).

- "What if" analysis - Automated program required that runs periodically at no more than a 10 minute interval (from pg. 117 of Blackout Report - #4.b) to analyze the impact on the security of the current power system state for specific Contingencies or simulated outages of the BES such as lines, generators, or other equipment. The analysis may be either a program that runs on the Reliability Coordinator's or Transmission Operator's EMS or through contracted services (3rd party, Reliability Coordinator, or other Transmission Operator).

5.1.2 Results Quality

Quality needs to be measured to ensure that the base case used by the automated analysis program(s) accurately represent the state of the system.

- For both current & "what if" analyses:
    - For Reliability Coordinator & Transmission Operator:
        - Compare physical 'tie' line values and generator injections plus selected interconnected transmission line flows from the automated analysis program(s) to actual metered values every time the program runs. These values have been selected because of the accuracy of the metering at those locations and their impact on the BES.
        - Compute the percentage deviation of the program values versus actual metered values
        - Compute the average of the percentages on a periodic basis and compare to the tolerance value. (Actual periodicity will be selected based on industry feedback.)
        - Tolerance must be +/- x%. (Actual value will be selected based on industry feedback.)

5.2 AVAILIBILITY

Responsible entities must establish a procedure for what to do if the program(s) is not available for more than 30 consecutive minutes.

Current - The automated programs must provide a solution every five minutes 99% of the time on a monthly basis.

'What if' - The automated programs must provide a solution every ten minutes 99% of the time on a monthly basis.

5.3 FAILURE NOTIFICATION

Notification of failure of the analysis capability to provide a solution to the System Operator must be made to the System Operator within 60 seconds of when failure is detected.

5.4 MAINTENANCE

Each functional entity shall provide System Operators with approval rights for planned maintenance of its analysis capabilities.

Informal Comment Form for Concept White Paper for Project 2009-02: Real-time Monitoring and Analysis Capabilities

Please **DO NOT** use this form to submit comments on the White Paper for Project 2009-02: Real-time Monitoring and Analysis Capabilities. This comment form must be completed by **April 4, 2011.**

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Background Information
Concept White Paper for Project 2009-02: Real-time Monitoring and Analysis Capabilities

The SDT has created this white paper to illustrate the concepts it intends to pursue as the project unfolds. The goal of the white paper is to solicit industry feedback on the concepts to serve as input to the eventual creation of standards and requirements on the topic of Real-time monitoring and analysis capabilities. The SDT is striving to emphasize capabilities and is not proposing to require the use of any specific tools.

The SDT is actively pursuing industry feedback and strongly encourages industry to provide alternatives to the concepts presented using specific language where possible.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The SDT has proposed Section 2 for the concepts on monitoring. Do you support these concepts? If you do not support these concepts, please specify why you disagree and include specific alternative language to resolve your concern.

   ☐ Yes

   ☐ No

   Comments:

2. The SDT has proposed Section 3 for the concepts on data exchange. If you do not support these concepts, please specify why you disagree and include specific alternative language to resolve your concern.

   ☐ Yes, I agree with the concepts

   ☐ No, I do not agree with the concepts

   Comments:

3. The SDT has proposed Section 4 for the concepts on alarming. If you do not support these concepts, please specify why you disagree and include specific alternative language to resolve your concern.

   ☐ Yes, I agree with the concepts

   ☐ No, I do not agree with the concepts

   Comments:

4. The SDT has proposed Section 4 for the concepts on Analysis. If you do not support these concepts, please specify why you disagree and include specific alternative language to resolve your concern.

   ☐ Yes, I agree with the concepts

   ☐ No, I do not agree with the concepts

   Comments:

5. Are there any other capabilities that you feel are necessary to cover the general topic of Real-time monitoring and analysis capabilities. Please be as specific as possible in raising your ideas.

Standards Announcement

Project 2009-02 Real-time Monitoring and Analysis Capabilities
Informal Comment Period Open
February 16 – April 4, 2011

Now available at: http://www.nerc.com/filez/standards/Project2009-02_Real-Time_Monitoring_Analysis_Capabilities.html

Informal Comment Period Open through 8 p.m. on Monday, April 4, 2011

The Project 2009-02 Real-time Monitoring and Analysis Capabilities Standard Drafting Team has posted for a 45-day informal comment period a White Paper on proposed concepts to support the development of real-time monitoring and analysis standards. The White Paper, along with an unofficial Word version of the comment form, have been posted on the project Web page at http://www.nerc.com/filez/standards/Project2009-02_Real-Time_Monitoring_Analysis_Capabilities.html.

Instructions

Please submit comments using the electronic form.

Next Steps

The drafting team will consider the input received on the concept White Paper as it begins preparing to draft standards.

Project Background

The need for improved visualization capabilities over a wide geographic area has been a recurrent theme in blackout investigations. According to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, dated April 2004, a principal cause of the August 2003 blackout was a lack of situational awareness, a result of inadequate reliability tools.

NERC's Operating Committee formed the Real-time Tools Best Practices Task Force (RTBPTF) to evaluate real-time tools and their usage within the industry. The Task Force produced a report "Real-Time Tools Survey Analysis and Recommendations," dated March 13, 2008 that included recommendations for the functionality, performance, and management of real-time tools.

This project addresses recommendations from the August 2003 Blackout Report, the RTBPTF report, and two directives from FERC Order 693.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Process Administrator, at monica.benson@nerc.net or at 609.452.8060.

North American Electric Reliability Corporation

Unofficial Nomination Form

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Solicitation for Drafting Team Nominations

DO NOT use this form for submitting nominations. The electronic nomination form should be used to submit nominations and it is due prior to **8 p.m. Eastern, Friday, March 6, 2015.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form. If you have any questions, contact Mark Olson (via email) or by telephone at (404) 446-9760.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in the review or drafting team meetings if appointed by the Standards Committee. If appointed, you are expected to attend most of the face-to-face drafting team meetings as well as participate in all the team meetings held via conference calls.

The time commitment for these projects is expected to be up to two face-to-face meetings per quarter (on average three full working days each meeting) with conference calls scheduled as needed to meet the agreed upon timeline the review or drafting team sets forth. Review and drafting teams also will have side projects, either individually or by subgroup, to present to the larger team for discussion and review. Lastly, an important component of the review and drafting team efforts is outreach. Members of the team should be conducting outreach during development prior to posting to ensure all issues can be discussed and resolved.

Background

Project 2009-02 is included in the 2015-2017 Reliability Standards Development Plan (RSDP) approved by the NERC Board of Trustees (Board) on November 13, 2014. Formal development of this project was paused in 2011 and will resume to address outstanding Federal Energy Regulatory Commission (FERC) directives and issues that were not consolidated into Project 2014-03 TOP/IRO Revisions.

Project 2009-02 was initiated in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). From 2009 to 2011, a SAR drafting team developed a SAR and technical white paper to establish requirements for the "functionality, performance, and maintenance of

Real-time Monitoring and Analysis Capabilities."[1] In early 2011, formal development stopped to prioritize efforts on other projects.

In May 2013, NERC filed revised TOP and IRO Reliability Standards with FERC for approval (Projects 2007-03 and Project 2006-06). FERC expressed concerns with the proposed standards and retirements, including proposed retirement of currently-enforceable requirements for monitoring and analysis capabilities prior to completing the development of replacement requirements that address the outstanding FERC directives[2]. New TOP and IRO standards developed in Project 2014-03 address FERC concerns with the exception of some Real-time monitoring and analysis issues.

Some members of the original SDT have indicated that they are no longer available to continue participating in Project 2009-02. Nominations of subject matter experts (SMEs) are being sought to replace SDT members that are no longer participating, and to provide diverse technical experience, industry leadership, and regional and entity representation.

The SDT will consider the FERC directives and guidance, stakeholder input, and relevant industry reports for the purpose of revising a SAR for Standards Committee action and revising the white paper that was in development in 2011. The project page contains prior work.

---

1 SAR is available at the following: http://www.nerc.com/pa/Stand/Project%20200902%20Realtime%20Reliability%20Monitoring%20and/2009-32_RTTSDT_Third_Posting_SAR_Clean_2010April1.pdf

2 FERC's November 21, 2013 TOP/IRO Notice of Proposed Rulemaking, P 57-61, 145 FERC ¶ 61,158

Please provide the following information for the nominee:	
Name:	
Title:	
Organization:	
Address:	
Telephone:	
Email:	

Please briefly describe the nominee's experience and qualifications to serve on the selected project(s):

If you are currently a member of any NERC SAR or standard drafting team, please list each team here:

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any NERC SAR or standard drafting team, please identify the team(s):

☐ No prior NERC SAR or standard drafting team.

☐ Prior experience on the following SAR or standard drafting team(s):

Select each NERC Region in which you have experience relevant to Project 2009-02:

☐ ERCOT	☐ NPCC	☐ SPP
☐ FRCC	☐ RF	☐ WECC
☐ MRO	☐ SERC	☐ NA – Not Applicable

Select each Industry Segment that you represent:

☐	1 — Transmission Owners

☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function[3] in which you have current or prior expertise:

☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:

Name:		Telephone:	
Organization:		Email:	
Name:		Telephone:	
Organization:		Email:	

[3] These functions are defined in the NERC Functional Model, which is available on the NERC web site.

Provide the names and contact information of your immediate supervisor or a member of your management who can confirm your organization’s willingness to support your active participation.

Standards Announcement

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Solicitation for Drafting Team Nominations

Now Available

Nominations are being sought for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities drafting team (SDT) members through **8 p.m. Eastern, Friday, March 6, 2015**.

Original members of the Project 2009-02 SDT who desire to continue to participate are also requested to submit a nomination.

Previous drafting or review team experience is beneficial but not required. A brief description of the desired qualifications, expected commitment, and other pertinent information is included below. Detailed information is included on the unofficial Word version of the nomination form which can be found on the project page. Use the electronic form to submit nomination(s).

Project 2009-02 – Real-time Reliability Monitoring and Analysis Capabilities

Project 2009-02 is included in the 2015-2017 Reliability Standards Development Plan (RSDP) approved by the NERC Board of Trustees (Board) on November 13, 2014. Formal development of this project was paused in 2011 and will resume to address outstanding Federal Energy Regulatory Commission (FERC) directives and issues that were not consolidated into Project 2014-03 TOP/IRO Revisions.

Project 2009-02 was initiated in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). From 2009 to 2011, a Standard Authorization Request (SAR) SDT developed a SAR and technical white paper to establish requirements for the "functionality, performance, and maintenance of Real-time Monitoring and Analysis Capabilities."[1] Some members of the original SDT have indicated that they are no longer available to continue participating in Project 2009-02. Nominations of subject matter experts (SMEs) are being sought to replace SDT members that are no longer participating, and to provide diverse technical experience, industry leadership, and regional and entity representation.

[1] SAR is available at the following: http://www.nerc.com/pa/Stand/Project%20200902%20Realtime%20Reliability%20Monitoring%20and/2009-32_RTTSDT_Third_Posting_SAR_Clean_2010April1.pdf

The SDT will consider the FERC directives and guidance, stakeholder input, and relevant industry reports for the purpose of revising the SAR for Standards Committee action and revising the white paper that was in development in 2011.

Next Steps

The Standards Committee is expected to begin appointing members to the SDT in April 2015. Nominees will be notified shortly after they have been appointed to the drafting team**.**

For information on the **Standards Development Process**, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Mark Olson (via email) or by telephone at (404) 446.9760.

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard(s):	Project 2009-02: Real-time Reliability Monitoring and Analysis Capabilities		
Date Submitted:	June 18, 2015		
SAR Requester Information			
Name:	Saad Malik		
Organization:	Peak Reliability		
Telephone:	970.776.5635	E-mail:	smalik@peakrc.com
SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☐ Revision to existing Standard		☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
To establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations.
Industry Need (What is the industry problem this request is trying to solve?):
According to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* dated April 2004 (2003 Blackout Report), a principal cause of the August 14 blackout was a lack of situational awareness. Recommendation 22 of the 2003 Blackout Report states that the industry should "evaluate and adopt better Real-time tools for operators and reliability coordinators." NERC's Operating Committee formed the Real-time Tools Best Practices Task Force (RTBPTF) to evaluate Real-time tools and their usage within the industry. The Task Force produced the report *Real-Time Tools Survey Analysis and Recommendations* dated March 13, 2008 (RTBPTF Report)

SAR Information
that included recommendations for the functionality, performance, and management of Real-time tools. The FERC and NERC Staff Report *Arizona-Southern California Outages on September 8, 2011* (2011 Southwest Outage Report) also cited weaknesses in Real-time situational awareness and recommended improvements in Real-time monitoring and analysis capabilities. In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to System operators: • P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.* • P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.* • P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.* This SAR addresses the event reports, Order No. 693 directives, and recommendations from the RTBPTF Report that have not been addressed in other standards projects. The SAR Drafting Team also conducted a Technical Conference on June 4, 2015 to obtain stakeholder input on reliability objectives to be addressed in the proposed project.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The Standards Drafting Team (SDT) shall develop requirements and definition(s), as needed, for Real-time monitoring and analysis capabilities to ensure effective operator situational awareness. The project will address recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
Situational awareness of Real-time system operations is enabled through monitoring and analysis tasks performed by operators. Existing and proposed TOP and IRO standards and definitions developed in

SAR Information
Project 2014-03 Revisions to TOP and IRO Standards require Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. The proposed project will provide additional reliability benefits by addressing issues with the availability and information quality of Real-time monitoring and analysis capabilities. Specifically, the SDT will develop requirements and definition(s), as needed, to accomplish the following: • Establish a common understanding of *monitoring* as it applies to Real-time situational awareness of the Bulk Electric System (BES), • Provide operators with indication(s) of the quality of information being provided by *monitoring* capabilities and procedure(s) to address data quality issues, • Provide operators with notification(s) during unplanned loss of *monitoring* capabilities, • Provide operators with indication(s) of the quality of information being provided by *analysis* capabilities and procedure(s) to address analysis quality issues, and • Provide operators with notification(s) during unplanned loss of *analysis* capabilities. When completed, the project will have addressed recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.

Reliability Functions		
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☐	Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.

Reliability and Market Interface Principles	
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Related Standards	
Standard No.	Explanation
Project 2014-03 Revisions to TOP and IRO Standards	Proposed TOP and IRO standards and definitions from Project 2014-03 require RC, TOP, and BAs to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. Unofficial Comment Form

Project 2009-02 Real-time Monitoring and Analysis Capabilities

DO NOT use this form for submitting comments. Use the electronic form to submit comments on the Standards Authorization Request (SAR) developed by the SAR Drafting Team (SAR DT). The electronic comment form must be completed by **8:00 p.m. Eastern, Monday, August 17, 2015**.

Documents and information about this project are available on the project page. If you have any questions, contact Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Background Information

In April 2015, the Standards Committee (SC) appointed a new SAR DT to resume development on Project 2009-02 Real-time Monitoring and Analysis Capabilities. This project originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) but was paused in 2011. In determining the recommended scope for standards development, the SAR DT reviewed previous work associated with this project along with recommendations from the 2008 RTBPTF report, FERC Order No. 693 directives, and recommendations from the 2011 Southwest Outage Report. Additionally, an industry technical conference was conducted on June 4, 2015, to solicit feedback and recommendations from industry stakeholders.

The proposed project will develop requirements and definition(s), as needed, for Real-time monitoring and analysis capabilities to ensure effective operator situational awareness. Existing and proposed TOP and IRO standards and definitions from Project 2014-03 Revisions to TOP and IRO Standards require Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) to perform monitoring and analysis to maintain reliable operations. Project 2009-02 will provide additional reliability benefits by addressing issues with the availability and information quality of Real-time monitoring and analysis capabilities as described in the SAR and supporting white paper.

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Do you agree with the proposed scope for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

2. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

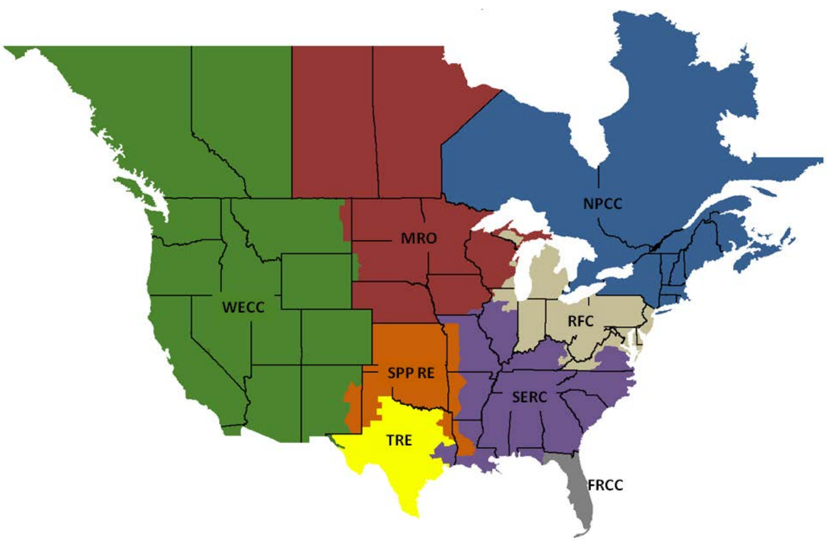
Table of Contents

Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk-Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RFC	Reliability*First* Corporation
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electric Coordinating Council

Introduction

In April 2015, the Standards Committee appointed a new Standards Authorization Request (SAR) Drafting Team (SAR DT) for Project 2009-02 Real-time Monitoring and Analysis Capabilities. This project originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). Several new Reliability Standards and defined terms have been approved or filed for approval in the years since Project 2009-02 was initiated, including the standards developed in Project 2014-03 Revisions to TOP and IRO Standards. As a result, many of the original issues identified by the RTBPTF for Project 2009-02 have been addressed. In addition, relevant observations and recommendations have emerged from more recent events on the Bulk Electric System (BES) and operating practices have evolved over time. The SAR DT has reviewed previous work done in Project 2009-02, new standards and defined terms, relevant industry report findings and recommendations including those contained in the 2011 Southwest Outage report, and industry observations and practices relevant to real-time situational awareness to assist in developing a comprehensive SAR.

This white paper describes the SAR DT's approach to developing the SAR and discusses the technical basis for developing Reliability Standards in Project 2009-02. This white paper and the associated SAR together are intended to fully describe the project purpose, industry need, and project scope.

Chapter 1 – Background

FERC Order No. 693[1] highlights the need for a minimum set of capabilities to be available to assist operators in making real-time decisions. The work done by the RTBPTF, which was formed by NERC in response to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, became the basis for the Real-time Monitoring and Analysis Capabilities (RTMAC) standards development project when it was initiated in 2009. Although Reliability Standards affecting the operating reliability of the Bulk Electric System (BES) have improved significantly over the years since first becoming mandatory in 2007, a reliability issue has persisted in the area of real-time situational awareness capabilities as highlighted in BES event reports and an independent review of the NERC Reliability Standards. A review of industry reports and recommendations pertaining to real-time monitoring and analysis capabilities is provided in this document and in the Appendix. These recommendations, along with the FERC Order No. 693 directives, describe the industry need for the current RTMAC standards project.

BES Event Reports

Project 2009-02, like some other Reliability Standards projects, is informed by the lessons learned from past outages. The two significant outages discussed below highlight issues in real-time situational awareness, among other reliability concerns. Many Communications (COM), Transmission Operations (TOP), and Interconnection Reliability Operations (IRO) standards have addressed event report recommendations to improve the way the BES is planned and operated. The scope of Project 2009-02 is intended to include remaining recommendations from the 2003 Blackout Report and the 2011 Southwest Outage Report that pertain to real-time monitoring and analysis capabilities.

2003 Blackout Report

The largest blackout in history to affect North America began on the afternoon of August 14, 2003 and disrupted over 61,800 Megawatts of electric load in the Northeastern U.S. and the Canadian province of Ontario. Severe impacts to electrical service lasted for nearly one week and an estimated 50 million people were affected. A comprehensive investigation conducted by U.S. and Canadian government and industry leaders identified a host of principal and contributing causes, including:

- Failure to maintain adequate reactive power support,
- Failure to ensure operation within secure limits,
- Inadequate vegetation management,
- Inadequate operator training,
- Failure to identify emergency conditions and communicate that status to neighboring systems, and
- Inadequate regional-scale visibility over the Bulk-Power System (BPS).

Among other causes, the 2003 blackout was linked to dysfunction of SCADA/EMS systems. Additionally, investigators pointed out that several deficiencies leading to the 2003 blackout were also identified weaknesses in previous outages, indicating the need for more effective response. Previous post-event reports included recommendations aimed at improving capabilities for visualizing changes to facilities within the system, and for visualizing changes to facilities in neighboring systems that could have a potential impact. A recurring recommendation also focused on providing capabilities for operators to evaluate courses of action. These

[1] *Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, 72 Fed. Reg. 16416 at P 1660 (Apr. 4, 2007), FERC Stats. And Regs.¶ 31,242, *order on reh'g,* Order No. 693-A, 120 FERC ¶ 61,053 (2007) (Order No. 693).

observations led to the recommendation in the final report of the 2003 blackout for NERC to **evaluate and adopt better real-time tools for operators and reliability coordinators.**[2]

In response, the NERC Operating Committee organized the RTBPTF to study the real-time situational awareness practices in use within the electric power industry and make recommendations concerning the establishment of minimum capabilities necessary for reliable operations. The RTBPTF report *Real-time Tools Survey Analysis and Recommendations,*[3] completed in 2008, is the result of extensive information gathering and analysis and includes recommendations for new or enhanced Reliability Standards, operating guides, and areas for further analysis. This report became a basis for initiating the Real-time Monitoring and Analysis Capabilities project in 2009.

Although exhaustive and comprehensive, some of the RTBPTF recommendations go beyond the scope of situational awareness monitoring and capabilities. In addition, many other recommendations have been addressed in other subsequent standards projects. The appendix provides a description of RTBPTF report recommendations and the SAR DT's determination of applicability within the scope of Project 2009-02.

An early Concept White Paper describing potential performance, availability, quality, and maintenance parameters based on the RTBPTF Report was developed in 2011. The SAR DT reviewed the white paper and confirmed that, due to significant changes to Reliability Standards and operating practices since it was drafted, the 2011 Concept White Paper is no longer relevant to the current effort in Project 2009-02.

2011 Southwest Outage Report

Like the 2003 blackout in the northeast, the blackout that occurred in the southwest in September 2011 was partly due to, or exacerbated by, inadequate real-time situational awareness. On the afternoon of September 8, 2011, the loss of a single 500 kV line led to widespread cascading outages affecting 2.7 million customers in Arizona, Southern California, and Baja, Mexico. Inadequate operations planning was a significant factor in the failure to maintain a secure N-1 state. However, the report also highlighted several concerns with entities and their ability to monitor, identify, and plan for the next most critical contingency in real-time.[4]

Project 2014-03 - Revisions to TOP and IRO Standards addressed many of the recommendations contained in the 2011 Southwest Outage Report related to operations planning and real-time situational awareness. A complete description is provided in the Southwest Outage Report mapping document for Project 2014-03.[5] Revised definitions and performance requirements for Real-time Assessments and Operational Planning Analysis and proposed requirements for developing and implementing Operating Plans to prevent and mitigate operating limit exceedances address most of the real-time situational awareness recommendations from the report. However some recommendations contain aspects pertaining to real-time capabilities that should be considered in Project 2009-02, as described in the appendix. Accordingly, Project 2009-02 will develop requirements to address remaining recommendations as described in the following chapter.

FERC Directives

In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to operators.[6] FERC indicated that the intent of the directive is to ensure operating entities have adequate tools to perform their real-time reliability functions.[7]

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*
- P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.*
- P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.*

Independent Experts Review Project (IERP) Report

In 2013, NERC retained a team of five industry experts to assess the quality of the enforceable body of standards and make recommendations for improvements that could be implemented by NERC and the industry.[8] Among the recommendations made by the panel of experts was the identification of potential risks to reliability that may not be adequately addressed in Reliability Standards. The report recommended resuming development of the Real-time Monitoring and Analysis Capabilities standards project.

Proposed TOP and IRO Standards

Since Project 2009-02 was initiated in 2009, many standards and definitions have been revised or developed that address real-time situational awareness issues. In particular, the revised TOP and IRO standards in Project 2014-03, which are pending regulatory approval, include key provisions for real-time situational awareness and operations planning. In reviewing the RTBPTF report recommendations for applicability in the current Project 2009-02 effort, the SAR DT considered the Project 2014-03 standards as noted in the Appendix.

The proposed TOP and IRO standards in Project 2014-03 provide requirements for performing monitoring and analysis through the definition of Real-time Assessment, Operational Planning Analysis, and the relevant requirements. Accordingly, additional requirements to perform monitoring or analysis will not be included in the scope for Project 2009-02. Furthermore, requirements for data exchange to support real-time monitoring and analysis will not be included in scope for Project 2009-02 because they are addressed through data specification requirements in IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3.

[6] Order No. 693 at P 905 (approving IRO-002-1 and directing modifications) and P 1665 (approving TOP-006-1 and directing modifications.

[7] Additionally, in approving VAR-001-1 - Voltage and Reactive Control, the Commission directed NERC to develop modifications to the standard to require periodic performance of voltage stability analysis to assist in real-time operations. The commission clarified that this could be accomplished through online tools where available, or offline simulation tools.

- §1875: *...[w]e direct the ERO, through its Reliability Standards development process, ...to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.*

VAR-001 was revised in the Project 2013-04, however the revised standard did not include a requirement for periodic performance of voltage stability analysis because voltage stability analysis is performed per SOL Methodology developed under FAC standards.

[8] See The Standards Independent Experts Review Project report. Available at www.nerc.com /pa/Stand/_layouts/xlviewer.aspx?id=/pa/Stand/Documents/P81_and%20IERP_Recommendations_for_Retirement_010815.xlsx.

Technical Conference

NERC and the SAR DT held a Technical Conference in Atlanta on June 4, 2015, to obtain industry input on reliability issues to be addressed in the proposed project. Participant subject matter experts representing a diverse mix of regional and functional entities shared their perspectives on the use of real-time situational awareness capabilities for reliable operations. There was consensus that many RTBPTF recommendations have been addressed in current or proposed TOP and IRO standards. However, Technical Conference participants agreed that issues identified by the RTBPTF pertaining to availability and information quality of real-time monitoring and analysis capabilities were still relevant.

Chapter 2 – Project Scope

The SAR DT has reviewed all recommendations from the RTBPTF and relevant recommendations from event reports, along with the existing body of standards, to identify remaining issues that should be in the scope for Project 2009-02. Table 1 below shows the resulting recommendations to be addressed. Additionally, the project will address outstanding FERC directives discussed in the preceding chapter.

Table 1: Report Recommendations to Address in Project 2009-02

Source	Recommendation	Discussion	Applicable Entity
2003 Blackout Report	Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators.	Project 2009-02 will develop requirements for real-time reliability monitoring and analysis capabilities to address issues not already addressed in other Reliability Standards. RTBPTF report recommendations will be considered in development.	RC, TOP, BA
2011 Southwest Outage Report	Recommendation 12 - [entities] should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2009-02 will develop requirements to improve the adequacy and operation of real-time monitoring and analysis capabilities. Requirements addressing the frequency that real-time tools run are contained in other standards and are not in the scope of this project.	RC, TOP, BA
RTBPTF Report	S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • Alarm Tools • Telemetry Data Systems • Network Topology Processor • State Estimator • Contingency Analysis	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. Prescription of specific tools is not in scope. Project approach is discussed below.	RC, TOP, BA as discussed below
RTBPTF Report	S7 - S8, S11-S12, S40 - Availability of various monitoring and analysis capability processes	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and analysis capabilities are not available (i.e., not performing their intended function).	RC, TOP, BA

Project Purpose and Approach

Project 2009-02 will develop requirements for real-time monitoring and analysis capabilities used by operators in support of reliable System operations. Functional requirements for performing *monitoring* and *analysis* tasks are well established in Reliability Standards as discussed throughout this white paper. However, reliability could be improved by:

- Developing a common understanding of *monitoring* as it applies to real-time situational awareness of the BES,
- Providing operators with indication(s) of the quality of information being provided by *monitoring* and *analysis* capabilities, and

- Providing operators with notification(s) during unplanned loss of *monitoring* and *analysis* capabilities.

Project 2009-02 will develop requirements and definition(s), as needed, to accomplish these reliability objectives as discussed.

Real-time Situational Awareness Concept

From the RTBPTF Report:

> *Situational awareness, as RTBPTF understands it, means ensuring that accurate information on current system conditions, including the likely effects of future contingencies, is continuously available in a form that allows operators to quickly grasp and fully understand actual operating conditions and take corrective action when necessary to maintain or restore reliable operations.*

The Project 2009-02 SAR DT believes that situational awareness encompasses two broad capabilities: monitoring and analysis. To be effective in supporting real-time situational awareness, monitoring and analysis must:

- Be performed with sufficient frequency to allow operators to understand operating conditions and take corrective actions when necessary,
- Provide awareness of information quality to allow operators to assess the accuracy of information being received on system conditions and take corrective actions when necessary, and
- Indicate when monitoring or analysis processes are not operating normally or are unavailable in order to provide operator awareness of the accuracy of the information being provided.

Project 2009-02 will develop new requirements and definition(s), as needed, that support this concept of situational awareness without duplicating aspects that are already addressed in the existing and proposed body of Reliability Standards. As discussed in the preceding chapter, requirements for the Reliability Coordinator (RC), Transmission Operator (TOP), and Balancing Authority (BA) to perform monitoring and analysis are covered under existing and proposed TOP and IRO standards. Therefore, Project 2009-02 will focus on developing requirements to address information quality and operator awareness of real-time monitoring and analysis capabilities. Table 2 shows reliability objectives that should be addressed in requirements for this project.

Monitoring

Monitoring BES facilities in real-time is a primary function of the RCs, TOPs, and BAs and is addressed in existing and proposed TOP and IRO standards. For RCs, proposed IRO-002-4 states:

> *R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.*

For TOPs and BAs, proposed TOP-001-3 states:

> *R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:*
>
> > *10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and*
> >
> > *10.2. Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.*

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

The SAR DT understands *monitoring* capabilities may include both alarming and information visualization. Project 2009-02 will aim to develop a consistent understanding of *monitoring* within the industry. The project will also address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of information being provided by a monitoring system, and indication when a monitoring system is not operating normally.

Analysis

The *analysis* component of the Real-time situational awareness concept is described by the definition of Real-time Assessment, which is pending FERC approval along with the proposed TOP and IRO standards. The proposed definition is as follows:

Real-time Assessment *- An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

Requirements for performing Real-time Assessments are contained in proposed IRO-008-2 and TOP-001-3:

Proposed IRO-008-2
R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Proposed TOP-001-3
R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

The SAR DT believes the proposed definition of Real-time Assessment and the requirements in proposed IRO-008-2 and TOP-001-3 provide RCs and TOPs with flexibility to determine which real-time tools, such as State Estimator, Contingency Analysis, and Stability Applications, are necessary to meet their real-time reliability functions. Consequently, prescriptive requirements for real-time tools are not in scope for Project 2009-02.

The project will address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of the analysis provided by a Real-time Assessment and notification when Real-time Assessment capabilities are not available.

Table 2: Project 2009-02 Reliability Objectives		
	Monitoring Capabilities	**Analysis Capabilities**
Quality	Provide operator with indication of information quality and procedures to address data quality issues.	Provide operator with indication of information quality and procedures to address analysis quality issues.

Availability	Provide operator with notification any time monitoring system is not operating normally.	Provide operator with notification any time Real-time Assessment capabilities are not available.

Appendix – Report Recommendations

The table below contains recommendations for improved real-time situational awareness capabilities found in relevant industry reports and how these recommendations have been addressed, if applicable. If recommendations have not been addressed fully, the table includes a description of how they should be addressed in Project 2009-02. The following industry reports are considered here[9]:

- 2003 Blackout Final Report
- 2011 Southwest Outage Report
- Real-time Tools Best Practices Task Force

Report Recommendation Mapping	
Report Recommendation	**Applicable Standard(s)**
2003 Blackout Final Report	
Recommendation 1-21, 23-46	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators. Operating Committee to evaluate the real-time operating tools necessary for reliability operation and reliability coordination, including backup capabilities. The committee's report is to address both minimum acceptable capabilities for critical reliability functions and a guide to best practices.	The Operating Committee established the RTBPTF to evaluate real-time operating tools and make recommendations for proposed standards. Project 2009-02 should consider these recommendations as discussed below.
2011 Southwest Outage Report	
Recommendation 1-10, 13-26	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 11 - TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Project 2014-03 developed the proposed definition of Real-time Assessment and proposed TOP-003-3 Requirement R1 which describes the requirements for a data specification that will provide all of the data that a TOP needs in order to fulfill its reliability function. Together, these address capabilities and required data TOPs must have to ensure adequate situational awareness. **Real-time Assessment -** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, Part 1.1**:

[9] *All industry reports are available on the 2009-02 Project Page: http://www.nerc.com/pa/Stand/Pages/Project-2009-02-Real-time-Reliability-Monitoring-and-Analysis-Capabilities.aspx.*

	A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.
Recommendation 12 - TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2014-03 developed a requirement for the performance of a Real-time Assessment for Transmission Operators. Standards developed in Project 2009-02 will address the adequacy of tools as described in this recommendation. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
Recommendation 27 - TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	Proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA) developed in Project 2014-03 specify that identified phase angle limitations must be considered and deal with applying phase angle information. Proposed TOP-002 Requirement R2 specifies that TOPs must have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified in the OPA. Data specification requirements in approved IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3 provide a means for RCs and TOPs to obtain phase angle information. **Proposed Definition: Operational Planning Analysis:** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment:** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System

	Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
RTBPTF Report	
S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • **Alarm Tools** • **Telemetry Data Systems** • **Network Topology Processor** • **State Estimator** • **Contingency Analysis**	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. However, prescription of specific tools is not in scope.
S2 - Compile and maintain a list of all bulk electric system elements within RC's area of responsibility.	Not in scope. Reliability objective is accomplished through monitoring and analysis requirements as discussed below.
S3 - Add new requirements and measures pertaining to RC monitoring of the bulk electric system.	Addresses in IRO standards (current and proposed). **IRO-002-2** R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. **IRO-003-2** R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. **Proposed IRO-002-4** R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
S4 - Develop data-exchange standards.	Addressed in proposed TOP-001-3 and IRO-002-4. **Proposed TOP-001-3** R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area. R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it

	needs data from in order to maintain reliability in its Balancing Authority Area. **Proposed IRO-002-4** R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
S5 - Develop data-availability standards and a process for trouble resolution and escalation.	Data availability and trouble resolution is addressed in IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S6 - Develop a new weather data requirement related to situational awareness and real-time operational capabilities.	EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard.
S7 - Specify and measure minimum availability for alarm tools.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the

	RTBPTF report to provide operator awareness when key monitoring, alarming, and analysis tools are not available (i.e. not performing their intended function).
S8 - Specify and measure minimum availability for network topology processor.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring, alarming, and analysis tools are not available (i.e. not performing their intended function).
S9 - Establish a uniform formal process to determine the "wide area view boundary" and show boundary data/results.	Wide-area is now a defined term. Recommendation has been addressed.
S10 - Develop compliance measures for verification of the usage of "wide-area overview display" visualization tools.	IRO standards revisions have addressed compliance measures.
S11 - Specify and measure minimum availability for state estimator, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring, alarming, and analysis tools are not available (i.e. not performing their intended function).
S12 - Specify and measure minimum availability for contingency analysis, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation to provide operator awareness when key monitoring, alarming, and analysis tools are not available (i.e. not performing their intended function).
S13 - Specify criteria and develop measures for defining contingencies.	Not in scope; Addressed in approved TPL and FAC standards.
S14 - Perform one-hour-ahead power-flow simulations to assess approaching SOL and IROL violations and corresponding measures.	Requirements for assessing pre- and post-contingency system conditions are addressed in Real-time Assessment (RTA) and Operational Planning Analysis (OPA) definitions. Requirements for performing RTA and OPA are contained in proposed TOP-001-3, TOP-002-4, IRO-008-2, and approved IRO-008-1. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2**

	R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
S15 - Provide real-time awareness of load-shed capability to address potential or actual IROL violations.	Addressed in proposed EOP-011-1, approved IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-

	reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions.

	IRO-010-1 R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S16 - Require BAs to monitor contingency reserves and calculate contingency reserves at a minimum periodicity of 10 seconds.	BA responsibilities for managing Contingency Reserve are addressed in the approved BAL-002-1 standard which is under revision in Project 2010-014. 1. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules.
S17 - Revise the current-day operations requirements to delineate specific, independent requirements for monitoring operating and reactive reserves.	Addressed in VAR-001-4, BAL-002, and proposed IRO-002-4 and TOP-001-3. **VAR-001-4** R4. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary.

	BAL-002-1 R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules. **Proposed IRO-002-4** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3** R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.
S18 - Establish document plans and procedures for conservative operations.	Addressed in proposed EOP-011-1 Requirement R1. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies

	and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions.
S19 - Restore system operations from an unknown operating state to proven and reliable limits within 30 minutes.	Addressed in proposed TOP-001-3, and IRO-008-2 and the proposed definitions for Operational Planning Analysis and Real-time Assessment. **Proposed TOP-001-3** R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R14. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within

	its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
S20 - Develop formal operating guides (mitigation plans) and measures for each IROL and any SOL or other conditions having a potential impact on reliability.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as

	a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S21 - Review and update operating guides (mitigation plans) when day-ahead or current day studies indicate the potential need to implement an operating guide.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S22 - Provide temporary operating guides (mitigation plans) with control actions for situations that could affect reliability but that have not been identified previously.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in

	Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S23 - Develop joint operating guides (mitigation plans) for situations that could require more than one RC or more than one TOP to execute actions.	Addressed in IRO-014-2, proposed IRO-014-3 and proposed IRO-008-2. **IRO-014-2** R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: ... **Proposed IRO-014-3** R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: ... **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S24 - Develop a formal procedure to document the processes for developing, reviewing, and updating operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S25 - Incorporate verifiable and traceable elements such as titles, document numbers, revision numbers, revision history, approvals, and dates when modifying operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S26 - Write operating guides (mitigation plans) in clear, unambiguous language, leaving nothing to interpretation.	Not in scope. This is administrative in nature.
S27 - State the specific purpose of existence for each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S28 - Summarize the specific situation assessment and address the method of performing the assessment in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S29 - Identify all appropriate preventive and remedial control actions in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S30 - Develop criteria in operating guides (mitigation plans) to support decisions regarding whether a specific control action should be taken.	Not in scope. This is administrative in nature.
S31 - Incorporate on-line tools that utilize on-line data when operating guides (mitigation plans) require calculations.	Not in scope. Recommendation is appropriate as a guideline rather than a reliability standard.

S32 - Make operating guides (mitigation plans) readily available via a quick-access method such as Web-based help, EMS display notes, or on-line help systems.	Not in scope. This is administrative in nature.
S33 - Provide the location, real-time status, and MWs of load available to be shed.	Addressed in proposed EOP-011-1 Requirement R1 Part 1.2.5 and proposed TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ...
S34 - Establish documented procedures for the reassessment and re-posturing of the system following an event.	Addressed in proposed TOP-002-4 and IRO-008-2, and approved EOP-005-2 and EOP-006-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses:

	4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ... **EOP-006-2** R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S35 - Provide information to operators to maintain awareness of the availability and capability of the blackstart generators and transmission restoration paths.	Addressed in approved IRO-010-1, proposed TOP-003-3, proposed IRO-010-2, approved EOP-005-2, and approved EOP-006-2. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability,

	uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... R1.6. Reporting requirements for the entities within the Reliability Coordinator Area during a restoration event. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ... R1.4. Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit. ... R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known

	changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **EOP-006-2** R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S36 - Plan and coordinate scheduled outages of blackstart generators and transmission restoration paths.	Addressed in approved EOP-005-2 and proposed IRO-017-1 - Outage Coordination. **EOP-005-2** R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **Proposed IRO-017-1** R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: ...
S37 - Maintain a Critical Equipment Monitoring Document to identify tools and procedures for monitoring critical equipment.	Not in scope. This is administrative in nature.
S38 - Maintain event logs pertaining to critical equipment status for a period of one year.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S39 - Maintain a Critical Equipment Maintenance and Testing Document identifying tools and procedures for maintenance, modification, and testing of critical equipment.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.

S40 - Monitor and maintain awareness of critical equipment status to ensure that lack of availability of critical equipment does not impair reliable operation.	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and analysis capabilities are not available (i.e., not performing their intended function).

Standards Announcement

Project 2009-02 Real-time Monitoring and Analysis Capabilities Standard Authorization Request

Formal Comment Period Open through August 17, 2015

Now Available

A 30-day formal comment period for the **Project 2009-02 Real-time Monitoring and Analysis Capabilities** Standard Authorization Request (SAR) is open through **8 p.m. Eastern, Monday, August 17, 2015.**

Commenting

Use the electronic form to submit comments on the SAR. If you experience any difficulties in using the electronic form, contact Nasheema Santos. An unofficial Word version of the comment form is posted on the project page.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Mark Olson (via email) or at (404) 446-9760.

Survey Report

Survey Details

Name 2009-02 Real-time Monitoring and Analysis Capabilities SAR

Description

Start Date 7/16/2015

End Date 8/17/2015

Associated Ballots

Survey Questions

1. Do you agree with the proposed scope for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

Yes

No

Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

Responses By Question

1. Do you agree with the proposed scope for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

Leonard Kula - Independent Electricity System Operator - 2 -

Selected Answer: No

Answer Comment:

We agree with the need to establish the requirements for real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations. However, we believe such requirements do not rise up to the level of Reliability Standards, whose objective is to drive the proper behaviors that contribute to reliability.

We believe real-time monitoring and analysis capabilities are the "one-off" type that is required for performing a registered entity's functions. Such capabilities need to be provided and tested at the organization certification stage, and in subsequent verification stages. Another example of this type of requirement is the provision of redundant communication facilities, or the installation of disturbance monitoring devices.

Therefore, we do not support this SAR, and propose that the requirements for providing the real-time monitoring and analysis capabilities be stipulated in the concerned functional entities' organization certification requirement.

Answer Comment:

The NSRF is aware of the Commission directives and past outage reports that have set the foundation for this project. Taken singularly (looking at these objectives, only) this Project should be rather straight forward. But as the SDT knows, the newly developed Requirements will be in addition to the real-time responsibilities that (System) operators have currently, in maintaining a balanced and secure system.

The NSRF wishes to remind the SDT that awareness (within Situational Awareness) should not turn into Situational Assurance (beyond a doubt). That *awareness* is "*knowing*" that something exist that may impact you and not necessarily having an *in depth understanding* of the root cause and effect of the situation. As an example, a TOP has a 345kV line trip and lock out. The TOP should have an *in depth understanding* of how the megawatt flows of their system will change when this lock out occurs. The impact BA Area does not need to *know* much beyond that the line has tripped, but rather needs the awareness that they may be called upon to help reconfigure their system (re-dispatch generation, shed load, etc.).

All Requirements (present and future) cannot remove the possibility of human error. A contributing factor to human error is data overload (ie, alarms [actual and false] communications [phone call, radio call, blast calls], processing this tremendous amount of information, having information constantly in a state of change and being compliant with ALL currently enforceable Standards. Note that System Operators have a higher tendency to make mistakes when their systems are stressed and usually in an emergency condition (either a capacity or transmission emergency). Not that their tools failed them but rather the most critical element or system condition wasn't mitigated first. The SDT must remain aware to *complexity creep* and look at ALL real-time operator responsibilities when developing this project and that adding new responsibilities may be detrimental to system reliability..

The NSRF looks forward to working with the SDT on this Project.

Note: We have progressed and are now aware of systems and conditions since the 2003 Blackout. Please consider this. Tools should be used as a "control" within an entity's Risk Assessment.

Answer Comment:

This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a "how" not "what" Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities for assurance that they have the ability to monitor appropriately in accordance with the Standards Requirements.

The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

Answer Comment:

The SAR has the "NEW" Standard box checked but not the "Revision to existing Standard" box. Based on the statement below from the SAR,
FirstEnergy feels the "Revision to existing Standard" should be checked also so other Standards can be included if necessary..

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*

Answer Comment:

How does NERC's Project 2009-02 differ from the work about to begin in the NERC Synchrophasor Measurements Subcommittee (SMS)? Should this project be part of SMS? In my mind ther is a great deal of overlap between the new SMS and Project 2009-02 and to a large extent, Project 2009-2 is dependent on the work to be done by SMS. Entergy recommend a delay or no vote on this project until SMS work is completed.

Answer Comment:

Suggest revising the Purpose to make it more encompassing. Suggest the following wording:

To establish situational awareness capabilities with results-based requirements for monitoring and analysis used by System Operators in support of reliable Real-time System operations.

The concepts being proposed in the scope of the SAR can be realized by revising the appropriate TOP and IRO standards by either revising existing requirements, or adding requirements. A new standard may not be necessary. Therefore, the SAR should provide the Drafting Team with the flexibility to add requirements to IRO-010-2 and TOP-003. For example, Requirement R2 in IRO-010-2 stipulates that:

“R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.”

This requirement satisfies both the posted Purpose of the SAR:

“To establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations.”

and our suggested revision above.

Answer Comment:

We agree with the overall scope of the SAR. However, we do have a two concerns to address.

First, the SAR indicates that it will address all recommendations of the RTBPTF while the SAR Justification indicates that not all recommendations will be implemented. If by “addressing the recommendations” the SAR indicates that recommendation will considered based on its merits, we agree. Furthermore, we agree with the disposition of the vast majority of the recommendations as written in the SAR justification.

Second, if a “common understanding of *monitoring*” means a definition will be developed, we caution the drafting team to conduct a complete wholesale review of all NERC reliability standards to be sure the definition would not change the meaning of other requirements or cause confusion on applicability of the definition.

Oshani Pathirane - Hydro One Networks, Inc. - 1,3 - NPCC

Selected Answer: Yes

Answer Comment:

Hydro One Networks Inc. would like to provide the following additional recommendations for the SDT's consideration:

1. The effort required to capture activities/best practices the majority of entities have already employed may be of value;

2. The standard does not appear to deliver the intended future direction for system monitoring and ways to achieve this;

3. By the nature and competitiveness of the MS industry, providers will continue to develop and offer new functionalities that may or may not be desirable for every entity. The effort would be better suited to standardize requirements and allow for the industry to catch up to a common standard. In other words, this effort would provide minimal benefit for entities that already have a modern EMS and for others a large change to meet current requirements;

4. The goal should be to level-off the playing field and have all entities reach the same level of monitoring first.

Answer Comment:

Our review team believes that the standards process has resulted in a mature set of Reliability Standards that already fully address FERC Order 693. With that being said, we feel that there is no need for continuing efforts on this project for the fear of redundancy. We have concerns that the scope of the SAR could result in requirements that are redundant to other existing Standards and inappropriately set minimum capabilities based on a list of best practices. The SAR scope seems to focus on quality of information for entities in carrying out their adherence to other Standards. Additionally, we feel that perhaps the documentation of the entities capabilities should be captured in either the Rules of Procedure or other certification or registration procedures rather than in a Reliability Standard. Another option would be to include descriptions or clarification of those capabilities within the supporting documentation of the other Standards.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: Yes

Answer Comment:

Texas RE noticed communicating results was not part of the SAR. Effective communications is part of situational awareness and can directly be related to the quality of information being provided as well as awareness of key monitoring and analysis capabilities. Monitoring and analysis capabilities should include communicating results to all entities requiring information. Is the SDT considering this type of communication? Texas RE is concerned the scope seems narrow. Has the SDT or NERC clearly identified all the recommendations and FERC directives have been thoroughly covered by the changes in all the relative Standards?

Texas RE acknowledges that FERC Order No. 693 mentioned that it did not wish to identify specific tools, but rather minimum capabilities. There are, however, standard industry tools for monitoring. Texas RE recommends the SDT consider making certain tools mandatory. Tools determine the status of reliability of the system. It seems as if the industry sees the need to call specific types of tools out but does not want the compliance aspects associated with the tools. State estimator and contingency analysis tool are extremely common utility practices to help ensure reliability. Is there a part of the BES that is not being monitored by a State Estimator or Contingency Analysis tool?

Sergio Banuelos - Tri-State G and T Association, Inc. - 1,3,5 - MRO,WECC

Selected Answer: No

Answer Comment:

Tri-State Generation and Transmission supports the comments submit by the Standards Review Committee (SRC).

In addition, Tri-State also would like to add the following. Tri-State recognizes that Real-time situational awareness might have been a factor of the 2003 Northeast blackout and the 2011 Southwest blackout, however we believe that over the past four years there has been significant developments and improvement in the tools that operators have available particularly within the WECC region. Additionally, the recent bifurcation in the WECC region and the subsequent creation of a standalone Reliability Coordinator has led to significant improvements in regional coordination, operations, and overall system visibility. We believe the new TOP-003-1 standard directly addresses the 'what' leaving the 'how' up to the individual utility, specifically:

Requirement R10 for Monitoring power System data in Real-time (and TOP-003-3)
Requirement R13 for Determining the current state of the BES and Evaluating the impact of ‘what if’ events on the current state of the BES
Requirement R19 for Exchanging power System data in Real-time

Tri-State does not agree with the SAR and its intentions but should the SAR proceed we urge the SDT to better define the intentions of the SAR. Specifically Tri-State does not understand how the SDT intends to quantify acceptable “quality” without resulting in a subjective audit? Also what is included in the term “analysis capabilities” and how will these items be sufficiently quantified to allow for a consistent audit approach across the various Regional Entities?

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Selected Answer: Yes

Answer Comment:

In general, BPA agrees with the scope of the SAR, and conceptually with the effort to tie performance based metrics to real time situational awareness. BPA also agrees with the SAR DT, that the scope of the Project 2009-02 should avoid prescriptive assumptions regarding the implementation of real time tools by a specific entity.

As noted in the SAR Justification, real time situational awareness is closely associated with the pending definition of Real-time Assessment. BPA suggests that the concept of providing operators with notification of Availability, as described by the SAR DT, is already implied by the pending requirements in proposed TOP-001-3 R13 and IRO-008-2 R4.

TOP-001-3 R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

IRO-008-2 R4: Each Reliability Coordinator shall ensure that a Real□time Assessment is performed at least once every 30 minutes.

The process an entity develops to avoid a violation of these requirements will necessitate prompt notification any time the entity's ability to perform the Real Time Assessment is degraded. Additional requirements would therefore be either redundant or unnecessarily prescriptive.

BPA notes that a measurement of the **quality** of monitoring or analysis tools is likely to be closely dependent on the tools and processes implemented by the individual entity. However, BPA agrees with the SAR DT that ongoing assessment of the tools and processes implemented by an entity to perform Real-time Assessment is both necessary and a gap in the existing standards. It is important to avoid the pitfall of implicitly requiring a specific implementation for Real Time Assessment. Any new standards developed by Project 2009-02 must also allow the industry to continue developing and improving on the best practices described by the NERC Real Time Best Practice Task Force in 2008.

Therefore, BPA suggests that Project 2009-02 should only focus on developing requirements for entities to establish, based on their own local implementation, 1) procedures for evaluating the quality of their Real Time Assessment and the information needed to perform it, and 2) the processes for maintaining the quality of the required information to the performance thresholds the entity determines are necessary for performing the Real Time Assessment.

Oliver Burke - Entergy - Entergy Services, Inc. - 1 -

Selected Answer:

Answer Comment:

Entergy has the following additional comments: 1. When writing standards for issues that are technology driven, extreme care must be used to avoid arbitrarly increasing costs without commensurare increase in benefit to reliability. 2. Standards should be technology neutral to the extent possible. 3. Need a bright-line voltage level guidance for which these new requirements apply. Different entities have their own definition of what consitutes Transmission levels. There presently exists a range from 100 kV to 44 kV in our region. 4. Need a bright-line guidance regarding extent of external monitoring that needs to be performed. A specific number, for example 10% impact, on internal lines and transformers would be extremely helpful. Currently entities in our region monitor anywhere from 5% to 10% impact, if possible, or up to three buses away.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Selected Answer:

Answer Comment:

Xcel Energy has questions about any new standards or proposed revisions to existing standards that would result from this project. How stringent are the requirements going to be? Will fully redundant systems be required? Can a TOP rely on the RC or other entity as a temporary backup? What about if the RC goes down?

Additionally, we have concerns about the level of detail that would be required. We believe that a requirment to analyze contingencies on neighboring systems could cause undue burden on smaller systems with larger neighbors.

Selected Answer:

Answer Comment:

Any revisions made must not address the specifics of what the situational awareness capabilities are, but must focus on the adequacy of the monitoring and analysis.

This proposed project should be considered for a guideline document as opposed to a standard. As written, the SAR appears to intend to write a “how” not “what” standard (i.e. it does appear to be a results-based standard). We believe that the existing Standards (i.e. IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (i.e. without defining the “how”), which is appropriate.

As an alternative, this could be considered a process to be used for certifying new entities for assurance that they have the ability to monitor appropriately in accordance with the Standard’s Requirements.

To avoid these issues in the future and to support communicating to FERC that a standard is not needed but another tool is more suitable, we suggest the future SARs be voted on by industry as to whether to proceed as a Standards project or use another means to achieve the ends.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:

Answer Comment:

Texas RE agrees with the RTBPTF report which states "Develop a new weather data requirement related to situational awareness and real-time operational capabilities." The drafting team's response, "EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard", is concerning because registered entities might not monitor weather as they should. Weather is extremely pertinent to situational awareness and real-time operational capabilities. Weather has a significant impact and, too often, exacerbates reliability issues. If it is a common utility practice than successful compliance should not be an issue. Is the SDT considering a Guideline like what was done for the common utility practice of preparing a generator for winter operation?

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Howard Gugel (via email) or at (404) 446-2560.

Questions

1. **Do you agree with the proposed scope for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.**
2. **Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.**

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the proposed scope for Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

Summary: The SDT thanks all commenters. Most commenters agree with the proposed scope for Project 2009-02. Some commenters raised concerns or provided recommendations that are summarized as follows:

- **Some commenters believe Project 2009-02 is not necessary, or that the reliability objectives should be addressed through the NERC Organization Certification Process.** The SDT maintains that the recommendations from BES event reports and the Real-time Tools Best Practices Task Force (RBPTF) Report that are referenced in the project SAR, as well as regulatory directives, establish the need for development of reliability standards. The SDT agrees that these capabilities should be demonstrated at the organization certification stage, but believes they should also be maintained on an ongoing basis through adherence to standards. Furthermore, development of standards is appropriate since, in general, organization certifications are based on the body of approved standards.

- **A commenter recommended modifying the SAR to indicate that the project could develop modifications to existing standards.** The SDT agrees that the project could either develop new standard(s) or modify existing TOP and IRO standards and modified the SAR accordingly.
- **A commenter noted notification of unavailability of analysis capabilities is implied in proposed TOP and IRO standards that are pending FERC approval.** The SDT agrees and modified the SAR to remove this reliability objective from Project 2009-02 scope.
- Several commenters provided recommendations for consideration during standards development.

Specific responses to all commenters are provided below.

Thomas Foltz - AEP - 5 -

Selected Answer: Yes

Andrew Pusztai - American Transmission Company, LLC - 1 -

Selected Answer: Yes

Leonard Kula - Independent Electricity System Operator - 2 -

Selected Answer: No

Answer Comment:

We agree with the need to establish the requirements for real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations. However, we believe such requirements do not rise up to the level of Reliability Standards, whose objective is to drive the proper behaviors that contribute to reliability.

We believe real-time monitoring and analysis capabilities are the “one-off” type that is required for performing a registered entity’s functions. Such capabilities need to be provided and tested at the organization certification stage, and in subsequent verification stages. Another example of this type of requirement is the provision of redundant communication facilities, or the installation of disturbance monitoring devices.

Therefore, we do not support this SAR, and propose that the requirements for providing the real-time monitoring and analysis capabilities be stipulated in the concerned functional entities’ organization certification requirement.

Response: Thank you for your comment. The SDT believes that the recommendations from BES event reports and the RTBPTF Report that are referenced in the project SAR, as well as regulatory directives, establish the need for development of reliability standards. Project 2009-02 has been scoped to include recommendations and directives that have not been addressed in other standards. The SDT agrees that these capabilities should be demonstrated at the organization certification stage, and should also be maintained on an ongoing basis through adherence to standards. Development of standards is also appropriate since, in general, organization certifications are based on the body of approved standards.

Selected Answer: Yes

Answer Comment:

The NSRF is aware of the Commission directives and past outage reports that have set the foundation for this project. Taken singularly (looking at these objectives, only) this Project should be rather straight forward. But as the SDT knows, the newly developed Requirements will be in addition to the real-time responsibilities that (System) operators have currently, in maintaining a balanced and secure system.

The NSRF wishes to remind the SDT that awareness (within Situational Awareness) should not turn into Situational Assurance (beyond a doubt). That *awareness* is "*knowing*" that something exist that may impact you and not necessarily having an *in depth understanding* of the root cause and effect of the situation. As an example, a TOP has a 345kV line trip and lock out. The TOP should have an *in depth understanding* of how the megawatt flows of their system will change when this lock out occurs. The impact BA Area does not need to *know* much beyond that the line has tripped, but rather needs the awareness that they may be called upon to help reconfigure their system (re-dispatch generation, shed load, etc.).

All Requirements (present and future) cannot remove the possibility of human error. A contributing factor to human error is data overload (ie, alarms [actual and false] communications [phone call, radio call, blast calls], processing this tremendous amount of information, having information constantly in a state of change and being compliant with ALL currently enforceable Standards. Note that System Operators have a higher tendency to make mistakes when their systems are stressed and usually in an emergency condition (either a capacity or transmission emergency). Not that their tools failed them but rather the most critical element or system condition wasn't mitigated first. The SDT must remain aware to *complexity creep* and look at ALL real-time operator responsibilities when developing this project and that adding new responsibilities may be detrimental to system reliability..

The NSRF looks forward to working with the SDT on this Project.

Note: We have progressed and are now aware of systems and conditions since the 2003 Blackout. Please consider this. Tools should be used as a "control" within an entity's Risk Assessment.

Response: Thank you for your comment.

John Fontenot - Bryan Texas Utilities - 1 -

Al Dicaprio	PJM	RFC	2
Ali Miremadi	CAISO	WECC	2

Selected Answer: No

Answer Comment:

This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a “how” not “what” Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the “how”), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities for assurance that they have the ability to monitor appropriately in accordance with the Standards Requirements.

The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the “what” regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity’s Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing “care and feeding” of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR’s objective.

Response: Thank you for your comment. The SDT believes that the recommendations from BES event reports and the RTBPTF Report that are referenced in the project SAR, as well as regulatory directives, establish the need for development of reliability standards. Project 2009-02 has been scoped to include recommendations and directives that have not been addressed in other standards. The SDT agrees that approved and proposed standards define requirements for performing monitoring and analysis tasks as described in the SAR Justification White Paper, and that the proposed project should not define or prescribe specific tools. In addressing the issues and recommendations identified in the SAR, the SDT will develop appropriate results-based requirements. The SDT agrees that monitoring and analysis capabilities should be demonstrated at the organization certification stage, and should also be maintained on an ongoing basis through adherence to standards. Development of standards is also appropriate since, in general, organization certifications are based on the body of approved standards.

Likes: 1 Tri-State G and T Association, Inc., 1,3,5, Banuelos Sergio

---

Sergio Banuelos - Tri-State G and T Association, Inc. - 1,3,5 - MRO,WECC

Selected Answer: No

Answer Comment:

1. Tri-State Generation and Transmission supports the comments submit by the Standards Review Committee (SRC).

2. In addition, Tri-State also would like to add the following. Tri-State recognizes that Real-time situational awareness might have been a factor of the 2003 Northeast blackout and the 2011 Southwest blackout, however we believe that over the past four years there has been significant developments and improvement in the tools that operators have available particularly within the WECC region. Additionally, the recent bifurcation in the WECC region and the subsequent creation of a standalone Reliability Coordinator has led to significant improvements in regional coordination, operations, and overall system visibility. We believe the new TOP-003-1 standard directly addresses the 'what' leaving the 'how' up to the individual utility, specifically:

Requirement R10 for Monitoring power System data in Real-time (and TOP-003-3)
Requirement R13 for Determining the current state of the BES and Evaluating the impact of 'what if' events on the current state of the BES
Requirement R19 for Exchanging power System data in Real-time

3. Tri-State does not agree with the SAR and its intentions but should the SAR proceed we urge the SDT to better define the intentions of the SAR. Specifically Tri-State does not understand how the SDT intends to quantify acceptable "quality" without resulting in a subjective audit? Also what is included in the term "analysis capabilities" and how will these items be sufficiently quantified to allow for a consistent audit approach across the various Regional Entities?

Response: Thank you for your comment.
1. See response to SRC.
2. The SDT has reviewed all proposed TOP and IRO standards from Project 2014-03, including TOP-001-3, and established the project scope accordingly as described in the SAR Justification White Paper.
3. Specific concerns related to the requirements will be addressed by the SDT in standards development. Analysis capabilities are described by the defined term Real-time Assessment.

christina bigelow - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer: Yes

Answer Comment: ERCOT supports the SRC's comments regarding the proposed SAR, but - should the SAR proceed - would urge the SDT to ensure that the focus remains on what needs to be done - not how it should be done.

Response: Thank you for your comment. See response to SRC.

Cindy Stewart	FirstEnergy Corp.	RFC	3
Doug Hohlbaugh	Ohio Edison	RFC	4
Robert Loy	FirstEnergy Solutions	RFC	5
Richard Hoag	FirstenergyCorp	RFC	NA - Not Applicable
Ann Ivanc	FirstEnergy Solutions	FRCC	6

Selected Answer: Yes

Answer Comment: The SAR has the "NEW" Standard box checked but not the "Revision to existing Standard" box. Based on the statement below from the SAR, FirstEnergy feels the "Revision to existing Standard" should be checked also so other Standards can be included if necessary..

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*

Response: Thank you for your comment. The SDT agrees and has revised the SAR accordingly.

Oliver Burke - Entergy - Entergy Services, Inc. - 1 -

Selected Answer: No

Answer Comment: How does NERC's Project 2009-02 differ from the work about to begin in the NERC Synchrophasor Measurements Subcommittee (SMS)? Should this project be part of SMS? In my mind ther is a great deal of overlap between the new SMS and Project 2009-02 and to a large extent, Project 2009-2 is dependent on the work to be done by SMS. Entergy recommend a delay or no vote on this project until SMS work is completed.

Response: Thank you for your comment. The scope for Project 2009-02 addresses specific recommendations and directives as described in the SAR. This scope differs from the approved project scope for SMS. The SDT does not agree that Project 2009-02 is dependent upon completion of work done by SMS.

Selected Answer: Yes

Answer Comment: Suggest revising the Purpose to make it more encompassing. Suggest the following wording:

To establish situational awareness capabilities with results-based requirements for monitoring and analysis used by System Operators in support of reliable Real-time System operations.

The concepts being proposed in the scope of the SAR can be realized by revising the appropriate TOP and IRO standards by either revising existing requirements, or adding requirements. A new standard may not be necessary. Therefore, the SAR should provide the Drafting Team with the flexibility to add requirements to IRO-010-2 and TOP-003. For example, Requirement R2 in IRO-010-2 stipulates that:

“R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.”

This requirement satisfies both the posted Purpose of the SAR:

“To establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations,”
and our suggested revision above.

Response: Thank you for your comment. The SDT agrees that the reliability objectives proposed in the SAR could be accomplished by modifying approved or proposed standards and has modified the SAR accordingly. The SDT believes the SAR Purpose section encompasses the project objectives as written. The recommendation for the purpose section will be considered as standard requirements are developed.

Selected Answer: Yes

Answer Comment: We agree with the overall scope of the SAR. However, we do have a two concerns to address.

First, the SAR indicates that it will address all recommendations of the RTBPTF while the SAR Justification indicates that not all recommendations will be implemented. If by "addressing the recommendations" the SAR indicates that recommendation will considered based on its merits, we agree. Furthermore, we agree with the disposition of the vast majority of the recommendations as written in the SAR justification.

Second, if a "common understanding of *monitoring*" means a definition will be developed, we caution the drafting team to conduct a complete wholesale review of all NERC reliability standards to be sure the definition would not change the meaning of other requirements or cause confusion on applicability of the definition.

Response: Thank you for your comment. The project will address those recommendations listed in Table 1 of the SAR Justification White Paper. The SDT acknowledges the potential impact that a definition can have on the body of standards.

Oshani Pathirane - Hydro One Networks, Inc. - 1,3 - NPCC

Selected Answer: Yes

Answer Comment:

Hydro One Networks Inc. would like to provide the following additional recommendations for the SDT's consideration:

1. The effort required to capture activities/best practices the majority of entities have already employed may be of value;

2. The standard does not appear to deliver the intended future direction for system monitoring and ways to achieve this;

3. By the nature and competitiveness of the MS industry, providers will continue to develop and offer new functionalities that may or may not be desirable for every entity. The effort would be better suited to standardize requirements and allow for the industry to catch up to a common standard. In other words, this effort would provide minimal benefit for entities that already have a modern EMS and for others a large change to meet current requirements;

4. The goal should be to level-off the playing field and have all entities reach the same level of monitoring first.

Response: Thank you for your comments. The SDT believes these comments will be addressed through standards development.

Scott Williams	City Utilities of Springfield	SPP	1,4

Selected Answer: No

Answer Comment: Our review team believes that the standards process has resulted in a mature set of Reliability Standards that already fully address FERC Order 693. With that being said, we feel that there is no need for continuing efforts on this project for the fear of redundancy. We have concerns that the scope of the SAR could result in requirements that are redundant to other existing Standards and inappropriately set minimum capabilities based on a list of best practices. The SAR scope seems to focus on quality of information for entities in carrying out their adherence to other Standards. Additionally, we feel that perhaps the documentation of the entities capabilities should be captured in either the Rules of Procedure or other certification or registration procedures rather than in a Reliability Standard. Another option would be to include descriptions or clarification of those capabilities within the supporting documentation of the other Standards.

Response: Thank you for your comments. The SAR addresses concerns with redundancy by mapping recommendations to specific requirements in the SAR Justification White Paper. The SDT believes the project's reliability objectives, which were derived from BES event reports, Order No. 693 directives, and the RTBPTF report, should be achieved through development of appropriate results-based requirements. The SDT agrees that these capabilities should be demonstrated at the organization certification stage, and should also be maintained on an ongoing basis through adherence to standards. Development of standards is also appropriate since, in general, organization certifications are based on the body of approved standards.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: Yes

Answer Comment: 1. Texas RE noticed communicating results was not part of the SAR. Effective communications is part of situational awareness and can directly be related to the quality of information being provided as well as awareness of key monitoring and analysis capabilities. Monitoring and analysis capabilities should include communicating results to all entities requiring information. Is the SDT considering this type of communication? Texas RE is concerned the scope seems narrow. Has the SDT or NERC clearly identified all the recommendations and FERC directives have been thoroughly covered by the changes in all the relative Standards?

2. Texas RE acknowledges that FERC Order No. 693 mentioned that it did not wish to identify specific tools, but rather minimum capabilities. There are, however, standard industry tools for monitoring. Texas RE recommends the SDT consider making certain tools mandatory. Tools determine the status of reliability of the system. It seems as if the industry sees the need to call specific types of tools out but does not want the compliance aspects associated with the tools. State estimator and contingency analysis tool are extremely common utility practices to help ensure reliability. Is there a part of the BES that is not being monitored by a State Estimator or Contingency Analysis tool?

Response: Thank you for your comment.
1. The SDT will consider communication of quality and availability information in Project 2009-02. The scope of Project 2009-02 was developed through a comprehensive review as described in the SAR Justification White Paper.
2. Requirements developed for Project 2009-02 will not prescribe specific tools, consistent with NERC guidelines to develop Reliability Standards that are technology-neutral. Requirements are designed to specify performance outcomes and provide entities with flexibility for determining how to meet the reliability objectives.

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Selected Answer: Yes

Answer Comment:	In general, BPA agrees with the scope of the SAR, and conceptually with the effort to tie performance based metrics to real time situational awareness. BPA also agrees with the SAR DT, that the scope of the Project 2009-02 should avoid prescriptive assumptions regarding the implementation of real time tools by a specific entity. As noted in the SAR Justification, real time situational awareness is closely associated with the pending definition of Real-time Assessment. BPA suggests that the concept of providing operators with notification of Availability, as described by the SAR DT, is already implied by the pending requirements in proposed TOP-001-3 R13 and IRO-008-2 R4. *TOP-001-3 R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.* *IRO-008-2 R4: Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.* The process an entity develops to avoid a violation of these requirements will necessitate prompt notification any time the entity's ability to perform the Real Time Assessment is degraded. Additional requirements would therefore be either redundant or unnecessarily prescriptive. BPA notes that a measurement of the **quality** of monitoring or analysis tools is likely to be closely dependent on the tools and processes implemented by the individual entity. However, BPA agrees with the SAR DT that ongoing assessment of the tools and processes implemented by an entity to perform Real-time Assessment is both necessary and a gap in the existing standards. It is important to avoid the pitfall of implicitly requiring a specific implementation for Real Time Assessment. Any new standards developed by Project 2009-02 must also allow the industry to continue developing and improving on the best practices described by the NERC Real Time Best Practice Task Force in 2008.

Therefore, BPA suggests that Project 2009-02 should only focus on developing requirements for entities to establish, based on their own local implementation, 1) procedures for evaluating the quality of their Real Time Assessment and the information needed to perform it, and 2) the processes for maintaining the quality of the required information to the performance thresholds the entity determines are necessary for performing the Real Time Assessment.

Response: Thank you for your comment. The SDT agrees that availability notification of Real-time Assessment capabilities is addressed in proposed TOP and IRO standards. The SAR has been modified accordingly.

2. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

Tony Eddleman	Nebraska Public Power District	MRO	1,3,5

Answer Comment: The NSRF wishes to point out that our industry has recently approved TOP-001-3 and it is currently pending approval from FERC. Specifically, R8, R10, R10.1, R10.2, R11, R12, R13, and R19 addresses several blackout recommendations concerning knowing how your system is performing and how to communicate mitigating actions to others. Please take this into consideration when developing this Standard.

Response: Thank you for your comment.

John Fontenot - Bryan Texas Utilities - 1 -

Answer Comment: none

Oliver Burke - Entergy - Entergy Services, Inc. - 1 -

Answer Comment:	Entergy has the following additional comments: 1. When writing standards for issues that are technology driven, extreme care must be used to avoid arbitrarly increasing costs without commensurare increase in benefit to reliability. 2. Standards should be technology neutral to the extent possible. 3. Need a bright-line voltage level guidance for which these new requirements apply. Different entities have their own definition of what consitutes Transmission levels. There presently exists a range from 100 kV to 44 kV in our region. 4. Need a bright-line guidance regarding extent of external monitoring that needs to be performed. A specific number, for example 10% impact, on internal lines and transformers would be extremely helpful. Currently entities in our region monitor anywhere from 5% to 10% impact, if possible, or up to three buses away.

Response: Thank you for your comments. The scope for this project includes quality and availability of monitoring and analysis capabilities. Determination of what should be monitored is not in scope, but is addressed by the applicable entities in other reliability standards.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Answer Comment:	Xcel Energy has questions about any new standards or proposed revisions to existing standards that would result from this project. How stringent are the requirements going to be? Will fully redundant systems be required? Can a TOP rely on the RC or other entity as a temporary backup? What about if the RC goes down? Additionally, we have concerns about the level of detail that would be required. We believe that a requirment to analyze contingencies on neighboring systems could cause undue burden on smaller systems with larger neighbors.

Response: Thank you for your comment. Specific questions about requirements are not within scope of the SAR but will be addressed in standards development.

Answer Comment:

Any revisions made must not address the specifics of what the situational awareness capabilities are, but must focus on the adequacy of the monitoring and analysis.

This proposed project should be considered for a guideline document as opposed to a standard. As written, the SAR appears to intend to write a "how" not "what" standard (i.e. it does appear to be a results-based standard). We believe that the existing Standards (i.e. IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (i.e. without defining the "how"), which is appropriate.

As an alternative, this could be considered a process to be used for certifying new entities for assurance that they have the ability to monitor appropriately in accordance with the Standard's Requirements.

To avoid these issues in the future and to support communicating to FERC that a standard is not needed but another tool is more suitable, we suggest the future SARs be voted on by industry as to whether to proceed as a Standards project or use another means to achieve the ends.

Response: Thank you for your comment. The SDT believes that the recommendations from BES event reports and the RTBPTF Report that are referenced in the project SAR establish the need for development of reliability standards. Project 2009-02 has been scoped to include recommendations that have not been addressed in other standards. The SDT agrees that these capabilities should be demonstrated at the organization certification stage, and should also be maintained on an ongoing basis through adherence to standards. Development of standards is also appropriate since, in general, organization certifications are based on the body of approved standards.

Kathleen Black - DTE Energy - 3,4,5 - RFC

Answer Comment: 2009-02 Real-time monitoring and analysis capabilities-S15 (Page 18 & 19), S18 (Page 21 and 22) and S33 (Page 26) all list EOP-011-1. EOP-011-1 is not effective due to not being approved by FERC. Although EOP-011-1 was written to consolidate EOP-001-2.1b, EOP-002-3.1 and EOP-003-2, we question if this project should be listing EOP-011-1 rather than the other 3 standards which are effective and approved.

Response: Thank you for your comment. The SAR DT included board-adopted Reliability Standards in its review where appropriate. The SDT does not consider this to be premature at this stage.

Ben Engelby - ACES Power Marketing - 6 -

Group Name: ACES Standards Collaborators - Real-time Project

Group Member Name	Entity	Region	Segments
Chip Koloini	Golden Spread Electric Cooperative, Inc.	SPP	5
Mark Ringhausen	Old Dominion Electric Cooperative	RFC	3,4
Ginger Mercier	Prairie Power, Inc.	SERC	1,3
Ellen Watkins	Sunflower Electric Power Corporation	SPP	1
Bob Solomon	Hoosier Energy Rural Electric Cooperative, Inc.	RFC	1

Answer Comment: There are two minor issues in the SAR Justification. On page 11, the last paragraph refers to Table 1. Yet, there is no Table 1. We assume Table 2 is supposed to be Table 1.

On page 15 regarding recommendation S3, “Addresses” should be “Addressed.”

Response: Thank you for your comment. The sentence on page 11 refers to Table 1: Report Recommendations to Address in Project 2009-02, which is found on page 9. The correction has been made to recommendation S3 on page 15.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Answer Comment: Texas RE agrees with the RTBPTF report which states “Develop a new weather data requirement related to situational awareness and real-time operational capabilities.” The drafting team’s response, “EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard”, is concerning because registered entities might not monitor weather as they should. Weather is extremely pertinent to situational awareness and real-time operational capabilities. Weather has a significant impact and, too often, exacerbates reliability issues. If it is a common utility practice than successful compliance should not be an issue. Is the SDT considering a Guideline like what was done for the common utility practice of preparing a generator for winter operation?

Response: Thank you for your comment. The SDT agrees that weather information is important for situational awareness and Real-time operational capabilities. However, there was general agreement within the SDT and participants at the SAR development technical conference held in June 2015 that, since the time of the RTBPTF report, weather data usage by operators has become common practice and as a result a standard requirement would not provide reliability benefit. Development of a guideline for weather information is not in scope for this project.

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Answer Comment: N/A

End of Report

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

This draft is the first posting of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 15, 2015
SAR posted for comment	July 16 - August 17, 2015

Anticipated Actions	Date
45-day formal comment period with initial ballot	September 2015
45-day formal comment period with additional ballot	December 2015
10-day final ballot	January 2016
NERC Board (Board) adoption	February 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **IRO-018-1**
3. **Purpose:** **Establish requirements for Real-time monitoring and analysis capabilities used by Reliability Coordinator System Operators in support of reliable System operations.**
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Reliability Coordinator (RC) uses a set of Real-time data identified in approved standard IRO-010-1a Requirement R1 and proposed standard IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform monitoring and Real-time Assessments appear in other standards.

Requirement R1 Part 1.2 of this standard specifies the RC shall include actions to coordinate resolution of data quality discrepancies in its Operating Process or Operating Procedure. These actions could be the same as the process to resolve data conflicts required by IRO-010-2 Requirement R3 Part 3.2, provided that this process could resolve Real-time data quality issues.

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

1.1. Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to:

1.1.1. Data outside of a prescribed data range;

1.1.2. Analog data not updated within a predetermined time period;

1.1.3. Data entered manually to override telemetered information; and

1.1.4. Data otherwise identified as invalid or suspect.

1.2. Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data.

M1. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Procedure or Operating Process in electronic or hard copy format meeting all provisions of Requirement R1, and 2) evidence the Reliability Coordinator implemented the Operating Procedure or Operating Process as called for in the Operating Procedure or Operating Process, such as dated operator or supporting logs, dated checklists, voice recordings, voice transcripts, or other evidence.

R2. Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M2. Each Reliability Coordinator shall have evidence it provided its System Operators with indications of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.

Rationale for Requirements R3 and R4: Requirements R3 and R4 ensure the RC's System Operators have procedures and receive indication(s) to address issues related to the quality of the analysis inputs used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards.

R3. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

3.1. Criteria for evaluating the quality of any analysis used in its Real-time Assessments; and

3.2. Actions to resolve quality deficiencies in any analysis used in its Real-time Assessments.

M3. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Procedure or Operating Process in electronic or hard copy format meeting all provisions of Requirement R3, and 2) evidence the Reliability Coordinator implemented the Operating Procedure or Operating Process as called for in the

Operating Procedure or Operating Process, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

R4. Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. Each Reliability Coordinator shall have evidence it provided its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

Rationale for Requirement R5: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An independent alarm process monitor is one that would not fail with a simultaneous failure of the alarm processor. A 'heartbeat' or 'watchdog' monitoring system may accomplish this objective.

R5. Each Reliability Coordinator shall utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

M5. Each Reliability Coordinator shall have evidence it utilized an independent alarm process monitor that provided notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show it was compliant for the full-time period since the last audit.

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R1, R2, and R5 and Measures M1, M2, and M5 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R3 and R4 and Measures M3 and M4 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	The Reliability Coordinator's Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments did not include one of the elements listed in Part 1.1 and Part 1.2. Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by existing and proposed TOP and IRO standards. As used in TOP and IRO standards, monitoring involves observing operating status and operating value(s) in Real-time for awareness of system conditions. Real-time monitoring includes the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes was moved to this section.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

This draft is the first posting of the proposed standard.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **TOP-010-1**
3. **Purpose:** **Establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations.**
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Transmission Operators
     - **4.1.2.** Balancing Authorities
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Transmission Operator (TOP) uses a set of Real-time data identified in proposed standard TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform monitoring and Real-time Assessments appear in other standards.

Requirement R1 Part 1.2 of this standard specifies the TOP shall include actions to coordinate resolution of Real-time data quality discrepancies in its Operating Process or Operating Procedure. These actions could be the same as the process to resolve data conflicts required by proposed TOP-003-3 Requirement R5 Part 5.2 provided that this process could resolve Real-time data quality issues.

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

1.1. Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to:

1.1.1. Data outside of a prescribed data range;

1.1.2. Analog data not updated within a predetermined time period;

1.1.3. Data entered manually to override telemetered information; and

1.1.4. Data otherwise identified as invalid or suspect.

1.2. Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data.

M1. Each Transmission Operator shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time Monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Procedure or Operating Process in electronic or hard copy format meeting all provisions of Requirement R1, and 2) evidence the Transmission Operator implemented the Operating Procedure or Operating Process as called for in the Operating Procedure or Operating Process, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: The Balancing Authority (BA) uses a set of Real-time data identified in proposed standard TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other standards.

Requirement R2 Part 2.2 of this standard specifies the BA shall include actions to coordinate resolution of Real-time data quality discrepancies in its Operating Process or Operating Procedure. These actions could be the same as the process to resolve data conflicts required by proposed TOP-003-3 Requirement R5 Part 5.2 provided that this process could resolve Real-time data quality issues.

R2. Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

2.1. Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to:

2.1.1. Data outside of a prescribed data range;

2.1.2. Analog data not updated within a predetermined time period;

2.1.3. Data entered manually to override telemetered information; and

2.1.4. Data otherwise identified as invalid or suspect.

2.2. Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data.

M2. Each Balancing Authority shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to: 1) an Operating Procedure or Operating Process in electronic or hard copy format meeting all provisions of Requirement R2, and 2) evidence the Balancing Authority implemented the Operating Procedure or Operating Process as called for in the Operating Procedure or Operating Process, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

R3. Each Transmission Operator shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. Each Transmission Operator shall have evidence it provided its System Operators with indications of the quality of Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.

R4. Each Balancing Authority shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. Each Balancing Authority shall have evidence it provided its System Operators with indications of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.

Rationale for Requirements R5 and R6: Requirements R5 and R6 ensure the TOP's System Operators have procedures and receive indication(s) to address issues related to the quality of the analysis inputs used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards.

R5. Each Transmission Operator shall implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

5.1. Criteria for evaluating the quality of any analysis used in its Real-time Assessments; and

5.2. Actions to resolve quality deficiencies in any analysis used in its Real-time Assessments.

M5. Each Transmission Operator shall have evidence it implemented its Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Procedure or Operating Process in electronic or hard copy format meeting all provisions of Requirement R5, and 2) evidence the Transmission Operator implemented the Operating Procedure or Operating Process as called for in the

Operating Procedure or Operating Process, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

R6. Each Transmission Operator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M6. Each Transmission Operator shall have evidence it provided its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessment capabilities. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

Rationale for Requirement R7: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An independent alarm process monitor is one that would not fail with a simultaneous failure of the alarm processor. A 'heartbeat' or 'watchdog' monitoring system may accomplish this objective.

R7. Each Transmission Operator and Balancing Authority shall utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

M7. Each Transmission Operator and Balancing Authority shall have evidence it utilized an independent alarm process monitor that provided notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain evidence of compliance for Requirements R1 through R4, and Requirement R7, and Measures M1 through M4, and Measure M7, for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ninety calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Operator shall retain evidence of compliance for Requirements R5 and R6 and Measures M5 and M6 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes was moved to this section.

Implementation Plan

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Requested Approvals

- IRO-018-1 - Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities
- TOP-010-1 - Real-time Reliability Monitoring and Analysis Capabilities

Requested Retirements

- None

Prerequisite Approval

- TOP-003-3 Operational Reliability Data

Proposed TOP-010-1 contains requirements addressing the quality of data necessary for Transmission Operators and Balancing Authorities to perform Real-time monitoring and analysis functions. Requirements for specifying and providing this data appear in TOP-003-3. Accordingly, proposed TOP-010-1 cannot become effective prior to TOP-003-3.

Effective Date

IRO-018-1

- Requirements R1, R2, and R5 shall become effective on the first day of the first calendar quarter that is 12 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1, R2, and R5 shall become effective on the first day of the first calendar quarter that is 12 months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
- Requirements R3 and R4 shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable

governmental authority is not required, Requirements R3 and R4 shall become effective on the first day of the first calendar quarter that is twelve months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

TOP-010-1

If the prerequisite approval occurs on or before approval of the standards in Project 2009-02:

- Requirements R1, R2, R3, R4, and R7 shall become effective on the first day of the first calendar quarter that is 12 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1, R2, R3, R4, and R7 shall become effective on the first day of the first calendar quarter that is 12 months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
- Requirements R5 and R6 shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R5 and R6 shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

If the prerequisite approval occurs after approval of the standards in Project 2009-02:

- Requirements R1, R2, R3, R4, and R7 shall become effective on the first day of the first calendar quarter that is 12 months after the date that TOP-003-3 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R1, R2, R3, R4, and R7 shall become effective on the first day of the first calendar quarter that is 12 months after the date TOP-010-1 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
- Requirements R5 and R6 shall become effective on the first day of the first calendar quarter that is 18 months after the date that TOP-003-3 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, Requirements R5 and R6 shall become effective on the first day of the first calendar quarter that is 18 months after the date TOP-010-1 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Unofficial Comment Form

Project 2009-02 Real-time Monitoring and Analysis Capabilities

IRO-018-1 and TOP-010-1

DO NOT use this form for submitting comments. Use the electronic form to submit comments on IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities and TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities. The electronic comment form must be completed by **8 p.m. Eastern, Monday, November 9, 2015**.

Documents and information about this project are available on the project page. If you have any questions, contact Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Background Information

Project 2009-02 Real-time Monitoring and Analysis Capabilities originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). The project SAR was revised earlier this year to account for proposed revisions to TOP and IRO standards developed in Project 2014-03 that are pending regulatory approval. Project 2009-02 is developing requirements to address monitoring and analysis capability issues identified in the 2008 RTBPTF report and the 2011 Southwest Outage Report, as well as addressing FERC Order No. 693 directives.

The Standard Drafting Team (SDT) developed two proposed Reliability Standards to meet the objectives outlined in the project SAR. IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities addresses issues related to the quality and availability of Reliability Coordinator (RC) monitoring and analysis capabilities. TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities contains similar proposed requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs).

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. The SDT has proposed a new standard IRO-018-1 to address RC monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

2. The SDT has proposed a new standard TOP-010-1 to address TOP and BA monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

3. Do you agree with the Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

☐ Yes
☐ No
Comments:

5. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.
Comments:

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard(s):	Project 2009-02: Real-time Reliability Monitoring and Analysis Capabilities		
Date Submitted:	June 18, 2015		
SAR Requester Information			
Name:	Saad Malik		
Organization:	Peak Reliability		
Telephone:	970.776.5635	E-mail:	smalik@peakrc.com
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☐ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
To establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations.
Industry Need (What is the industry problem this request is trying to solve?):
According to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* dated April 2004 (2003 Blackout Report), a principal cause of the August 14 blackout was a lack of situational awareness. Recommendation 22 of the 2003 Blackout Report states that the industry should "evaluate and adopt better Real-time tools for operators and reliability coordinators." NERC's Operating Committee formed the Real-time Tools Best Practices Task Force (RTBPTF) to evaluate Real-time tools and their usage within the industry. The Task Force produced the report *Real-Time Tools Survey Analysis and Recommendations* dated March 13, 2008 (RTBPTF Report)

SAR Information
that included recommendations for the functionality, performance, and management of Real-time tools. The FERC and NERC Staff Report *Arizona-Southern California Outages on September 8, 2011* (2011 Southwest Outage Report) also cited weaknesses in Real-time situational awareness and recommended improvements in Real-time monitoring and analysis capabilities. In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to System operators: • P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.* • P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.* • P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.* This SAR addresses the event reports, Order No. 693 directives, and recommendations from the RTBPTF Report that have not been addressed in other standards projects. The SAR Drafting Team also conducted a Technical Conference on June 4, 2015 to obtain stakeholder input on reliability objectives to be addressed in the proposed project.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The Standards Drafting Team (SDT) shall develop requirements and definition(s), as needed, for Real-time monitoring and analysis capabilities to ensure effective operator situational awareness. The project will address recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
Situational awareness of Real-time system operations is enabled through monitoring and analysis tasks performed by operators. Existing and proposed TOP and IRO standards and definitions developed in

SAR Information
Project 2014-03 Revisions to TOP and IRO Standards require Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. The proposed project will provide additional reliability benefits by addressing issues with the availability and information quality of Real-time monitoring and analysis capabilities. Specifically, the SDT will develop requirements and definition(s), as needed, to accomplish the following: • Establish a common understanding of *monitoring* as it applies to Real-time situational awareness of the Bulk Electric System (BES), • Provide operators with indication(s) of the quality of information being provided by *monitoring* capabilities and procedure(s) to address data quality issues, • Provide operators with notification(s) during unplanned loss of *monitoring* capabilities, and • Provide operators with indication(s) of the quality of information being provided by *analysis* capabilities and procedure(s) to address analysis quality issues. When completed, the project will have addressed recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.

Reliability Functions		
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☐	Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.

Reliability and Market Interface Principles	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Related Standards	
Standard No.	**Explanation**
Project 2014-03 Revisions to TOP and IRO Standards	Proposed TOP and IRO standards and definitions from Project 2014-03 require RC, TOP, and BAs to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. The proposed standards and definitions are pending regulatory approval.

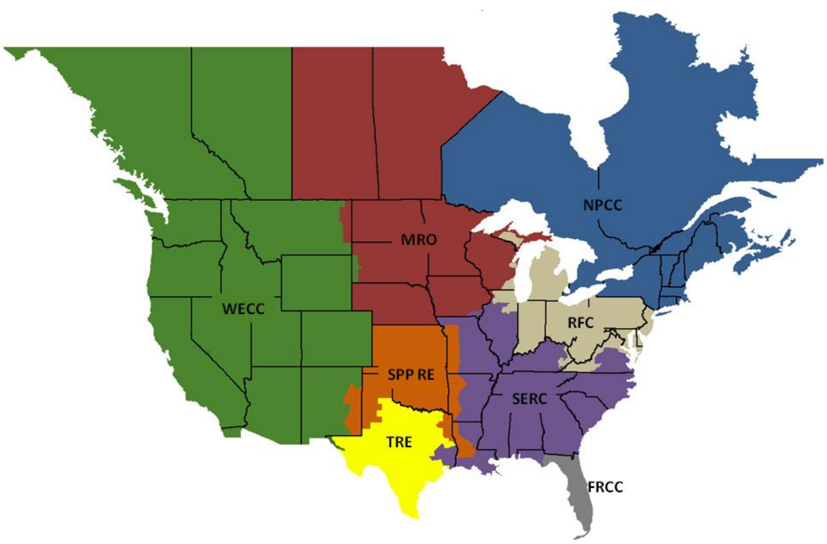
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk-Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RFC	Reliability*First* Corporation
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electric Coordinating Council

Introduction

In April 2015, the Standards Committee appointed a new Standards Authorization Request (SAR) Drafting Team (SAR DT) for Project 2009-02 Real-time Monitoring and Analysis Capabilities. This project originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). Several new Reliability Standards and defined terms have been approved or filed for approval in the years since Project 2009-02 was initiated, including the standards developed in Project 2014-03 Revisions to TOP and IRO Standards. As a result, many of the original issues identified by the RTBPTF for Project 2009-02 have been addressed. In addition, relevant observations and recommendations have emerged from more recent events on the Bulk Electric System (BES) and operating practices have evolved over time. The SAR DT has reviewed previous work done in Project 2009-02, new standards and defined terms, relevant industry report findings and recommendations including those contained in the 2011 Southwest Outage report, and industry observations and practices relevant to real-time situational awareness to assist in developing a comprehensive SAR.

This white paper describes the SAR DT's approach to developing the SAR and discusses the technical basis for developing Reliability Standards in Project 2009-02. This white paper and the associated SAR together are intended to fully describe the project purpose, industry need, and project scope.

Chapter 1 – Background

FERC Order No. 693[1] highlights the need for a minimum set of capabilities to be available to assist operators in making real-time decisions. The work done by the RTBPTF, which was formed by NERC in response to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, became the basis for the Real-time Monitoring and Analysis Capabilities (RTMAC) standards development project when it was initiated in 2009. Although Reliability Standards affecting the operating reliability of the Bulk Electric System (BES) have improved significantly over the years since first becoming mandatory in 2007, a reliability issue has persisted in the area of real-time situational awareness capabilities as highlighted in BES event reports and an independent review of the NERC Reliability Standards. A review of industry reports and recommendations pertaining to real-time monitoring and analysis capabilities is provided in this document and in the Appendix. These recommendations, along with the FERC Order No. 693 directives, describe the industry need for the current RTMAC standards project.

BES Event Reports

Project 2009-02, like some other Reliability Standards projects, is informed by the lessons learned from past outages. The two significant outages discussed below highlight issues in real-time situational awareness, among other reliability concerns. Many Communications (COM), Transmission Operations (TOP), and Interconnection Reliability Operations (IRO) standards have addressed event report recommendations to improve the way the BES is planned and operated. The scope of Project 2009-02 is intended to include remaining recommendations from the 2003 Blackout Report and the 2011 Southwest Outage Report that pertain to real-time monitoring and analysis capabilities.

2003 Blackout Report

The largest blackout in history to affect North America began on the afternoon of August 14, 2003 and disrupted over 61,800 Megawatts of electric load in the Northeastern U.S. and the Canadian province of Ontario. Severe impacts to electrical service lasted for nearly one week and an estimated 50 million people were affected. A comprehensive investigation conducted by U.S. and Canadian government and industry leaders identified a host of principal and contributing causes, including:

- Failure to maintain adequate reactive power support,
- Failure to ensure operation within secure limits,
- Inadequate vegetation management,
- Inadequate operator training,
- Failure to identify emergency conditions and communicate that status to neighboring systems, and
- Inadequate regional-scale visibility over the Bulk-Power System (BPS).

Among other causes, the 2003 blackout was linked to dysfunction of SCADA/EMS systems. Additionally, investigators pointed out that several deficiencies leading to the 2003 blackout were also identified weaknesses in previous outages, indicating the need for more effective response. Previous post-event reports included recommendations aimed at improving capabilities for visualizing changes to facilities within the system, and for visualizing changes to facilities in neighboring systems that could have a potential impact. A recurring recommendation also focused on providing capabilities for operators to evaluate courses of action. These

[1] *Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, 72 Fed. Reg. 16416 at P 1660 (Apr. 4, 2007), FERC Stats. And Regs.¶ 31,242, *order on reh'g,* Order No. 693-A, 120 FERC ¶ 61,053 (2007) (Order No. 693).

observations led to the recommendation in the final report of the 2003 blackout for NERC to **evaluate and adopt better real-time tools for operators and reliability coordinators.**[2]

In response, the NERC Operating Committee organized the RTBPTF to study the real-time situational awareness practices in use within the electric power industry and make recommendations concerning the establishment of minimum capabilities necessary for reliable operations. The RTBPTF report *Real-time Tools Survey Analysis and Recommendations,*[3] completed in 2008, is the result of extensive information gathering and analysis and includes recommendations for new or enhanced Reliability Standards, operating guides, and areas for further analysis. This report became a basis for initiating the Real-time Monitoring and Analysis Capabilities project in 2009.

Although exhaustive and comprehensive, some of the RTBPTF recommendations go beyond the scope of situational awareness monitoring and capabilities. In addition, many other recommendations have been addressed in other subsequent standards projects. The appendix provides a description of RTBPTF report recommendations and the SAR DT's determination of applicability within the scope of Project 2009-02.

An early Concept White Paper describing potential performance, availability, quality, and maintenance parameters based on the RTBPTF Report was developed in 2011. The SAR DT reviewed the white paper and confirmed that, due to significant changes to Reliability Standards and operating practices since it was drafted, the 2011 Concept White Paper is no longer relevant to the current effort in Project 2009-02.

2011 Southwest Outage Report

Like the 2003 blackout in the northeast, the blackout that occurred in the southwest in September 2011 was partly due to, or exacerbated by, inadequate real-time situational awareness. On the afternoon of September 8, 2011, the loss of a single 500 kV line led to widespread cascading outages affecting 2.7 million customers in Arizona, Southern California, and Baja, Mexico. Inadequate operations planning was a significant factor in the failure to maintain a secure N-1 state. However, the report also highlighted several concerns with entities and their ability to monitor, identify, and plan for the next most critical contingency in real-time.[4]

Project 2014-03 - Revisions to TOP and IRO Standards addressed many of the recommendations contained in the 2011 Southwest Outage Report related to operations planning and real-time situational awareness. A complete description is provided in the Southwest Outage Report mapping document for Project 2014-03.[5] Revised definitions and performance requirements for Real-time Assessments and Operational Planning Analysis and proposed requirements for developing and implementing Operating Plans to prevent and mitigate operating limit exceedances address most of the real-time situational awareness recommendations from the report. However some recommendations contain aspects pertaining to real-time capabilities that should be considered in Project 2009-02, as described in the appendix. Accordingly, Project 2009-02 will develop requirements to address remaining recommendations as described in the following chapter.

FERC Directives

In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to operators.[6] FERC indicated that the intent of the directive is to ensure operating entities have adequate tools to perform their real-time reliability functions.[7]

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*
- P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.*
- P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.*

Independent Experts Review Project (IERP) Report

In 2013, NERC retained a team of five industry experts to assess the quality of the enforceable body of standards and make recommendations for improvements that could be implemented by NERC and the industry.[8] Among the recommendations made by the panel of experts was the identification of potential risks to reliability that may not be adequately addressed in Reliability Standards. The report recommended resuming development of the Real-time Monitoring and Analysis Capabilities standards project.

Proposed TOP and IRO Standards

Since Project 2009-02 was initiated in 2009, many standards and definitions have been revised or developed that address real-time situational awareness issues. In particular, the revised TOP and IRO standards in Project 2014-03, which are pending regulatory approval, include key provisions for real-time situational awareness and operations planning. In reviewing the RTBPTF report recommendations for applicability in the current Project 2009-02 effort, the SAR DT considered the Project 2014-03 standards as noted in the Appendix.

The proposed TOP and IRO standards in Project 2014-03 provide requirements for performing monitoring and analysis through the definition of Real-time Assessment, Operational Planning Analysis, and the relevant requirements. Accordingly, additional requirements to perform monitoring or analysis will not be included in the scope for Project 2009-02. Furthermore, requirements for data exchange to support real-time monitoring and analysis will not be included in scope for Project 2009-02 because they are addressed through data specification requirements in IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3.

[6] Order No. 693 at P 905 (approving IRO-002-1 and directing modifications) and P 1665 (approving TOP-006-1 and directing modifications.

[7] Additionally, in approving VAR-001-1 - Voltage and Reactive Control, the Commission directed NERC to develop modifications to the standard to require periodic performance of voltage stability analysis to assist in real-time operations. The commission clarified that this could be accomplished through online tools where available, or offline simulation tools.

- §1875: *...[w]e direct the ERO, through its Reliability Standards development process, ...to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.*

VAR-001 was revised in the Project 2013-04, however the revised standard did not include a requirement for periodic performance of voltage stability analysis because voltage stability analysis is performed per SOL Methodology developed under FAC standards.

[8] See The Standards Independent Experts Review Project report. Available at www.nerc.com /pa/Stand/_layouts/xlviewer.aspx?id=/pa/Stand/Documents/P81_and%20IERP_Recommendations_for_Retirement_010815.xlsx.

Technical Conference

NERC and the SAR DT held a Technical Conference in Atlanta on June 4, 2015, to obtain industry input on reliability issues to be addressed in the proposed project. Participant subject matter experts representing a diverse mix of regional and functional entities shared their perspectives on the use of real-time situational awareness capabilities for reliable operations. There was consensus that many RTBPTF recommendations have been addressed in current or proposed TOP and IRO standards. However, Technical Conference participants agreed that issues identified by the RTBPTF pertaining to availability and information quality of real-time monitoring and analysis capabilities were still relevant.

Chapter 2 – Project Scope

The SAR DT has reviewed all recommendations from the RTBPTF and relevant recommendations from event reports, along with the existing body of standards, to identify remaining issues that should be in the scope for Project 2009-02. Table 1 below shows the resulting recommendations to be addressed. Additionally, the project will address outstanding FERC directives discussed in the preceding chapter.

Table 1: Report Recommendations to Address in Project 2009-02

Source	Recommendation	Discussion	Applicable Entity
2003 Blackout Report	Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators.	Project 2009-02 will develop requirements for real-time reliability monitoring and analysis capabilities to address issues not already addressed in other Reliability Standards. RTBPTF report recommendations will be considered in development.	RC, TOP, BA
2011 Southwest Outage Report	Recommendation 12 - [entities] should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2009-02 will develop requirements to improve the adequacy and operation of real-time monitoring and analysis capabilities. Requirements addressing the frequency that real-time tools run are contained in other standards and are not in the scope of this project.	RC, TOP, BA
RTBPTF Report	S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • Alarm Tools • Telemetry Data Systems • Network Topology Processor • State Estimator • Contingency Analysis	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. Prescription of specific tools is not in scope. Project approach is discussed below.	RC, TOP, BA as discussed below
RTBPTF Report	S7 - S8, S11-S12, S40 - Availability of various monitoring and analysis capability processes	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring capabilities are not available (i.e., not performing their intended function).	RC, TOP, BA

Project Purpose and Approach

Project 2009-02 will develop requirements for real-time monitoring and analysis capabilities used by operators in support of reliable System operations. Functional requirements for performing *monitoring* and *analysis* tasks are well established in Reliability Standards as discussed throughout this white paper. However, reliability could be improved by:

- Developing a common understanding of *monitoring* as it applies to real-time situational awareness of the BES,
- Providing operators with indication(s) of the quality of information being provided by *monitoring* and *analysis* capabilities, and
- Providing operators with notification(s) during unplanned loss of *monitoring* capabilities.

Project 2009-02 will develop requirements and definition(s), as needed, to accomplish these reliability objectives as discussed.

Real-time Situational Awareness Concept

From the RTBPTF Report:

> *Situational awareness, as RTBPTF understands it, means ensuring that accurate information on current system conditions, including the likely effects of future contingencies, is continuously available in a form that allows operators to quickly grasp and fully understand actual operating conditions and take corrective action when necessary to maintain or restore reliable operations.*

The Project 2009-02 SAR DT believes that situational awareness encompasses two broad capabilities: monitoring and analysis. To be effective in supporting real-time situational awareness, monitoring and analysis must:

- Be performed with sufficient frequency to allow operators to understand operating conditions and take corrective actions when necessary,
- Provide awareness of information quality to allow operators to assess the accuracy of information being received on system conditions and take corrective actions when necessary, and
- Indicate when monitoring or analysis processes are not operating normally or are unavailable in order to provide operator awareness of the accuracy of the information being provided.

Project 2009-02 will develop new requirements and definition(s), as needed, that support this concept of situational awareness without duplicating aspects that are already addressed in the existing and proposed body of Reliability Standards. As discussed in the preceding chapter, requirements for the Reliability Coordinator (RC), Transmission Operator (TOP), and Balancing Authority (BA) to perform monitoring and analysis are covered under existing and proposed TOP and IRO standards. Therefore, Project 2009-02 will focus on developing requirements to address information quality and operator awareness of real-time monitoring and analysis capabilities. Table 2 shows reliability objectives that should be addressed in requirements for this project.

Monitoring

Monitoring BES facilities in real-time is a primary function of the RCs, TOPs, and BAs and is addressed in existing and proposed TOP and IRO standards. For RCs, proposed IRO-002-4 states:

> *R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.*

For TOPs and BAs, proposed TOP-001-3 states:

> *R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:*
>
> > *10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and*
> >
> > *10.2. Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.*
>
> *R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.*

The SAR DT understands *monitoring* capabilities may include both alarming and information visualization. Project 2009-02 will aim to develop a consistent understanding of *monitoring* within the industry. The project will also address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of information being provided by a monitoring system, and indication when a monitoring system is not operating normally.

Analysis

The *analysis* component of the Real-time situational awareness concept is described by the definition of Real-time Assessment, which is pending FERC approval along with the proposed TOP and IRO standards. The proposed definition is as follows:

> ***Real-time Assessment*** *- An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

Requirements for performing Real-time Assessments are contained in proposed IRO-008-2 and TOP-001-3:

> ***Proposed IRO-008-2***
> *R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.*
>
> ***Proposed TOP-001-3***
> *R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.*

The SAR DT believes the proposed definition of Real-time Assessment and the requirements in proposed IRO-008-2 and TOP-001-3 provide RCs and TOPs with flexibility to determine which real-time tools, such as State Estimator, Contingency Analysis, and Stability Applications, are necessary to meet their real-time reliability functions. Consequently, prescriptive requirements for real-time tools are not in scope for Project 2009-02.

The project will address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of the analysis used in Real-time Assessments.

Table 2: Project 2009-02 Reliability Objectives

	Monitoring Capabilities	Analysis Capabilities
Quality	Provide operator with indication of information quality and procedures to address data quality issues.	Provide operator with indication of information quality and procedures to address analysis quality issues.
Availability	Provide operator with notification any time monitoring system is not operating normally.	N/A

Appendix – Report Recommendations

The table below contains recommendations for improved real-time situational awareness capabilities found in relevant industry reports and how these recommendations have been addressed, if applicable. If recommendations have not been addressed fully, the table includes a description of how they should be addressed in Project 2009-02. The following industry reports are considered here[9]:

- 2003 Blackout Final Report
- 2011 Southwest Outage Report
- Real-time Tools Best Practices Task Force

Report Recommendation Mapping	
Report Recommendation	**Applicable Standard(s)**
2003 Blackout Final Report	
Recommendation 1-21, 23-46	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators. Operating Committee to evaluate the real-time operating tools necessary for reliability operation and reliability coordination, including backup capabilities. The committee's report is to address both minimum acceptable capabilities for critical reliability functions and a guide to best practices.	The Operating Committee established the RTBPTF to evaluate real-time operating tools and make recommendations for proposed standards. Project 2009-02 should consider these recommendations as discussed below.
2011 Southwest Outage Report	
Recommendation 1-10, 13-26	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 11 - TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Project 2014-03 developed the proposed definition of Real-time Assessment and proposed TOP-003-3 Requirement R1 which describes the requirements for a data specification that will provide all of the data that a TOP needs in order to fulfill its reliability function. Together, these address capabilities and required data TOPs must have to ensure adequate situational awareness. **Real-time Assessment -** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, Part 1.1**:

[9] *All industry reports are available on the 2009-02 Project Page: http://www.nerc.com/pa/Stand/Pages/Project-2009-02-Real-time-Reliability-Monitoring-and-Analysis-Capabilities.aspx.*

	A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.
Recommendation 12 - TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2014-03 developed a requirement for the performance of a Real-time Assessment for Transmission Operators. Standards developed in Project 2009-02 will address the adequacy of tools as described in this recommendation. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
Recommendation 27 - TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	Proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA) developed in Project 2014-03 specify that identified phase angle limitations must be considered and deal with applying phase angle information. Proposed TOP-002 Requirement R2 specifies that TOPs must have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified in the OPA. Data specification requirements in approved IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3 provide a means for RCs and TOPs to obtain phase angle information. **Proposed Definition: Operational Planning Analysis:** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment:** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System

	Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
RTBPTF Report	
S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • **Alarm Tools** • **Telemetry Data Systems** • **Network Topology Processor** • **State Estimator** • **Contingency Analysis**	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. However, prescription of specific tools is not in scope.
S2 - Compile and maintain a list of all bulk electric system elements within RC's area of responsibility.	Not in scope. Reliability objective is accomplished through monitoring and analysis requirements as discussed below.
S3 - Add new requirements and measures pertaining to RC monitoring of the bulk electric system.	Addressed in IRO standards (current and proposed). **IRO-002-2** R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. **IRO-003-2** R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. **Proposed IRO-002-4** R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
S4 - Develop data-exchange standards.	Addressed in proposed TOP-001-3 and IRO-002-4. **Proposed TOP-001-3** R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area. R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it

	needs data from in order to maintain reliability in its Balancing Authority Area. **Proposed IRO-002-4** R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
S5 - Develop data-availability standards and a process for trouble resolution and escalation.	Data availability and trouble resolution is addressed in IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S6 - Develop a new weather data requirement related to situational awareness and real-time operational capabilities.	EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard.
S7 - Specify and measure minimum availability for alarm tools.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the

	RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function). Availability notification for analysis tools is addressed in IRO-008-1, and proposed IRO-008-2 proposed TOP-001-3 from Project 2014-30. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
S8 - Specify and measure minimum availability for network topology processor.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S9 - Establish a uniform formal process to determine the "wide area view boundary" and show boundary data/results.	Wide-area is now a defined term. Recommendation has been addressed.
S10 - Develop compliance measures for verification of the usage of "wide-area overview display" visualization tools.	IRO standards revisions have addressed compliance measures.
S11 - Specify and measure minimum availability for state estimator, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S12 - Specify and measure minimum availability for contingency analysis, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S13 - Specify criteria and develop measures for defining contingencies.	Not in scope; Addressed in approved TPL and FAC standards.
S14 - Perform one-hour-ahead power-flow simulations to assess approaching SOL and IROL violations and corresponding measures.	Requirements for assessing pre- and post-contingency system conditions are addressed in Real-time Assessment (RTA) and Operational Planning Analysis (OPA) definitions. Requirements for performing RTA and OPA are contained in

	proposed TOP-001-3, TOP-002-4, IRO-008-2, and approved IRO-008-1. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations.

	(Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
S15 - Provide real-time awareness of load-shed capability to address potential or actual IROL violations.	Addressed in proposed EOP-011-1, approved IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including:

	2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time

	monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S16 - Require BAs to monitor contingency reserves and calculate contingency reserves at a minimum periodicity of 10 seconds.	BA responsibilities for managing Contingency Reserve are addressed in the approved BAL-002-1 standard which is under revision in Project 2010-014. 1. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules.
S17 - Revise the current-day operations requirements to delineate specific, independent requirements for monitoring operating and reactive reserves.	Addressed in VAR-001-4, BAL-002, and proposed IRO-002-4 and TOP-001-3. **VAR-001-4** R4. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules. **Proposed IRO-002-4** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3** R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.
S18 - Establish document plans and procedures for conservative operations.	Addressed in proposed EOP-011-1 Requirement R1. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating

	Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions.

S19 - Restore system operations from an unknown operating state to proven and reliable limits within 30 minutes.	Addressed in proposed TOP-001-3, and IRO-008-2 and the proposed definitions for Operational Planning Analysis and Real-time Assessment. **Proposed TOP-001-3** R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R14. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be

	provided through internal systems or through third-party services.)
S20 - Develop formal operating guides (mitigation plans) and measures for each IROL and any SOL or other conditions having a potential impact on reliability.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S21 - Review and update operating guides (mitigation plans) when day-ahead or current day studies indicate the potential need to implement an operating guide.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for

	the next-day provided by its Transmission Operators and Balancing Authorities.
S22 - Provide temporary operating guides (mitigation plans) with control actions for situations that could affect reliability but that have not been identified previously.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S23 - Develop joint operating guides (mitigation plans) for situations that could require more than one RC or more than one TOP to execute actions.	Addressed in IRO-014-2, proposed IRO-014-3 and proposed IRO-008-2. **IRO-014-2** R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: ... **Proposed IRO-014-3** R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: ... **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as

	a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S24 - Develop a formal procedure to document the processes for developing, reviewing, and updating operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S25 - Incorporate verifiable and traceable elements such as titles, document numbers, revision numbers, revision history, approvals, and dates when modifying operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S26 - Write operating guides (mitigation plans) in clear, unambiguous language, leaving nothing to interpretation.	Not in scope. This is administrative in nature.
S27 - State the specific purpose of existence for each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S28 - Summarize the specific situation assessment and address the method of performing the assessment in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S29 - Identify all appropriate preventive and remedial control actions in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S30 - Develop criteria in operating guides (mitigation plans) to support decisions regarding whether a specific control action should be taken.	Not in scope. This is administrative in nature.
S31 - Incorporate on-line tools that utilize on-line data when operating guides (mitigation plans) require calculations.	Not in scope. Recommendation is appropriate as a guideline rather than a reliability standard.
S32 - Make operating guides (mitigation plans) readily available via a quick-access method such as Web-based help, EMS display notes, or on-line help systems.	Not in scope. This is administrative in nature.
S33 - Provide the location, real-time status, and MWs of load available to be shed.	Addressed in proposed EOP-011-1 Requirement R1 Part 1.2.5 and proposed TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and

	1.2.6. Reliability impacts of extreme weather conditions. **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ...
S34 - Establish documented procedures for the reassessment and re-posturing of the system following an event.	Addressed in proposed TOP-002-4 and IRO-008-2, and approved EOP-005-2 and EOP-006-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ...

	EOP-006-2 R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S35 - Provide information to operators to maintain awareness of the availability and capability of the blackstart generators and transmission restoration paths.	Addressed in approved IRO-010-1, proposed TOP-003-3, proposed IRO-010-2, approved EOP-005-2, and approved EOP-006-2. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... R1.6. Reporting requirements for the entities within the Reliability Coordinator Area during a restoration event. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses,

	Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ... R1.4. Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit. ... R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **EOP-006-2** R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S36 - Plan and coordinate scheduled outages of blackstart generators and transmission restoration paths.	Addressed in approved EOP-005-2 and proposed IRO-017-1 - Outage Coordination. **EOP-005-2** R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **Proposed IRO-017-1** R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation

	and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: ...
S37 - Maintain a Critical Equipment Monitoring Document to identify tools and procedures for monitoring critical equipment.	Not in scope. This is administrative in nature.
S38 - Maintain event logs pertaining to critical equipment status for a period of one year.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S39 - Maintain a Critical Equipment Maintenance and Testing Document identifying tools and procedures for maintenance, modification, and testing of critical equipment.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S40 - Monitor and maintain awareness of critical equipment status to ensure that lack of availability of critical equipment does not impair reliable operation.	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and analysis capabilities are not available (i.e., not performing their intended function).

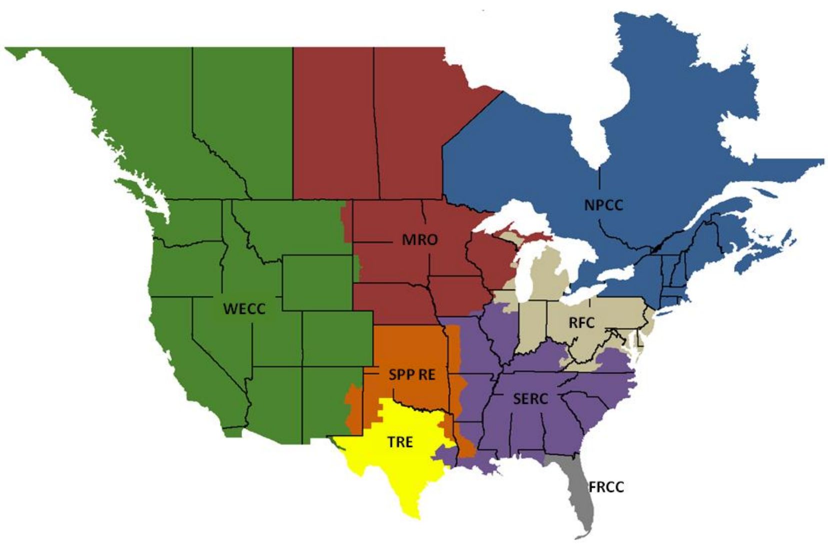
Table of Contents

Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk-Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RFC	Reliability*First* Corporation
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electric Coordinating Council

Introduction

In April 2015, the Standards Committee appointed a new Standards Authorization Request (SAR) Drafting Team (SAR DT) for Project 2009-02 Real-time Monitoring and Analysis Capabilities. This project originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). Several new Reliability Standards and defined terms have been approved or filed for approval in the years since Project 2009-02 was initiated, including the standards developed in Project 2014-03 Revisions to TOP and IRO Standards. As a result, many of the original issues identified by the RTBPTF for Project 2009-02 have been addressed. In addition, relevant observations and recommendations have emerged from more recent events on the Bulk Electric System (BES) and operating practices have evolved over time. The SAR DT has reviewed previous work done in Project 2009-02, new standards and defined terms, relevant industry report findings and recommendations including those contained in the 2011 Southwest Outage report, and industry observations and practices relevant to real-time situational awareness to assist in developing a comprehensive SAR.

This white paper describes the SAR DT's approach to developing the SAR and discusses the technical basis for developing Reliability Standards in Project 2009-02. This white paper and the associated SAR together are intended to fully describe the project purpose, industry need, and project scope.

Chapter 1 – Background

FERC Order No. 693[1] highlights the need for a minimum set of capabilities to be available to assist operators in making real-time decisions. The work done by the RTBPTF, which was formed by NERC in response to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, became the basis for the Real-time Monitoring and Analysis Capabilities (RTMAC) standards development project when it was initiated in 2009. Although Reliability Standards affecting the operating reliability of the Bulk Electric System (BES) have improved significantly over the years since first becoming mandatory in 2007, a reliability issue has persisted in the area of real-time situational awareness capabilities as highlighted in BES event reports and an independent review of the NERC Reliability Standards. A review of industry reports and recommendations pertaining to real-time monitoring and analysis capabilities is provided in this document and in the Appendix. These recommendations, along with the FERC Order No. 693 directives, describe the industry need for the current RTMAC standards project.

BES Event Reports

Project 2009-02, like some other Reliability Standards projects, is informed by the lessons learned from past outages. The two significant outages discussed below highlight issues in real-time situational awareness, among other reliability concerns. Many Communications (COM), Transmission Operations (TOP), and Interconnection Reliability Operations (IRO) standards have addressed event report recommendations to improve the way the BES is planned and operated. The scope of Project 2009-02 is intended to include remaining recommendations from the 2003 Blackout Report and the 2011 Southwest Outage Report that pertain to real-time monitoring and analysis capabilities.

2003 Blackout Report

The largest blackout in history to affect North America began on the afternoon of August 14, 2003 and disrupted over 61,800 Megawatts of electric load in the Northeastern U.S. and the Canadian province of Ontario. Severe impacts to electrical service lasted for nearly one week and an estimated 50 million people were affected. A comprehensive investigation conducted by U.S. and Canadian government and industry leaders identified a host of principal and contributing causes, including:

- Failure to maintain adequate reactive power support,
- Failure to ensure operation within secure limits,
- Inadequate vegetation management,
- Inadequate operator training,
- Failure to identify emergency conditions and communicate that status to neighboring systems, and
- Inadequate regional-scale visibility over the Bulk-Power System (BPS).

Among other causes, the 2003 blackout was linked to dysfunction of SCADA/EMS systems. Additionally, investigators pointed out that several deficiencies leading to the 2003 blackout were also identified weaknesses in previous outages, indicating the need for more effective response. Previous post-event reports included recommendations aimed at improving capabilities for visualizing changes to facilities within the system, and for visualizing changes to facilities in neighboring systems that could have a potential impact. A recurring recommendation also focused on providing capabilities for operators to evaluate courses of action. These

[1] *Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, 72 Fed. Reg. 16416 at P 1660 (Apr. 4, 2007), FERC Stats. And Regs.¶ 31,242, *order on reh'g,* Order No. 693-A, 120 FERC ¶ 61,053 (2007) (Order No. 693).

observations led to the recommendation in the final report of the 2003 blackout for NERC to **evaluate and adopt better real-time tools for operators and reliability coordinators.**[2]

In response, the NERC Operating Committee organized the RTBPTF to study the real-time situational awareness practices in use within the electric power industry and make recommendations concerning the establishment of minimum capabilities necessary for reliable operations. The RTBPTF report *Real-time Tools Survey Analysis and Recommendations,*[3] completed in 2008*,* is the result of extensive information gathering and analysis and includes recommendations for new or enhanced Reliability Standards, operating guides, and areas for further analysis. This report became a basis for initiating the Real-time Monitoring and Analysis Capabilities project in 2009.

Although exhaustive and comprehensive, some of the RTBPTF recommendations go beyond the scope of situational awareness monitoring and capabilities. In addition, many other recommendations have been addressed in other subsequent standards projects. The appendix provides a description of RTBPTF report recommendations and the SAR DT's determination of applicability within the scope of Project 2009-02.

An early Concept White Paper describing potential performance, availability, quality, and maintenance parameters based on the RTBPTF Report was developed in 2011. The SAR DT reviewed the white paper and confirmed that, due to significant changes to Reliability Standards and operating practices since it was drafted, the 2011 Concept White Paper is no longer relevant to the current effort in Project 2009-02.

2011 Southwest Outage Report

Like the 2003 blackout in the northeast, the blackout that occurred in the southwest in September 2011 was partly due to, or exacerbated by, inadequate real-time situational awareness. On the afternoon of September 8, 2011, the loss of a single 500 kV line led to widespread cascading outages affecting 2.7 million customers in Arizona, Southern California, and Baja, Mexico. Inadequate operations planning was a significant factor in the failure to maintain a secure N-1 state. However, the report also highlighted several concerns with entities and their ability to monitor, identify, and plan for the next most critical contingency in real-time.[4]

Project 2014-03 - Revisions to TOP and IRO Standards addressed many of the recommendations contained in the 2011 Southwest Outage Report related to operations planning and real-time situational awareness. A complete description is provided in the Southwest Outage Report mapping document for Project 2014-03.[5] Revised definitions and performance requirements for Real-time Assessments and Operational Planning Analysis and proposed requirements for developing and implementing Operating Plans to prevent and mitigate operating limit exceedances address most of the real-time situational awareness recommendations from the report. However some recommendations contain aspects pertaining to real-time capabilities that should be considered in Project 2009-02, as described in the appendix. Accordingly, Project 2009-02 will develop requirements to address remaining recommendations as described in the following chapter.

FERC Directives

In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to operators.[6] FERC indicated that the intent of the directive is to ensure operating entities have adequate tools to perform their real-time reliability functions.[7]

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*
- P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.*
- P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.*

Independent Experts Review Project (IERP) Report

In 2013, NERC retained a team of five industry experts to assess the quality of the enforceable body of standards and make recommendations for improvements that could be implemented by NERC and the industry.[8] Among the recommendations made by the panel of experts was the identification of potential risks to reliability that may not be adequately addressed in Reliability Standards. The report recommended resuming development of the Real-time Monitoring and Analysis Capabilities standards project.

Proposed TOP and IRO Standards

Since Project 2009-02 was initiated in 2009, many standards and definitions have been revised or developed that address real-time situational awareness issues. In particular, the revised TOP and IRO standards in Project 2014-03, which are pending regulatory approval, include key provisions for real-time situational awareness and operations planning. In reviewing the RTBPTF report recommendations for applicability in the current Project 2009-02 effort, the SAR DT considered the Project 2014-03 standards as noted in the Appendix.

The proposed TOP and IRO standards in Project 2014-03 provide requirements for performing monitoring and analysis through the definition of Real-time Assessment, Operational Planning Analysis, and the relevant requirements. Accordingly, additional requirements to perform monitoring or analysis will not be included in the scope for Project 2009-02. Furthermore, requirements for data exchange to support real-time monitoring and analysis will not be included in scope for Project 2009-02 because they are addressed through data specification requirements in IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3.

---

[6] Order No. 693 at P 905 (approving IRO-002-1 and directing modifications) and P 1665 (approving TOP-006-1 and directing modifications.

[7] Additionally, in approving VAR-001-1 - Voltage and Reactive Control, the Commission directed NERC to develop modifications to the standard to require periodic performance of voltage stability analysis to assist in real-time operations. The commission clarified that this could be accomplished through online tools where available, or offline simulation tools.

- §1875: *...[w]e direct the ERO, through its Reliability Standards development process, ...to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.*

VAR-001 was revised in the Project 2013-04, however the revised standard did not include a requirement for periodic performance of voltage stability analysis because voltage stability analysis is performed per SOL Methodology developed under FAC standards.

[8] See The Standards Independent Experts Review Project report. Available at www.nerc.com /pa/Stand/_layouts/xlviewer.aspx?id=/pa/Stand/Documents/P81_and%20IERP_Recommendations_for_Retirement_010815.xlsx.

Technical Conference

NERC and the SAR DT held a Technical Conference in Atlanta on June 4, 2015, to obtain industry input on reliability issues to be addressed in the proposed project. Participant subject matter experts representing a diverse mix of regional and functional entities shared their perspectives on the use of real-time situational awareness capabilities for reliable operations. There was consensus that many RTBPTF recommendations have been addressed in current or proposed TOP and IRO standards. However, Technical Conference participants agreed that issues identified by the RTBPTF pertaining to availability and information quality of real-time monitoring and analysis capabilities were still relevant.

Chapter 2 – Project Scope

The SAR DT has reviewed all recommendations from the RTBPTF and relevant recommendations from event reports, along with the existing body of standards, to identify remaining issues that should be in the scope for Project 2009-02. Table 1 below shows the resulting recommendations to be addressed. Additionally, the project will address outstanding FERC directives discussed in the preceding chapter.

Table 1: Report Recommendations to Address in Project 2009-02

Source	Recommendation	Discussion	Applicable Entity
2003 Blackout Report	Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators.	Project 2009-02 will develop requirements for real-time reliability monitoring and analysis capabilities to address issues not already addressed in other Reliability Standards. RTBPTF report recommendations will be considered in development.	RC, TOP, BA
2011 Southwest Outage Report	Recommendation 12 - [entities] should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2009-02 will develop requirements to improve the adequacy and operation of real-time monitoring and analysis capabilities. Requirements addressing the frequency that real-time tools run are contained in other standards and are not in the scope of this project.	RC, TOP, BA
RTBPTF Report	S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • Alarm Tools • Telemetry Data Systems • Network Topology Processor • State Estimator • Contingency Analysis	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. Prescription of specific tools is not in scope. Project approach is discussed below.	RC, TOP, BA as discussed below
RTBPTF Report	S7 - S8, S11-S12, S40 - Availability of various monitoring and analysis capability processes	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring ~~and analysis~~ capabilities are not available (i.e., not performing their intended function).	RC, TOP, BA

Project Purpose and Approach

Project 2009-02 will develop requirements for real-time monitoring and analysis capabilities used by operators in support of reliable System operations. Functional requirements for performing *monitoring* and *analysis* tasks are well established in Reliability Standards as discussed throughout this white paper. However, reliability could be improved by:

- Developing a common understanding of *monitoring* as it applies to real-time situational awareness of the BES,
- Providing operators with indication(s) of the quality of information being provided by *monitoring* and *analysis* capabilities, and

- Providing operators with notification(s) during unplanned loss of *monitoring* ~~and *analysis*~~ capabilities.

Project 2009-02 will develop requirements and definition(s), as needed, to accomplish these reliability objectives as discussed.

Real-time Situational Awareness Concept

From the RTBPTF Report:

> *Situational awareness, as RTBPTF understands it, means ensuring that accurate information on current system conditions, including the likely effects of future contingencies, is continuously available in a form that allows operators to quickly grasp and fully understand actual operating conditions and take corrective action when necessary to maintain or restore reliable operations.*

The Project 2009-02 SAR DT believes that situational awareness encompasses two broad capabilities: monitoring and analysis. To be effective in supporting real-time situational awareness, monitoring and analysis must:

- Be performed with sufficient frequency to allow operators to understand operating conditions and take corrective actions when necessary,
- Provide awareness of information quality to allow operators to assess the accuracy of information being received on system conditions and take corrective actions when necessary, and
- Indicate when monitoring or analysis processes are not operating normally or are unavailable in order to provide operator awareness of the accuracy of the information being provided.

Project 2009-02 will develop new requirements and definition(s), as needed, that support this concept of situational awareness without duplicating aspects that are already addressed in the existing and proposed body of Reliability Standards. As discussed in the preceding chapter, requirements for the Reliability Coordinator (RC), Transmission Operator (TOP), and Balancing Authority (BA) to perform monitoring and analysis are covered under existing and proposed TOP and IRO standards. Therefore, Project 2009-02 will focus on developing requirements to address information quality and operator awareness of real-time monitoring and analysis capabilities. Table 2 shows reliability objectives that should be addressed in requirements for this project.

Monitoring

Monitoring BES facilities in real-time is a primary function of the RCs, TOPs, and BAs and is addressed in existing and proposed TOP and IRO standards. For RCs, proposed IRO-002-4 states:

> *R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.*

For TOPs and BAs, proposed TOP-001-3 states:

> *R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:*
>
> > *10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and*
> >
> > *10.2. Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.*

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

The SAR DT understands *monitoring* capabilities may include both alarming and information visualization. Project 2009-02 will aim to develop a consistent understanding of *monitoring* within the industry. The project will also address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of information being provided by a monitoring system, and indication when a monitoring system is not operating normally.

Analysis

The *analysis* component of the Real-time situational awareness concept is described by the definition of Real-time Assessment, which is pending FERC approval along with the proposed TOP and IRO standards. The proposed definition is as follows:

Real-time Assessment *- An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

Requirements for performing Real-time Assessments are contained in proposed IRO-008-2 and TOP-001-3:

Proposed IRO-008-2
R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Proposed TOP-001-3
R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

The SAR DT believes the proposed definition of Real-time Assessment and the requirements in proposed IRO-008-2 and TOP-001-3 provide RCs and TOPs with flexibility to determine which real-time tools, such as State Estimator, Contingency Analysis, and Stability Applications, are necessary to meet their real-time reliability functions. Consequently, prescriptive requirements for real-time tools are not in scope for Project 2009-02.

The project will address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of the analysis ~~provided by~~used in ~~a~~ Real-time Assessments~~ and notification when Real-time Assessment capabilities are not available~~.

Table 2: Project 2009-02 Reliability Objectives		
	Monitoring Capabilities	**Analysis Capabilities**
Quality	Provide operator with indication of information quality and procedures to address data quality issues.	Provide operator with indication of information quality and procedures to address analysis quality issues.

Availability	Provide operator with notification any time monitoring system is not operating normally.	~~Provide operator with notification any time Real-time Assessment capabilities are not available.~~ N/A

Appendix – Report Recommendations

The table below contains recommendations for improved real-time situational awareness capabilities found in relevant industry reports and how these recommendations have been addressed, if applicable. If recommendations have not been addressed fully, the table includes a description of how they should be addressed in Project 2009-02. The following industry reports are considered here[9]:

- 2003 Blackout Final Report
- 2011 Southwest Outage Report
- Real-time Tools Best Practices Task Force

Report Recommendation Mapping	
Report Recommendation	**Applicable Standard(s)**
2003 Blackout Final Report	
Recommendation 1-21, 23-46	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators. Operating Committee to evaluate the real-time operating tools necessary for reliability operation and reliability coordination, including backup capabilities. The committee's report is to address both minimum acceptable capabilities for critical reliability functions and a guide to best practices.	The Operating Committee established the RTBPTF to evaluate real-time operating tools and make recommendations for proposed standards. Project 2009-02 should consider these recommendations as discussed below.
2011 Southwest Outage Report	
Recommendation 1-10, 13-26	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 11 - TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Project 2014-03 developed the proposed definition of Real-time Assessment and proposed TOP-003-3 Requirement R1 which describes the requirements for a data specification that will provide all of the data that a TOP needs in order to fulfill its reliability function. Together, these address capabilities and required data TOPs must have to ensure adequate situational awareness. **Real-time Assessment -** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, Part 1.1**:

[9] *All industry reports are available on the 2009-02 Project Page: http://www.nerc.com/pa/Stand/Pages/Project-2009-02-Real-time-Reliability-Monitoring-and-Analysis-Capabilities.aspx.*

	A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.
Recommendation 12 - TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2014-03 developed a requirement for the performance of a Real-time Assessment for Transmission Operators. Standards developed in Project 2009-02 will address the adequacy of tools as described in this recommendation. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
Recommendation 27 - TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	Proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA) developed in Project 2014-03 specify that identified phase angle limitations must be considered and deal with applying phase angle information. Proposed TOP-002 Requirement R2 specifies that TOPs must have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified in the OPA. Data specification requirements in approved IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3 provide a means for RCs and TOPs to obtain phase angle information. **Proposed Definition: Operational Planning Analysis:** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment:** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System

	Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
RTBPTF Report	
S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • **Alarm Tools** • **Telemetry Data Systems** • **Network Topology Processor** • **State Estimator** • **Contingency Analysis**	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. However, prescription of specific tools is not in scope.
S2 - Compile and maintain a list of all bulk electric system elements within RC's area of responsibility.	Not in scope. Reliability objective is accomplished through monitoring and analysis requirements as discussed below.
S3 - Add new requirements and measures pertaining to RC monitoring of the bulk electric system.	~~Addresses~~ Addressed in IRO standards (current and proposed). **IRO-002-2** R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. **IRO-003-2** R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. **Proposed IRO-002-4** R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
S4 - Develop data-exchange standards.	Addressed in proposed TOP-001-3 and IRO-002-4. **Proposed TOP-001-3** R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area.

	R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Balancing Authority Area. **Proposed IRO-002-4** R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
S5 - Develop data-availability standards and a process for trouble resolution and escalation.	Data availability and trouble resolution is addressed in IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S6 - Develop a new weather data requirement related to situational awareness and real-time operational capabilities.	EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard.
S7 - Specify and measure minimum availability for alarm tools.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and

	alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and~~,~~ alarming~~, and analysis~~ tools are not available (i.e. not performing their intended function). Availability notification for analysis tools is addressed in IRO-008-1, and proposed IRO-008-2 proposed TOP-001-3 from Project 2014-30. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
S8 - Specify and measure minimum availability for network topology processor.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and ~~,~~ alarming~~, and analysis~~ tools are not available (i.e. not performing their intended function).
S9 - Establish a uniform formal process to determine the “wide area view boundary” and show boundary data/results.	Wide-area is now a defined term. Recommendation has been addressed.
S10 - Develop compliance measures for verification of the usage of “wide-area overview display” visualization tools.	IRO standards revisions have addressed compliance measures.
S11 - Specify and measure minimum availability for state estimator, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and~~,~~ alarming~~, and analysis~~ tools are not available (i.e. not performing their intended function).
S12 - Specify and measure minimum availability for contingency analysis, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation to provide operator awareness when key monitoring~~,~~ and alarming~~, and analysis~~ tools are not available (i.e. not performing their intended function).
S13 - Specify criteria and develop measures for defining contingencies.	Not in scope; Addressed in approved TPL and FAC standards.

S14 - Perform one-hour-ahead power-flow simulations to assess approaching SOL and IROL violations and corresponding measures.	Requirements for assessing pre- and post-contingency system conditions are addressed in Real-time Assessment (RTA) and Operational Planning Analysis (OPA) definitions. Requirements for performing RTA and OPA are contained in proposed TOP-001-3, TOP-002-4, IRO-008-2, and approved IRO-008-1. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and

	Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
S15 - Provide real-time awareness of load-shed capability to address potential or actual IROL violations.	Addressed in proposed EOP-011-1, approved IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s);

	2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to

	perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S16 - Require BAs to monitor contingency reserves and calculate contingency reserves at a minimum periodicity of 10 seconds.	BA responsibilities for managing Contingency Reserve are addressed in the approved BAL-002-1 standard which is under revision in Project 2010-014. 1. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules.
S17 - Revise the current-day operations requirements to delineate specific, independent requirements for monitoring operating and reactive reserves.	Addressed in VAR-001-4, BAL-002, and proposed IRO-002-4 and TOP-001-3. **VAR-001-4** R4. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules. **Proposed IRO-002-4** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3** R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.
S18 - Establish document plans and procedures for conservative operations.	Addressed in proposed EOP-011-1 Requirement R1. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-

	reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions.

S19 - Restore system operations from an unknown operating state to proven and reliable limits within 30 minutes.	Addressed in proposed TOP-001-3, and IRO-008-2 and the proposed definitions for Operational Planning Analysis and Real-time Assessment. **Proposed TOP-001-3** R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R14. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be

	provided through internal systems or through third-party services.)
S20 - Develop formal operating guides (mitigation plans) and measures for each IROL and any SOL or other conditions having a potential impact on reliability.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S21 - Review and update operating guides (mitigation plans) **when day-ahead or current day studies indicate the potential need to implement an operating guide.**	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for

	the next-day provided by its Transmission Operators and Balancing Authorities.
S22 - Provide temporary operating guides (mitigation plans) with control actions for situations that could affect reliability but that have not been identified previously.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S23 - Develop joint operating guides (mitigation plans) for situations that could require more than one RC or more than one TOP to execute actions.	Addressed in IRO-014-2, proposed IRO-014-3 and proposed IRO-008-2. **IRO-014-2** R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: ... **Proposed IRO-014-3** R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: ... **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as

	a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S24 - Develop a formal procedure to document the processes for developing, reviewing, and updating operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S25 - Incorporate verifiable and traceable elements such as titles, document numbers, revision numbers, revision history, approvals, and dates when modifying operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S26 - Write operating guides (mitigation plans) in clear, unambiguous language, leaving nothing to interpretation.	Not in scope. This is administrative in nature.
S27 - State the specific purpose of existence for each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S28 - Summarize the specific situation assessment and address the method of performing the assessment in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S29 - Identify all appropriate preventive and remedial control actions in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S30 - Develop criteria in operating guides (mitigation plans) to support decisions regarding whether a specific control action should be taken.	Not in scope. This is administrative in nature.
S31 - Incorporate on-line tools that utilize on-line data when operating guides (mitigation plans) require calculations.	Not in scope. Recommendation is appropriate as a guideline rather than a reliability standard.
S32 - Make operating guides (mitigation plans) readily available via a quick-access method such as Web-based help, EMS display notes, or on-line help systems.	Not in scope. This is administrative in nature.
S33 - Provide the location, real-time status, and MWs of load available to be shed.	Addressed in proposed EOP-011-1 Requirement R1 Part 1.2.5 and proposed TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and

	1.2.6. Reliability impacts of extreme weather conditions. **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ...
S34 - Establish documented procedures for the reassessment and re-posturing of the system following an event.	Addressed in proposed TOP-002-4 and IRO-008-2, and approved EOP-005-2 and EOP-006-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ...

	EOP-006-2 R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S35 - Provide information to operators to maintain awareness of the availability and capability of the blackstart generators and transmission restoration paths.	Addressed in approved IRO-010-1, proposed TOP-003-3, proposed IRO-010-2, approved EOP-005-2, and approved EOP-006-2. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... R1.6. Reporting requirements for the entities within the Reliability Coordinator Area during a restoration event. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses,

	Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ... R1.4. Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit. ... R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **EOP-006-2** R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S36 - Plan and coordinate scheduled outages of blackstart generators and transmission restoration paths.	Addressed in approved EOP-005-2 and proposed IRO-017-1 - Outage Coordination. **EOP-005-2** R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **Proposed IRO-017-1** R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation

	and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: ...
S37 - Maintain a Critical Equipment Monitoring Document to identify tools and procedures for monitoring critical equipment.	Not in scope. This is administrative in nature.
S38 - Maintain event logs pertaining to critical equipment status for a period of one year.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be “installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools”. Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S39 - Maintain a Critical Equipment Maintenance and Testing Document identifying tools and procedures for maintenance, modification, and testing of critical equipment.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be “installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools”. Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S40 - Monitor and maintain awareness of critical equipment status to ensure that lack of availability of critical equipment does not impair reliable operation.	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and analysis capabilities are not available (i.e., not performing their intended function).

Violation Risk Factor and Violation Severity Level Justifications

Project 2009-02 Real-time Monitoring and Analysis Capabilities

This document provides the Standard Drafting Team's (SDT) justification for assignment of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for each requirement in Project 2009-02.

Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk

requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities

- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of VRFs corresponding to requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per-violation per-day basis is the “default” for penalty calculations.

VRF Justification

The requirements in IRO-018-1 and TOP-010-1 were developed to address certain issues related to the Real-time monitoring and analysis capabilities used by operators of the BES. IRO-018-1 contains five requirements applicable to Reliability Coordinators (RCs), while TOP-010-1 contains seven analogous requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs). A Medium VRF is proposed for all requirements in both standards according to the guidelines as explained below.

VRF Justifications – IRO-018-1 (R1-R5) and TOP-010-1 (R1-R7)	
Proposed VRF	**Medium**
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report. N/A. The requirements are not directly connected to conclusions from the 2003 Blackout, but rather address specific recommendations from NERC Technical Committees.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The requirements have no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. These are new requirements. The VRFs in IRO-018-1 are consistent with those contained in TOP-010-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. A VRF of Medium is consistent with the NERC VRF definition. The requirements in IRO-018-1 and TOP-010-1 address issues related to the quality and availability of monitoring and analysis capabilities used by RCs, TOPs, and BAs in maintaining reliable operations. Violation of any of these requirements could directly affect the ability to effectively monitor and control the Bulk Electric System. However, violation of any of these requirements is unlikely to lead to Bulk Electric System instability, separation, or cascading failures. Therefore, a VRF of Medium is appropriate.

VRF Justifications – IRO-018-1 (R1-R5) and TOP-010-1 (R1-R7)	
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. Each requirement contains one objective, therefore a single VRF is assigned to each requirement.

VSL Justification

Proposed VSLs – IRO-018-1, R1			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Reliability Coordinator's Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments did not include one of the elements listed in Part 1.1 and Part 1.2.	The Reliability Coordinator's Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments did not include any of the elements listed in Part 1.1 and Part 1.2; OR The Reliability Coordinator did not implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to

			perform its Real-time monitoring and Real-time Assessments.

VSL Justifications – IRO-018-1, R1	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The requirement may be described by elements or quantities to evaluate degrees of compliance. Two VSLs are specified for a graduated scale.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary.

Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Proposed VSLs – IRO-018-1, R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator did not provide its System Operators with indication(s) of the quality of Real-time data used to perform its Real-time monitoring and Real-time Assessments.

VSL Justifications – IRO-018-1, R2	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The requirement does not have elements or quantities to evaluate degrees of compliance. A VSL of Severe is assigned for non-compliance.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is binary and assigned a Severe VSL. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSL is worded consistently with the corresponding requirement.

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Proposed VSLs – IRO-018-1, R3			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Reliability Coordinator's Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments did not include one of the elements listed in Part 3.1 and Part 3.2.	The Reliability Coordinator's Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments did not include any of the elements listed in Part 3.1 and Part 3.2.; OR The Reliability Coordinator did not implement an Operating Process or Operating Procedure

			to maintain the quality of any analysis used in its Real-time Assessments.

VSL Justifications – IRO-018-1, R3	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The requirement may be described by elements or quantities to evaluate degrees of compliance. Two VSLs are specified for a graduated scale.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties. Guideline 2a: The proposed VSL is not binary.

Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Proposed VSLs – IRO-018-1, R4			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator did not provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments.

VSL Justifications – IRO-018-1, R4	
NERC VSL Guidelines	Consistent with NERC's VSL Guidelines. The requirement does not have elements or quantities to evaluate degrees of compliance. A VSL of Severe is assigned for non-compliance.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is no prior compliance obligation related to the subject of this standard.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	The proposed VSL is written to ensure uniformity and consistency in the determination of penalties.

Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The proposed VSL is binary and assigned a Severe VSL. Guideline 2b: The proposed VSL does not use ambiguous terms, supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Order No. 693 Citation	Directive/Guidance	Resolution
P 905-906	Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.	Proposed IRO-018-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the Reliability Coordinator's (RC) monitoring and analysis capabilities. The monitoring and analysis capabilities required by proposed IRO-018-1 and other IRO standards discussed below ensure RCs have the capabilities to maintain Real-time situational awareness. **Monitoring Capabilities** Requirements R1 and R2 address the quality of the Real-time data needed by the RC to perform its monitoring and Real-time Assessments. Each RC is required to implement a documented procedure for addressing Real-time data quality issues, including invalid or time-late data, and must provide System Operators with information to indicate the quality of data received. Requirement R5 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring RCs to use an independent alarm process monitor. Requirements for the RC to perform Real-time monitoring are specified in currently-enforceable IRO-002-2, IRO-003-2, and proposed IRO-002-4 from Project 2014-03. ***Proposed IRO-018-1*** **R1.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to: **1.1.1.** Data outside of a prescribed data range; **1.1.2.** Analog data not updated within a predetermined time period; **1.1.3.** Data entered manually to override telemetered information; and **1.1.4.** Data otherwise identified as invalid or suspect. **1.2.** Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data. **R2.** Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. **R5.** Each Reliability Coordinator shall utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***Currently-enforceable IRO-002-2*** **R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be

Order No. 693 Citation	Directive/Guidance	Resolution
		critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. ***Currently-enforceable IRO-003-2*** **R1.** Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. ***Proposed IRO-002-4 (pending regulatory approval)*** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **<u>Analysis Capabilities</u>** Requirements R3 and R4 address the quality of the analysis used by the RC to perform its Real-time Assessments. Each RC is required to implement a documented procedure to maintain the quality of the analysis used in its Real-time Assessments and must provide System Operators with information to indicate the quality of this analysis.

Order No. 693 Citation	Directive/Guidance	Resolution
		Requirements for the RC to perform Real-time Assessments are specified in currently-enforceable IRO-008-1 and proposed IRO-008-2. ***Proposed IRO-018-1*** **R3.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: **3.1.** Criteria for evaluating the quality of any analysis used in its Real-time Assessments; and **3.2.** Actions to resolve quality deficiencies in any analysis used in its Real-time Assessments. **R4.** Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. ***Currently-enforceable IRO-008-1*** **R2.** Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. ***Revised definition of Real-time Assessment (pending regulatory approval)*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and

Order No. 693 Citation	Directive/Guidance	Resolution
		identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***Proposed IRO-008-2 (pending regulatory approval)*** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
P 1660	We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.	Proposed TOP-010-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the monitoring and analysis capabilities used by Transmission Operators (TOPs) and Balancing Authorities (BAs). The monitoring and analysis capabilities required by proposed TOP-010-1 and other TOP standards discussed below ensure TOPs and BAs have the capabilities to maintain Real-time situational awareness. **<u>Monitoring Capabilities</u>** Requirements R1 through R4 address the quality of the Real-time data needed by TOPs and BAs to perform their Real-time monitoring and Real-time analysis. Each TOP and BA is required to implement a documented procedure for addressing Real-time data quality issues, including invalid or time-late data, and must provide System Operators with information to indicate the quality of data received. Requirement R7 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring TOPs and BAs to use an independent alarm process monitor. Requirements for TOPs to perform Real-time monitoring are specified in currently-enforceable TOP-006-2 and proposed TOP-001-3 from Project 2014-03.

Order No. 693 Citation	Directive/Guidance	Resolution
		Requirements for BAs to perform Real-time monitoring are specified in currently-enforceable TOP-006-2, proposed TOP-001-3 from Project 2014-03, and BAL standards. ***Proposed TOP-010-1*** **R1.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to: **1.1.1.** Data outside of a prescribed data range; **1.1.2.** Analog data not updated within a predetermined time period; **1.1.3.** Data entered manually to override telemetered information; and **1.1.4.** Data otherwise identified as invalid or suspect. **1.2.** Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data. **R2.** Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: **2.1** Criteria for evaluating potential Real-time data quality discrepancies including, but not limited to: **2.1.1.** Data outside of a prescribed data range;

Order No. 693 Citation	Directive/Guidance	Resolution
		2.1.2. Analog data not updated within a predetermined time period; **2.1.3.** Data entered manually to override telemetered information; and **2.1.4.** Data otherwise identified as invalid or suspect. **2.2** Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data. **R3.** Each Transmission Operator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. **R4.** Each Balancing Authority shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. **R7.** Each Transmission Operator and Balancing Authority shall utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***Currently-enforceable TOP-006-2*** **R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use. **1.1.** - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2.** - Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission

Order No. 693 Citation	Directive/Guidance	Resolution
		Operators of all generation and transmission resources available for use. ***Proposed TOP-001-3 (pending regulatory approval)*** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **10.1.** Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and **10.2.** Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. **<u>Analysis Capabilities</u>** Requirements R5 and R6 address the quality of the analysis used by the TOP to perform its Real-time Assessments. Each TOP is required to implement a documented procedure to maintain the quality of the analysis used in its Real-time Assessments and must provide System Operators with information to indicate the quality of this analysis. Requirements for the TOP to perform Real-time Assessments are specified in proposed TOP-003-3 from Project 2014-03.

Order No. 693 Citation	Directive/Guidance	Resolution
		Proposed TOP-010-1 **R5.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: **5.1.** Criteria for evaluating the quality of any analysis used in its Real-time Assessments; and **5.2.** Actions to resolve quality deficiencies in any analysis used in its Real-time Assessments. **R6.** Each Transmission Operator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. ***Proposed definition of Real-time Assessment (pending regulatory approval)*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***Proposed TOP-001-3 (pending regulatory approval)*** **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
P 1875	...[w]e direct the ERO, through its Reliability Standards development process, to modify Reliability Standard VAR-001-1	The directive was considered in developing the scope of Project 2009-02. NERC believes currently enforceable IRO standards,

Order No. 693 Citation	Directive/Guidance	Resolution
	to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.	proposed TOP and IRO standards, and currently-enforceable VAR standards address the directive as discussed below. Accordingly, additional requirements were not developed in Project 2009-02. RCs and TOPs are required to periodically perform Real-time Assessments consisting of an evaluation of system conditions "to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions." Entities must use whatever analysis is necessary to obtain an evaluation of system conditions, which may include real-time voltage stability analysis. Real-time Assessments assist operators in maintaining operations within established SOLs and IROLs, to include voltage stability criteria. Requirements for performing Real-time Assessments are contained in currently-enforceable IRO-008-1 and proposed IRO-008-2 and TOP-001-3 Reliability Standards as discussed above. VAR-001-1 was revised in Project 2013-04. The resulting standard, VAR-001-4, did not include an explicit requirement for periodic performance of voltage stability analysis because "such analysis would be performed pursuant to the SOL methodology developed under FAC standards."[1] VAR-001-4 requirement R1 specifies the TOP must establish a system voltage schedule as part of its plan to operate within SOLs and IROLs. ***Currently-enforceable VAR-001-4*** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an

Order No. 693 Citation	Directive/Guidance	Resolution
		associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. **1.1.** Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

Standards Announcement
Reminder
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities
IRO-018-1 and TOP-010-1

Initial Ballots and Non-binding Polls Open through November 9, 2015

Now Available

Initial ballots for **IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities** and **TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities** and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Monday, November 9, 2015**.

Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standards and non-binding polls by clicking here. If you experience any difficulties in using the electronic form, contact Nasheema Santos.

Next Steps

The drafting team will consider all comments received during the formal comment period and determine the next steps for the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Standards Announcement

Project 2009-02
Real-time Monitoring and Analysis Capabilities
IRO-018-1 and TOP-010-1

Formal Comment Period Open through November 9, 2015
Ballot Pools Forming through October 23, 2015

Now Available

A 45-day formal comment period for **IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities** and **TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities** is open through **8 p.m. Eastern, Monday, November 9, 2015**.

Commenting
Use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, contact Nasheema Santos. An unofficial Word version of the comment form is posted on the project page.

Join the Ballot Pools
Ballot pools are being formed through **8 p.m. Eastern, Friday, October 23, 2015.** Registered Ballot Body members may join the ballot pools here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at mailto:EROhelpdesk@nerc.net (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps
Initial ballots for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 30 – November 9, 2015**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Initial Ballots and Non-binding Polls Results

Now Available

Initial ballots for **Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities** and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded **8 p.m. Eastern, November 9, 2015.**

The standards are as follows:

- IRO-018-1 - **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
- TOP-010-1 - **Real-time Reliability Monitoring and Analysis Capabilities**

The standards did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides the detailed results.

	Ballot	Non-binding Poll
Standard	Quorum / Approval	Quorum / Supportive Opinions
IRO-018-1	84.59% / 47.38%	82.71% / 54.61%
TOP-010-1	84.49% / 48.00%	83.94% / 56.25%

Next Steps

The drafting team will consider all comments received during the formal comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Survey Report

Survey Details

Name 2009-02 Real-time Monitoring and Analysis Capabilities | IRO-018-1 & TOP-010-1

Description

Start Date 9/24/2015

End Date 11/9/2015

Associated Ballots

2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 IN 1 ST

2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 Non-binding Poll IN 1 NB

2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 IN 1 ST

2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 Non-binding Poll IN 1 NB

Survey Questions

1. The SDT has proposed a new standard IRO-018-1 to address RC monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Yes

No

2. The SDT has proposed a new standard TOP-010-1 to address TOP and BA monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Yes

No

3. Do you agree with the Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

Yes

No

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

Yes

No

5. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

Responses By Question

Answer Comment:

Our comments on the SAR posting essentially disagreed with the creation of this standard and the TOP-010 standard to mandate monitoring and analysis capability for the RC and TOP, which are the fundamental "bread and butter" capabilities that these entities must have to perform their assigned functions. We further suggested that the FERC directive could be met by an alternative but more appropriate means of incorporating the necessary requirements in the Organization Certification Requirements.

The SDT disagree with our proposal citing that: "…. these capabilities should be demonstrated at the organization certification stage, but believes they should also be maintained on an ongoing basis through adherence to standards. Furthermore, development of standards is appropriate since, in general, organization certifications are based on the body of approved standards."

We continue to respectfully disagree that "maintained on an ongoing basis through adherence to standards" is the only approach. Such maintenance can also be mandated through the certification process. For example, if basic monitoring capability is required for certification, there needs to be periodic assessment of whether or not such capability continues to exist at a level to be specified, or no lower than that assessed at the initial certification stage. To argue that the only way to ensure maintenance through adherence to standards, then a good part of the current

certification requirements will have to become standards or whose quality or functional capability need to be ascertained through standards. This is not the case today, nor do we think this is the case in the future.

We once again urge the standard drafting team to consider the organization certification alternative as a means to address this FERC directive. For so long as the directive is met, it should not matter whether the requirements are incorporated into the certification requirements or in a new standard. Putting them into certification requirement is consistent with the intended use of organization certification process to ensure the responsible entities have the capability to fulfill their functional obligations; whereas putting them into reliability standards is inconsistent with the intended use of standards to drive the right planning and operation behaviors.

Notwithstanding the above disagreement with creating this and the TOP-010 standards, the currently posted draft standard appears to be micro-managing the requirements and process for providing adequate tool/capability.

The 5 requirements in the proposed IRO—018 standard essentially require that the RC:

· Implement an Operating Process or Operating Procedure to address the quality of the Real-time data;

· Indicate to the operating personnel the quality of the Real-time data

· Implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments

· Provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments

· Utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

These requirements mandate the “how”, not the “what”, and are overly prescriptive and micro-managing the daily business of the RC. If the SDT

decides to keep using a standard to meet the FERC directive, then the standard needs only to be one requirement that mandates the RC having in place acceptable quality monitoring and analysis capability at all times (except the down time for repair but for which a backup needs to be in place) for the RC to perform its functions and meet all applicable reliability standard. This requirement will be the "what", i.e., the necessary capability to perform the RC functions with specific reliability outcome - to ensure reliability.

In brief, we are unable to support this standard for two main reasons: (a) that the standard is more suited for inclusion in the Organization Certification Requirements and (b) the standard as currently drafted is overly prescriptive and micro-managing.

We would like to see "quality" defined or clarrified. Also, we are not sure who is responsible for the quality of the data received from the interconnections. We also support some of the comments coming out of the MRO standards group.

Answer Comment:

The NSRF has concerns with redundancy and technical complications with the IRO-018-1 standard as proposed. The data quality objective can be simplified into a single requirement IRO-018-1 or TOP-001-3 / IRO-008 which is for entities to have tools or processes that consider data quality to reasonably assure a reasonably high confidence that the system is in a reliable state. Existing Energy Management Systems (EMS) / Real-Time Contingency Analysis (RTCA) tools already have this capability.

Redundancy:

The NSRF recognizes that FERC directed the drafting team to address missing data quality issues based on the 2003 blackout report. However, existing standards TOP-001-3 and TOP-003-3 already require effective monitoring and control which includes proper data.

As an example, R13 of TOP-001-3 sets clear requirements that a real-time assessment must be performed at least once every 30 minutes.

All TOPs assessment tools already consider bad data detection and identification from embedded software algorithms which are pre-requisites for successful execution of SE/RTCA. TOP's engaged in monitoring the execution of their assessment tool(s) already address problems with data input quality and assessment quality.

Assessment tools must have robust data quality input and assessment capabilities to detect and identify problem(s) with any single piece of data (out of thousands of inputs) especially if that particular bad input (or limited set of bad input data) did NOT affect overall successful performance of the tool.

Technical Compliance Complications that Distort the Reliability Goal:

The zero defect nature of compliance, until fixed, drives unnecessary costly EMS / RTCA system upgrades without measureable system reliability improvements. The proposed TOP-010 and IRO-018 standards introduce vague and unclear formulations that will cause misunderstandings during compliance audits. Therefore, it is better to revise TOP-010 to a single requirement or revise TOP-001-3 or TOP-003-3 (and the corresponding IRO standards) with an additional simple requirement for entities to have tools or processes that considers data quality to reasonably assure a high confidence that the system is in a reliable state.

Assessment tools use thousands of input data points including analog measurements and switching device statuses. Therefore, the reliability goal(s) are that the assessment tool has bad data detection and identification algorithms that allow the assessment tool to solve, and notify / log the system operator of bad data, and alarm if the bad data may compromise the assessment or solution.

Identifying vague input data issues such as “analog data not updated” or “data identified as suspect” is problematic from a compliance standpoint. Some Energy management Systems (EMS) simply do cannot identify all suspect data and therefore the zero defect compliance expectation to identify all suspect data or all bad analog data is technically infeasible. The reliability goal is a high confidence assessment that the system is in a reliable state. That is very different from the stated compliance zero defect standard as written to identify all “analog data not updated” or identify “all suspect data”.

Significant technical problems exist with the TOP-010 requirements when applied to input data received from other TOPs or RC's (either directly or via ICCP). There are no technically feasible mechanisms to detect for “manually entered statuses. An example is detecting a manually entered “CLOSED” circuit breaker status whose actual status is “OPEN”, if such data was received via ICCP.

TOP-010 R3 is unclearly defined as Transmission Operators would have major difficulty in coming up with a conclusion as to what is “the quality of data necessary to perform real-time assessment”. At any moment in time, any specific measurement (or subset of measurements) might either be lost or be detected as “bad”. That does not necessarily mean that the real-time assessment would be inaccurate or invalid. The tool’s accuracy can be measured by other inherent quantitative indicators such as algebraic sum of allocation errors” or “confidence percentile”. An aggregate reasonable confidence percentile measurement would be a sufficient system reliability objective reasonably proving the system was in a reliable state.

TOP-010 R5 introduces unclear terminology of “maintaining the quality of any analysis used in real-time assessment”.

William Temple - William Temple On Behalf of: Mark Holman, PJM Interconnection, L.L.C., 2

Selected Answer: No

Answer Comment:

RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC/TOP/BA shall implement and Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed.

PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

Jonathan Appelbaum - United Illuminating Co. - 1 -

Selected Answer: No

Answer Comment:

R1.1 uses “but not limited to”. That language is too open ended and cannot be audited or compliance limited. Compare it to R3. ‘ But not Limited to” only belongs in a Measurement.

R2 is a ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that state estimator can’t solve. Modern EMS systems incorporate data quality checks within their algorithms. However, how this requirement is phrased will dramatically impact the compliance risk an organization faces.

In part 1.1 of R1, if the bulleted list is intended to be an example list, then the examples should not be given part numbers but should be rolled up into the main sentence. If it is intended to be a minimum set of criteria, then “but not limited to” should be replaced with “at a minimum”.

Jared Shakespeare - Peak Reliability - 1 -

Selected Answer: No

Answer Comment:

While Peak supports the spirit of this proposed Standard, Peak recommends there be a requirement for entities who provide data per IRO-010 to resolve data quality issues in a mutually agreeable time schedule. The RC could have a process, but if there is no requirement for entities to fix the issues the end result is not achieved. The Standard as written falls short of providing resolution. The same comments apply to TOP-010-1.

Answer Comment:

We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard requires a one-size fits all approach that is leading to varied interpretations on “quality” and “adequacy” and may not enhance reliability of the BES.

We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability.

Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We also find it problematic when an entity may not "own" the data and is simply receiving a quality flag from a sender. The RC for example may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

The use of the term "suspect" in R2.1.4 in TOP-010-1 could lead to an interpretation that the operator "should have suspected" the data was incorrect. The word "suspect" is used in some EMS packages as an identifier for garbage or data that is suspect. We recommend the word be evaluated and replaced.

R3 is very problematic in that it infers there is a level of in-adequacy that studies must not fall below when requiring a level of "quality" to be maintained. This seems to be an attempt to not use the word "adequate". Without defining the required level of quality, there is no way an entity can be compliant. Any entity may experience some reduced level of quality, but may still have acceptable performance from their studies without taking action to correct or mitigate the data. As written, the entity would be in violation for simply failing to "maintain" the level of quality. Perhaps R3 could be written this way:

R3. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain an acceptable level of quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

3.1. Criteria for determining the minimum quality of any analysis used in its Real-time Assessments; and

3.2. Actions to resolve unacceptable quality deficiencies in any analysis used in its Real-time Assessments.

R4 seems to be applicable to situations where a tool is used to perform the RTA. This can become problematic when the assessment is simply an evaluation done by reviewing data and determining that no changes on the system have occurred such as could occur with a TOP who has only a few BES elements and does not possess an EMS or RTCA style "tool".

We suggest that altering the phrase "independent alarm process monitor" could be beneficial. As stated, the phrasing seems to suggest particular processes or tools rather than the intent to just have an "independent process" to monitor the alarming system. We suggest the change as:

R5. Each Reliability Coordinator shall utilize a process to independently monitor its Real-time monitoring alarm process monitor in order to provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

Selected Answer: No

Answer Comment:

The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to "fix." If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage though standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would, in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other "things" would happen).

Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard.

This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a "how" not "what" Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data, for assurance that RC, BA and TOPs have the ability to monitor appropriately in accordance with existing, performance-based Standards Requirements.

The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

Answer Comment:

By Part 1.1 stating “Criteria for evaluating potential Real-time data quality discrepancies…” implies that a contingency analysis has to be done. Suggest removing “potential” from Part 1.1.

Language in R1.1 uses “but not limited to”. That language is too open ended and cannot be audited. Compare it to R3 use of “shall include”. “But not limited to” only belongs in a Measurement.

R2 is a bit ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that the state estimator can’t solve.

Suggest replacing the word “any” from R3 and R4 (relative to “any analysis”) and replacing with “reliability related” as “any” could be too broadly applied or interpreted. Additionally, the term analysis is broad. Standards related to Project 2014-03, approved through NERC as of this time, define such things as Real Time Assessments and Operational Planning Analysis. It's not exactly clear what analysis would be referring to.

Answer Comment:

(1) The language within Requirement R1 is vague and should not require criteria for evaluating data quality. References to criteria for evaluating data quality should not be ambiguous and unenforceable. The requirement needs to identify what real-time data is necessary to perform monitoring and assessments and consider if the data specifications maintained for reliability. The SDT should also clarify what is considered “quality” data and how an entity should identify data quality. The minimum criteria is not specific and does not provide enough information to make an objective determination.

(2) Requirement R4 provides indications that the drafting team expects System Operators to receive quality data. If an entity makes data available with a quality code, but the system fails to update the quality code, is this a violation? The SDT also needs to identify the evidence required for this requirement and if a validation process is necessary.

(3) The language within Requirement R5 expects an entity to have redundant alarms or independent alarms for real-time monitoring. What does “independent” mean in this context? The drafting team provides technical examples such as “heartbeat” or “watchdog” monitoring systems in its rationale, but does the independent system need to be separate from the real-time monitoring?

ReliabilityFirst offers the following comments for consideration:

1. **Requirement R2**

    i. **It is unclear as to what the phrase "indication(s) of the quality of the Real-time data" is referring to. RF requests clarification on the term "indications" and what this involves.**

    i. **Also, since the System Operators work for the RC, it is unclear whom at the RC will be providing "indications" to the System Operators. As written, the System Operators (working for the RC) could provide indications to themselves. This does not seem to be the intent of the Requirement.**

2. **Requirement R4**

    i. **Similar to Requirement R1, it is unclear as to what the phrase "indication(s) of the quality of any analysis" is referring to. RF requests clarification on the term "indications" and what this involves.**

    i. **Also, since the System Operators work for the RC, it is unclear whom at the RC will be providing "indications" to the System Operators. As written, the System Operators (working for the RC) could provide indications to themselves. This does not seem to be the intent of the Requirement.**

Answer Comment:

Comments: ERCOT expresses its concern that the proposed standard is too prescriptive and goes beyond the associated FERC directive regarding a requirement addressing “capabilities.” In particular, these standards were developed to address operator awareness of tool or other outages that could impact real-time monitoring. Further, several of the requirements involve many more entities than the Reliability Coordinators and, absent a requirement for coordination, participation, and action in response to the Reliability Coordinator when an issue is identified, the proposed standard will not achieve its intended objective as written. This is extremely challenging (R1.2) because the majority of issues related to poor data quality or invalid analysis tool solutions can only be resolved by parties outside of the Reliability Coordinator (e.g facility owners, telecom companies, etc.) Additionally, real-time data and monitoring capabilities are critical to the certification of a Reliability Coordinator and are not “dynamic.” Because such “capabilities” are complex, require coordination and inputs from other entities, and are key to the continued performance of a Reliability Coordinator’s duties, they are not subject to change or revision often and, therefore, likely do not need continued monitoring and assessment. Finally, several other reliability standards and associated requirements are contingent upon the availability of real-time tools and data, which standards and requirements are subject to the compliance monitoring and enforcement program. Thus, ERCOT would recommend that requirements addressing capabilities be utilized during certification and not as a reliability standard subject to the compliance monitoring and enforcement program.

Should NERC continue this project, however, ERCOT recommends that they are narrowly focused on alerting and alarming operators when their tools and/or displays are no longer working or otherwise compromised during real-time operations. Accordingly, ERCOT provides the following comments by requirement:

Requirements R1 and R2

ERCOT respectfully recommends that requirements R1 and R2 be combined. Because the need to address data issues generally arises as a result of a data indicator or the need for manual data intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Hence, ERCOT proposes the following:

R1. Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R1.1 The Reliability Coordinator shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated.

Although this change does not accomplish the intended objective since the parties required to respond to the RC's actions initiated to coordinate resolution do not have any requirements to respond or correct the issue, it does however limit the requirements to what the RC as an entity has control over.

Requirements R3 and R4

ERCOT respectfully recommends that requirements R3 and R4 be combined. Because the need to address issues with real-time analyses generally arises as a result of an indicator that a particular analysis did not complete, is offline, or there is a need for manual intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Additionally, the availability of back up or offline processes for real-time analyses mitigates the risks associated with an issue or outage of analysis capabilities. For R4, specifically "quality" is more ambiguous when considering analysis tools vs data quality. Data quality is more discrete defined by predetermined limits for analog values and logic behind discrete/binary values. Analysis "quality" is not an appropriate term as it infers a range rather than a discrete nature (valid/invalid).Hence, ERCOT proposes the following:

R3. Each Reliability Coordinator shall provide its System Operators with indication (s) of the tool(s) used in its Real-time monitoring and Real-time Assessments are functioning as intended. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R3.1 The Reliability Coordinator shall initiate actions to resolve any issues internally and to coordinate resolution of any data issues that are impacting such tool(s) with entity(ies) responsible for providing data inputs to such tool(s) when failure or degradation is indicated.

ERCOT recommends that necessary revisions be made to the Violation Severity Levels to ensure consistency with the proposed revisions.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: No

Answer Comment:

Texas RE recommends making the retention period for R3 longer than 30 days. This requirement consists of a procedure and the implementation of a procedure. A 30 day retention policy will make it very difficult for a registered entity to demonstrate compliance. The policy implies that there is not a reliability issue if compliance monitoring is not performed within 30 days (or every 30 days). Is there an event analysis category that captures quality of data and assessments where the CEA may call for longer retention? Effectively this retention policy is indicative of masking a reliability issue where the quality of the data used in assessments and the quality indication to the System Operators may be inadequate to perform the reliability functions and the only indication of a failure will occur during an event (or the preceding 30 days of a monitoring activity).

Texas RE suggests making IRO-018-1 R3, R4 clearer by using some of the language from the rationale. The requirements address "quality of analysis", which could depend on many factors, while the rationale uses the language "to address issues related to the quality of the analysis inputs used for Real-time Assessments".

Texas RE recommends revising the phrase "with indication(s) of" used in proposed IRO-18-001, R2 and R4 as it is vague. Presumably, the purpose of IRO-18-001, R2 and R4 appears to be to ensure that the results of the required evaluations of potential Real-time data quality discrepancies are communicated to System Operators so they can be incorporated into Real-time monitoring and Real-time assessments. Accordingly, Registered Entities should be required to provide appropriate information from their data quality assessments to their System Operators. Texas RE suggests substituting "relevant information and/or analyses concerning" for "with indication(s) of" to require appropriate, relevant information and/or any analyses of the quality of Real-time data be communicated to System Operators, not merely indications of data quality.

The reference to "with indications of" in the corresponding measures should also be revised along these lines. However, the types of evidence identified in the measures satisfy the proposed "relevant information and/or analyses concerning" standard.

Answer Comment:

Southern believes that the criteria in R1.1 should be limited to the RC’s ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4.

Each RC has the inherent responsibility to protect the integrity of the system in its RC area and contribute to the overall integrity of Interconnection. In order to fulfill this responsibility, the RC performs monitoring through the information collected from the modeled facilities in its RC area to accurately assess the state of the system and to perform real time assessments. Throughout this process, the RC is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

Thomas Foltz - AEP - 5 -

Selected Answer: No

Answer Comment:

Clarity is needed regarding how granular the Requirements are to the data points themselves. For example, is the Transmission Operator obligated in R3 to provide indication(s) of quality on a data point basis, or rather, may it be done as a collection of data points, grouping them as needed? Of even greater concern, would the “actions to coordinate resolution” in R1 need to be performed on a per-data point basis as well? Hundreds of thousands of data points are involved in Real-time monitoring and Real-time Assessments, and the requirements in this standard must be written realistically to accommodate a high volume of data points which continue to increase.

In addition, AEP has a large volume of data provided by external entities. AEP would have little to no ability to “coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data” as specified in R1.2, for this externally provided data.

Perhaps a re-ordering of the TOP-10-1 requirements could help the overall flow of the standard. For example, it may be preferable to have a Requirement for indications of quality (R3 for example) to precede a Requirement to have an Operating Process or Operating Procedure to address the quality of that data (R1 for example).

Tyson Archie - Platte River Power Authority - 5 -

Selected Answer: No

Answer Comment:

Platte River (PRPA) like many smaller TOP's does not have an EMS system capable of performing Real-Time Assessments. To accomplish this task, we contract our Reliability Coordinator to run our Real-Time Assessments. Platte River provides data points to the RC, who runs the Real-Time Analyses and then provides PRPA with the advanced applications.

PRPA does not have a concern with the intent of the standard, but requests that the drafting team address the possibility of relying on 3rd party contracts to perform Real-Time Assessments for entities that do not possess the ability to perform each of the requirements in this standard.

Without the ability to contract a 3rd party for these services, the financial burden of purchasing and installing a new EMS system capable of performing these tasks would easily reach into the millions of dollars.

Answer Comment:

R1 and R2:

It can be very difficult to identify some of the real-time data quality problems listed in this Standard, particularly analog data that is not updating. Many current systems do not have the capability to easily detect this for all analogs, and adding this capability for all data points could require extensive Software, database, and/or Hardware (for performance reasons) changes that cannot be easily or quickly implemented.

As real-time telemetry becomes more de-centralized in the field and as we are required to rely more and more on data from other entities (via ICCP), it becomes more and more difficult to detect data that is out of range. Putting this requirement on an entity that has no control over the source of the data or how it is provided seems to put an unfair regulatory burden on that entity.

Most of the real-time data quality criteria seem focused on analog data, but incorrect digital data can have a greater impact on analysis results than incorrect/stale analog data. However, identifying non-updating digital data can be even more difficult than identifying non-updating analog data.

How do we prove to an auditor that we identified all instances of data with poor quality?

These requirements seemed focused on evaluating the quality of incoming real-time data. Are there any requirements for providing accurate quality codes with data? For example:

Both ICCP and some RTU protocols support including quality codes with data values. For example, if an entity receiving ICCP data relies on these quality codes to at least partially determine the quality of a data point, then the received quality codes need to be accurate.

Both ICCP and some RTU protocols support including time-stamps of the most recent change of a data point value. Some systems use this received time-stamp when processing the data, and it can impact applications used by operators, including where a new alarm for that point appears in an EMS/SCADA alarm list. Receiving an incorrect time-stamp can negatively impact the information and results provided to an operator.

R3 and R4:

What is considered sufficient notification to an operator of real-time data quality problems? If quality codes are shown on EMS/SCADA displays, an operator may not look at the displays with data quality issues. But if alarms are generated to notify the operator, the increase in alarm volume may detract the operator's attention from more important alarms.

Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA.

R5: There is no guidance provided for a Transmission Operator to create criteria to evaluate the quality of analysis used in its Real-time Assessments. If an auditor will be expected to review the criteria used by a Transmission Operator, the guidelines that will be provided to auditors for this purpose should be listed here.

R7: With current EMS/SCADA architectures, it can be difficult to define what comprises the "alarm processor". While requirements R1-R4 of this Standard may cover the quality of the telemetered inputs to the EMS/SCADA, there are many EMS/SCADA components used after that to make operators aware of alarms. It is not just a specific alarm processing program, but also includes things such as the EMS/SCADA data dissemination programs, the EMS/SCADA User Interface application, audible alarming capabilities, even the operator console hardware itself. Should this requirement be re-worded to make it clearly cover the ability of the system to make alarms available to operators and not imply it is limited it to a specific “program”?

VSLs:

R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard?

William Temple - William Temple On Behalf of: Mark Holman, PJM Interconnection, L.L.C., 2

Selected Answer: No

Answer Comment:

RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC/TOP/BA shall implement and Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed.

PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

R1.1 uses “but not limited to”. That language is too open ended and cannot be audited or compliance limited. Compare it to R3. ‘ But not Limited to” only belongs in a Measurement.

R2 is ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that state estimator can’t solve. Modern EMS systems incorporate data quality checks within their algorithms. However, how this requirement is phrased will dramatically impact the compliance risk an organization faces.

Answer Comment:

The MidAmerican Energy Company (MEC) has concerns with redundancy and technical complications with the TOP-010 standard as proposed. The data quality objective can be simplified into a single requirement in either TOP-010-1 or TOP-001-3 which is for entities to have tools or processes that consider data quality to reasonably assure a reasonably high confidence that the system is in a reliable state. Existing Energy Management Systems (EMS) and Real-Time Contingency Analysis (RTCA) tools already have this capability.

Redundancy:

The MEC recognizes that FERC directed the drafting team to address missing data quality issues based on the 2003 blackout report. However, existing standards TOP-001-3 and TOP-003-3 already require effective monitoring and control which includes proper data quality.

As an example, R13 of TOP-001-3 sets clear requirements that a real-time assessment must be performed at least once every 30 minutes. That requirement includes the identification and consideration of data quality to provide successful assessment solutions at least once every 30 minutes.

TOP-001-3 R13 requires TOPs to have operating processes or procedures that address issues bad data detection and identifications that are likely to cause assessment failures such as non-convergence or invalid solutions.

All TOPs assessment tools already consider bad data detection and identification from embedded software algorithms which are pre-requisites for successful execution of SE/RTCA. TOP's engaged in monitoring the execution of their assessment tool(s) already address problems with data input quality and assessment quality.

Assessment tools must have robust data quality input and assessment capabilities to detect and identify problem(s) with any single piece of data (out of thousands of inputs) especially if that particular bad input (or limited set of bad input data) did NOT affect overall successful performance of the tool.

Technical Compliance Complications that Distort the Reliability Goal:

The zero defect nature of compliance, until fixed, drives unnecessary costly EMS / RTCA system upgrades without measureable system reliability improvements. The proposed TOP-010 standards introduce vague and unclear formulations that will cause misunderstandings during compliance audits. Therefore, it is better to revise TOP-010 to a single requirement or revise TOP-001-3 or TOP-003-3 with an additional simple requirement for entities to have tools or processes that considers data quality to reasonably assure a high confidence that the system is in a reliable state.

Assessment tools use thousands of input data points including analog measurements and switching device statuses. Therefore, the reliability goal(s) are that the assessment tool has bad data detection and identification algorithms that allow the assessment tool to solve, and notify / log the system operator of bad data, and alarm if the bad data may compromise the assessment or solution.

Identifying vague input data issues such as "analog data not updated" or "data identified as suspect" is problematic from a compliance standpoint. Some Energy management Systems (EMS) simply do cannot identify all suspect data and therefore the zero defect compliance expectation to identify all suspect data or all bad analog data is technically infeasible. The reliability goal is a high confidence assessment that the system is in a reliable state. That is very different from the stated compliance zero defect standard as written to identify all "analog data not updated" or identify "all suspect data".

Significant technical problems exist with the TOP-010 requirements when applied to input data received from other TOPs or RC's (either directly or via ICCP). There are no technically feasible mechanism to detect for "manually entered statuses.

An example is detecting a manually entered “CLOSED” circuit breaker status whose actual status is “OPEN”, if such data was received via ICCP.

TOP-010 R3 is unclearly defined as Transmission Operators would have major difficulty in coming up with a conclusion as to what is “the quality of data necessary to perform real-time assessment”. At any moment in time, any specific measurement (or subset of measurements) might either be lost or be detected as “bad”. That does not necessarily mean that the real-time assessment would be inaccurate or invalid. The tool’s accuracy can be measured by other inherent quantitative indicators such as algebraic sum of allocation errors” or “confidence percentile”. An aggregate reasonable confidence percentile measurement would be a sufficient system reliability objective reasonably proving the system was in a reliable state.

TOP-010 R5 introduces unclear terminology of “maintaining the quality of any analysis used in real-time assessment”.

Angela Gaines - Portland General Electric Co. - 1,3,5,6 - WECC

Selected Answer: No

Answer Comment:

PGE thanks the drafting team for there efforts regarding the development of this proposed standard. After meeting with the SMEs involved with the proposed standard, they've provided the following:

SUMMARY

- We recommend a “No” vote on TOP-010-1 at this time because we feel additional clarity is needed.
- Submit comments on the following:
    - Requesting clarification on the meaning of *analysis* and *Real-time Assessments*. (Human or machine.)
    - If R5 is addressing the knowledge or ability of operators, it belongs in PER-005, not here.

Answer Comment:

R1, R2, R3, & R4: Duke Energy questions the use of the term “analysis” in R2 and R4, attributable to the BA, but is not present in R1 and R3 that is attributable to the TOP. The use of the term analysis in this context suggests that the BA has some sort of responsibility to carry out analyses similar to that of the RC or TOP. We disagree with this premise. Also, we question why the term “analysis” is not present in R1 or R3. The TOP does in fact have responsibilities to carry out analyses, and this should be acknowledged in R1 and R3. Duke Energy suggests that all references to the BA performing an analysis be removed in all attributable requirements, and that analysis that are expected to be performed by the TOP be referenced in requirements attributable to it.

R5: We request further clarification on the use of the phrase “analysis inputs” in the Rationale of R5, as opposed to the use of the term “analysis” in the wording of R5. Is the use of “inputs” meaning other types of data or operational conditions that aren’t described in R1-R4? More clarification regarding what is meant by the phrase “analysis inputs” would be helpful.

R7: Duke Energy requests further explanation on what it meant by the use of the term “processor” in regards to the failure of a Real-time monitoring of an alarm processor. Is this referring to independent hardware that monitors EMS/SCADA or independent processes within the EMS system? Is separate hardware necessary, or will separate processes be sufficient? Should this be something that is housed outside of the EMS? We feel that an example of what is meant by independent (does this mean external?), as well as “processor” would enhance clarity in this requirement.

In part 1.1 of R1, if the bulleted list is intended to be an example list, then the examples should not be given part numbers but should be rolled up into the main sentence. If it is intended to be a minimum set of criteria, then “but not limited to” should be replaced with “at a minimum”.

In part 2.1 of R2, if the bulleted list is intended to be an example list, then the examples should not be given part numbers but should be rolled up into the main sentence. If it is intended to be a minimum set of criteria, then “but not limited to” should be replaced with “at a minimum”.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Selected Answer: Yes

Answer Comment:

ATC supports the comments submitted by the MRO NSRF.

However, raise the following question: Does having a process or procedure support your quality of Real-time data? It’s not the process or procedure but rather what systems do you have in place to alert the TOP/BA that there is an issue with your data (R1.1 – R1.2).

R1 and R2:

o It can be very difficult to identify some of the real-time data quality problems listed in this Standard, particularly analog data that is not updating. Many current systems do not have the capability to easily detect this for all analogs, and adding this capability for all data points could require extensive Software, database, and/or Hardware (for performance reasons) changes that cannot be easily or quickly implemented.

As real-time telemetry becomes more de-centralized in the field and as we are required to rely more and more on data from other entities (via ICCP), it becomes more and more difficult to detect data that is out of range. Putting this requirement on an entity that has o   no control over the source of the data or how it is provided seems to put an unfair regulatory burden on that entity.

o   Most of the real-time data quality criteria seem focused on analog data, but incorrect digital data can have a greater impact on analysis results than incorrect/stale analog data. However, identifying non-updating digital data can be even more difficult than identifying non-updating analog data.

o   How do we prove to an auditor that we identified all instances of data with poor quality?

o   These requirements seemed focused on evaluating the quality of incoming real-time data. Are there any requirements for providing accurate quality codes with data? For example:

§ Both ICCP and some RTU protocols support including quality codes with data values. For example, if an entity receiving ICCP data relies on these quality codes to at least partially determine the quality of a data point, then the received quality codes need to be accurate.

§ Both ICCP and some RTU protocols support including time-stamps of the most recent change of a data point value.   Some systems use this received time-stamp when processing the data, and it can impact applications used by operators, including where a new alarm for that point appears in an EMS/SCADA alarm list. Receiving an incorrect time-stamp can negatively impact the information and results provided to an operator.

R3 and R4:

o   What is considered sufficient notification to an operator of real-time data quality problems? If quality codes are shown on EMS/SCADA displays, an operator may not look at the displays with data quality issues. But if alarms are generated to notify the operator, the increase in alarm volume may detract the operator's attention from more important alarms.

o   Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA.

R5: There is no guidance provided for a Transmission Operator to create criteria to evaluate the quality of analysis used in its Real-time Assessments. If an auditor will be expected to review the criteria used by a Transmission Operator, the guidelines that will be provided to auditors for this purpose should be listed here.

R7: With current EMS/SCADA architectures, it can be difficult to define what comprises the "alarm processor". While requirements R1-R4 of this Standard may cover the quality of the telemetered inputs to the EMS/SCADA, there are many EMS/SCADA components used after that to make operators aware of alarms. It is not just a specific alarm processing program, but also includes

· things such as the EMS/SCADA data dissemination programs, the EMS/SCADA User Interface application, audible alarming capabilities, even the operator console hardware itself. Should this requirement be re-worded to make it clearly cover the ability of the system to make alarms available to operators and not imply it is limited it to a specific “program”?

VSLs:

o R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented.

o R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard?

Scott McGough - Georgia System Operations Corporation - 3 -

Selected Answer: No

Answer Comment:

This standard creates a double jeopardy situation. Requirement R1 Part 1.2 of this standard specifies the TOP shall include actions to coordinate resolution of Real-time data quality discrepancies in its Operating Process or Operating Procedure. These actions are also required by proposed TOP-003-3 Requirement R5 Part 5.2 which requires a process to resolve data conflicts for the data required by the data specification in Requirement TOP-003-3 R3. If that data specification requires the provision of Real-time data, then TOP-003-3 Part 5.2 requires a process to resolve data conflicts and quality discrepancies with that Real-time data.

Suggested wording: **R1.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data**, excluding Real-time data already addressed by TOP-003-3 R5 Part 5.2,** necessary to perform its Real-time monitoring and Real-time Assessments.

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1 -

Selected Answer: No

Answer Comment:

CenterPoint Energy feels R1.1.2 (Analog data not updated within a predetermined time period) brings more of a compliance burden than a reliability benefit. CenterPoint Energy has confidence System Operators investigate and communicate these issues upon suspicion; however, defining a predetermined time period for a data quality code check including each individual piece of data poses a threat to the System Operator's focus monitoring important issues on the grid. CenterPoint Energy also realizes there is a challenge in deciphering whether or not a value has simply not changed in a predetermined time period or if that value hasn't updated. CenterPoint Energy recommends the SDT clarify that 1.1.2 refers to the universe or a pre-defined subset of data and not specific to any one, individual piece of data.

Selected Answer: No

Answer Comment:

Comments: These comments are submitted on behalf of the following PPL NERC Registered Affiliates (“PPL”): Louisville Gas and Electric Company, Kentucky Utilities Company and PPL Electric Utilities Corporation. The PPL NERC Registered Affiliates are registered in two regions (RFC and SERC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.

The PPL NERC Registered Affiliates believe if additional requirements are necessary for TOP’s and BA’s to address the quality of their Real-time data, then these requirements should be included in the proposed Reliability Standard TOP-003-3. Per TOP-003-3 (pending regulatory approval) , TOP’s and BA’s are required to maintain a documented specification for the data necessary to perform its Real-time monitoring and Real-time assessments including periodicity for providing data and a mutually agreeable process for resolving data conflicts. Therefore, adding additional requirements to TOP-003-3 to address the quality of the TOP and BA specified data is less of a compliance burden to stakeholders than creating a new standard.

If the SDT chooses to continue with the proposed TOP-010 standard, we request the sub-requirements R1.1.1 thru 1.1.4 and R2.1.1 thru 2.1.4 be removed from the proposed TOP-010 to allow entities the flexibility to write an Operating Process or Operating Procedure tailored to their system and their Reliability Coordinators specifications where applicable.

Answer Comment:

Following are the same comments we provided on IRO-018-1 draft. They are generally applicable to the proposed TOP-010-1 Standard also.

We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard requires a one-size fits all approach that is leading to varied interpretations on “quality” and “adequacy” and may not enhance reliability of the BES.

We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability.

Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We also find it problematic when an entity may not "own" the data and is simply receiving a quality flag from a sender. The RC for example may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

The use of the term "suspect" in R2.1.4 in TOP-010-1 could lead to an interpretation that the operator "should have suspected" the data was incorrect. The word "suspect" is used in some EMS packages as an identifier for garbage or data that is suspect. We recommend the word be evaluated and replaced.

R3 is very problematic in that it infers there is a level of in-adequacy that studies must not fall below when requiring a level of "quality" to be maintained. This seems to be an attempt to not use the word "adequate". Without defining the required level of quality, there is no way an entity can be compliant. Any entity may experience some reduced level of quality, but may still have acceptable performance from their studies without taking action to correct or mitigate the data. As written, the entity would be in violation for simply failing to "maintain" the level of quality. Perhaps R3 could be written this way:

R3. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain an acceptable level of quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

3.1. Criteria for determining the minimum quality of any analysis used in its Real-time Assessments; and

3.2. Actions to resolve unacceptable quality deficiencies in any analysis used in its Real-time Assessments.

R4 seems to be applicable to situations where a tool is used to perform the RTA. This can become problematic when the assessment is simply an evaluation done by reviewing data and determining that no changes on the system have occurred such as could occur with a TOP who has only a few BES elements and does not possess an EMS or RTCA style "tool".

We suggest that altering the phrase “independent alarm process monitor” could be beneficial. As stated, the phrasing seems to suggest particular processes or tools rather than the intent to just have an “independent process” to monitor the alarming system. We suggest the change as:

R5. Each Reliability Coordinator shall utilize a process to independently monitor its Real-time monitoring alarm process monitor in order to provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

Kathleen Goodman - Kathleen Goodman On Behalf of: Michael Puscas, ISO New England, Inc., 2

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to “fix.” If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage though standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would, in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other “things” would happen).

Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard.

This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a "how" not "what" Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data, for assurance that RC, BA and TOPs have the ability to monitor appropriately in accordance with existing, performance-based Standards Requirements.

The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

Some of the criteria listed in R1.1 is confusing. Data outside of prescribed data range would more likely indicate unusual system conditions rather that a data quality issue. We are currently unsure how the monitoring of these criteria could be implemented without additional software. Also, since implementation is part of the Measurement we would assume some logging of this implementation would be necessary to prove compliance which is also a process without and obvious means of accomplishment. There needs to be some substantial guidance or technical discussion providing information on what would be the expectations for utilities to be in compliance with this standard.

Answer Comment:

Each requirement is unique to a particular functional entity. Requirements can be eliminated by having each requirement refer to Transmission Operator and Balancing Authority.

Similarly to IRO-018-1, language in R1.1 uses “but not limited to”. That language is too open ended and cannot be audited. Compare it to R3 use of “shall include”. “But not limited to” only belongs in a Measurement.

R2 is a bit ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that the state estimator can’t solve.

Suggest replacing the word “any” from R5 and R6 (relative to “any analysis”) and replacing with “reliability related” as “any” could be too broadly applied or interpreted. Additionally, the term analysis is broad. Standards related to Project 2014-03, approved through NERC as of this time, define such things as Real Time Assessments and Operational Planning Analysis. It’s not exactly clear what analysis would be referring to.

Answer Comment:

(1) The standard has significant burdens on System Operators to demonstrate compliance. Requirements R2, R3, and R5.2 expect solution frequencies every 5 minutes, 12 times an hour, 288 times a day. Does each quality deficiency occurring during this period need to be resolved? A RTU communication issue lasting only 10 minutes would impact a minority number of these instances and generate unnecessary work for a system operator. We believe the SDT should provide some qualifier for this requirement.

(2) We believe this standard has the potential to add to the System Operator's workload and take their attention away from their duties of monitoring system reliability. NERC has spent significant efforts to educate industry on situational awareness and human performance topics, including cognitive overload where too much stimuli affecting a System Operator will have negative effects on their performance.

(3) The standard also introduces potential double jeopardy concerns between requirements TOP-010 R2 and BAL-005 R5. At the time of the webinar, the SDT did not look into these possibilities. However, NERC did later respond to the potential double jeopardy with the following statement:

"R5 in proposed BAL-005-1 is limited to information associated with Reporting ACE. R2 in proposed TOP-010-1 applies to Real-time data necessary to perform the BA's analysis functions and Real-time monitoring. These functions go beyond BAL-005 as described in the NERC Functional Model and existing and proposed TOP and IRO standards. Double jeopardy is never an issue because NERC Rules of Procedure include provisions for handling incidences of non-compliance with two or more requirements. Specifically, NERC or the regional entity would issue a single penalty or sanction as called for in the Rules of Procedure (Appendix 4B, Section 2.5)."

We disagree with this approach, as the ROP is focused on being in violation of a single requirement or sub-requirement, not to separate requirements. The issue of double jeopardy could occur when there is an event based on poor ACE data quality, which could also implicate TOP-010-1. While TOP-010-1 contains additional data, it is possible to be in violation of two requirements for the same instance, which is the very definition of double jeopardy. The NERC ROP does not provide relief for this situation.

(4) We have concerns with the potential impact to a System Operator's general awareness of the system. The System Operator will now be spending more time logging and performing actions strictly for compliance instead of BES Operation activities. While we understand that the proposed standard allows the entity to determine the amount of operator action needed, can this be similarly defined in a Process or Procedure? We have concerns that an auditor may not interpret the standard to allow other employees to mitigate any data or analyze errors, such as an EMS Engineer or other support personnel. We request that the SDT consider revising the standard to clarify that a System Operator does not specifically have to be the one who mitigates such issues. Furthermore, how does the SDT expect entities to show compliance with "implementation" of their Process of Procedure?

(5) The proposed standard includes requirements that should enhance, not detract, from the System Operator's situational awareness since it is based on recommendations from the RTBPTF report. The SDT is mindful that System Operators need to remain focused on relevant real-time information while carrying out their duties. The proposed requirements should provide entities the flexibility to determine which operating personnel carry out required actions. Implementation could be demonstrated through evidence that the Operating Process or Procedure is used for its intended purpose. This evidence which might include checklists, operator logs, or operations support logs, for example.

(6) Compliance with the proposed requirements is not evaluated by counting quality codes on data points. The measures, VRFs, and VSLs are constructed to evaluate the capability-based performance requirements, as described in section 2.4 of the SPM. This section states that Capability-based Requirements are defined capabilities needed by one or more entities to perform reliability functions which can be measured by demonstrating that the capability exists as required.

Selected Answer: No

Answer Comment:

ReliabilityFirst offers the following comments for consideration:

1. **Requirement R3 and R4**

   i. **It is unclear as to what the phrase “indication(s) of the quality of the Real-time data” is referring to. RF requests clarification on the term “indications” and what this involves.**

   i. **Also, since the System Operators work for the respected TOP or BA, it is unclear whom at the respected TOP or BA will be providing “indications” to the System Operators. As written, the System Operators (working for the TOP or BA) could provide indications to themselves. This does not seem to be the intent of the Requirement.**

2. **Requirement R6**

   i. **It is unclear as to what the phrase “indication(s) of the quality of any analysis…” is referring to. RF requests clarification on the term “indications” and what this involves.**

   i. **Also, since the System Operators work for the TOP, it is unclear whom at the TOP will be providing “indications” to the System Operators. As written, the System Operators (working for the TOP) could provide indications to themselves. This does not seem to be the intent of the Requirement.**

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer: No

Answer Comment:

Comments: ERCOT reiterates its comments above as applicable to TOP-010-1. Should NERC continue this project, however, ERCOT provides the following comments by requirement:

Requirements R1 and R3/Requirements R2 and R4

ERCOT respectfully recommends that requirements R1 and R3 and Requirements R2 and R4 be combined. Because the need to address data issues generally arises as a result of a data indicator or the need for manual data intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Hence, ERCOT proposes the following:

R1. Each Transmission Operator shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its Real-time monitoring and Realtime Assessments. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R1.1 The Transmission Operator shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated.

R2. Each Balancing Authority shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R2.1 The Balancing Authority shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated.

Requirements R5 and R6

ERCOT respectfully recommends that requirements R5 and R6 be combined. Because the need to address issues with real-time analyses generally arises as a result of an indicator that a particular analysis did not complete, is offline or there is a need for manual intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Additionally, the availability of back up or offline processes for real-time analyses mitigates the risks associated with an issue or outage of analysis capabilities. Hence, ERCOT proposes the following:

R3. Each Transmission Operator shall provide its System Operators with indication(s) of the tool(s) used in its Real-time monitoring and Real-time Assessments are functioning as intended. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R3.1 The Transmission Operator shall initiate actions to resolve any issues internally and to coordinate resolution of any data issues that are impacting such tool(s) with entity(ies) responsible for providing data inputs to such tool(s) when failure or degradation is indicated.

Jeffrey Watkins - Jeffrey Watkins On Behalf of: Eric Schwarzrock, Berkshire Hathaway - NV Energy, 5

Selected Answer: No

Answer Comment:

R1 and R2: The requirements are vague as to what constitutes quality. Do we consider out of tolerance? High value? Low value? What is too high? What is too low?

R3 and R4: If quality alarms are generated to alert the operator, the increase in alarm volume may distract the operator from more important alarms. If quality codes are shown on the EMS/SCADA displays, an operator may not look at or notice the displays with data quality issues.

Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA.

R5: TOP-001-3 R13 requires that a real-time assessment is performed at least once every 30 minutes. In order to resolve any issues with the quality of analysis for the real-time assessment outside of normal business hours may require staff to come into the office to resolve which may take more than 30 minutes. This would put an entity out of compliance with TOP-001-3, unless staffing is increased which may not be feasible.

There is no guidance provided to create criteria to evaluate the quality of analysis used in Real-time Assessments. There could be discrepancies between an auditor and an entity over what is acceptable criteria. Guidelines that will an auditor could be expected to review should be listed.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Selected Answer: No

Answer Comment:

The criterion specified in R1.1 and R1.2 is too prescriptive. The requirements as written are requiring System Operators to monitor the quality of all data specified per proposed TOP-003-3 R1. In a Real-time system there are thousands of data points used and having a few of those outside prescribed data range or not updated within a predetermined time period may have no impact on BES reliability. Requiring System Operators to track the quality of all data can be a distraction and an unnecessary burden. ITC believes the intent of the standard is for entities to pay attention to quality of certain pre-identified data used in Real-time monitoring and analysis. However, the future standard TOP-003-3 will result in this requirement being applied to all data used in Real-time monitoring and analysis. Transmission Operators are required to perform a Real-time assessment and these assessments most commonly utilize tools which are designed to reduce dependencies on bad, invalid, or suspect data therefore placing a requirement for evaluating invalid or suspect data in Real-time does not provide any reliability benefit.

The proposed TOP-001-3 R1 requires that each Transmission Operator (TOP) shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. Proposed TOP-001-3 R10 requires TOP to determine SOL exceedances and TOP-001-3 R12 requires TOP to not operate outside IROL for more associated IROL Tv. These requirements together inherently imply that the Transmission Operator should ensure quality of data used in Real-time to get the desired outcome from the Real-time Assessment which is to maintain reliability of its area by monitoring SOLs and IROLs and taking appropriate actions. The proposed TOP-010-1 R1 seems to be specifying ‘How to’ comply with these requirements which does not meet the result base standard practice. In addition, the rationale for R13 in proposed TOP-001-3 states “The Transmission Operator’s Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements and how to adapt to conditions where processes, procedures, and automated software systems are not available (if used)”. Thus, the actions needed on data quality are already expected in the Operating Plan to ensure the desired outcome. Therefore, a new requirement for data quality may be redundant.

In summary, it is appropriate to have an Operating Procedure to maintain and address quality of data used in Real-time Assessment. However, the monitoring and analysis of data quality for all data in Real-time is not practical and does not add value to reliability. Real-time Assessment tools used by TOPs have processes to manage bad data and provide valid results. Data quality should be monitored outside of the Real-time operator environment wherein staff other than System Operators can analyze patterns of data to identify data quality issues that truly impact Real-time analysis. The measures specified in TOP-010-1 indicate dated operator logs and voice recordings as evidence for compliance which will require the System Operator to monitor quality of all data. Also, the expectation of the System Operator to review data quality in Real-time for every data point is overkill.

TOP-010-1 R3 is redundant when compared to TOP-010-1 R6. R6 is requiring an indication of quality of analysis used in Real-time Assessment wherein R3 is requiring indication of quality of data used in Real-time Assessment. The quality of analysis used for Real-time Assessments may be an indicator of quality of data used in Real-time Assessment thus having a requirement on both is redundant and can result in multiple noncompliance incidents for a single problem. For example, a single bad Real-time data point may constitute a violation of TOP-010-1 R3 and since this data is used in Real-time Assessment it may also cause a violation of TOP-010-1 R6.

ITC supports TOP-010-1 R7 having an independent processor to monitor Real-time alarm system because it provides value due to the heavy reliance on alarms by System Operators for situational awareness. However, the standard should specify if the unavailability of independent processor creates a violation of standard requirements. Although, the implementation plan of 12 months for R7 is unrealistic as compliance with this requirement may require entities to procure and implement new tools which is a lengthy process.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: No

Answer Comment:

Texas RE recommends adding the Balancing Authority (BA) function to the applicability of R5 and R6. While it could be argued that a BA does not have to perform Real-time Assessments per a Reliability Standard requirement (in other words explicitly stated as required to do Real-time Assessments), its actions to maintain frequency are effectively as assessment based on Real-time data.

Texas RE suggests using language from the rational to make TOP-010-1 R5 and R6 clearer. The requirements address "quality of analysis", which could depend on many factors, while the rationale uses the language "to address issues related to the quality of the analysis inputs used for Real-time Assessments".

Texas RE recommends revising the phrase "with indication(s) of" used in proposed TOP-10-1, R3, R4, and R6 as it is vague. The purpose of TOP-10-1, R3, R4, and R6 appears to be to ensure that the results of the required evaluations of potential Real-time data quality discrepancies are communicated to System Operators so that information regarding such data discrepancies could potentially be incorporated into Real-time monitoring, analysis functions, and Real-time assessments. Accordingly, registered entities should be required actually to provide the actual information from their data quality assessments to their System Operators. Texas RE would suggest substituting "relevant information and/or analyses concerning" for "with indication(s) of" to require appropriate, relevant information and/or any analyses of the quality of Real-time data be communicated to System Operators, not merely indications of data quality.

The reference to "with indications of" in the corresponding measures should also be revised along these lines. However, the types of evidence identified in the measures satisfy the proposed "relevant information and/or analyses concerning" standard.

David Jendras - Ameren - Ameren Services - 3 -

Selected Answer: No

Answer Comment:

R4 states "Each Balancing Authority shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring." Are the analysis functions limited to real-time analysis, or could this be interpreted to apply to study and after the fact analysis? We believe that this needs to be clear.

R5. What does "maintain the quality" mean? What if the quality of the analysis is not currently what it should be, then this requirement appears to preclude improving that quality.

R6 requires "indication(s) of the quality of any analysis"; how is quality defined? We believe this is very ambiguous as written and for us internal discussions resulted in multiple opinions. We believe that the term Quality needs to be concisely defined within the requirement.

Answer Comment:

Southern believes that the criteria in R1.1 should be limited to the BA/TOP's ability to monitor and assess the current/expected condition of its BA/TOP area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4.

Each TOP has the inherent responsibility to protect the integrity of the system in its BA/TOP area and to not contribute or cause any system violations in adjacent BA/TOP areas. In order to fulfill this responsibility, the BA/TOP performs monitoring through the information collected from the modeled facilities in its TOP areas to accurately assess the state of the system. The BA/TOP is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

Answer Comment:

The implementation plan is too short if entities need to specify, order and deploy new or modified Energy Management Systems (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and systems.

The key is to allow entities the proper time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short term.

The standard objective needs to be modified to a feasible reliability objective such as the assessment provides a reasonably high confidence interval that the system is in a reliable state. TOPs and BAs should be given much more time to make appropriate changes to their tools and EMS systems and to test their capabilities to detect and implement operating plans to respond to bad data detection and identification. The time needed to modify, specify, install, adjust and test systems or tool to meet the proposed standard should be, at a minimum, 3 to 5 years.

Duke Energy is not in favor of the proposed 12 months and 18 months staggered implementation plan. In one of our previous comments, we requested that additional information be provided regarding the what is meant by the use of the terms alarm process monitor. If this alarm process monitor is something that would necessitate an entity to go out and procure something that is does not currently own, then additional time would be needed. The timeframe of 18 months for all requirements seems more appropriate.

Answer Comment:

If TOP-003-3 is approved at the same time or after TOP-010-1, then the result of the implementation plan as drafted is that requirements to have quality data become effective at the same time as requirements that could cause the TOP and BA to be seeing new data for the first time. R5 of TOP-003-3 could result in a large volume of new data, so more time should be afforded to the receiving TOP and BA to become familiar with and begin utilizing that new data. We recommend the timeframes for **implementation of TOP-010-1 be modified to be 18 months and 24 months**, at a minimum, to allow for separation from TOP-003-3 R5. A section could be added that addresses a scenario where TOP-003-3 is approved well before TOP-010-1.

Based on the proposed standards, 12 months should be sufficient time to simply develop a written procedure and ensure operators are knowledgeable. However, depending on what the final version of the standard looks like, it may be impossible to meet some of the resulting requirements unless systems are replaced. In that case, 36 months may be required.

Answer Comment:

(1) The implementation plan is too short if entities need to specify, order, and deploy a new or modified Energy Management System (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and infrastructure.

(2) The key is to allow entities adequate time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short-term.

(3) In the alternative, if the SDT determines that it will not extend the implementation to 60 months, we ask the SDT to consider making all requirements effective after 18 months. Staggered effective dates has caused significant and unnecessary implementation issues, such as the confusion that occurred with implementing PRC-005 and its various requirements.

Selected Answer: No

Answer Comment:

ITC supports TOP-010-1 R7 having an independent processor to monitor Real-time alarm system because it provides value due to the heavy reliance on alarms by System Operators for situational awareness. However, the standard should specify if the unavailability of independent processor creates a violation of standard requirements. Although, the implementation plan of 12 months for R7 is unrealistic as compliance with this requirement may require entities to procure and implement new tools which is a lengthy process.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: No

Answer Comment:

Texas RE is concerned the Implementation Plan allows for an increase in risk to the BES if quality is not already being addressed. To ensure reliable operations, Texas RE suggests decreasing the Implementation plan to a more reasonable time period such as the first day of the first quarter after approval for all requirements except R7, which requires TOPs and BAs to utilize an alarm process monitor. Twelve months is not an unreasonable time for the development of an independent alarm process monitor.

Southern believes that the implementation date should be pushed back to allow time for the industry to determine the appropriate technology that is sufficient for each entity's operations. We also believe that in order to fully comply with the proposed standard, enough time should be allowed for the industry to update their current procedures and/or to create acceptable procedures, provide training to the appropriate System Operators and allow sufficient time for the entities to determine the technology available that is available and appropriate to support their operations, along with the required functionality.

Answer Comment:

The binary approach to the VSLs seems too severe. Suggest that the drafting team consider revising the VSLs to utilize moderate, high, and then severe if the entity missed one, two, three, or finally all data quality elements.

R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard?

The standard objective needs to be modified to a feasible reliability objective such as the assessment provides a reasonably high confidence interval that the system is in a reliable state. Vague and unclear definitions will lead to significant audit discrepancies as to what appropriate measures are when it comes to implementation of operating processes/procedures.

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1 -

Selected Answer: No

Answer Comment:

CenterPoint Energy feels the VSLs for R1, R2, and R5 do not match the intended meaning in the language of the Requirements (implementation). It appears the focus is more on exclusion of criteria during the development phase of Operating Processes and Procedures. CenterPoint Energy feels there are developmental phases of Operating Processes and Procedures and implantation phases, and perhaps the Requirements should be separated to reflect each. In doing so, the VSLs could and should be more balanced, in both instances, from Lower VSL to Severe VSL and not so heavily weighted for documentation deficiencies.

Answer Comment:

The SDT should consider revising the VSLs to be on a graduated scale. Binary treatment of these requirements is improper and leads to higher dollar penalties for violations than are not commensurate with the risks to reliability.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: No

Answer Comment:

Texas RE recommends revising the VSLs for proposed IRO-18-001, R1 and TOP-10-1, R1 and R2. Specifically, the distinction between a High VSL and a Severe VSL for each of these requirements needs clarification as to how the use of subparts establishing the various required elements that must be included within the criteria for evaluating Real-time data quality discrepancies in Parts 1.1 and 2.1, respectively, will be addressed.

The current VSLs for each of these three requirements could be read to assign only a High VSL to a registered entity that has: (1) only adopted one of the four required criteria elements in Part 1.1 (or Part 2.1 for TOP-10-1, R2) for evaluating potential Real-time data quality discrepancies; and (2) has not adopted any actions to coordinate the resolution of Real-time data quality discrepancies as required under Part 1.2 (or Part 2.2 for TOP-10-1, R2). For example, the High VSL category for TOP-10-1, R1 could potentially apply to a Registered Entity that adopts criteria for evaluating data outside of a prescribed data range, but fails to adopt similar criteria for analog data that is not updated within a predetermined time period, data entered manually to override telemetered information, data otherwise identified as invalid or suspect, as well as fails to specify any actions to coordinate the resolution of Real-time data quality discrepancies with the entity responsible for provide the data.

Texas RE suggests a better approach would be to specify that a High VSL for proposed IRO-18-001, R1 and TOP-10-1, R1 and R2 would apply to Registered Entities that have failed to adopt one or more of the required criteria in Parts 1.1 or 2.1, respectively, or have failed to adopt actions to address Real-time data discrepancies as required in Parts 1.2 or 2.2, respectively. The Severe VSL category would then be reserved for instances in which a Registered Entity has failed to (1) adopt one or more of the required criteria for evaluating Real-time data quality discrepancies and (2) adopt actions to coordinate resolution of Real-time data quality discrepancies. To use the previous example regarding the VSLs for TOP-10-1, R1, a Registered Entity that adopts criteria for evaluating data outside of a prescribed data range, but fails to adopt similar criteria for analog data that is not updated within a predetermined time period, data entered manually to override telemetered information, data otherwise identified as invalid or suspect, as well as fails to specify any actions to coordinate the resolution of Real-time data quality discrepancies would now be subject to a Severe VSL.

This approach would align the VSLs for IRO-18-001, R1 and TOP-10-1, R1 and R2 with the VSLs for other requirements in the proposed standards that do not have specifically required criteria elements. For example, under TOP-10-1, R5, the High VSL category applies to a Registered Entity if it does not establish (1) criteria for evaluating the quality of any analysis under in its Real-time assessments; or (2) actions to resolve quality deficiencies. In turn, the Severe VSL category under TOP-10-1, R5 is applicable to Registered Entity that has failed to both establish criteria for evaluating and actions to resolve quality deficiencies.

Answer Comment:

AEP has chosen to vote negative on TOP-010-1, primarily driven by our concerns of a) how granular the Requirements may be regarding the data points themselves and b) the impact of R1.2 on externally provided data. As previously stated, TOP-10-1 must be written in a reasonable manner that is able to accommodate the high volume of data points which continue to increase.

Selected Answer:

Answer Comment:

Certification requirements are the appropriate place for mandating facilities and capabilities needed to perform reliability functions. These requirements can be enforced in a similar fashion as their reliability standard counterparts without de-certifying an entity if and when requirements are violated. We urge the drafting team, NERC, the Standards Committee and the regulators to think outside of the box and not let taking the right approach be bound by existing document framework.

Suggest that the Standard Drafting team clarify that an independent alarm process monitor can be a separate and independent process within the same EMS system (R7). Therefore if an entity has a heartbeat monitor already integrated into its EMS system, the heartbeat monitor can be used. Independent doesn’t necessarily mean an independent box / system completely separate from the EMS.

Selected Answer:

Answer Comment:

Even though IRO-018-1 and TOP-010-1 are applicable to different functional entities, the contents are repetitive. It would be less cumbersome if one standard could be generated that would be applicable to all the functional entities.

Results based standards should focus on the "what" or objective opinions express by some are that the standard is overly prescriptive and could be more suited to a guideline document.

We question the SDT's practice of posting the revised SAR along with the draft standard. It is unclear if the industry is to provide feedback about the removal of "analysis" from the SAR. This appears to be a substantive change to the project's scope.

Comments: ERCOT expresses concern that overly prescriptive requirements will hinder – not benefit – the processes and interactions occurring between functional entities currently as well as the continuous improvement of tools and associated capabilities. If the risk to be addressed is operator awareness of data and analysis quality issues and the taking of prompt action to resolve such issues, ERCOT recommends limited requirements that most directly address these risks. Overly prescriptive requirements that hinder tool and analyses improvement and the free-flow of functional entity communications that are already occurring do not benefit reliability. Further, the complicated nature of data exchange, inputs, and analyses require coordination and cooperation amongst many registered entities. Without a reciprocal obligation by other entities to facilitate responsiveness when an issue arises, the proposed standards and requirements will not achieve their intended objective. Until such obligation is included in the proposed standard, ERCOT is unable to support its approval. This reciprocal obligation is critical for achieving the implied objective of the proposed standard because – even where a Reliability Coordinator initiates resolution of issues quickly – lack of responsiveness by the entity that is situated to address an issue will prevent effective, efficient resolution.

Overall, ITC supports the intent of the standard which is to ensure that quality of Real-time Assessment is adequate to maintain BES reliability. However, the assessment of Real-time data and Real-time Assessment quality is a function better performed offline using larger sets of historical data to identify systematic issues, monitor performance trends of Real-time Assessment, and implement corrective actions. The proposed standard as written can be interpreted that System Operators should monitor and address all data and Real-time Assessment quality issues in Real-time which may be distracting to the Operator. In addition, the term ‘quality’ is very subjective and can lead to different interpretations by different TOPs and regional entities making it difficult to prove and assess compliance.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:

Answer Comment:

Texas RE recommends reviewing references in the Evidence Retention section of TOP-010-1. There is reference to R5 and R6 having a rolling 30 day period for evidence. It would seem that is an incorrect reference as R5 requires implementation of a Process or Procedure. The 30-day period is short of a timeframe and is not supported by industry practice. Similar statement for IRO-018-1 except it references R3 and R4. R3 is a requirement to implement a procedure. The SDT may have been trying to capture the quality of data indication requirements in each of the Standards.

In TOP-010-1, why is the data retention for a BA different from that for a TOP (relates to the incorrect reference but if the reference is corrected this issue goes away)?

Comments of the Foundation for Resilient Societies, Inc. on NERC Project 2009-2, Draft NERC Standard IRO-018-1, "Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities."

Submitted to NERC on November 9, 2015

The Foundation for Resilient Societies, Inc. supports "reliability standards" that are designed to improve the reliability of the bulk electric system. We supported the near-real-time monitoring initiative for critical equipment, "Project 2012-01 Equipment Monitoring and Diagnostic Devices." Unfortunately, the NERC Standards Committee moved to cancel this project at their June 5, 2013 meeting and this cancellation was later approved by the NERC Board of Trustees. During the period when no NERC monitoring project was in process, Generator Operators used the potential lack of "visibility" during solar geomagnetic disturbances (GMD) to seek and obtain exemption from NERC Standard EOP-010-1 — Geomagnetic Disturbance Operations. This imprudent exemption increased risks to large power transformers in the bulk power system.

The present revival of a NERC real-time monitoring standard has potential to improve equipment monitoring and system reliability. But the lack of metrics or boundary conditions for equipment or events requiring real-time monitoring undermines the prospective benefits of this proposed standard. Without metrics, how can measures such as "dated operator or supporting logs, dated checklists, voice recordings (or other evidence)" be evaluated?

There are no connections between these processes and/or procedures for monitoring reliability or performing analysis, on the one hand, and cybersecurity standards, on the other hand. The latter critically affects reliability. How are these interrelationships to be considered?

The term "quality" as used 23 times in the standard is a very general term. Its composition is affected by hundreds of factors in instrumentation, pre-Reliability Coordinator processing, etc. Can reliability even be determined in the absence of a grid-wide standard for data flows?

The rationale for R3 and R4 asserts that "operators have procedures and receive indication(s) to address issues related to the quality of the analysis inputs used for Real-time Assessments." How can such a vague process be judged compliant or non-compliant? The measurement examples cited in M2, "computer printouts" (of what?) and system specifications (what "systems"?), are so non-deterministic as to be meaningless in judging quality of analysis.

Compliance would be nearly non-enforceable for these vague reliability monitoring and analytic assessments. How is NERC planning on enforcing compliance particularly when most Reliability Coordinators (RC) are also the Regional Entity? In almost every case, the RC has no evidence to support compliance with these unmeasurable, metric-less requirements as prescribed in this set of standards.

Significantly, the draft standard does not require monitoring of critical equipment such as large power transformers, generators, or reactive power support devices. Instead, the standard takes the approach of requiring monitoring of the "quality" of whatever data flows might exist. A good way to minimize compliance costs with this standard would be to simply eliminate data flows from critical equipment.

Overall, the Standard Drafting Team needs to be more specific and more rigorous. Otherwise, a vague standard will leave the false impression that real-time monitoring requirements exist; whereas, in reality, the standard will provide an escape hatch for equipment monitoring requirements, resulting in net harm to reliability of the bulk power system.

Unofficial Comment Form

Project 2009-02 Real-time Monitoring and Analysis Capabilities
IRO-018-1 and TOP-010-1

DO NOT use this form for submitting comments. Use the electronic form to submit comments on IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities and TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities. The electronic comment form must be completed by **8 p.m. Eastern, Monday, November 9, 2015**.

Documents and information about this project are available on the project page. If you have any questions, contact Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Background Information

Project 2009-02 Real-time Monitoring and Analysis Capabilities originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). The project SAR was revised earlier this year to account for proposed revisions to TOP and IRO standards developed in Project 2014-03 that are pending regulatory approval. Project 2009-02 is developing requirements to address monitoring and analysis capability issues identified in the 2008 RTBPTF report and the 2011 Southwest Outage Report, as well as addressing FERC Order No. 693 directives.

The Standard Drafting Team (SDT) developed two proposed Reliability Standards to meet the objectives outlined in the project SAR. IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities addresses issues related to the quality and availability of Reliability Coordinator (RC) monitoring and analysis capabilities. TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities contains similar proposed requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs).

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. The SDT has proposed a new standard IRO-018-1 to address RC monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

x No
Comments: Southern believes that the criteria in R1.1 should be limited to the RC's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4.

Each RC has the inherent responsibility to protect the integrity of the system in its RC area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. Other approved standards require the RC to have monitoring tools and capabilities to assess system conditions in its area and to perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability.

In order to fulfill its responsibility, the RC performs monitoring through the information collected from the modeled facilities in its RC area to accurately assess the state of the system and to perform real time assessments. Throughout this process, the RC is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

2. The SDT has proposed a new standard TOP-010-1 to address TOP and BA monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

x No

Comments: Southern believes that the criteria in R1.1 should be limited to the BA/TOP's ability to monitor and assess the current/expected condition of its BA/TOP area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4.

Each BA/TOP has the inherent responsibility to protect the integrity of the system in its BA/TOP area and to not contribute or cause any system violations in adjacent BA/TOP areas as required by other approved reliability standards. These already approved standards require the BA/TOP to continuously monitor the modeled facilities in its BA/TOP area and to accurately assess the state of the system using the information collected.

The BA/TOP is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

3. Do you agree with the Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

X No

Comments: Southern believes that the implementation date should be pushed back to allow time for the industry to determine the appropriate technology that is sufficient for each entity's operations. We also believe that in order to fully comply with the proposed standard, enough time should be allowed for the industry to update their current procedures and/or to create acceptable procedures, provide training to the appropriate System Operators and allow sufficient time for the entities to determine the technology available that is available and appropriate to support their operations, along with the required functionality.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

X No

Comments: Southern believes that the VRFs and VSLs for the proposed standards are too high and should be modified.

5. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has not been included, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Howard Gugel (via email) or at (404) 446-9693.

The Project 2009-02 Standards Drafting Team (SDT) appreciates the careful review and constructive feedback from stakeholders. As a result of comments received, the SDT made many improvements to the standards and implementation plan to incorporate stakeholder recommendations. Although Section 4.12 of the NERC Standard Processes Manual indicates that the SDT is not required to respond in writing to comments from the previous posting when it has identified the need to make significant changes to the standard, the SDT is providing summary responses to the comments received in order to facilitate stakeholder understanding of the changes made for the second posting.

The following is an overview of changes made by the SDT. Specific comments and revisions are discussed more fully in the summary consideration that follows.

- **Operating Procedures for Real-time data quality.** The SDT removed requirement parts that were unnecessarily prescriptive and clarified the scope of required actions to resolve Real-time data quality issues.
- **Operator awareness of Real-time data and analysis quality.** Stand-alone requirements to provide indications of Real-time data quality and analysis quality to System Operators were removed. The reliability objectives are to be addressed within the applicable entity's Operating Procedures.
- **Operating Procedures for analysis quality.** The SDT clarified the scope of the required actions to resolve analysis quality issues affecting the applicable entity's Real-time Assessments.
- **Alarm process monitoring.** The SDT revised the requirement for clarity.
- **Violation Severity Levels (VSLs).** The SDT revised the VSLs and fully incorporated degrees for assessing non-compliance with the requirements.
- **Implementation Plan.** The proposed Implementation Plan was revised such that all requirements become effective 18 months following regulatory approval.
- The SDT added a Guidelines and Technical Basis section with expanded details from the rationale boxes to clarify the SDT's intent.
- Requirement time horizons were revised.

Questions

1. The SDT has proposed a new standard IRO-018-1 to address RC monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

2. The SDT has proposed a new standard TOP-010-1 to address TOP and BA monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

3. Do you agree with the Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not **agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.**

5. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. The SDT has proposed a new standard IRO-018-1 to address RC monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Summary Consideration

Operating Procedures for Real-time data quality. The SDT removed requirement parts that were unnecessarily prescriptive, and clarified the scope of required actions to resolve Real-time data quality issues. In response to issues and concerns from stakeholders explained below, proposed IRO-018-1 Requirement R1 was revised as follows:

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: [Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]

1.1. Criteria for evaluating ~~potential~~ the quality of Real-time data; ~~quality discrepancies including, but not limited to:~~

~~1.1.1. Data outside of a prescribed data range;~~

~~1.1.2. Analog data not updated within a predetermined time period;~~

~~1.1.3. Data entered manually to override telemetered information; and~~

~~1.1.4. Data otherwise identified as invalid or suspect.~~

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to ~~coordinate resolution~~ resolve ~~of~~ Real-time data quality issues ~~discrepancies~~ with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

Specific comments and SDT responses are provided below:

- **Some commenters indicated that the proposed Requirement R1 was overly prescriptive or required entities to have criteria for evaluating Real-time data quality that may not apply to all systems used in Real-time monitoring.** The SDT revised this requirement in both of the proposed standards to align with the SDT's intent. The example list of criteria that needs to be addressed in the Operating Procedure or Operating Process has been moved to the guidelines and technical basis section, and the list clearly indicates that only the applicable criteria need to be included.
- **Other commenters suggested including additional details, metrics, or boundary conditions for equipment or events in the proposed standard to establish criteria for data quality.** The SDT considered alternate requirements/parts to specify data quality within the standard and determined that the best approach for reliability was for applicable entities to determine criteria for evaluating data quality in its Operating Procedures or Operating Processes. This is the approach taken with the

proposed standard. The SDT does not believe that there is a 'one size fits all' metric for data quality as part of a continent-wide standard requirement. The SDT believes that the data quality issue is best decided on a case-by-case basis using sound professional judgment and described in the applicable entity's Operating Procedure or Operating Process.

- **Commenters stated that the some data quality issues were beyond the direct control of the applicable entity. Commenters also proposed adding requirements to compel entities providing bad data to take corrective action.** The proposed standard requires entities to have an Operating Procedure or Operating Process to address the quality of Real-time data necessary to perform Real-time monitoring and Real-time Assessments. Entities have flexibility for determining the appropriate approach for evaluating the quality of their Real-time data, and for determining how to resolve Real-time data quality issues affecting Real-time assessments. The SDT believes an Operating Procedure or Operating Process can be developed to address data quality issues, even if they are beyond the direct control of the applicable entity. To satisfy the intent of the requirement, Part 1.3 requires that actions be taken to resolve data quality issues with the appropriate entities responsible for the data. The SDT does not believe additional requirements in proposed IRO-018-1 are necessary. IRO-010-1a and IRO-010-2 data specification standard establish obligations for entities to provide data and information to the Reliability Coordinator.
- **A commenter was concerned that the scope of data to be addressed was too broad.** The SDT modified the requirement (now Part 1.3) and provided a clear description of the SDT's intent in the Guidelines and Technical Basis Section. Requirement R1 Part 1.3 specifies the RC shall include actions to resolve Real-time data quality issues when its Real-time Assessments are affected. The Operating Procedure or Process should clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Operator awareness of Real-time data and analysis quality. Stand-alone requirements to provide indications of Real-time data quality and analysis quality to System Operators were removed (Requirements R2 and R4, respectively, in initial draft standard). The reliability objectives are to be addressed within the applicable entity's Operating Procedures or Operating Processes. Specific comments are below, along with SDT responses:

- **Some commenters suggested combining requirements for Operating Procedures with requirements to provide notifications to operators.** The SDT removed the stand-alone requirement to provide indications of Real-time data and analysis quality and incorporated the objective in requirements for Operating Procedures.
- **Commenters were concerned that the proposed requirement to provide System Operators with indications of data or analysis quality could potentially detract from operator situational awareness, or that evidence of compliance with the proposed requirement for each data point was burdensome.** In the proposed revised standard, entities are required to

include provisions for indicating data quality in their Operating Procedures. Provisions could include descriptions of quality indicators that are currently in use, such as display color codes, data quality flags, or other such indicators used by operating personnel as found in Real-time monitoring specifications. This approach provides entities with flexibility to determine how to achieve the reliability objective of providing operators with indications of data quality within the capabilities of existing Real-time monitoring and Real-time Assessment systems. The SDT is not implying that an entity would or should overload the operator with alarm indications of every instance of data quality issues. The SDT believes that the data quality issue is best decided on a case-by-case basis using sound professional judgment and described in the applicable entity's Operating Procedure or Operating Process.

Operating Procedures to address the quality of analysis used in Real-time Assessments. The SDT clarified the scope of actions to resolve analysis quality issues required to be included in an entities Operating Procedure or Operating Process, and added clarifying details to the rationale and Guidelines and Technical Basis section of the proposed standard. Proposed Requirement R2 is revised as follows:

~~R3.~~R2. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to ~~maintain~~ address the quality of ~~any~~ analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: [Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]

2.1. Criteria for evaluating the quality of ~~any~~ analysis used in its Real-time Assessments; and

~~3.1.~~2.2. Provisions to indicate the quality of ~~any~~ analysis used in its Real-time Assessments; and

~~3.2.~~2.3. Actions to resolve analysis quality issues affecting its Real-time Assessments ~~deficiencies in any analysis used in its Real-time Assessments~~.

Specific comments and SDT responses are provided below:

- **Commenters asked for clarification on what the SDT meant by *any analysis used in Real-time Assessments.*** Analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis, or other studies used for Real-time Assessments. Some entities may use several types of analysis in performing a Real-time Assessment. The Operating Procedure must address the quality of these analysis inputs to Real-time Assessments.
- **Commenters indicated the wording of the proposed requirement was unclear or overly broad.** The SDT revised the requirement by replacing *maintain* with *address*. An Operating Procedure addresses the quality of analysis used in Real-time Assessments by containing: 1) criteria for evaluating quality; 2) provisions to indicate quality to operating personnel; and 3) actions to resolve analysis quality issues affecting Real-time Assessment. The proposed requirement provides entities with flexibility to establish criteria for evaluating quality, accounting for system characteristics, Real-time Assessment approach,

and the capabilities of their Real-time tools. The SDT added a non-exclusive list of sources of quality criteria in the guidelines and technical basis section of the standard: "*The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-Time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.*"

- **A commenter was concerned that requirement part (2.3) wording was overly broad and implied that action was required to resolve every analysis quality deficiency.** The SDT modified the requirement (now Part 2.3) to clarify that the Operating Procedure must include actions to resolve analysis quality issues that affect its Real-time Assessments.
- **A commenter recommended increasing the evidence retention period for this requirement from 30-days.** The evidence retention period is aligned with the evidence retention period for performing Real-time Assessments contained in IRO-008-1 Requirement R2 and IRO-008-2 Requirement R4, which is a rolling 30-day window.

Independent Alarm Process Monitoring. Several commenters sought clarification regarding what is meant by an independent alarm process monitor. The SDT revised the requirement and rationale box to clarify the intent as shown below.

Rationale for Requirement R4: *The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.*

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term independent. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R4. Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

- **Some commenters asked if the independent alarm processor needed to be separate from the EMS system.** The proposed requirement does not preclude use of the EMS system as an independent alarm process monitor.

Time Horizons. A commenter questioned the *same-day operations* time horizon. The SDT agrees that all requirements should be satisfied in Real-time and has removed same-day operations.

Commenters questioned the need for reliability standards to address these issues and suggested that the reliability objectives would be better achieved through Organization Certification program. The proposed requirements in IRO-018-1 and TOP-010-1 address outstanding regulatory directives from Order No. 693 and various industry recommendations as described in the SAR.

Although this project was paused in 2011, it received renewed focus in 2013 when FERC identified shortcomings in previously proposed TOP and IRO standards (See FERC Notice of Proposed Remand issued Nov 21, 2013). Project 2014-03 - Revisions to TOP and IRO Standards was initiated to address issues identified in FERC's November 2013 NOPR, however the Project 2014-03 SDT, NERC Staff, and FERC Staff agreed that Real-time Monitoring and Analysis capabilities would not be completely addressed within the project. Accordingly, the Standards Committee authorized resumption of Project 2009-02 in 2015 following NERC's filing of TOP and IRO standards from Project 2014-03. The SDT's experience and the ongoing efforts to improve Real-time situational awareness within the industry indicate that issues of data quality and Real-time analysis quality remain relevant reliability objectives. The proposed standards address these in a manner that provides flexibility for applicable entities to account for system needs and Real-time monitoring and analysis capabilities. Furthermore, addressing these reliability issues through standards ensures ongoing accountability that begins with organization certification and is maintained through day-to-day operations.

Selected Answer: No

Answer Comment:	Our comments on the SAR posting essentially disagreed with the creation of this standard and the TOP-010 standard to mandate monitoring and analysis capability for the RC and TOP, which are the fundamental “bread and butter” capabilities that these entities must have to perform their assigned functions. We further suggested that the FERC directive could be met by an alternative but more appropriate means of incorporating the necessary requirements in the Organization Certification Requirements. The SDT disagree with our proposal citing that: “…. these capabilities should be demonstrated at the organization certification stage, but believes they should also be maintained on an ongoing basis through adherence to standards. Furthermore, development of standards is appropriate since, in general, organization certifications are based on the body of approved standards.” We continue to respectfully disagree that “maintained on an ongoing basis through adherence to standards” is the only approach. Such maintenance can also be mandated through the certification process. For example, if basic monitoring capability is required for certification, there needs to be periodic assessment of whether or not such capability continues to exist at a level to be specified, or no lower than that assessed at the initial certification stage. To argue that the only way to ensure maintenance through adherence to standards, then a good part of the current certification requirements will have to become standards or whose quality or functional capability need to be ascertained through standards. This is not the case today, nor do we think this is the case in the future. We once again urge the standard drafting team to consider the organization certification alternative as a means to address this FERC directive. For so long as the directive is met, it should not matter whether the requirements are incorporated into the certification requirements or in a new standard. Putting them into certification requirement is consistent with the intended use of

organization certification process to ensure the responsible entities have the capability to fulfill their functional obligations; whereas putting them into reliability standards is inconsistent with the intended use of standards to drive the right planning and operation behaviors.

Notwithstanding the above disagreement with creating this and the TOP-010 standards, the currently posted draft standard appears to be micro-managing the requirements and process for providing adequate tool/capability.

The 5 requirements in the proposed IRO—018 standard essentially require that the RC:

- Implement an Operating Process or Operating Procedure to address the quality of the Real-time data;

· Indicate to the operating personnel the quality of the Real-time data

· Implement an Operating Process or Operating Procedure to maintain the quality of any analysis used in its Real-time Assessments

· Provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments

· Utilize an independent alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

These requirements mandate the “how”, not the “what”, and are overly prescriptive and micro-managing the daily business of the RC. If the SDT decides to keep using a standard to meet the FERC directive, then the standard needs only to be one requirement that mandates the RC having in place acceptable quality monitoring and analysis capability at all times

	(except the down time for repair but for which a backup needs to be in place) for the RC to perform its functions and meet all applicable reliability standard. This requirement will be the "what", i.e., the necessary capability to perform the RC functions with specific reliability outcome - to ensure reliability. In brief, we are unable to support this standard for two main reasons: (a) that the standard is more suited for inclusion in the Organization Certification Requirements and (b) the standard as currently drafted is overly prescriptive and micro-managing.

Answer Comment:	The NSRF has concerns with redundancy and technical complications with the IRO-018-1 standard as proposed. The data quality objective can be simplified into a single requirement IRO-018-1 or TOP-001-3 / IRO-008 which is for entities to have tools or processes that consider data quality to reasonably assure a reasonably high confidence that the system is in a reliable state. Existing Energy Management Systems (EMS) / Real-Time Contingency Analysis (RTCA) tools already have this capability. **Redundancy:** The NSRF recognizes that FERC directed the drafting team to address missing data quality issues based on the 2003 blackout report. However, existing standards TOP-001-3 and TOP-003-3 already require effective monitoring and control which includes proper data. As an example, R13 of TOP-001-3 sets clear requirements that a real-time assessment must be performed at least once every 30 minutes. All TOPs assessment tools already consider bad data detection and identification from embedded software algorithms which are pre-requisites for successful execution of SE/RTCA. TOP's engaged in monitoring the execution of their assessment tool(s) already address problems with data input quality and assessment quality. Assessment tools must have robust data quality input and assessment capabilities to detect and identify problem(s) with any single piece of data (out of thousands of inputs) especially if that particular bad input (or limited set of bad input data) did NOT affect overall successful performance of the tool. **Technical Compliance Complications that Distort the Reliability Goal:**

	The zero defect nature of compliance, until fixed, drives unnecessary costly EMS / RTCA system upgrades without measureable system reliability improvements. The proposed TOP-010 and IRO-018 standards introduce vague and unclear formulations that will cause misunderstandings during compliance audits. Therefore, it is better to revise TOP-010 to a single requirement or revise TOP-001-3 or TOP-003-3 (and the corresponding IRO standards) with an additional simple requirement for entities to have tools or processes that considers data quality to reasonably assure a high confidence that the system is in a reliable state. Assessment tools use thousands of input data points including analog measurements and switching device statuses. Therefore, the reliability goal(s) are that the assessment tool has bad data detection and identification algorithms that allow the assessment tool to solve, and notify / log the system operator of bad data, and alarm if the bad data may compromise the assessment or solution. Identifying vague input data issues such as “analog data not updated” or “data identified as suspect” is problematic from a compliance standpoint. Some Energy management Systems (EMS) simply do cannot identify all suspect data and therefore the zero defect compliance expectation to identify all suspect data or all bad analog data is technically infeasible. The reliability goal is a high confidence assessment that the system is in a reliable state. That is very different from the stated compliance zero defect standard as written to identify all “analog data not updated” or identify “all suspect data”. Significant technical problems exist with the TOP-010 requirements when applied to input data received from other TOPs or RC’s (either directly or via ICCP). There are no technically feasible mechanisms to detect for “manually entered statuses. An example is detecting a manually entered “CLOSED” circuit breaker status whose actual status is “OPEN”, if such data was received via ICCP.

TOP-010 R3 is unclearly defined as Transmission Operators would have major difficulty in coming up with a conclusion as to what is “the quality of data necessary to perform real-time assessment”. At any moment in time, any specific measurement (or subset of measurements) might either be lost or be detected as “bad”. That does not necessarily mean that the real-time assessment would be inaccurate or invalid. The tool’s accuracy can be measured by other inherent quantitative indicators such as algebraic sum of allocation errors” or “confidence percentile”. An aggregate reasonable confidence percentile measurement would be a sufficient system reliability objective reasonably proving the system was in a reliable state.

TOP-010 R5 introduces unclear terminology of “maintaining the quality of any analysis used in real-time assessment”.

Selected Answer: No

Answer Comment:		RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES. Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state: Each RC/TOP/BA shall implement and Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry. Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed. PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

Selected Answer: No

Answer Comment: R1.1 uses “but not limited to”. That language is too open ended and cannot be audited or compliance limited. Compare it to R3. ‘ But not Limited to” only belongs in a Measurement.

R2 is a ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that state estimator can’t solve. Modern EMS systems incorporate data quality checks within their algorithms. However, how this requirement is phrased will dramatically impact the compliance risk an organization faces.

Selected Answer: No

Answer Comment:

While Peak supports the spirit of this proposed Standard, Peak recommends there be a requirement for entities who provide data per IRO-010 to resolve data quality issues in a mutually agreeable time schedule. The RC could have a process, but if there is no requirement for entities to fix the issues the end result is not achieved. The Standard as written falls short of providing resolution. The same comments apply to TOP-010-1.

Answer Comment:

We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard requires a one-size fits all approach that is leading to varied interpretations on “quality” and “adequacy” and may not enhance reliability of the BES.

We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability.

Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We also find it problematic when an entity may not “own” the data and is simply receiving a quality flag from a sender. The RC for example may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

The use of the term “suspect” in R2.1.4 in TOP-010-1 could lead to an interpretation that the operator “should have suspected” the data was incorrect. The word “suspect” is used in some EMS packages as an identifier for garbage or data that is suspect. We recommend the word be evaluated and replaced.

R3 is very problematic in that it infers there is a level of in-adequacy that studies must not fall below when requiring a level of “quality” to be maintained. This seems to be an attempt to not use the word “adequate”. Without defining the required level of quality, there is no way an entity can be compliant. Any entity may experience some reduced level of quality, but may still have acceptable performance from their studies without taking action to correct or mitigate the data. As written, the entity would be in violation for simply failing to “maintain” the level of quality. Perhaps R3 could be written this way:

R3. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain an acceptable level of quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

3.1. Criteria for determining the minimum quality of any analysis used in its Real-time Assessments; and

3.2. Actions to resolve unacceptable quality deficiencies in any analysis used in its Real-time Assessments.

	R4 seems to be applicable to situations where a tool is used to perform the RTA. This can become problematic when the assessment is simply an evaluation done by reviewing data and determining that no changes on the system have occurred such as could occur with a TOP who has only a few BES elements and does not possess an EMS or RTCA style "tool". We suggest that altering the phrase "independent alarm process monitor" could be beneficial. As stated, the phrasing seems to suggest particular processes or tools rather than the intent to just have an "independent process" to monitor the alarming system. We suggest the change as: **R5.** Each Reliability Coordinator shall utilize a process to independently monitor its Real-time monitoring alarm process monitor in order to provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

Kathleen Goodman - Kathleen Goodman On Behalf of: Michael Puscas, ISO New England, Inc., 2

Selected Answer:	No

Answer Comment:	The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to "fix." If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage though standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would, in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other "things" would happen). Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard. This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a "how" not "what" Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data, for assurance that RC, BA and TOPs have the ability to monitor appropriately in accordance with existing, performance-based Standards Requirements. The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded

in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

Answer Comment:

By Part 1.1 stating “Criteria for evaluating potential Real-time data quality discrepancies…” implies that a contingency analysis has to be done. Suggest removing “potential” from Part 1.1.

Language in R1.1 uses “but not limited to”. That language is too open ended and cannot be audited. Compare it to R3 use of “shall include”. “But not limited to” only belongs in a Measurement.

R2 is a bit ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that the state estimator can’t solve.

Suggest replacing the word “any” from R3 and R4 (relative to “any analysis”) and replacing with “reliability related” as “any” could be too broadly applied or interpreted. Additionally, the term analysis is broad. Standards related to Project 2014-03, approved through NERC as of this time, define such things as Real Time Assessments and Operational Planning Analysis. It’s not exactly clear what analysis would be referring to.

Selected Answer: No

Answer Comment:	(1) The language within Requirement R1 is vague and should not require criteria for evaluating data quality. References to criteria for evaluating data quality should not be ambiguous and unenforceable. The requirement needs to identify what real-time data is necessary to perform monitoring and assessments and consider if the data specifications maintained for reliability. The SDT should also clarify what is considered "quality" data and how an entity should identify data quality. The minimum criteria is not specific and does not provide enough information to make an objective determination. (2) Requirement R4 provides indications that the drafting team expects System Operators to receive quality data. If an entity makes data available with a quality code, but the system fails to update the quality code, is this a violation? The SDT also needs to identify the evidence required for this requirement and if a validation process is necessary. (3) The language within Requirement R5 expects an entity to have redundant alarms or independent alarms for real-time monitoring. What does "independent" mean in this context? The drafting team provides technical examples such as "heartbeat" or "watchdog" monitoring systems in its rationale, but does the independent system need to be separate from the real-time monitoring?

Anthony Jablonski - ReliabilityFirst - 10 -

Selected Answer:	No

Answer Comment:	ReliabilityFirst offers the following comments for consideration: 1. Requirement R2 i. It is unclear as to what the phrase “indication(s) of the quality of the Real-time data” is referring to. RF requests clarification on the term “indications” and what this involves. i. Also, since the System Operators work for the RC, it is unclear whom at the RC will be providing “indications” to the System Operators. As written, the System Operators (working for the RC) could provide indications to themselves. This does not seem to be the intent of the Requirement. 2. Requirement R4 i. Similar to Requirement R1, it is unclear as to what the phrase “indication(s) of the quality of any analysis” is referring to. RF requests clarification on the term “indications” and what this involves. i. Also, since the System Operators work for the RC, it is unclear whom at the RC will be providing “indications” to the System Operators. As written, the System Operators (working for the RC) could provide indications to themselves. This does not seem to be the intent of the Requirement.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer:	No

Answer Comment:	Comments: ERCOT expresses its concern that the proposed standard is too prescriptive and goes beyond the associated FERC directive regarding a requirement addressing "capabilities." In particular, these standards were developed to address operator awareness of tool or other outages that could impact real-time monitoring. Further, several of the requirements involve many more entities than the Reliability Coordinators and, absent a requirement for coordination, participation, and action in response to the Reliability Coordinator when an issue is identified, the proposed standard will not achieve its intended objective as written. This is extremely challenging (R1.2) because the majority of issues related to poor data quality or invalid analysis tool solutions can only be resolved by parties outside of the Reliability Coordinator (e.g facility owners, telecom companies, etc.) Additionally, real-time data and monitoring capabilities are critical to the certification of a Reliability Coordinator and are not "dynamic." Because such "capabilities" are complex, require coordination and inputs from other entities, and are key to the continued performance of a Reliability Coordinator's duties, they are not subject to change or revision often and, therefore, likely do not need continued monitoring and assessment. Finally, several other reliability standards and associated requirements are contingent upon the availability of real-time tools and data, which standards and requirements are subject to the compliance monitoring and enforcement program. Thus, ERCOT would recommend that requirements addressing capabilities be utilized during certification and not as a reliability standard subject to the compliance monitoring and enforcement program. Should NERC continue this project, however, ERCOT recommends that they are narrowly focused on alerting and alarming operators when their tools and/or displays are no longer working or otherwise compromised during real-time operations. Accordingly, ERCOT provides the following comments by requirement: **Requirements R1 and R2**

ERCOT respectfully recommends that requirements R1 and R2 be combined. Because the need to address data issues generally arises as a result of a data indicator or the need for manual data intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Hence, ERCOT proposes the following:

R1. Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R1.1 The Reliability Coordinator shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated.

Although this change does not accomplish the intended objective since the parties required to respond to the RC's actions initiated to coordinate resolution do not have any requirements to respond or correct the issue, it does however limit the requirements to what the RC as an entity has control over.

Requirements R3 and R4

ERCOT respectfully recommends that requirements R3 and R4 be combined. Because the need to address issues with real-time analyses generally arises as a result of an indicator that a particular analysis did not complete, is offline, or there is a need for manual intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Additionally, the availability of back up or offline processes for real-time analyses mitigates the risks associated with an issue or outage of analysis capabilities. For R4, specifically "quality" is more ambiguous when considering analysis tools vs data quality. Data quality is more discrete defined by predetermined limits for analog values and logic behind discrete/binary values. Analysis "quality" is not an appropriate term as it infers a range rather than a discrete nature (valid/invalid).Hence, ERCOT proposes the following:

R3. Each Reliability Coordinator shall provide its System Operators with indication(s) of the tool(s) used in its Real-time monitoring and Real-time Assessments are functioning as intended. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

R3.1 The Reliability Coordinator shall initiate actions to resolve any issues internally and to coordinate resolution of any data issues that are impacting such tool(s) with entity(ies) responsible for providing data inputs to such tool(s) when failure or degradation is indicated.

ERCOT recommends that necessary revisions be made to the Violation Severity Levels to ensure consistency with the proposed revisions.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Answer Comment: Neutral position as it does not applies to ITC

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:	No
Answer Comment:	Texas RE recommends making the retention period for R3 longer than 30 days. This requirement consists of a procedure and the implementation of a procedure. A 30 day retention policy will make it very difficult for a registered entity to demonstrate compliance. The policy implies that there is not a reliability issue if compliance monitoring is not performed within 30 days (or every 30 days). Is there an event analysis category that captures quality of data and assessments where the CEA may call for longer retention? Effectively this retention policy is indicative of masking a reliability issue where the quality of the data used in assessments and the quality indication to the System Operators may be inadequate to perform the reliability functions and the only indication of a failure will occur during an event (or the preceding 30 days of a monitoring activity). Texas RE suggests making IRO-018-1 R3, R4 clearer by using some of the language from the rationale. The requirements address “quality of analysis”, which could depend on many factors, while the rationale uses the language “to address issues related to the quality of the analysis inputs used for Real-time Assessments”. Texas RE recommends revising the phrase “with indication(s) of” used in proposed IRO-18-001, R2 and R4 as it is vague. Presumably, the purpose of IRO-18-001, R2 and R4 appears to be to ensure that the results of the required evaluations of potential Real-time data quality discrepancies are communicated to System Operators so they can be incorporated into Real-time monitoring and Real-time assessments. Accordingly, Registered Entities should be required to provide appropriate information from their data quality assessments to their System Operators. Texas RE suggests substituting “relevant information and/or analyses concerning” for “with indication(s) of”

to require appropriate, relevant information and/or any analyses of the quality of Real-time data be communicated to System Operators, not merely indications of data quality.

The reference to “with indications of” in the corresponding measures should also be revised along these lines. However, the types of evidence identified in the measures satisfy the proposed “relevant information and/or analyses concerning” standard.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC

Group Name: Southern Company

Group Member Name	Entity	Region	Segments
Robert Schaffeld	Southern Company Services, Inc	SERC	1
John Ciza	Southern Company Generation and Energy Marketing	SERC	6
R Scott Moore	Alabama Power Company	SERC	3
William Shultz	Southern Company Generation	SERC	5

Selected Answer: No

Answer Comment:	Southern believes that the criteria in R1.1 should be limited to the RC's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4. Each RC has the inherent responsibility to protect the integrity of the system in its RC area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. Other approved standards require the RC to have monitoring tools and capabilities to assess system conditions in its area and to perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability. In order to fulfill its responsibility, the RC performs monitoring through the information collected from the modeled facilities in its RC area to accurately assess the state of the system and to perform real time assessments. Throughout this process, the RC is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

2. The SDT has proposed a new standard TOP-010-1 to address TOP and BA monitoring and analysis capability issues identified in project SAR. Do you agree with the proposed standard? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Summary Consideration

TOP Operating Procedures for Real-time data quality. The SDT removed requirement parts that were unnecessarily prescriptive, and clarified the scope of required actions to resolve Real-time data quality issues. In response to issues and concerns from stakeholders explained below, proposed TOP-010-1 Requirement R1 was revised as follows:

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: [Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]

1.1. Criteria for evaluating ~~potential~~ the quality of Real-time data; ~~quality discrepancies including, but not limited to:~~

~~1.1.1. Data outside of a prescribed data range;~~

~~1.1.2. Analog data not updated within a predetermined time period;~~

~~1.1.3. Data entered manually to override telemetered information; and~~

~~1.1.4. Data otherwise identified as invalid or suspect.~~

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to ~~coordinate resolution~~ resolve ~~of~~ Real-time data quality issues ~~discrepancies~~ with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

Specific comments and SDT responses are provided below:

- **Some commenters indicated that the proposed Requirement R1 was overly prescriptive or required entities to have criteria for evaluating Real-time data quality that may not apply to all systems used in Real-time monitoring.** The SDT revised this requirement in both of the proposed standards to align with the SDT's intent. The example list of criteria that needs to be addressed in the Operating Procedure or Operating Process has been moved to the guidelines and technical basis section, and the list clearly indicates that only the applicable criteria need to be included.
- **Other commenters suggested including additional details or metrics in the proposed standard to establish criteria for data quality.** The SDT considered alternate requirements/parts to specify data quality within the standard and determined that the best approach for reliability was for applicable entities to determine criteria for evaluating data quality in its Operating Procedures or Operating Processes. This is the approach taken with the proposed standard. The SDT does not believe that there is

a ‘one size fits all’ metric for data quality as part of a continent-wide standard requirement. The SDT believes that the data quality issue is best decided on a case-by-case basis using sound professional judgment and described in the applicable entity’s Operating Procedure or Operating Process.

- **Commenters stated that the some data quality issues were beyond the direct control of the applicable entity. Commenters also proposed adding requirements to compel entities providing bad data to take corrective action.** The proposed standard requires entities to have an Operating Procedure or Operating Process to address the quality of Real-time data necessary to perform Real-time monitoring and Real-time Assessments. Entities have flexibility for determining the appropriate approach for evaluating the quality of their Real-time data, and for determining how to resolve Real-time data quality issues affecting Real-time assessments. The SDT believes an Operating Procedure or Operating Process can be developed to address data quality issues, even if they are beyond the direct control of the applicable entity. To satisfy the intent of the requirement, Part 1.3 requires that actions be taken to resolve data quality issues with the appropriate entities responsible for the data. The SDT does not believe additional requirements in proposed TOP-010-1 are necessary. TOP-003-3 data specification standard establishes obligations for entities to provide data and information to the Transmission Operator.
- **A commenter was concerned that the scope of data to be addressed was too broad.** The SDT modified the requirement (now Part 1.3) and provided a clear description of the SDT's intent in the Guidelines and Technical Basis Section. Requirement R1 Part 1.3 specifies the TOP shall include actions to resolve Real-time data quality issues when its Real-time Assessments are affected. The Operating Procedure or Process should clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

BA Operating Procedures for Real-time data quality. The SDT revised proposed Requirement R2 for consistency with proposed Requirement R1.

- **A commenter suggested removal of the reference to the analysis functions performed by the BA.** Proposed TOP-010-1 Requirement R2 addresses the quality of Real-time data required by proposed TOP-003-3 and used in the performance of the BA's Real-time reliability functions. Proposed standard TOP-003-3 Requirement R2 requires the BA to have a data specification for its analysis functions and Real-time monitoring. These analysis functions are described in the NERC Functional Model and other Reliability Standards.
- **A commenter suggested that BA requirements in the proposed standard could create 'double jeopardy' with proposed BAL-005 requirements.** NERC Rules of Procedure Appendix 4B section 2.5 addresses enforcement actions where multiple violations involving more than one Reliability Standard are the result of a single act or common incidence of noncompliance. The requirement in proposed BAL-005-1 is limited to information associated with Reporting ACE, whereas the requirement in proposed TOP-010-1 applies to Real-time data necessary to perform the BA's analysis functions and Real-time monitoring. These functions go beyond BAL-005 as described in the NERC Functional Model and existing and proposed TOP and IRO standards.

Operator awareness of Real-time data and analysis quality. Stand-alone requirements to provide indications of Real-time data quality and analysis quality to System Operators were removed (Requirements R3, R4, and R6 in initial draft standard). The reliability objectives are to be addressed within the applicable entity's Operating Procedures or Operating Processes. Specific comments are below, along with SDT responses:

- **Some commenters suggested combining requirements for Operating Procedures with requirements to provide notifications to operators.** The SDT removed the stand-alone requirement to provide indications of Real-time data and analysis quality and incorporated the objective in requirements for Operating Procedures.
- **Commenters were concerned that the proposed requirement to provide System Operators with indications of data or analysis quality could potentially detract from operator situational awareness, or that evidence of compliance with the proposed requirement for each data point was burdensome.** In the proposed revised standard, entities are required to include provisions for indicating data quality in their Operating Procedures. Provisions could include descriptions of quality indicators that are currently in use, such as display color codes, data quality flags, or other such indicators used by operating personnel as found in Real-time monitoring specifications. This approach provides entities with flexibility to determine how to achieve the reliability objective of providing operators with indications of data quality within the capabilities of existing Real-time monitoring and Real-time Assessment systems. The SDT is not implying that an entity would or should overload the operator with alarm indications of every instance of data quality issues. The SDT believes that the data quality issue is best decided on a case-by-case basis using sound professional judgment and described in the applicable entity's Operating Procedure or Operating Process.

Operating Procedures to address the quality of analysis used in Real-time Assessments. The SDT clarified the scope of actions to resolve analysis quality issues required to be included in an entities Operating Procedure or Operating Process, and added clarifying details to the rationale and Guidelines and Technical Basis section of the proposed standard. Proposed Requirement R3 is revised as follows:

~~R5.~~R3. Each Transmission Operator shall implement an Operating Process or Operating Procedure to ~~maintain~~ address the quality of ~~any~~ analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: [Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]

3.1. Criteria for evaluating the quality of ~~any~~ analysis used in its Real-time Assessments; and

~~3.1.~~3.2. Provisions to indicate the quality of ~~any~~ analysis used in its Real-time Assessments; and

~~3.2.~~3.3. Actions to resolve analysis quality issues affecting its Real-time Assessments ~~deficiencies in any analysis used in its Real-time Assessments~~.

Specific comments and SDT responses are provided below:

- **Commenters asked for clarification on what the SDT meant by *any analysis used in Real-time Assessments.*** Analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis, or other studies used for Real-time Assessments. Some entities may use several types of analysis in performing a Real-time Assessment. The Operating Procedure must address the quality of these analysis inputs to Real-time Assessments.
- **Commenters indicated the wording of the proposed requirement was unclear or overly broad.** The SDT revised the requirement by replacing *maintain* with *address*. An Operating Procedure addresses the quality of analysis used in Real-time Assessments by containing: 1) criteria for evaluating quality; 2) provisions to indicate quality to operating personnel; and 3) actions to resolve analysis quality issues affecting Real-time Assessment. The proposed requirement provides entities with flexibility to establish criteria for evaluating quality, accounting for system characteristics, Real-time Assessment approach, and the capabilities of their Real-time tools. The SDT added a non-exclusive list of sources of quality criteria in the guidelines and technical basis section of the standard: "*The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-Time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.*"
- **A commenter was concerned that requirement part (3.3) wording was overly broad and implied that action was required to resolve every analysis quality deficiency.** The SDT modified the requirement (now Part 3.3) to clarify that the Operating Procedure must include actions to resolve analysis quality issues that affect its Real-time Assessments.
- **A commenter recommended increasing the evidence retention period for this requirement from 30-days.** The evidence retention period is aligned with the evidence retention period for performing Real-time Assessments contained in TOP-001-3 Requirement R13, which is a rolling 30-day window.

Independent Alarm Process Monitoring. Several commenters sought clarification regarding what is meant by an independent alarm process monitor. The SDT The SDT revised the requirement and rationale box to clarify the intent as shown below. " *An ~~independent~~ alarm process monitor is independent if it ~~one that~~ will ~~would~~ not fail with a simultaneous failure of the Real-time monitoring alarm processor. ~~A 'heartbeat' or 'watchdog' monitoring system may accomplish this objective.~~*" The SDT believes the intended capability is appropriately identified by the proposed requirement and the revised rationale box.

- **Some commenters asked if the independent alarm processor needed to be separate from the EMS system.** The proposed requirement does not preclude use of the EMS system as an independent alarm process monitor.

Use of third-party services to perform Real-time Assessments. A commenter recommended the SDT address the possibility that some TOPs use a third-party to perform Real-time Assessments. The proposed definition of Real-time Assessment provides for the use of third-party services. The SDT believes the requirements in proposed TOP-010-1 must be satisfied by the applicable entity, regardless of whether that entity is performing its own Real-time Assessment or it has contracted with a third-party provider.

Time Horizons. A commenter questioned the *same-day operations* time horizon. The SDT agrees that all requirements should be satisfied in Real-time and has removed same-day operations.

Commenters questioned the need for reliability standards to address these issues and suggested that the reliability objectives would be better achieved through Organization Certification program. The proposed requirements in IRO-018-1 and TOP-010-1 address outstanding regulatory directives from Order No. 693 and various industry recommendations as described in the SAR. Although this project was paused in 2011, it received renewed focus in 2012 when FERC identified shortcomings in previously proposed TOP and IRO standards (See FERC Notice of Proposed Remand issued Nov 21, 2013). Project 2014-03 - Revisions to TOP and IRO Standards was initiated to address issues identified in FERC's November 2013 NOPR, however the Project 2014-03 SDT, NERC Staff, and FERC Staff agreed that Real-time Monitoring and Analysis capabilities would not be completely addressed within the project. Accordingly, the Standards Committee authorized resumption of Project 2009-02 in 2015 following NERC's filing of TOP and IRO standards from Project 2014-03. The SDT's experience and the ongoing efforts to improve Real-time situational awareness within the industry indicate that issues of data quality and Real-time analysis quality remain relevant reliability objectives. The proposed standards address these in a manner that provides flexibility for applicable entities to account for system needs and Real-time monitoring and analysis capabilities. Furthermore, addressing these reliability issues through standards ensures ongoing accountability that begins with organization certification and is maintained through day-to-day operations.

John Fontenot - Bryan Texas Utilities - 1 -

Selected Answer: Yes

Jeff Wells - Grand River Dam Authority - 3 -

Selected Answer: Yes

Thomas Foltz - AEP - 5 -

Selected Answer: No

Answer Comment:	Clarity is needed regarding how granular the Requirements are to the data points themselves. For example, is the Transmission Operator obligated in R3 to provide indication(s) of quality on a data point basis, or rather, may it be done as a collection of data points, grouping them as needed? Of even greater concern, would the “actions to coordinate resolution” in R1 need to be performed on a per-data point basis as well? Hundreds of thousands of data points are involved in Real-time monitoring and Real-time Assessments, and the requirements in this standard must be written realistically to accommodate a high volume of data points which continue to increase. In addition, AEP has a large volume of data provided by external entities. AEP would have little to no ability to “coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data” as specified in R1.2, for this externally provided data. Perhaps a re-ordering of the TOP-10-1 requirements could help the overall flow of the standard. For example, it may be preferable to have a Requirement for indications of quality (R3 for example) to precede a Requirement to have an Operating Process or Operating Procedure to address the quality of that data (R1 for example).

Leonard Kula - Independent Electricity System Operator - 2 -

Selected Answer:	No
Answer Comment:	**We do not agree with the need to create this standard, and the way the proposed standard is drafted (overly prescriptive and micro-managing). Please see our comments under Q1**.

Tyson Archie - Platte River Power Authority - 5 -

Selected Answer: No

Answer Comment:

Platte River (PRPA) like many smaller TOP's does not have an EMS system capable of performing Real-Time Assessments. To accomplish this task, we contract our Reliability Coordinator to run our Real-Time Assessments. Platte River provides data points to the RC, who runs the Real-Time Analyses and then provides PRPA with the advanced applications.

PRPA does not have a concern with the intent of the standard, but requests that the drafting team address the possibility of relying on 3rd party contracts to perform Real-Time Assessments for entities that do not possess the ability to perform each of the requirements in this standard.

Without the ability to contract a 3rd party for these services, the financial burden of purchasing and installing a new EMS system capable of performing these tasks would easily reach into the millions of dollars.

Selected Answer: Yes

Answer Comment:	R1 and R2: It can be very difficult to identify some of the real-time data quality problems listed in this Standard, particularly analog data that is not updating. Many current systems do not have the capability to easily detect this for all analogs, and adding this capability for all data points could require extensive Software, database, and/or Hardware (for performance reasons) changes that cannot be easily or quickly implemented. As real-time telemetry becomes more de-centralized in the field and as we are required to rely more and more on data from other entities (via ICCP), it becomes more and more difficult to detect data that is out of range. Putting this requirement on an entity that has no control over the source of the data or how it is provided seems to put an unfair regulatory burden on that entity. Most of the real-time data quality criteria seem focused on analog data, but incorrect digital data can have a greater impact on analysis results than incorrect/stale analog data. However, identifying non-updating digital data can be even more difficult than identifying non-updating analog data. How do we prove to an auditor that we identified all instances of data with poor quality? These requirements seemed focused on evaluating the quality of incoming real-time data. Are there any requirements for providing accurate quality codes with data? For example: Both ICCP and some RTU protocols support including quality codes with data values. For example, if an entity receiving ICCP data relies on these quality codes to at least partially determine the quality of a data point, then the received quality codes need to be accurate.

	Both ICCP and some RTU protocols support including time-stamps of the most recent change of a data point value. Some systems use this received time-stamp when processing the data, and it can impact applications used by operators, including where a new alarm for that point appears in an EMS/SCADA alarm list. Receiving an incorrect time-stamp can negatively impact the information and results provided to an operator. R3 and R4: What is considered sufficient notification to an operator of real-time data quality problems? If quality codes are shown on EMS/SCADA displays, an operator may not look at the displays with data quality issues. But if alarms are generated to notify the operator, the increase in alarm volume may detract the operator's attention from more important alarms. Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA. R5: There is no guidance provided for a Transmission Operator to create criteria to evaluate the quality of analysis used in its Real-time Assessments. If an auditor will be expected to review the criteria used by a Transmission Operator, the guidelines that will be provided to auditors for this purpose should be listed here. R7: With current EMS/SCADA architectures, it can be difficult to define what comprises the "alarm processor". While requirements R1-R4 of this Standard may cover the quality of the telemetered inputs to the EMS/SCADA, there are many EMS/SCADA components used after that to make operators aware of alarms. It is not just a specific alarm processing program, but also includes things such as the EMS/SCADA data dissemination programs, the EMS/SCADA User Interface application, audible alarming capabilities, even the operator

	console hardware itself. Should this requirement be re-worded to make it clearly cover the ability of the system to make alarms available to operators and not imply it is limited it to a specific “program”? VSLs: R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented. R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented. R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard?
Joe O'Brien - NiSource - Northern Indiana Public Service Co. - 6 - Selected Answer:	 No

Answer Comment:	We would like to see "quality" defined or clarrified. Also, we are not sure who is responsible for the quality of the data received from the interconnections. We also support some of the comments coming out of the MRO standards group.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Selected Answer:	Yes
Answer Comment:	***ATC supports the comments submitted by the MRO NSRF.*** However, raise the following question: Does having a process or procedure support your quality of Real-time data? It's not the process or procedure but rather what systems do you have in place to alert the TOP/BA that there is an issue with your data (R1.1 – R1.2). **R1 and R2:** o It can be very difficult to identify some of the real-time data quality problems listed in this Standard, particularly analog data that is not updating. Many current systems do not have the capability to easily detect this for all analogs, and adding this capability for all data points could require extensive Software, database, and/or Hardware (for performance reasons) changes that cannot be easily or quickly implemented. As real-time telemetry becomes more de-centralized in the field and as we are required to rely more and more on data from other entities (via ICCP), it becomes more and more difficult to detect data that is out of range. Putting this requirement on an entity that has

o no control over the source of the data or how it is provided seems to put an unfair regulatory burden on that entity.

o Most of the real-time data quality criteria seem focused on analog data, but incorrect digital data can have a greater impact on analysis results than incorrect/stale analog data. However, identifying non-updating digital data can be even more difficult than identifying non-updating analog data.

o How do we prove to an auditor that we identified all instances of data with poor quality?

o These requirements seemed focused on evaluating the quality of incoming real-time data. Are there any requirements for providing accurate quality codes with data? For example:

§ Both ICCP and some RTU protocols support including quality codes with data values. For example, if an entity receiving ICCP data relies on these quality codes to at least partially determine the quality of a data point, then the received quality codes need to be accurate.

§ Both ICCP and some RTU protocols support including time-stamps of the most recent change of a data point value. Some systems use this received time-stamp when processing the data, and it can impact applications used by operators, including where a new alarm for that point appears in an EMS/SCADA alarm list. Receiving an incorrect time-stamp can negatively impact the information and results provided to an operator.

R3 and R4:

o What is considered sufficient notification to an operator of real-time data quality problems? If quality codes are shown on EMS/SCADA displays, an operator may not look at the displays with data quality issues. But if alarms are generated to notify the operator, the increase in alarm volume may detract the operator's attention from more important alarms.

o Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA.

R5: There is no guidance provided for a Transmission Operator to create criteria to evaluate the quality of analysis used in its Real-time Assessments. If an auditor will be expected to review the criteria used by a Transmission Operator, the guidelines that will be provided to auditors for this purpose should be listed here.

R7: With current EMS/SCADA architectures, it can be difficult to define what comprises the "alarm processor". While requirements R1-R4 of this Standard may cover the quality of the telemetered inputs to the EMS/SCADA, there are many EMS/SCADA components used after that to make operators aware of alarms. It is not just a specific alarm processing program, but also includes

· things such as the EMS/SCADA data dissemination programs, the EMS/SCADA User Interface application, audible alarming capabilities, even the operator console hardware itself. Should this requirement be re-worded to make it clearly cover the ability of the system to make alarms available to operators and not imply it is limited it to a specific "program"?

VSLs:

o R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented.

o R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented.

R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard?

Kathleen Goodman - Kathleen Goodman On Behalf of: Michael Puscas, ISO New England, Inc., 2

Selected Answer: No

Answer Comment:	The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to "fix." If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage though standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would, in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other "things" would happen). Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard. This proposed project appears to be well-suited for a guideline document as opposed to a Standard. As written, the SAR appears to intend to write a "how" not "what" Standard (*i.e.*, it does not appear to be a results-based standard). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data, for assurance that RC, BA and TOPs have the ability to monitor appropriately in accordance with existing, performance-based Standards Requirements. The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded

	in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement. Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others. Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

William Temple - William Temple On Behalf of: Mark Holman, PJM Interconnection, L.L.C., 2

Selected Answer:	No
Answer Comment:	RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

	Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state: Each RC/TOP/BA shall implement and Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry. Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed. PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

Selected Answer:	No

Answer Comment:	R1.1 uses “but not limited to”. That language is too open ended and cannot be audited or compliance limited. Compare it to R3. ‘ But not Limited to” only belongs in a Measurement. R2 is ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that state estimator can’t solve. Modern EMS systems incorporate data quality checks within their algorithms. However, how this requirement is phrased will dramatically impact the compliance risk an organization faces.

Darnez Gresham - Darnez Gresham On Behalf of: Thomas Mielnik, Berkshire Hathaway Energy - MidAmerican Energy Co., 1, 3

Selected Answer:	No

Answer Comment:	The MidAmerican Energy Company (MEC) has concerns with redundancy and technical complications with the TOP-010 standard as proposed. The data quality objective can be simplified into a single requirement in either TOP-010-1 or TOP-001-3 which is for entities to have tools or processes that consider data quality to reasonably assure a reasonably high confidence that the system is in a reliable state. Existing Energy Management Systems (EMS) and Real-Time Contingency Analysis (RTCA) tools already have this capability. **Redundancy:** The MEC recognizes that FERC directed the drafting team to address missing data quality issues based on the 2003 blackout report. However, existing standards TOP-001-3 and TOP-003-3 already require effective monitoring and control which includes proper data quality. As an example, R13 of TOP-001-3 sets clear requirements that a real-time assessment must be performed at least once every 30 minutes. That requirement includes the identification and consideration of data quality to provide successful assessment solutions at least once every 30 minutes. TOP-001-3 R13 requires TOPs to have operating processes or procedures that address issues bad data detection and identifications that are likely to cause assessment failures such as non-convergence or invalid solutions. All TOPs assessment tools already consider bad data detection and identification from embedded software algorithms which are pre-requisites for successful execution of SE/RTCA. TOP's engaged in monitoring the execution of their assessment tool(s) already address problems with data input quality and assessment quality. Assessment tools must have robust data quality input and assessment capabilities to detect and identify problem(s) with any single piece of data

(out of thousands of inputs) especially if that particular bad input (or limited set of bad input data) did NOT affect overall successful performance of the tool.

Technical Compliance Complications that Distort the Reliability Goal:

The zero defect nature of compliance, until fixed, drives unnecessary costly EMS / RTCA system upgrades without measureable system reliability improvements. The proposed TOP-010 standards introduce vague and unclear formulations that will cause misunderstandings during compliance audits. Therefore, it is better to revise TOP-010 to a single requirement or revise TOP-001-3 or TOP-003-3 with an additional simple requirement for entities to have tools or processes that considers data quality to reasonably assure a high confidence that the system is in a reliable state.

Assessment tools use thousands of input data points including analog measurements and switching device statuses. Therefore, the reliability goal(s) are that the assessment tool has bad data detection and identification algorithms that allow the assessment tool to solve, and notify / log the system operator of bad data, and alarm if the bad data may compromise the assessment or solution.

Identifying vague input data issues such as “analog data not updated” or “data identified as suspect” is problematic from a compliance standpoint. Some Energy management Systems (EMS) simply do cannot identify all suspect data and therefore the zero defect compliance expectation to identify all suspect data or all bad analog data is technically infeasible. The reliability goal is a high confidence assessment that the system is in a reliable state. That is very different from the stated compliance zero defect standard as written to identify all “analog data not updated” or identify “all suspect data”.

	Significant technical problems exist with the TOP-010 requirements when applied to input data received from other TOPs or RC's (either directly or via ICCP). There are no technically feasible mechanism to detect for "manually entered statuses. An example is detecting a manually entered "CLOSED" circuit breaker status whose actual status is "OPEN", if such data was received via ICCP. TOP-010 R3 is unclearly defined as Transmission Operators would have major difficulty in coming up with a conclusion as to what is "the quality of data necessary to perform real-time assessment". At any moment in time, any specific measurement (or subset of measurements) might either be lost or be detected as "bad". That does not necessarily mean that the real-time assessment would be inaccurate or invalid. The tool's accuracy can be measured by other inherent quantitative indicators such as algebraic sum of allocation errors" or "confidence percentile". An aggregate reasonable confidence percentile measurement would be a sufficient system reliability objective reasonably proving the system was in a reliable state. TOP-010 R5 introduces unclear terminology of "maintaining the quality of any analysis used in real-time assessment".

Angela Gaines - Portland General Electric Co. - 1,3,5,6 - WECC

Selected Answer:	No

Answer Comment:

PGE thanks the drafting team for their efforts regarding the development of this proposed standard. After meeting with the SMEs involved with the proposed standard, they've provided the following:

SUMMARY

• We recommend a “No” vote on TOP-010-1 at this time because we feel additional clarity is needed.

• Submit comments on the following:

◦ Requesting clarification on the meaning of *analysis* and *Real-time Assessments*. (Human or machine.)

◦ If R5 is addressing the knowledge or ability of operators, it belongs in PER-005, not here.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RFC

Group Member Name	Entity	Region	Segments
Doug Hils	Duke Energy	RFC	1
Lee Schuster	Duke Energy	FRCC	3
Dale Goodwine	Duke Energy	SERC	5
Greg Cecil	Duke Energy	RFC	6

Selected Answer: No

Answer Comment:

R1, R2, R3, & R4: Duke Energy questions the use of the term “analysis” in R2 and R4, attributable to the BA, but is not present in R1 and R3 that is attributable to the TOP. The use of the term analysis in this context suggests that the BA has some sort of responsibility to carry out analyses similar to that of the RC or TOP. We disagree with this premise. Also, we question why the term “analysis” is not present in R1 or R3. The TOP does in fact have responsibilities to carry out analyses, and this should be acknowledged in R1 and R3. Duke Energy suggests that all references to the BA performing an analysis be removed in all attributable requirements, and that analysis that are expected to be performed by the TOP be referenced in requirements attributable to it.

R5: We request further clarification on the use of the phrase “analysis inputs” in the Rationale of R5, as opposed to the use of the term “analysis” in the wording of R5. Is the use of “inputs” meaning other types of data or operational conditions that aren’t described in R1-R4? More clarification regarding what is meant by the phrase “analysis inputs” would be helpful.

R7: Duke Energy requests further explanation on what it meant by the use of the term “processor” in regards to the failure of a Real-time monitoring of an alarm processor. Is this referring to independent hardware that monitors EMS/SCADA or independent processes within the EMS system? Is separate hardware necessary, or will separate processes be sufficient? Should this be something that is housed outside of the EMS? We feel that an example of what is meant by independent (does this mean external?), as well as “processor” would enhance clarity in this requirement.

Answer Comment:

In part 1.1 of R1, if the bulleted list is intended to be an example list, then the examples should not be given part numbers but should be rolled up into the main sentence. If it is intended to be a minimum set of criteria, then “but not limited to” should be replaced with “at a minimum”.

In part 2.1 of R2, if the bulleted list is intended to be an example list, then the examples should not be given part numbers but should be rolled up into the main sentence. If it is intended to be a minimum set of criteria, then “but not limited to” should be replaced with “at a minimum”.

Scott McGough - Georgia System Operations Corporation - 3 -

Selected Answer:	No
Answer Comment:	This standard creates a double jeopardy situation. Requirement R1 Part 1.2 of this standard specifies the TOP shall include actions to coordinate resolution of Real-time data quality discrepancies in its Operating Process or Operating Procedure. These actions are also required by proposed TOP-003-3 Requirement R5 Part 5.2 which requires a process to resolve data conflicts for the data required by the data specification in Requirement TOP-003-3 R3. If that data specification requires the provision of Real-time data, then TOP-003-3 Part 5.2 requires a process to resolve data conflicts and quality discrepancies with that Real-time data. Suggested wording: **R1.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data**, excluding Real-time data already addressed by TOP-003-3 R5 Part 5.2,** necessary to perform its Real-time monitoring and Real-time Assessments.

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1 -

Selected Answer:	No

Answer Comment:	CenterPoint Energy feels R1.1.2 (Analog data not updated within a predetermined time period) brings more of a compliance burden than a reliability benefit. CenterPoint Energy has confidence System Operators investigate and communicate these issues upon suspicion; however, defining a predetermined time period for a data quality code check including each individual piece of data poses a threat to the System Operator's focus monitoring important issues on the grid. CenterPoint Energy also realizes there is a challenge in deciphering whether or not a value has simply not changed in a predetermined time period or if that value hasn't updated. CenterPoint Energy recommends the SDT clarify that 1.1.2 refers to the universe or a pre-defined subset of data and not specific to any one, individual piece of data.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3

Linn Oelker	LG&E and KU Energy, LLC	SERC	6
Justin Bencomo	LG&E and KU Energy, LLC	SERC	1,3,5,6

Selected Answer: No

Answer Comment:

Comments: These comments are submitted on behalf of the following PPL NERC Registered Affiliates ("PPL"): Louisville Gas and Electric Company, Kentucky Utilities Company and PPL Electric Utilities Corporation. The PPL NERC Registered Affiliates are registered in two regions (RFC and SERC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.

The PPL NERC Registered Affiliates believe if additional requirements are necessary for TOP's and BA's to address the quality of their Real-time data, then these requirements should be included in the proposed Reliability Standard TOP-003-3. Per TOP-003-3 (pending regulatory approval) , TOP's and BA's are required to maintain a documented specification for the data necessary to perform its Real-time monitoring and Real-time assessments including periodicity for providing data and a mutually agreeable process for resolving data conflicts. Therefore, adding additional requirements to TOP-003-3 to address the quality of the TOP and BA specified data is less of a compliance burden to stakeholders than creating a new standard.

If the SDT chooses to continue with the proposed TOP-010 standard, we request the sub-requirements R1.1.1 thru 1.1.4 and R2.1.1 thru 2.1.4 be removed from the proposed TOP-010 to allow entities the flexibility to write an Operating Process or Operating Procedure tailored to their system and their Reliability Coordinators specifications where applicable.

Selected Answer: No

Answer Comment:

Following are the same comments we provided on IRO-018-1 draft. They are generally applicable to the proposed TOP-010-1 Standard also.

We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard requires a one-size fits all approach that is leading to varied interpretations on “quality” and “adequacy” and may not enhance reliability of the BES.

We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability.

Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We also find it problematic when an entity may not “own” the data and is simply receiving a quality flag from a sender. The RC for example may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

The use of the term “suspect” in R2.1.4 in TOP-010-1 could lead to an interpretation that the operator “should have suspected” the data was incorrect. The word “suspect” is used in some EMS packages as an identifier for garbage or data that is suspect. We recommend the word be evaluated and replaced.

R3 is very problematic in that it infers there is a level of in-adequacy that studies must not fall below when requiring a level of “quality” to be maintained. This seems to be an attempt to not use the word “adequate”. Without defining the required level of quality, there is no way an entity can be compliant. Any entity may experience some reduced level of quality, but may still have acceptable performance from their studies without taking action to correct or mitigate the data. As written, the entity would be in violation for simply failing to “maintain” the level of quality. Perhaps R3 could be written this way:

R3. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to maintain an acceptable level of quality of any analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations, Real-time Operations]*

3.1. Criteria for determining the minimum quality of any analysis used in its Real-time Assessments; and

3.2. Actions to resolve unacceptable quality deficiencies in any analysis used in its Real-time Assessments.

R4 seems to be applicable to situations where a tool is used to perform the RTA. This can become problematic when the assessment is simply an evaluation done by reviewing data and determining that no changes on the system have occurred such as could occur with a TOP who has only a few BES elements and does not possess an EMS or RTCA style "tool".

We suggest that altering the phrase “independent alarm process monitor” could be beneficial. As stated, the phrasing seems to suggest particular processes or tools rather than the intent to just have an “independent process” to monitor the alarming system. We suggest the change as:

R5. Each Reliability Coordinator shall utilize a process to independently monitor its Real-time monitoring alarm process monitor in order to provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Selected Answer: Yes

Jack Stamper - Clark Public Utilities - 3 -

Selected Answer: No

Answer Comment: Some of the criteria listed in R1.1 is confusing. Data outside of prescribed data range would more likely indicate unusual system conditions rather that a data quality issue. We are currently unsure how the monitoring of these criteria could be implemented without additional software. Also, since implementation is part of the Measurement we would assume some logging of this implementation would be necessary to prove compliance which is also a process without and obvious means of accomplishment. There needs to be some substantial guidance or technical discussion providing information on what would be the expectations for utilities to be in compliance with this standard.

Selected Answer: No

Answer Comment:	Each requirement is unique to a particular functional entity. Requirements can be eliminated by having each requirement refer to Transmission Operator and Balancing Authority. Similarly to IRO-018-1, language in R1.1 uses “but not limited to”. That language is too open ended and cannot be audited. Compare it to R3 use of “shall include”. “But not limited to” only belongs in a Measurement. R2 is a bit ambiguous in whether a single data point of bad quality needs to be flagged or if the aggregate data is so bad that the state estimator can’t solve. Suggest replacing the word “any” from R5 and R6 (relative to “any analysis”) and replacing with “reliability related” as “any” could be too broadly applied or interpreted. Additionally, the term analysis is broad. Standards related to Project 2014-03, approved through NERC as of this time, define such things as Real Time Assessments and Operational Planning Analysis. It’s not exactly clear what analysis would be referring to.

Glenn Pressler - CPS Energy - 1 -

Selected Answer:	No
Answer Comment:	R5: Need to clarify. What is “quality of any analysis used”? Need to clarify & better define. How is SO notified & Will SO need evidence? R7: Regarding “independent alarm process monitor (IAPM)”: Need more clarity; is this separate from the SCADA data /SCADA system? Is an IAPM separate from SCADA system? Need more clarity.

Selected Answer: No

Answer Comment: (1) The standard has significant burdens on System Operators to demonstrate compliance. Requirements R2, R3, and R5.2 expect solution frequencies every 5 minutes, 12 times an hour, 288 times a day. Does each quality deficiency occurring during this period need to be resolved? A RTU communication issue lasting only 10 minutes would impact a minority number of these instances and generate unnecessary work for a system operator. We believe the SDT should provide some qualifier for this requirement.

(2) We believe this standard has the potential to add to the System Operator's workload and take their attention away from their duties of monitoring system reliability. NERC has spent significant efforts to educate industry on situational awareness and human performance topics, including cognitive overload where too much stimuli affecting a System Operator will have negative effects on their performance.

(3) The standard also introduces potential double jeopardy concerns between requirements TOP-010 R2 and BAL-005 R5. At the time of the webinar, the SDT did not look into these possibilities. However, NERC did later respond to the potential double jeopardy with the following statement:

"R5 in proposed BAL-005-1 is limited to information associated with Reporting ACE. R2 in proposed TOP-010-1 applies to Real-time data necessary to perform the BA's analysis functions and Real-time monitoring. These functions go beyond BAL-005 as described in the NERC Functional Model and existing and proposed TOP and IRO standards. Double jeopardy is never an issue because NERC Rules of Procedure include provisions for handling incidences of non-compliance with two or more requirements. Specifically, NERC or the regional entity would issue a single penalty or sanction as called for in the Rules of Procedure (Appendix 4B, Section 2.5)."

We disagree with this approach, as the ROP is focused on being in violation of a single requirement or sub-requirement, not to separate requirements. The issue of double jeopardy could occur when there is an event based on poor ACE data quality, which could also implicate TOP-010-1. While TOP-010-1 contains additional data, it is possible to be in violation of two requirements for the same instance, which is the very definition of double jeopardy. The NERC ROP does not provide relief for this situation.

(4) We have concerns with the potential impact to a System Operator's general awareness of the system. The System Operator will now be spending

	more time logging and performing actions strictly for compliance instead of BES Operation activities. While we understand that the proposed standard allows the entity to determine the amount of operator action needed, can this be similarly defined in a Process or Procedure? We have concerns that an auditor may not interpret the standard to allow other employees to mitigate any data or analyze errors, such as an EMS Engineer or other support personnel. We request that the SDT consider revising the standard to clarify that a System Operator does not specifically have to be the one who mitigates such issues. Furthermore, how does the SDT expect entities to show compliance with "implementation" of their Process of Procedure? (5) The proposed standard includes requirements that should enhance, not detract, from the System Operator's situational awareness since it is based on recommendations from the RTBPTF report. The SDT is mindful that System Operators need to remain focused on relevant real-time information while carrying out their duties. The proposed requirements should provide entities the flexibility to determine which operating personnel carry out required actions. Implementation could be demonstrated through evidence that the Operating Process or Procedure is used for its intended purpose. This evidence which might include checklists, operator logs, or operations support logs, for example. (6) Compliance with the proposed requirements is not evaluated by counting quality codes on data points. The measures, VRFs, and VSLs are constructed to evaluate the capability-based performance requirements, as described in section 2.4 of the SPM. This section states that Capability-based Requirements are defined capabilities needed by one or more entities to perform reliability functions which can be measured by demonstrating that the capability exists as required.

Jennifer Losacco - NextEra Energy - Florida Power and Light Co. - 1 - FRCC

Selected Answer:	Yes

Anthony Jablonski - ReliabilityFirst - 10 -

Selected Answer:	No
Answer Comment:	ReliabilityFirst offers the following comments for consideration:

1. **Requirement R3 and R4**

i. It is unclear as to what the phrase “indication(s) of the quality of the Real-time data” is referring to. RF requests clarification on the term “indications” and what this involves.

i. Also, since the System Operators work for the respected TOP or BA, it is unclear whom at the respected TOP or BA will be providing “indications” to the System Operators. As written, the System Operators (working for the TOP or BA) could provide indications to themselves. This does not seem to be the intent of the Requirement.

2. **Requirement R6**

i. It is unclear as to what the phrase “indication(s) of the quality of any analysis…” is referring to. RF requests clarification on the term “indications” and what this involves.

i. Also, since the System Operators work for the TOP, it is unclear whom at the TOP will be providing “indications” to the System Operators. As written,

	the System Operators (working for the TOP) could provide indications to themselves. This does not seem to be the intent of the Requirement.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer:	No
Answer Comment:	Comments: ERCOT reiterates its comments above as applicable to TOP-010-1. Should NERC continue this project, however, ERCOT provides the following comments by requirement: Requirements R1 and R3/Requirements R2 and R4 ERCOT respectfully recommends that requirements R1 and R3 and Requirements R2 and R4 be combined. Because the need to address data issues generally arises as a result of a data indicator or the need for manual data intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Hence, ERCOT proposes the following: R1. Each Transmission Operator shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its Real-time monitoring and Realtime Assessments. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] R1.1 The Transmission Operator shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated. R2. Each Balancing Authority shall provide its System Operators with

	indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] R2.1 The Balancing Authority shall initiate actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data when failure or degradation is indicated. **Requirements R5 and R6** ERCOT respectfully recommends that requirements R5 and R6 be combined. Because the need to address issues with real-time analyses generally arises as a result of an indicator that a particular analysis did not complete, is offline or there is a need for manual intervention by system operators, the value of a process to address such issues without the context of time or need is significantly diminished. Additionally, the availability of back up or offline processes for real-time analyses mitigates the risks associated with an issue or outage of analysis capabilities. Hence, ERCOT proposes the following: R3. Each Transmission Operator shall provide its System Operators with indication(s) of the tool(s) used in its Real-time monitoring and Real-time Assessments are functioning as intended. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations] R3.1 The Transmission Operator shall initiate actions to resolve any issues internally and to coordinate resolution of any data issues that are impacting such tool(s) with entity(ies) responsible for providing data inputs to such tool(s) when failure or degradation is indicated.

Jeffrey Watkins - Jeffrey Watkins On Behalf of: Eric Schwarzrock, Berkshire Hathaway - NV Energy, 5

Selected Answer:	No
Answer Comment:	R1 and R2: The requirements are vague as to what constitutes quality. Do we consider out of tolerance? High value? Low value? What is too high? What is too low? R3 and R4: If quality alarms are generated to alert the operator, the increase in alarm volume may distract the operator from more important alarms. If quality codes are shown on the EMS/SCADA displays, an operator may not look at or notice the displays with data quality issues. Summarizing the quality of thousands of real-time measurements for an operator may not be something existing systems can easily do. This may require software and possibly hardware additions to an EMS/SCADA. R5: TOP-001-3 R13 requires that a real-time assessment is performed at least once every 30 minutes. In order to resolve any issues with the quality of analysis for the real-time assessment outside of normal business hours may require staff to come into the office to resolve which may take more than 30 minutes. This would put an entity out of compliance with TOP-001-3, unless staffing is increased which may not be feasible. There is no guidance provided to create criteria to evaluate the quality of analysis used in Real-time Assessments. There could be discrepancies between an auditor and an entity over what is acceptable criteria. Guidelines that will an auditor could be expected to review should be listed.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Selected Answer:	No
Answer Comment:	The criterion specified in R1.1 and R1.2 is too prescriptive. The requirements as written are requiring System Operators to monitor the quality of all data specified per proposed TOP-003-3 R1. In a Real-time system there are thousands of data points used and having a few of those outside prescribed data range or not updated within a predetermined time period may have no impact on BES reliability. Requiring System Operators to track the quality of all data can be a distraction and an unnecessary burden. ITC believes the intent of the standard is for entities to pay attention to quality of certain pre-identified data used in Real-time monitoring and analysis. However, the future standard TOP-003-3 will result in this requirement being applied to all data used in Real-time monitoring and analysis. Transmission Operators are required to perform a Real-time assessment and these assessments most commonly utilize tools which are designed to reduce dependencies on bad, invalid, or suspect data therefore placing a requirement for evaluating invalid or suspect data in Real-time does not provide any reliability benefit. The proposed TOP-001-3 R1 requires that each Transmission Operator (TOP) shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. Proposed TOP-001-3 R10 requires TOP to determine SOL exceedances and TOP-001-3 R12 requires TOP to not operate outside IROL for more associated IROL Tv. These requirements together inherently imply that the Transmission Operator should ensure quality of data used in Real-time to get the desired outcome from the Real-time Assessment which is to maintain reliability of its area by monitoring SOLs and IROLs and taking appropriate actions. The proposed TOP-010-1 R1 seems to be specifying 'How to' comply with these requirements which does not meet the result base standard practice. In addition, the rationale for R13 in

proposed TOP-001-3 states "The Transmission Operator's Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements and how to adapt to conditions where processes, procedures, and automated software systems are not available (if used)". Thus, the actions needed on data quality are already expected in the Operating Plan to ensure the desired outcome. Therefore, a new requirement for data quality may be redundant.

In summary, it is appropriate to have an Operating Procedure to maintain and address quality of data used in Real-time Assessment. However, the monitoring and analysis of data quality for all data in Real-time is not practical and does not add value to reliability. Real-time Assessment tools used by TOPs have processes to manage bad data and provide valid results. Data quality should be monitored outside of the Real-time operator environment wherein staff other than System Operators can analyze patterns of data to identify data quality issues that truly impact Real-time analysis. The measures specified in TOP-010-1 indicate dated operator logs and voice recordings as evidence for compliance which will require the System Operator to monitor quality of all data. Also, the expectation of the System Operator to review data quality in Real-time for every data point is overkill.

TOP-010-1 R3 is redundant when compared to TOP-010-1 R6. R6 is requiring an indication of quality of analysis used in Real-time Assessment wherein R3 is requiring indication of quality of data used in Real-time Assessment. The quality of analysis used for Real-time Assessments may be an indicator of quality of data used in Real-time Assessment thus having a requirement on both is redundant and can result in multiple noncompliance incidents for a single problem. For example, a single bad Real-time data point may constitute a violation of TOP-010-1 R3 and since this data is used in Real-time Assessment it may also cause a violation of TOP-010-1 R6.

	ITC supports TOP-010-1 R7 having an independent processor to monitor Real-time alarm system because it provides value due to the heavy reliance on alarms by System Operators for situational awareness. However, the standard should specify if the unavailability of independent processor creates a violation of standard requirements. Although, the implementation plan of 12 months for R7 is unrealistic as compliance with this requirement may require entities to procure and implement new tools which is a lengthy process.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:	No
Answer Comment:	Texas RE recommends adding the Balancing Authority (BA) function to the applicability of R5 and R6. While it could be argued that a BA does not have to perform Real-time Assessments per a Reliability Standard requirement (in other words explicitly stated as required to do Real-time Assessments), its actions to maintain frequency are effectively as assessment based on Real-time data. Texas RE suggests using language from the rational to make TOP-010-1 R5 and R6 clearer. The requirements address “quality of analysis”, which could depend on many factors, while the rationale uses the language “to address issues related to the quality of the analysis inputs used for Real-time Assessments”. Texas RE recommends revising the phrase “with indication(s) of” used in

proposed TOP-10-1, R3, R4, and R6 as it is vague. The purpose of TOP-10-1, R3, R4, and R6 appears to be to ensure that the results of the required evaluations of potential Real-time data quality discrepancies are communicated to System Operators so that information regarding such data discrepancies could potentially be incorporated into Real-time monitoring, analysis functions, and Real-time assessments. Accordingly, registered entities should be required actually to provide the actual information from their data quality assessments to their System Operators. Texas RE would suggest substituting “relevant information and/or analyses concerning” for “with indication(s) of” to require appropriate, relevant information and/or any analyses of the quality of Real-time data be communicated to System Operators, not merely indications of data quality.

The reference to “with indications of” in the corresponding measures should also be revised along these lines. However, the types of evidence identified in the measures satisfy the proposed “relevant information and/or analyses concerning” standard.

David Jendras - Ameren - Ameren Services - 3 -

Selected Answer: No

Answer Comment: R4 states "Each Balancing Authority shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring." Are the analysis functions limited to real-time analysis, or could this be interpreted to apply to study and after the fact analysis? We believe that this needs to be clear.

R5. What does "maintain the quality" mean? What if the quality of the analysis is not currently what it should be, then this requirement appears to preclude improving that quality.

R6 requires "indication(s) of the quality of any analysis"; how is quality defined? We believe this is very ambiguous as written and for us internal discussions resulted in multiple opinions. We believe that the term Quality needs to be concisely defined within the requirement.

Tammy Porter - Tammy Porter On Behalf of: Rod Kinard, Oncor Electric Delivery, 1

Selected Answer: No

Answer Comment: This standard is too vague and needs additional clarification. We support some of the comments from MRO.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC

Group Name: Southern Company

Group Member Name	Entity	Region	Segments

Robert Schaffeld	Southern Company Services, Inc	SERC	1
John Ciza	Southern Company Generation and Energy Marketing	SERC	6
R Scott Moore	Alabama Power Company	SERC	3
William Shultz	Southern Company Generation	SERC	5

Selected Answer: No

Answer Comment:

Southern believes that the criteria in R1.1 should be limited to the BA/TOP's ability to monitor and assess the current/expected condition of its BA/TOP area within the capabilities of its monitoring tools not including the criteria listed in R1.1.1-R1.1.4.

Each BA/TOP has the inherent responsibility to protect the integrity of the system in its BA/TOP area and to not contribute or cause any system violations in adjacent BA/TOP areas as required by other approved reliability standards. These already approved standards require the BA/TOP to continuously monitor the modeled facilities in its BA/TOP area and to accurately assess the state of the system using the information collected.

The BA/TOP is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments. To impose a new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

3. Do you agree with the Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

Summary Consideration

The SDT revised the proposed Implementation Plan based on stakeholder feedback. The proposed effective date is 18 months following regulatory approval for all requirements instead of the 12 months for some requirements and 18 months for the remainder as proposed in the initial draft Implementation Plan.

Specific comments and SDT responses are below:

- **Some commenters indicated that the proposed 12 and 18 month periods create confusion and suggested all requirements become effective 18 months following regulatory approval.** The SDT agrees and modified the proposed Implementation Plan accordingly.
- **Many commenters indicated that the implementation time was too short to allow EMS systems to be modified or procured. Commenters proposed various alternative periods up to 60 months.** Most recommendations for extended implementation periods cited a need to procure EMS systems based on rigid interpretations of requirements in the initial draft standard. The SDT believes the revised requirements in proposed IRO-018-1 and TOP-010-1 are clearer and implementable within the 18 month period and should not require procurement of new systems.
- **A commenter indicated the proposed implementation plan was too long because the capabilities are already well-established throughout the industry, and the reliability objectives should be addressed as quickly as possible.** Based on stake holder feedback and the SDT's experience, the SDT believes the proposed implementation period provides entities with necessary time to implement Operating Procedures or Processes and, if needed, upgrade functions of their Real-time monitoring and Real-time Assessment systems.

Answer Comment:

The implementation plan is too short if entities need to specify, order and deploy new or modified Energy Management Systems (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and systems.

The key is to allow entities the proper time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short term.

The standard objective needs to be modified to a feasible reliability objective such as the assessment provides a reasonably high confidence interval that the system is in a reliable state. TOPs and BAs should be given much more time to make appropriate changes to their tools and EMS systems and to test their capabilities to detect and implement operating plans to respond to bad data detection and identification. The time needed to modify, specify, install, adjust and test systems or tool to meet the proposed standard should be, at a minimum, 3 to 5 years

Selected Answer: No

Answer Comment:

If TOP-003-3 is approved at the same time or after TOP-010-1, then the result of the implementation plan as drafted is that requirements to have quality data become effective at the same time as requirements that could cause the TOP and BA to be seeing new data for the first time. R5 of TOP-003-3 could result in a large volume of new data, so more time should be afforded to the receiving TOP and BA to become familiar with and begin utilizing that new data. We recommend the timeframes for **implementation of TOP-010-1 be modified to be 18 months and 24 months**, at a minimum, to allow for separation from TOP-003-3 R5. A section could be added that addresses a scenario where TOP-003-3 is approved well before TOP-010-1.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Kayleigh Wilkerson	Lincoln Electric System	MRO	1,3,5
Kyle McMenamin	Xcel Energy	SPP	1,3,5,6

Selected Answer: No

Answer Comment: Based on the proposed standards, 12 months should be sufficient time to simply develop a written procedure and ensure operators are knowledgeable. However, depending on what the final version of the standard looks like, it may be impossible to meet some of the resulting requirements unless systems are replaced. In that case, 36 months may be required.

Selected Answer:	No
Answer Comment:	(1) The implementation plan is too short if entities need to specify, order, and deploy a new or modified Energy Management System (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and infrastructure. (2) The key is to allow entities adequate time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short-term. (3) In the alternative, if the SDT determines that it will not extend the implementation to 60 months, we ask the SDT to consider making all requirements effective after 18 months. Staggered effective dates has caused significant and unnecessary implementation issues, such as the confusion that occurred with implementing PRC-005 and its various requirements.

Jennifer Losacco - NextEra Energy - Florida Power and Light Co. - 1 - FRCC

Selected Answer:	Yes

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer:	Yes

Answer Comment:	Comments: ERCOT's comments above notwithstanding, the proposed implementation plan appears reasonable.

Jeffrey Watkins - Jeffrey Watkins On Behalf of: Eric Schwarzrock, Berkshire Hathaway - NV Energy, 5

Selected Answer:	No
Answer Comment:	12 months may be too short depending on the capabilities of existing systems. More time may be needed to assess the existing capabilities of the EMS/SCADA system and if new systems are needed, time will be required to specify, order and deploy a new EMS system.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Selected Answer:	No
Answer Comment:	ITC supports TOP-010-1 R7 having an independent processor to monitor Real-time alarm system because it provides value due to the heavy reliance on alarms by System Operators for situational awareness. However, the standard should specify if the unavailability of independent processor creates a violation of standard requirements. Although, the implementation plan of 12 months for R7 is unrealistic as compliance with this requirement may require entities to procure and implement new tools which is a lengthy process.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:	No
Answer Comment:	Texas RE is concerned the Implementation Plan allows for an increase in risk to the BES if quality is not already being addressed. To ensure reliable operations, Texas RE suggests decreasing the Implementation plan to a more reasonable time period such as the first day of the first quarter after approval for all requirements except R7, which requires TOPs and BAs to utilize an alarm process monitor. Twelve months is not an unreasonable time for the development of an independent alarm process monitor.

David Jendras - Ameren - Ameren Services - 3 -

Selected Answer:	Yes

Tammy Porter - Tammy Porter On Behalf of: Rod Kinard, Oncor Electric Delivery, 1

Answer Comment:	This standard is too vague and needs additional clarification. We support some of the comments from MRO.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC

Group Name: Southern Company

Group Member Name	Entity	Region	Segments
Robert Schaffeld	Southern Company Services, Inc	SERC	1
John Ciza	Southern Company Generation and Energy Marketing	SERC	6
R Scott Moore	Alabama Power Company	SERC	3
William Shultz	Southern Company Generation	SERC	5

Selected Answer: No

Answer Comment: Southern believes that the implementation date should be pushed back to allow time for the industry to determine the appropriate technology that is sufficient for each entity's operations. We also believe that in order to fully comply with the proposed standard, enough time should be allowed for the industry to update their current procedures and/or to create acceptable procedures, provide training to the appropriate System Operators and allow sufficient time for the entities to determine the technology available that is available and appropriate to support their operations, along with the required functionality.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

Summary Consideration. VSL's have been revised in the proposed standards to incorporate stakeholder feedback and changes to the proposed requirements. The SDT has made use of levels as much as possible to describe varying degrees of compliance with the proposed requirements.

John Fontenot - Bryan Texas Utilities - 1 -

Selected Answer: Yes

Jeff Wells - Grand River Dam Authority - 3 -

Selected Answer: Yes

Thomas Foltz - AEP - 5 -

Selected Answer: No

Answer Comment: The team may want to consider using a more gradient-based approach for R1, R2, and R5, and using more than two VSL categories (driven by the number of elements not considered). If the requirements continue to use two VSL categories only, the High VSL should instead state "excluded at least one but not all of the elements…"

Leonard Kula - Independent Electricity System Operator - 2 -

Selected Answer: No

Answer Comment: **We do not agree with the need for the standard, and therefore do not agree with the proposed VRFs and VSLs.**

Joe O'Brien - NiSource - Northern Indiana Public Service Co. - 6 -

Selected Answer: Yes

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Selected Answer: No

Answer Comment: Xcel Energy believes that the proposed VSLs are not appropriate. The full spectrum of VSLs (Low/Med/High/Severe) should be utilized for each requirement, and that full clarification of what quantifies a violation at each severity level should be disseminated.

Emily Rousseau - MRO - 1,2,3,4,5,6 - MRO

Selected Answer: No

Answer Comment:	The binary approach to the VSLs seems too severe. Suggest that the drafting team consider revising the VSLs to utilize moderate, high, and then severe if the entity missed one, two, three, or finally all data quality elements. R3 & R4: It is not clear from the wording of the single VSL level (which is Severe) if a violation of this Standard is incurred only if there are NO indications of quality of real-time data. If the meaning is to include situations where one or a few points with bad quality are missed (i.e., not notified to an operator) than assigning a Severe VSL seems inappropriate, and several levels of violations should be implemented. R6: Is it correct that a violation of this Standard is incurred only if there are NO indications provided to operators of poor quality of analysis results, and that missing some number of these instances is not a violation of this Standard? If the intent is to consider even a single miss a violation then assigning it a Severe VSL seems inappropriate, and several levels of violations should be implemented. R7: Is it correct that occasional failures of the independent alarm process monitor are not violations of this Standard? The standard objective needs to be modified to a feasible reliability objective such as the assessment provides a reasonably high confidence interval that the system is in a reliable state. Vague and unclear definitions will lead to significant audit discrepancies as to what appropriate measures are when it comes to implementation of operating processes/procedures.

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1 -

Selected Answer: No

Answer Comment: CenterPoint Energy feels the VSLs for R1, R2, and R5 do not match the intended meaning in the language of the Requirements (implementation). It appears the focus is more on exclusion of criteria during the development phase of Operating Processes and Procedures. CenterPoint Energy feels there are developmental phases of Operating Processes and Procedures and implantation phases, and perhaps the Requirements should be separated to reflect each. In doing so, the VSLs could and should be more balanced, in both instances, from Lower VSL to Severe VSL and not so heavily weighted for documentation deficiencies.

Answer Comment: The SDT should consider revising the VSLs to be on a graduated scale. Binary treatment of these requirements is improper and leads to higher dollar penalties for violations than are not commensurate with the risks to reliability.

Jennifer Losacco - NextEra Energy - Florida Power and Light Co. - 1 - FRCC

Selected Answer: Yes

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer: No

Answer Comment: Comments: As the proposed requirements in IRO-018 and TOP-010 are primarily administrative in nature, ERCOT does not support the approval of VSLs that are high and severe. Administrative requirements regarding operating processes should be considered a low VSL; alarming or other indicator activity should be considered for a VSL no higher than medium.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Selected Answer: No

Answer Comment: Refer to comments submitted for question #3.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer: No

Answer Comment:	Texas RE recommends revising the VSLs for proposed IRO-18-001, R1 and TOP-10-1, R1 and R2. Specifically, the distinction between a High VSL and a Severe VSL for each of these requirements needs clarification as to how the use of subparts establishing the various required elements that must be included within the criteria for evaluating Real-time data quality discrepancies in Parts 1.1 and 2.1, respectively, will be addressed. The current VSLs for each of these three requirements could be read to assign only a High VSL to a registered entity that has: (1) only adopted one of the four required criteria elements in Part 1.1 (or Part 2.1 for TOP-10-1, R2) for evaluating potential Real-time data quality discrepancies; and (2) has not adopted any actions to coordinate the resolution of Real-time data quality discrepancies as required under Part 1.2 (or Part 2.2 for TOP-10-1, R2). For example, the High VSL category for TOP-10-1, R1 could potentially apply to a Registered Entity that adopts criteria for evaluating data outside of a prescribed data range, but fails to adopt similar criteria for analog data that is not updated within a predetermined time period, data entered manually to override telemetered information, data otherwise identified as invalid or suspect, as well as fails to specify any actions to coordinate the resolution of Real-time data quality discrepancies with the entity responsible for provide the data. Texas RE suggests a better approach would be to specify that a High VSL for proposed IRO-18-001, R1 and TOP-10-1, R1 and R2 would apply to Registered Entities that have failed to adopt one or more of the required criteria in Parts 1.1 or 2.1, respectively, or have failed to adopt actions to address Real-time data discrepancies as required in Parts 1.2 or 2.2, respectively. The Severe VSL category would then be reserved for instances in which a Registered Entity has failed to (1) adopt one or more of the required criteria for evaluating Real-time data quality discrepancies and (2) adopt actions to coordinate resolution of Real-time data quality discrepancies. To use the previous example regarding the VSLs for TOP-10-1, R1, a Registered Entity

	that adopts criteria for evaluating data outside of a prescribed data range, but fails to adopt similar criteria for analog data that is not updated within a predetermined time period, data entered manually to override telemetered information, data otherwise identified as invalid or suspect, as well as fails to specify any actions to coordinate the resolution of Real-time data quality discrepancies would now be subject to a Severe VSL. This approach would align the VSLs for IRO-18-001, R1 and TOP-10-1, R1 and R2 with the VSLs for other requirements in the proposed standards that do not have specifically required criteria elements. For example, under TOP-10-1, R5, the High VSL category applies to a Registered Entity if it does not establish (1) criteria for evaluating the quality of any analysis under in its Real-time assessments; or (2) actions to resolve quality deficiencies. In turn, the Severe VSL category under TOP-10-1, R5 is applicable to Registered Entity that has failed to both establish criteria for evaluating and actions to resolve quality deficiencies.

David Jendras - Ameren - Ameren Services - 3 -

Selected Answer:	No

R Scott Moore	Alabama Power Company	SERC	3
William Shultz	Southern Company Generation	SERC	5

Selected Answer: No

Answer Comment: Southern believes that the VRFs and VSLs for the proposed standards are too high and should be modified.

5. Provide any additional comments for the Standard Drafting Team (SDT) to consider, if desired.

Summary Consideration. The SDT thanks all commenters. Comments addressed in other sections are not duplicated here.

- **A commenter recommended combining proposed IRO-018-1 and TOP-010-1 into a single standard.** The proposed standards are intended to be consistent with the existing body of standards such that IRO standards apply to RCs and TOP standards apply to TOP and BAs.
- **A commenter indicated that the proposed standards should require monitoring of critical equipment.** Requirements to perform monitoring are addressed in other standards, such as IRO-002-2, IRO-003-2, proposed IRO-002-4, proposed TOP-001-3. Project 2009-02 is developing requirements to address the capabilities used by entities in performing Real-time monitoring and analysis.

- **A commenter asked how interrelationships between cybersecurity standards and requirements for performing monitoring and analysis are to be considered.** Applicable entities must consider cybersecurity standards and all other relevant NERC reliability standards in developing Operating Procedures and Operating Processes specified in the proposed standards. The SDT believes the requirements in the proposed standards do not detract from the ability of an applicable entity to comply with cybersecurity or any other standard.
- **A commenter asserted that requirements and measures for analysis quality in the proposed standard were vague and unenforceable. The commenter also questioned the ability of Regional Entities to enforce compliance of Reliability Coordinators.** The rationale box cited by the commenter has been revised to provide specific examples of types of analysis used applicable entities in performing Real-time Assessments. Additional detail related to this proposed requirement was added to the Guidelines and Technical Basis section. The SDT does not believe Regional Entities would be unable to enforce the proposed requirements in accordance with NERC Rules of Procedure.

Answer Comment: We question the SDT's practice of posting the revised SAR along with the draft standard. It is unclear if the industry is to provide feedback about the removal of "analysis" from the SAR. This appears to be a substantive change to the project's scope.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2 -

Selected Answer:

Answer Comment: Comments: ERCOT expresses concern that overly prescriptive requirements will hinder – not benefit – the processes and interactions occurring between functional entities currently as well as the continuous improvement of tools

	and associated capabilities. If the risk to be addressed is operator awareness of data and analysis quality issues and the taking of prompt action to resolve such issues, ERCOT recommends limited requirements that most directly address these risks. Overly prescriptive requirements that hinder tool and analyses improvement and the free-flow of functional entity communications that are already occurring do not benefit reliability. Further, the complicated nature of data exchange, inputs, and analyses require coordination and cooperation amongst many registered entities. Without a reciprocal obligation by other entities to facilitate responsiveness when an issue arises, the proposed standards and requirements will not achieve their intended objective. Until such obligation is included in the proposed standard, ERCOT is unable to support its approval. This reciprocal obligation is critical for achieving the implied objective of the proposed standard because – even where a Reliability Coordinator initiates resolution of issues quickly – lack of responsiveness by the entity that is situated to address an issue will prevent effective, efficient resolution.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:

Answer Comment:	Texas RE recommends reviewing references in the Evidence Retention section of TOP-010-1. There is reference to R5 and R6 having a rolling 30 day period for evidence. It would seem that is an incorrect reference as R5 requires implementation of a Process or Procedure. The 30-day period is short of a timeframe and is not supported by industry practice. Similar statement for IRO-018-1 except it references R3 and R4. R3 is a requirement to implement a procedure. The SDT may have been trying to capture the quality of data indication requirements in each of the Standards. In TOP-010-1, why is the data retention for a BA different from that for a TOP (relates to the incorrect reference but if the reference is corrected this issue goes away)?
David Jendras - Ameren - Ameren Services - 3 -	
Selected Answer:	
Answer Comment:	In our opinion, clarity is needed throughout the proposed standards so that entities will not be confused over how the requirements will be audited.

Additional Comments Submitted by William R. Harris for the Foundation For Resilient Societies, Inc.:

The Foundation for Resilient Societies, Inc. supports "reliability standards" that are designed to improve the reliability of the bulk electric system. We supported the near-real-time monitoring initiative for critical equipment, "Project 2012-01 Equipment Monitoring and Diagnostic Devices." Unfortunately, the NERC Standards Committee moved to cancel this project at their June 5, 2013 meeting and this cancellation was later approved by the NERC Board of Trustees. During the period when no NERC monitoring project was in process, Generator Operators used the potential lack of "visibility" during solar geomagnetic disturbances (GMD) to seek and obtain exemption from NERC Standard EOP-010-1 — Geomagnetic Disturbance Operations. This imprudent exemption increased risks to large power transformers in the bulk power system.

The present revival of a NERC real-time monitoring standard has potential to improve equipment monitoring and system reliability. But the lack of metrics or boundary conditions for equipment or events requiring real-time monitoring undermines the prospective benefits of this proposed standard. Without metrics, how can measures such as "dated operator or supporting logs, dated checklists, voice recordings (or other evidence)" be evaluated?

There are no connections between these processes and/or procedures for monitoring reliability or performing analysis, on the one hand, and cybersecurity standards, on the other hand. The latter critically affects reliability. How are these interrelationships to be considered?

The term "quality" as used 23 times in the standard is a very general term. Its composition is affected by hundreds of factors in instrumentation, pre-Reliability Coordinator processing, etc. Can reliability even be determined in the absence of a grid-wide standard for data flows?

The rationale for R3 and R4 asserts that "operators have procedures and receive indication(s) to address issues related to the quality of the analysis inputs used for Real-time Assessments." How can such a vague process be judged compliant or non-compliant? The measurement examples cited in M2, "computer printouts" (of what?) and system specifications (what "systems"?), are so non-deterministic as to be meaningless in judging quality of analysis.

Compliance would be nearly non-enforceable for these vague reliability monitoring and analytic assessments. How is NERC planning on enforcing compliance particularly when most Reliability Coordinators (RC) are also the Regional Entity? In almost every case, the RC has no evidence to support compliance with these unmeasurable, metric-less requirements as prescribed in this set of standards.

Significantly, the draft standard does not require monitoring of critical equipment such as large power transformers, generators, or reactive power support devices. Instead, the standard takes the approach of requiring monitoring of the "quality" of whatever data flows might exist. A good way to minimize compliance costs with this standard would be to simply eliminate data flows from critical equipment.

Overall, the Standard Drafting Team needs to be more specific and more rigorous. Otherwise, a vague standard will leave the false impression that real-time monitoring requirements exist; whereas, in reality, the standard will provide an escape hatch for equipment monitoring requirements, resulting in net harm to reliability of the bulk power system.

End of Report

Standard Development Timeline

This drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the second posting of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 15, 2015
SAR posted for comment	July 16 - August 17, 2015
45-day formal comment period with initial ballot	September 24 - November 9, 2015

Anticipated Actions	Date
45-day formal comment period with additional ballot	December 2015
10-day final ballot	February 2016
NERC Board (Board) adoption	May 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **IRO-018-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Reliability Coordinator (RC) uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform Real-time monitoring and Real-time Assessments appear in other standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the RC shall include actions to resolve Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. These actions could be the same as the process used to resolve data conflicts required by IRO-010-2 Requirement R3 Part 3.2 provided that this process resolves Real-time data quality issues.

The revision in Part 1.3 to resolve Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator or supporting logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

R2. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

2.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

2.3. Actions to resolve analysis quality issues affecting its Real-time Assessments.

M2. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R2. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R3. Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. Each Reliability Coordinator shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R1 and R3 and Measures M1and M3 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirement R2 and Measure M2 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO standards. As used in TOP and IRO standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring includes the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The RC uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform monitoring and Real-time Assessments appear in other standards.

The RC's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed IRO-018-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the RC shall include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Requirement R2

Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time

Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R3

Requirement R3 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. A stalled Real-time monitoring alarm processor must not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

This ~~section is maintained by the~~ drafting team ~~during the development of~~maintained this section while developing the standard~~ and~~. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the ~~first~~second posting of the proposed standard.

     - **4.1.1.** Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

> **Rationale for Requirement R1:** The Reliability Coordinator (RC) uses a set of Real-time data identified in ~~approved standard~~ IRO-010-1a Requirement R1 and~~ proposed standard~~ IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform Real-time monitoring and Real-time Assessments appear in other standards.
>
> The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.
>
> Requirement R1 Part 1.~~2~~3 of this standard specifies the RC shall include actions to ~~coordinate resolution of~~resolve Real-time data quality ~~discrepancies~~issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. These actions could be the same as the process used to resolve data conflicts required by IRO-010-2 Requirement R3 Part 3.2, provided that this process ~~could~~resolves Real-time data quality issues.
>
> The revision in Part 1.3 to resolve Real-time data quality issues~~.~~ *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

1.1. Criteria for evaluating ~~potential~~the quality of Real-time data ~~quality discrepancies including, but not limited~~;

~~**1.1.1.** Data outside of a prescribed data range;~~

~~**1.1.2.** Analog data not updated within a predetermined time period;~~

~~**1.1.3.** Data entered manually to override telemetered information; and~~

~~**1.1.1.** Data otherwise identified as invalid or suspect~~.

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

~~**1.2.**~~**1.3.** Actions to resolve ~~coordinate resolution of~~Real-time data quality ~~discrepancies~~issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Proce~~dure~~ss or Operating Proce~~ss~~dure in electronic or hard copy format meeting all provisions of Requirement R1~~,~~; and 2) evidence the Reliability Coordinator implemented the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure as called for in the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure, such as dated operator or supporting logs, dated checklists, voice recordings, voice transcripts, or other evidence.

~~**R2.** Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

~~**M2.** Each Reliability Coordinator shall have evidence it provided its System Operators with indications of the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.~~

Rationale for ~~Requirements R3 and R4:~~ ~~Requirements R3 and R4 ensure the RC's System Operators~~**Requirement R2:** Requirement R2 ensures RCs have procedures ~~and receive indication(s)~~ to address issues related to the quality of the analysis ~~inputs~~results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

~~R3.~~R2. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to ~~maintain~~address the quality of ~~any~~ analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

2.1. Criteria for evaluating the quality of ~~any~~analysis used in its Real-time Assessments;

~~3.1.~~2.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

~~3.2.~~2.3. Actions to resolve ~~quality deficiencies in any~~ analysis ~~used in~~quality issues affecting its Real-time Assessments.

~~M3.~~M2. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to ~~maintain~~address the quality of ~~any~~ analysis used in its Real-time Assessments~~.~~ as specified in Requirement R2. This evidence could include, but is not limited to: 1) an Operating Proce~~dure~~ss or Operating Proces~~s~~dure in electronic or hard copy format meeting all provisions of Requirement ~~R3,~~R2; and 2) evidence the Reliability Coordinator implemented the Operating Proce~~dure~~ss or Operating Proces~~s~~dure as called for in the Operating Proce~~dure~~ss or Operating Proces~~s~~dure , such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

~~**R4.** Each Reliability Coordinator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

~~Each Reliability Coordinator shall have evidence it provided its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.~~

Rationale for Requirement ~~R5~~R3: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

~~An~~The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor ~~is one that would~~must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor. ~~A 'heartbeat' or 'watchdog' monitoring system may accomplish this objective.~~

~~R5.~~R3. Each Reliability Coordinator shall ~~utilize~~have an ~~independent~~ alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

~~M4.~~M3. Each Reliability Coordinator shall have evidence ~~it utilized~~of an ~~independent~~ alarm process monitor that provide~~d~~s notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R1~~, R2,~~ and ~~R5~~R3 and Measures ~~M1, M2, and M5~~M1and M3 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ~~ninety~~90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for ~~Requirements R3~~Requirement R2 and ~~R4 and Measures M3 and M4~~Measure

M2 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by ~~existing and proposed~~ TOP and IRO standards. As used in TOP and IRO standards, monitoring involves observing operating status and operating ~~value(s)~~values in Real-time for awareness of system conditions. Real-time monitoring includes the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The RC uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform monitoring and Real-time Assessments appear in other standards.

The RC's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed IRO-018-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the RC shall include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Requirement R2

Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time

Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R3

Requirement R3 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. A stalled Real-time monitoring alarm processor must not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon ~~BOT~~NERC Board of Trustees adoption, the text from the rationale text boxes ~~was~~will be moved to this section.

Standard Development Timeline

This drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the second posting of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 15, 2015
SAR posted for comment	July 16 - August 17, 2015
45-day formal comment period with initial ballot	September 24 - November 9, 2015

Anticipated Actions	Date
45-day formal comment period with additional ballot	December 2015
10-day final ballot	February 2016
NERC Board (Board) adoption	May 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Real-time Reliability Monitoring and Analysis Capabilities**

2. **Number:** **TOP-010-1**

3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Operators

   4.1.2. Balancing Authorities

5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Transmission Operator (TOP) uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform Real-time monitoring and Real-time Assessments appear in other standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the TOP shall include actions to resolve Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. These actions could be the same as the process used to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2, provided that this process resolves Real-time data quality issues.

The revision in Part 1.3 to resolve Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Transmission Operator shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: The Balancing Authority (BA) uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 of this standard specifies the BA shall include actions to resolve Real-time data quality issues affecting its analysis functions in its Operating Process or Operating Procedure. These actions could be the same as the process to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2 provided that this process resolves Real-time data quality issues.

The revision in Part 2.3 to resolve Real-time data quality issues *when data quality affects its analysis functions* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R2. Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of Real-time data;

2.2. Provisions to indicate the quality of Real-time data to the System Operator; and

2.3. Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions.

M2. Each Balancing Authority shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Balancing Authority implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

R3. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

3.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

3.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

3.3. Actions to resolve analysis quality issues affecting its Real-time Assessments.

M3. Each Transmission Operator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R3. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R3; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R4: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R4. Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. Each Transmission Operator and Balancing Authority shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain evidence of compliance for Requirements R1, R2, and R4, and Measures M1, M2, and M4 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Operator shall retain evidence of compliance for Requirement R3 and Measure M3 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO standards. As used in TOP and IRO standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring includes the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The TOP uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform monitoring and Real-time Assessments appear in other standards.

The TOP's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the TOP shall include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Requirement R2

The BA uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other standards.

The BA's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R2 Part 2.1. The criteria supports identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 specifies the BA shall include in its Operating Process or Operating Procedure actions to resolve Real-time data quality issues when data quality affects its analysis functions. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the analysis quality so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

<u>Requirement R3</u>

Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

<u>Requirement R4</u>

Requirement R4 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. A stalled Real-time monitoring alarm processor should not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **TOP-010-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities ~~used by System Operators in~~to support ~~of~~ reliable System operations.
4. **Applicability:**
   4.1. Functional Entities:
   4.1.1. Transmission Operators
   4.1.2. Balancing Authorities
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Transmission Operator (TOP) uses a set of Real-time data identified in ~~proposed standard~~ TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform Real-time monitoring and Real-time Assessments appear in other standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.~~2~~3 of this standard specifies the TOP shall include actions to ~~coordinate resolution of~~resolve Real-time data quality ~~discrepancies~~issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. These actions could be the same as the process used to resolve data conflicts required by ~~proposed~~ TOP-003-3 Requirement R5 Part 5.2 provided that this process ~~could~~resolves Real-time data quality issues.

The revision in Part 1.3 to resolve Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

1.1. Criteria for evaluating ~~potential~~the quality of Real-time data ~~quality discrepancies including, but not limited~~;

~~**1.1.1.** Data outside of a prescribed data range;~~

~~**1.1.2.** Analog data not updated within a predetermined time period;~~

~~**1.1.3.** Data entered manually to override telemetered information; and~~

~~**1.1.1.** Data otherwise identified as invalid or suspect.~~

1.2. Provisions to~~:~~ indicate the quality of Real-time data to the System Operator; and

1.3. Actions to ~~coordinate resolution of~~resolve Real-time data quality ~~discrepancies~~issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Transmission Operator shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time ~~M~~monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Proce~~dure~~ss or Operating Proce~~ss~~dure in electronic or hard copy format meeting all provisions of Requirement R1~~,~~; and 2) evidence the Transmission Operator implemented the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure as called for in the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: The Balancing Authority (BA) uses a set of Real-time data identified in ~~proposed standard~~ TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.~~2~~3 of this standard specifies the BA shall include actions to ~~coordinate resolution of~~resolve Real-time data quality ~~discrepancies~~issues affecting its analysis functions in its Operating Process or Operating Procedure. These actions could be the same as the process to resolve data conflicts required by ~~proposed~~ TOP-003-3 Requirement R5 Part 5.2 provided that this process ~~could~~ resolves Real-time data quality issues.

The revision in Part 2.3 to resolve Real-time data quality issues *when data quality affects its analysis functions* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R2. Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

2.1. Criteria for evaluating ~~potential~~the quality of Real-time data~~ quality discrepancies including, but not limited~~;

~~**2.1.1.** Data outside of a prescribed data range;~~

~~**2.1.2.** Analog data not updated within a predetermined time period;~~

~~**2.1.3.** Data entered manually to override telemetered information; and~~

~~**2.1.1.** Data otherwise identified as invalid or suspect.~~

2.2. Provisions to~~:~~ indicate the quality of Real-time data to the System Operator; and

2.3. ~~2.2~~Actions to ~~coordinate resolution of~~resolve Real-time data quality ~~discrepancies~~issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions.

M2. Each Balancing Authority shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to: 1) an Operating Proce~~dure~~ss or Operating Proce~~ss~~dure in electronic or hard copy format meeting all provisions of Requirement R2~~,~~; and 2) evidence the Balancing Authority implemented the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure as called for in the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

~~**R3.** Each Transmission Operator shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

~~**M3.** Each Transmission Operator shall have evidence it provided its System Operators with indications of the quality of Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.~~

~~**R4.** Each Balancing Authority shall provide its System Operators with indication(s) of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

~~**M4.** Each Balancing Authority shall have evidence it provided its System Operators with indications of the quality of Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to, computer printouts, system specifications, or other evidence.~~

Rationale for ~~Requirements R5 and R6:~~ ~~Requirements R5 and R6 ensure the TOP's System Operators~~**Requirement R3:** Requirement R3 ensures TOPs have procedures ~~and receive indication(s)~~ to address issues related to the quality of the analysis ~~inputs~~results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

~~R5.~~R3. Each Transmission Operator shall implement an Operating Process or Operating Procedure to ~~maintain~~address the quality of ~~any~~ analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

3.1. Criteria for evaluating the quality of ~~any~~analysis used in its Real-time Assessments;

~~5.1.~~3.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

~~5.2.~~3.3. Actions to resolve ~~quality deficiencies in any~~ analysis ~~used in~~quality issues affecting its Real-time Assessments.

~~M5.~~M3. Each Transmission Operator shall have evidence it implemented its Operating Process or Operating Procedure to ~~maintain~~address the quality of ~~any~~ analysis used in its Real-time Assessments~~.~~ as specified in Requirement R3. This evidence could include, but is not limited to: 1) an Operating Proce~~dure~~ss or Operating Proce~~ss~~dure in electronic or hard copy format meeting all provisions of Requirement ~~R5,~~R3; and 2) evidence the Transmission Operator implemented the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure as called for in the Operating Proce~~dure~~ss or Operating Proce~~ss~~dure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

~~**R6.** Each Transmission Operator shall provide its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessments. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

~~**M6.** Each Transmission Operator shall have evidence it provided its System Operators with indication(s) of the quality of any analysis used in its Real-time Assessment capabilities. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.~~

> **Rationale for Requirement ~~R7~~R4:** The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.
>
> ~~An~~The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor ~~is one that would~~must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor. ~~A 'heartbeat' or 'watchdog' monitoring system may accomplish this objective.~~

~~R7.~~R4. Each Transmission Operator and Balancing Authority shall ~~utilize~~have an ~~independent~~ alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: ~~Same Day Operations,~~ Real-time Operations]*

~~M7.~~M4. Each Transmission Operator and Balancing Authority shall have evidence ~~it utilized~~of an ~~independent~~ alarm process monitor that provide~~d~~s notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain evidence of compliance for Requirements R1 ~~through~~, R2, and R4, and ~~Requirement R7, and~~ Measures M1~~ through M4~~, M2, and ~~Measure M7,~~M4 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of ~~ninety~~90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Operator shall retain evidence of compliance for ~~Requirements R5 and R6 and Measures M5 and M6~~Requirement R3 and Measure M3 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by ~~existing and proposed~~ TOP and IRO standards. As used in TOP and IRO standards, monitoring involves observing operating status and operating ~~value(s)~~values in Real-time for awareness of system conditions. Real-time monitoring includes the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The TOP uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform monitoring and Real-time Assessments appear in other standards.

The TOP's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the TOP shall include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Requirement R2

The BA uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other standards.

The BA's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R2 Part 2.1. The criteria supports identification of applicable data quality issues, such as:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 specifies the BA shall include in its Operating Process or Operating Procedure actions to resolve Real-time data quality issues when data quality affects its analysis functions. The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the analysis quality so that effective actions can be taken to resolve data quality issues in an appropriate timeframe.

Requirement R3

Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must include~~s~~ provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R4

Requirement R4 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. A stalled Real-time monitoring alarm processor should not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon ~~BOT~~NERC Board of Trustees adoption, the text from the rationale text boxes ~~was~~will be moved to this section.

Implementation Plan

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Requested Approvals

- IRO-018-1 - Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities
- TOP-010-1 - Real-time Reliability Monitoring and Analysis Capabilities

Requested Retirements

- None

Prerequisite Approval

Rationale: Due to regulatory approval of TOP-003-3, the prerequisite approval from the initial draft Implementation Plan has been satisfied.

- None

Revisions to Defined Terms in the NERC Glossary

None

Applicable Entities

- Reliability Coordinators
- Transmission Operators
- Balancing Authorities

Effective Date

Rationale: The Implementation Plan has been revised and simplified such that all requirements become effective 18 months following regulatory approval. The implementation period provides entities time to implement Operating Processes or Operating Procedures and enhance functions of their Real-time monitoring systems, as necessary.

IRO-018-1

- All Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

TOP-010-1

- All Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or

as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Unofficial Comment Form

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities IRO-018-1 and TOP-010-1

DO NOT use this form for submitting comments. Use the electronic form to submit comments on IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities and TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities. The electronic comment form must be completed by **8 p.m. Eastern, Monday, January 25, 2016**.

Documents and information about this project are available on the project page. If you have any questions, contact Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Background Information

Project 2009-02 Real-time Monitoring and Analysis Capabilities originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). The project SAR was revised earlier this year to account for revisions to TOP and IRO standards developed in Project 2014-03. Project 2009-02 is developing requirements to address monitoring and analysis capability issues identified in the 2008 RTBPTF report and the 2011 Southwest Outage Report, as well as addressing FERC Order No. 693 directives.

The Standard Drafting Team (SDT) has revised the two draft Reliability Standards in response to stakeholder comments from the initial posting. IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities addresses issues related to the quality and availability of Reliability Coordinator (RC) monitoring and analysis capabilities. TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities contains proposed requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs).

Questions

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Do you agree with the changes made by the SDT to draft standard IRO-018-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

2. Do you agree with the changes made by the SDT to draft standard TOP-010-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

3. Do you agree with the revised Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

☐ Yes
☐ No
Comments:

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

☐ Yes
☐ No
Comments:

5. Provide any additional comments for the SDT to consider, if desired.
Comments:

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.com

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard(s):	Project 2009-02: Real-time Reliability Monitoring and Analysis Capabilities		
Date Submitted:	June 18, 2015		
SAR Requester Information			
Name:	Saad Malik		
Organization:	Peak Reliability		
Telephone:	970.776.5635	E-mail:	smalik@peakrc.com
SAR Type (Check as many as applicable)			
☒ New Standard		☐ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
To establish requirements for Real-time monitoring and analysis capabilities used by System Operators in support of reliable System operations.
Industry Need (What is the industry problem this request is trying to solve?):
According to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* dated April 2004 (2003 Blackout Report), a principal cause of the August 14 blackout was a lack of situational awareness. Recommendation 22 of the 2003 Blackout Report states that the industry should "evaluate and adopt better Real-time tools for operators and reliability coordinators." NERC's Operating Committee formed the Real-time Tools Best Practices Task Force (RTBPTF) to evaluate Real-time tools and their usage within the industry. The Task Force produced the report *Real-Time Tools Survey Analysis and Recommendations* dated March 13, 2008 (RTBPTF Report)

SAR Information
that included recommendations for the functionality, performance, and management of Real-time tools. The FERC and NERC Staff Report *Arizona-Southern California Outages on September 8, 2011* (2011 Southwest Outage Report) also cited weaknesses in Real-time situational awareness and recommended improvements in Real-time monitoring and analysis capabilities. In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to System operators: • P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.* • P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.* • P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.* This SAR addresses the event reports, Order No. 693 directives, and recommendations from the RTBPTF Report that have not been addressed in other standards projects. The SAR Drafting Team also conducted a Technical Conference on June 4, 2015 to obtain stakeholder input on reliability objectives to be addressed in the proposed project.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The Standards Drafting Team (SDT) shall develop requirements and definition(s), as needed, for Real-time monitoring and analysis capabilities to ensure effective operator situational awareness. The project will address recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
Situational awareness of Real-time system operations is enabled through monitoring and analysis tasks performed by operators. Existing and proposed TOP and IRO standards and definitions developed in

SAR Information
Project 2014-03 Revisions to TOP and IRO Standards require Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. The proposed project will provide additional reliability benefits by addressing issues with the availability and information quality of Real-time monitoring and analysis capabilities. Specifically, the SDT will develop requirements and definition(s), as needed, to accomplish the following: • Establish a common understanding of *monitoring* as it applies to Real-time situational awareness of the Bulk Electric System (BES), • Provide operators with indication(s) of the quality of information being provided by *monitoring* capabilities and procedure(s) to address data quality issues, • Provide operators with notification(s) during unplanned loss of *monitoring* capabilities, and • Provide operators with indication(s) of the quality of information being provided by *analysis* capabilities and procedure(s) to address analysis quality issues. When completed, the project will have addressed recommendations from the 2003 Blackout Report, the 2011 Southwest Outage Report, and the RTBPTF Report, as well as directives from FERC Order No. 693, that have not already been addressed in existing or proposed Reliability Standards.

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☐	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.

Reliability Functions		
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☐	Generator Owner	Owns and maintains generation facilities.
☐	Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.

Reliability and Market Interface Principles	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Related Standards	
Standard No.	**Explanation**
Project 2014-03 Revisions to TOP and IRO Standards	Proposed TOP and IRO standards and definitions from Project 2014-03 require RC, TOP, and BAs to perform monitoring and analysis to prevent instability, uncontrolled separation, and Cascading outages that adversely impact the Interconnection. The proposed standards and definitions are pending regulatory approval.

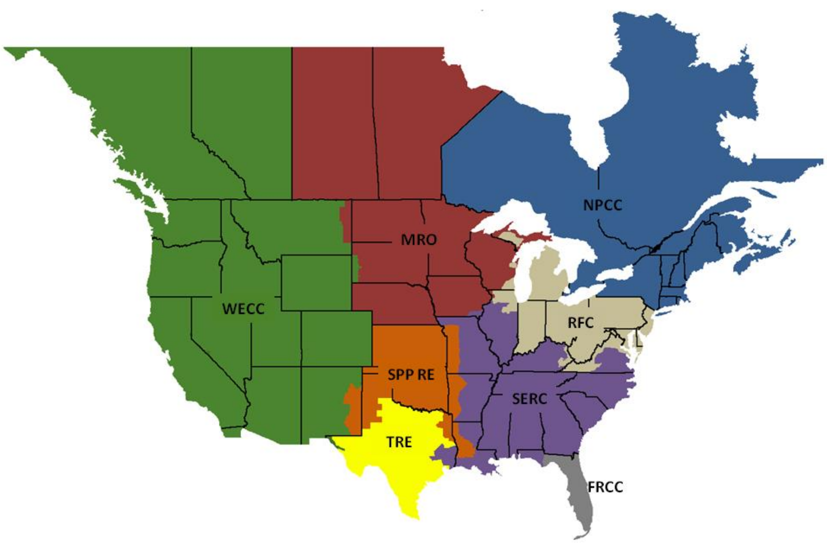
Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the Bulk-Power System (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC's area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC's jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.



FRCC	Florida Reliability Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RFC	Reliability*First* Corporation
SERC	SERC Reliability Corporation
SPP-RE	Southwest Power Pool Regional Entity
TRE	Texas Reliability Entity
WECC	Western Electric Coordinating Council

Introduction

In April 2015, the Standards Committee appointed a new Standards Authorization Request (SAR) Drafting Team (SAR DT) for Project 2009-02 Real-time Monitoring and Analysis Capabilities. This project originated in 2009 in response to work done by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF). Several new Reliability Standards and defined terms have been approved or filed for approval in the years since Project 2009-02 was initiated, including the standards developed in Project 2014-03 Revisions to TOP and IRO Standards. As a result, many of the original issues identified by the RTBPTF for Project 2009-02 have been addressed. In addition, relevant observations and recommendations have emerged from more recent events on the Bulk Electric System (BES) and operating practices have evolved over time. The SAR DT has reviewed previous work done in Project 2009-02, new standards and defined terms, relevant industry report findings and recommendations including those contained in the 2011 Southwest Outage report, and industry observations and practices relevant to real-time situational awareness to assist in developing a comprehensive SAR.

This white paper describes the SAR DT's approach to developing the SAR and discusses the technical basis for developing Reliability Standards in Project 2009-02. This white paper and the associated SAR together are intended to fully describe the project purpose, industry need, and project scope.

Chapter 1 – Background

FERC Order No. 693[1] highlights the need for a minimum set of capabilities to be available to assist operators in making real-time decisions. The work done by the RTBPTF, which was formed by NERC in response to the *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, became the basis for the Real-time Monitoring and Analysis Capabilities (RTMAC) standards development project when it was initiated in 2009. Although Reliability Standards affecting the operating reliability of the Bulk Electric System (BES) have improved significantly over the years since first becoming mandatory in 2007, a reliability issue has persisted in the area of real-time situational awareness capabilities as highlighted in BES event reports and an independent review of the NERC Reliability Standards. A review of industry reports and recommendations pertaining to real-time monitoring and analysis capabilities is provided in this document and in the Appendix. These recommendations, along with the FERC Order No. 693 directives, describe the industry need for the current RTMAC standards project.

BES Event Reports

Project 2009-02, like some other Reliability Standards projects, is informed by the lessons learned from past outages. The two significant outages discussed below highlight issues in real-time situational awareness, among other reliability concerns. Many Communications (COM), Transmission Operations (TOP), and Interconnection Reliability Operations (IRO) standards have addressed event report recommendations to improve the way the BES is planned and operated. The scope of Project 2009-02 is intended to include remaining recommendations from the 2003 Blackout Report and the 2011 Southwest Outage Report that pertain to real-time monitoring and analysis capabilities.

2003 Blackout Report

The largest blackout in history to affect North America began on the afternoon of August 14, 2003 and disrupted over 61,800 Megawatts of electric load in the Northeastern U.S. and the Canadian province of Ontario. Severe impacts to electrical service lasted for nearly one week and an estimated 50 million people were affected. A comprehensive investigation conducted by U.S. and Canadian government and industry leaders identified a host of principal and contributing causes, including:

- Failure to maintain adequate reactive power support,
- Failure to ensure operation within secure limits,
- Inadequate vegetation management,
- Inadequate operator training,
- Failure to identify emergency conditions and communicate that status to neighboring systems, and
- Inadequate regional-scale visibility over the Bulk-Power System (BPS).

Among other causes, the 2003 blackout was linked to dysfunction of SCADA/EMS systems. Additionally, investigators pointed out that several deficiencies leading to the 2003 blackout were also identified weaknesses in previous outages, indicating the need for more effective response. Previous post-event reports included recommendations aimed at improving capabilities for visualizing changes to facilities within the system, and for visualizing changes to facilities in neighboring systems that could have a potential impact. A recurring recommendation also focused on providing capabilities for operators to evaluate courses of action. These

[1] *Mandatory Reliability Standards for the Bulk-Power System,* Order No. 693, 72 Fed. Reg. 16416 at P 1660 (Apr. 4, 2007), FERC Stats. And Regs.¶ 31,242, *order on reh'g,* Order No. 693-A, 120 FERC ¶ 61,053 (2007) (Order No. 693).

observations led to the recommendation in the final report of the 2003 blackout for NERC to **evaluate and adopt better real-time tools for operators and reliability coordinators.**[2]

In response, the NERC Operating Committee organized the RTBPTF to study the real-time situational awareness practices in use within the electric power industry and make recommendations concerning the establishment of minimum capabilities necessary for reliable operations. The RTBPTF report *Real-time Tools Survey Analysis and Recommendations,*[3] completed in 2008, is the result of extensive information gathering and analysis and includes recommendations for new or enhanced Reliability Standards, operating guides, and areas for further analysis. This report became a basis for initiating the Real-time Monitoring and Analysis Capabilities project in 2009.

Although exhaustive and comprehensive, some of the RTBPTF recommendations go beyond the scope of situational awareness monitoring and capabilities. In addition, many other recommendations have been addressed in other subsequent standards projects. The appendix provides a description of RTBPTF report recommendations and the SAR DT's determination of applicability within the scope of Project 2009-02.

An early Concept White Paper describing potential performance, availability, quality, and maintenance parameters based on the RTBPTF Report was developed in 2011. The SAR DT reviewed the white paper and confirmed that, due to significant changes to Reliability Standards and operating practices since it was drafted, the 2011 Concept White Paper is no longer relevant to the current effort in Project 2009-02.

2011 Southwest Outage Report

Like the 2003 blackout in the northeast, the blackout that occurred in the southwest in September 2011 was partly due to, or exacerbated by, inadequate real-time situational awareness. On the afternoon of September 8, 2011, the loss of a single 500 kV line led to widespread cascading outages affecting 2.7 million customers in Arizona, Southern California, and Baja, Mexico. Inadequate operations planning was a significant factor in the failure to maintain a secure N-1 state. However, the report also highlighted several concerns with entities and their ability to monitor, identify, and plan for the next most critical contingency in real-time.[4]

Project 2014-03 - Revisions to TOP and IRO Standards addressed many of the recommendations contained in the 2011 Southwest Outage Report related to operations planning and real-time situational awareness. A complete description is provided in the Southwest Outage Report mapping document for Project 2014-03.[5] Revised definitions and performance requirements for Real-time Assessments and Operational Planning Analysis and proposed requirements for developing and implementing Operating Plans to prevent and mitigate operating limit exceedances address most of the real-time situational awareness recommendations from the report. However some recommendations contain aspects pertaining to real-time capabilities that should be considered in Project 2009-02, as described in the appendix. Accordingly, Project 2009-02 will develop requirements to address remaining recommendations as described in the following chapter.

FERC Directives

In approving the original TOP and IRO standards in Order No. 693, FERC directed future improvements that would require a minimum set of capabilities be made available to operators.[6] FERC indicated that the intent of the directive is to ensure operating entities have adequate tools to perform their real-time reliability functions.[7]

- P 905: *Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions.*
- P 906*: [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.*
- P 1660: *We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.*

Independent Experts Review Project (IERP) Report

In 2013, NERC retained a team of five industry experts to assess the quality of the enforceable body of standards and make recommendations for improvements that could be implemented by NERC and the industry.[8] Among the recommendations made by the panel of experts was the identification of potential risks to reliability that may not be adequately addressed in Reliability Standards. The report recommended resuming development of the Real-time Monitoring and Analysis Capabilities standards project.

Proposed TOP and IRO Standards

Since Project 2009-02 was initiated in 2009, many standards and definitions have been revised or developed that address real-time situational awareness issues. In particular, the revised TOP and IRO standards in Project 2014-03, which are pending regulatory approval, include key provisions for real-time situational awareness and operations planning. In reviewing the RTBPTF report recommendations for applicability in the current Project 2009-02 effort, the SAR DT considered the Project 2014-03 standards as noted in the Appendix.

The proposed TOP and IRO standards in Project 2014-03 provide requirements for performing monitoring and analysis through the definition of Real-time Assessment, Operational Planning Analysis, and the relevant requirements. Accordingly, additional requirements to perform monitoring or analysis will not be included in the scope for Project 2009-02. Furthermore, requirements for data exchange to support real-time monitoring and analysis will not be included in scope for Project 2009-02 because they are addressed through data specification requirements in IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3.

---

[6] Order No. 693 at P 905 (approving IRO-002-1 and directing modifications) and P 1665 (approving TOP-006-1 and directing modifications.

[7] Additionally, in approving VAR-001-1 - Voltage and Reactive Control, the Commission directed NERC to develop modifications to the standard to require periodic performance of voltage stability analysis to assist in real-time operations. The commission clarified that this could be accomplished through online tools where available, or offline simulation tools.

- §1875: *...[w]e direct the ERO, through its Reliability Standards development process, ...to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.*

VAR-001 was revised in the Project 2013-04, however the revised standard did not include a requirement for periodic performance of voltage stability analysis because voltage stability analysis is performed per SOL Methodology developed under FAC standards.

[8] See The Standards Independent Experts Review Project report. Available at www.nerc.com /pa/Stand/_layouts/xlviewer.aspx?id=/pa/Stand/Documents/P81_and%20IERP_Recommendations_for_Retirement_010815.xlsx.

Technical Conference

NERC and the SAR DT held a Technical Conference in Atlanta on June 4, 2015, to obtain industry input on reliability issues to be addressed in the proposed project. Participant subject matter experts representing a diverse mix of regional and functional entities shared their perspectives on the use of real-time situational awareness capabilities for reliable operations. There was consensus that many RTBPTF recommendations have been addressed in current or proposed TOP and IRO standards. However, Technical Conference participants agreed that issues identified by the RTBPTF pertaining to availability and information quality of real-time monitoring and analysis capabilities were still relevant.

Chapter 2 – Project Scope

The SAR DT has reviewed all recommendations from the RTBPTF and relevant recommendations from event reports, along with the existing body of standards, to identify remaining issues that should be in the scope for Project 2009-02. Table 1 below shows the resulting recommendations to be addressed. Additionally, the project will address outstanding FERC directives discussed in the preceding chapter.

Table 1: Report Recommendations to Address in Project 2009-02

Source	Recommendation	Discussion	Applicable Entity
2003 Blackout Report	Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators.	Project 2009-02 will develop requirements for real-time reliability monitoring and analysis capabilities to address issues not already addressed in other Reliability Standards. RTBPTF report recommendations will be considered in development.	RC, TOP, BA
2011 Southwest Outage Report	Recommendation 12 - [entities] should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2009-02 will develop requirements to improve the adequacy and operation of real-time monitoring and analysis capabilities. Requirements addressing the frequency that real-time tools run are contained in other standards and are not in the scope of this project.	RC, TOP, BA
RTBPTF Report	S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • Alarm Tools • Telemetry Data Systems • Network Topology Processor • State Estimator • Contingency Analysis	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. Prescription of specific tools is not in scope. Project approach is discussed below.	RC, TOP, BA as discussed below
RTBPTF Report	S7 - S8, S11-S12, S40 - Availability of various monitoring and analysis capability processes	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring capabilities are not available (i.e., not performing their intended function).	RC, TOP, BA

Project Purpose and Approach

Project 2009-02 will develop requirements for real-time monitoring and analysis capabilities used by operators in support of reliable System operations. Functional requirements for performing *monitoring* and *analysis* tasks are well established in Reliability Standards as discussed throughout this white paper. However, reliability could be improved by:

- Developing a common understanding of *monitoring* as it applies to real-time situational awareness of the BES,
- Providing operators with indication(s) of the quality of information being provided by *monitoring* and *analysis* capabilities, and
- Providing operators with notification(s) during unplanned loss of *monitoring* capabilities.

Project 2009-02 will develop requirements and definition(s), as needed, to accomplish these reliability objectives as discussed.

Real-time Situational Awareness Concept

From the RTBPTF Report:

> *Situational awareness, as RTBPTF understands it, means ensuring that accurate information on current system conditions, including the likely effects of future contingencies, is continuously available in a form that allows operators to quickly grasp and fully understand actual operating conditions and take corrective action when necessary to maintain or restore reliable operations.*

The Project 2009-02 SAR DT believes that situational awareness encompasses two broad capabilities: monitoring and analysis. To be effective in supporting real-time situational awareness, monitoring and analysis must:

- Be performed with sufficient frequency to allow operators to understand operating conditions and take corrective actions when necessary,
- Provide awareness of information quality to allow operators to assess the accuracy of information being received on system conditions and take corrective actions when necessary, and
- Indicate when monitoring or analysis processes are not operating normally or are unavailable in order to provide operator awareness of the accuracy of the information being provided.

Project 2009-02 will develop new requirements and definition(s), as needed, that support this concept of situational awareness without duplicating aspects that are already addressed in the existing and proposed body of Reliability Standards. As discussed in the preceding chapter, requirements for the Reliability Coordinator (RC), Transmission Operator (TOP), and Balancing Authority (BA) to perform monitoring and analysis are covered under existing and proposed TOP and IRO standards. Therefore, Project 2009-02 will focus on developing requirements to address information quality and operator awareness of real-time monitoring and analysis capabilities. Table 2 shows reliability objectives that should be addressed in requirements for this project.

Monitoring

Monitoring BES facilities in real-time is a primary function of the RCs, TOPs, and BAs and is addressed in existing and proposed TOP and IRO standards. For RCs, proposed IRO-002-4 states:

> *R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.*

For TOPs and BAs, proposed TOP-001-3 states:

> *R10. Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:*
>
> > *10.1. Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and*
> >
> > *10.2. Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.*
>
> *R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.*

The SAR DT understands *monitoring* capabilities may include both alarming and information visualization. Project 2009-02 will aim to develop a consistent understanding of *monitoring* within the industry. The project will also address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of information being provided by a monitoring system, and indication when a monitoring system is not operating normally.

Analysis

The *analysis* component of the Real-time situational awareness concept is described by the definition of Real-time Assessment, which is pending FERC approval along with the proposed TOP and IRO standards. The proposed definition is as follows:

> ***Real-time Assessment*** *- An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)*

Requirements for performing Real-time Assessments are contained in proposed IRO-008-2 and TOP-001-3:

> ***Proposed IRO-008-2***
> *R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.*
>
> ***Proposed TOP-001-3***
> *R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.*

The SAR DT believes the proposed definition of Real-time Assessment and the requirements in proposed IRO-008-2 and TOP-001-3 provide RCs and TOPs with flexibility to determine which real-time tools, such as State Estimator, Contingency Analysis, and Stability Applications, are necessary to meet their real-time reliability functions. Consequently, prescriptive requirements for real-time tools are not in scope for Project 2009-02.

The project will address recommendations from Table 1 by developing requirements to ensure operators are provided with an indication of the quality of the analysis used in Real-time Assessments.

Table 2: Project 2009-02 Reliability Objectives		
	Monitoring Capabilities	**Analysis Capabilities**
Quality	Provide operator with indication of information quality and procedures to address data quality issues.	Provide operator with indication of information quality and procedures to address analysis quality issues.
Availability	Provide operator with notification any time monitoring system is not operating normally.	N/A

Appendix – Report Recommendations

The table below contains recommendations for improved real-time situational awareness capabilities found in relevant industry reports and how these recommendations have been addressed, if applicable. If recommendations have not been addressed fully, the table includes a description of how they should be addressed in Project 2009-02. The following industry reports are considered here[9]:

- 2003 Blackout Final Report
- 2011 Southwest Outage Report
- Real-time Tools Best Practices Task Force

Report Recommendation Mapping	
Report Recommendation	**Applicable Standard(s)**
2003 Blackout Final Report	
Recommendation 1-21, 23-46	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 22 - Evaluate and adopt better real-time tools for operators and reliability coordinators. Operating Committee to evaluate the real-time operating tools necessary for reliability operation and reliability coordination, including backup capabilities. The committee's report is to address both minimum acceptable capabilities for critical reliability functions and a guide to best practices.	The Operating Committee established the RTBPTF to evaluate real-time operating tools and make recommendations for proposed standards. Project 2009-02 should consider these recommendations as discussed below.
2011 Southwest Outage Report	
Recommendation 1-10, 13-26	Report recommendations do not apply to Real-time reliability monitoring and analysis capabilities.
Recommendation 11 - TOPs should review their real-time monitoring tools, such as State Estimator and RTCA, to ensure that such tools represent critical facilities needed for the reliable operation of the BPS.	Project 2014-03 developed the proposed definition of Real-time Assessment and proposed TOP-003-3 Requirement R1 which describes the requirements for a data specification that will provide all of the data that a TOP needs in order to fulfill its reliability function. Together, these address capabilities and required data TOPs must have to ensure adequate situational awareness. **Real-time Assessment -** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-003-3, Requirement R1, Part 1.1**:

[9] *All industry reports are available on the 2009-02 Project Page: http://www.nerc.com/pa/Stand/Pages/Project-2009-02-Real-time-Reliability-Monitoring-and-Analysis-Capabilities.aspx.*

	A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator.
Recommendation 12 - TOPs should take measures to ensure that their real-time tools are adequate, operational, and run frequently enough to provide their operators the situational awareness necessary to identify and plan for contingencies and reliably operate their systems.	Project 2014-03 developed a requirement for the performance of a Real-time Assessment for Transmission Operators. Standards developed in Project 2009-02 will address the adequacy of tools as described in this recommendation. **Proposed TOP-001-3, Requirement R13:** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
Recommendation 27 - TOPs should have: (1) the tools necessary to determine phase angle differences following the loss of lines; and (2) mitigation and operating plans for reclosing lines with large phase angle differences.	Proposed definitions of Real-time Assessment (RTA) and Operational Planning Analysis (OPA) developed in Project 2014-03 specify that identified phase angle limitations must be considered and deal with applying phase angle information. Proposed TOP-002 Requirement R2 specifies that TOPs must have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified in the OPA. Data specification requirements in approved IRO-010-1, proposed IRO-010-2, and proposed TOP-003-3 provide a means for RCs and TOPs to obtain phase angle information. **Proposed Definition: Operational Planning Analysis:** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed Definition: Real-time Assessment:** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System

	Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.
RTBPTF Report	
S1 - Mandate the following reliability tools as mandatory monitoring and analysis tools. • **Alarm Tools** • **Telemetry Data Systems** • **Network Topology Processor** • **State Estimator** • **Contingency Analysis**	Project 2009-02 will address requirements for Real-time monitoring and analysis capabilities. However, prescription of specific tools is not in scope.
S2 - Compile and maintain a list of all bulk electric system elements within RC's area of responsibility.	Not in scope. Reliability objective is accomplished through monitoring and analysis requirements as discussed below.
S3 - Add new requirements and measures pertaining to RC monitoring of the bulk electric system.	Addressed in IRO standards (current and proposed). **IRO-002-2** R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. **IRO-003-2** R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. **Proposed IRO-002-4** R3. Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
S4 - Develop data-exchange standards.	Addressed in proposed TOP-001-3 and IRO-002-4. **Proposed TOP-001-3** R19. Each Transmission Operator shall have data exchange capabilities with the entities that it has identified that it needs data from in order to maintain reliability in its Transmission Operator Area. R20. Each Balancing Authority shall have data exchange capabilities with the entities that it has identified that it

	needs data from in order to maintain reliability in its Balancing Authority Area. **Proposed IRO-002-4** R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
S5 - Develop data-availability standards and a process for trouble resolution and escalation.	Data availability and trouble resolution is addressed in IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S6 - Develop a new weather data requirement related to situational awareness and real-time operational capabilities.	EOP-010-1 covers space weather dissemination. The SAR DT views monitoring other weather information as common utility practice that does not require a reliability standard.
S7 - Specify and measure minimum availability for alarm tools.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the

	RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function). Availability notification for analysis tools is addressed in IRO-008-1, and proposed IRO-008-2 proposed TOP-001-3 from Project 2014-30. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
S8 - Specify and measure minimum availability for network topology processor.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S9 - Establish a uniform formal process to determine the “wide area view boundary” and show boundary data/results.	Wide-area is now a defined term. Recommendation has been addressed.
S10 - Develop compliance measures for verification of the usage of “wide-area overview display” visualization tools.	IRO standards revisions have addressed compliance measures.
S11 - Specify and measure minimum availability for state estimator, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S12 - Specify and measure minimum availability for contingency analysis, including a requirement for solution quality.	The RTBPTF recommended a requirement be developed to provide operator awareness when key monitoring and alarming tools are not performing their intended functions. Project 2009-02 will address the recommendation to provide operator awareness when key monitoring and alarming tools are not available (i.e. not performing their intended function).
S13 - Specify criteria and develop measures for defining contingencies.	Not in scope; Addressed in approved TPL and FAC standards.
S14 - Perform one-hour-ahead power-flow simulations to assess approaching SOL and IROL violations and corresponding measures.	Requirements for assessing pre- and post-contingency system conditions are addressed in Real-time Assessment (RTA) and Operational Planning Analysis (OPA) definitions. Requirements for performing RTA and OPA are contained in

	proposed TOP-001-3, TOP-002-4, IRO-008-2, and approved IRO-008-1. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **Proposed TOP-001-3** R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **IRO-008-1** R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations.

	(Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)
S15 - Provide real-time awareness of load-shed capability to address potential or actual IROL violations.	Addressed in proposed EOP-011-1, approved IRO-010-1 and proposed IRO-010-2 and TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including:

	2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time

	monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
S16 - Require BAs to monitor contingency reserves and calculate contingency reserves at a minimum periodicity of 10 seconds.	BA responsibilities for managing Contingency Reserve are addressed in the approved BAL-002-1 standard which is under revision in Project 2010-014. 1. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules.
S17 - Revise the current-day operations requirements to delineate specific, independent requirements for monitoring operating and reactive reserves.	Addressed in VAR-001-4, BAL-002, and proposed IRO-002-4 and TOP-001-3. **VAR-001-4** R4. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. **BAL-002-1** R1. Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules. **Proposed IRO-002-4** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **Proposed TOP-001-3** R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.
S18 - Establish document plans and procedures for conservative operations.	Addressed in proposed EOP-011-1 Requirement R1. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating

	Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 1.2.6. Reliability impacts of extreme weather conditions. R2. Each Balancing Authority shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate Capacity Emergencies and Energy Emergencies within its Balancing Authority Area. The Operating Plan(s) shall include the following, as applicable: 2.1. Roles and responsibilities for activating the Operating Plan(s); 2.2. Processes to prepare for and mitigate Emergencies including: 2.2.1. Notification to its Reliability Coordinator, to include current and projected conditions when experiencing a Capacity Emergency or Energy Emergency; 2.2.2. Requesting an Energy Emergency Alert, per Attachment 1; 2.2.3. Managing generating resources in its Balancing Authority Area to address: 2.2.3.1. capability and availability; 2.2.3.2. fuel supply and inventory concerns; 2.2.3.3. fuel switching capabilities; and 2.2.3.4. environmental constraints. 2.2.4. Public appeals for voluntary Load reductions; 2.2.5. Requests to government agencies to implement their programs to achieve necessary energy reductions; 2.2.6. Reduction of internal utility energy use; 2.2.7. Use of Interruptible Load, curtailable Load and demand response; 2.2.8. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and 2.2.9. Reliability impacts of extreme weather conditions.

S19 - Restore system operations from an unknown operating state to proven and reliable limits within 30 minutes.	Addressed in proposed TOP-001-3, and IRO-008-2 and the proposed definitions for Operational Planning Analysis and Real-time Assessment. **Proposed TOP-001-3** R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R14. Each Transmission Operator shall initiate its Operating Plan to mitigate an SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **Proposed IRO-008-2** R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. **Proposed definition** **Operational Planning Analysis -** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Proposed definition** **Real-time Assessment** - An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be

	provided through internal systems or through third-party services.)
S20 - Develop formal operating guides (mitigation plans) and measures for each IROL and any SOL or other conditions having a potential impact on reliability.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S21 - Review and update operating guides (mitigation plans) when day-ahead or current day studies indicate the potential need to implement an operating guide.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for

	the next-day provided by its Transmission Operators and Balancing Authorities.
S22 - Provide temporary operating guides (mitigation plans) with control actions for situations that could affect reliability but that have not been identified previously.	Addressed in proposed TOP-002-4 and IRO-008-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S23 - Develop joint operating guides (mitigation plans) for situations that could require more than one RC or more than one TOP to execute actions.	Addressed in IRO-014-2, proposed IRO-014-3 and proposed IRO-008-2. **IRO-014-2** R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: ... **Proposed IRO-014-3** R1. Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: ... **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as

	a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.
S24 - Develop a formal procedure to document the processes for developing, reviewing, and updating operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S25 - Incorporate verifiable and traceable elements such as titles, document numbers, revision numbers, revision history, approvals, and dates when modifying operating guides (mitigation plans).	Not in scope; this is administrative in nature.
S26 - Write operating guides (mitigation plans) in clear, unambiguous language, leaving nothing to interpretation.	Not in scope. This is administrative in nature.
S27 - State the specific purpose of existence for each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S28 - Summarize the specific situation assessment and address the method of performing the assessment in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S29 - Identify all appropriate preventive and remedial control actions in each operating guide (mitigation plan).	Not in scope. This is administrative in nature.
S30 - Develop criteria in operating guides (mitigation plans) to support decisions regarding whether a specific control action should be taken.	Not in scope. This is administrative in nature.
S31 - Incorporate on-line tools that utilize on-line data when operating guides (mitigation plans) require calculations.	Not in scope. Recommendation is appropriate as a guideline rather than a reliability standard.
S32 - Make operating guides (mitigation plans) readily available via a quick-access method such as Web-based help, EMS display notes, or on-line help systems.	Not in scope. This is administrative in nature.
S33 - Provide the location, real-time status, and MWs of load available to be shed.	Addressed in proposed EOP-011-1 Requirement R1 Part 1.2.5 and proposed TOP-003-3. **Proposed EOP-011-1** R1. Each Transmission Operator shall develop, maintain, and implement one or more Reliability Coordinator-reviewed Operating Plan(s) to mitigate operating Emergencies in its Transmission Operator Area. The Operating Plan(s) shall include the following, as applicable: 1.1. Roles and responsibilities for activating the Operating Plan(s); 1.2. Processes to prepare for and mitigate Emergencies including: 1.2.1. Notification to its Reliability Coordinator, to include current and projected conditions, when experiencing an operating Emergency; 1.2.2. Cancellation or recall of Transmission and generation outages; 1.2.3. Transmission system reconfiguration; 1.2.4. Redispatch of generation request; 1.2.5. Provisions for operator-controlled manual Load shedding that minimizes the overlap with automatic Load shedding and are capable of being implemented in a timeframe adequate for mitigating the Emergency; and

	1.2.6. Reliability impacts of extreme weather conditions. **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ...
S34 - Establish documented procedures for the reassessment and re-posturing of the system following an event.	Addressed in proposed TOP-002-4 and IRO-008-2, and approved EOP-005-2 and EOP-006-2. **Proposed TOP-002-4** R2. Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. R4. Each Balancing Authority shall have an Operating Plan(s) for the next-day that addresses: 4.1 Expected generation resource commitment and dispatch 4.2 Interchange scheduling 4.3 Demand patterns 4.4 Capacity and energy reserve requirements, including deliverability capability **Proposed IRO-008-2** R2. Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ...

	EOP-006-2 R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S35 - Provide information to operators to maintain awareness of the availability and capability of the blackstart generators and transmission restoration paths.	Addressed in approved IRO-010-1, proposed TOP-003-3, proposed IRO-010-2, approved EOP-005-2, and approved EOP-006-2. **IRO-010-1** R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. ... R1.6. Reporting requirements for the entities within the Reliability Coordinator Area during a restoration event. ... **Proposed TOP-003-3** R1. Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: 1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. ... **Proposed IRO-010-2** R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: 1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses,

	Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **EOP-005-2** R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: ... R1.4. Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit. ... R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **EOP-006-2** R1. Each Reliability Coordinator shall have a Reliability Coordinator Area restoration plan. The scope of the Reliability Coordinator's restoration plan starts when Blackstart Resources are utilized to re-energize a shut down area of the Bulk Electric System (BES), or separation has occurred between neighboring Reliability Coordinators, or an energized island has been formed on the BES within the Reliability Coordinator Area. The scope of the Reliability Coordinator's restoration plan ends when all of its Transmission Operators are interconnected and its Reliability Coordinator Area is connected to all of its neighboring Reliability Coordinator Areas. The restoration plan shall include: ...
S36 - Plan and coordinate scheduled outages of blackstart generators and transmission restoration paths.	Addressed in approved EOP-005-2 and proposed IRO-017-1 - Outage Coordination. **EOP-005-2** R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. **Proposed IRO-017-1** R1. Each Reliability Coordinator shall develop, implement, and maintain an outage coordination process for generation

	and Transmission outages within its Reliability Coordinator Area. The outage coordination process shall: ...
S37 - Maintain a Critical Equipment Monitoring Document to identify tools and procedures for monitoring critical equipment.	Not in scope. This is administrative in nature.
S38 - Maintain event logs pertaining to critical equipment status for a period of one year.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S39 - Maintain a Critical Equipment Maintenance and Testing Document identifying tools and procedures for maintenance, modification, and testing of critical equipment.	Not in scope. This recommendation is to write a requirement for 'critical equipment', which the RTBPTF considered to be "installed equipment that makes up infrastructure and systems (including communication networks, data links, hardware, software applications, and data bases) that are directly used as critical real-time tools". Project 2009-02 will address capabilities, and not specific tools. Therefore the recommendation is not applicable to the project.
S40 - Monitor and maintain awareness of critical equipment status to ensure that lack of availability of critical equipment does not impair reliable operation.	Project 2009-02 will address the recommendation from the RTBPTF report to provide operator awareness when key monitoring and analysis capabilities are not available (i.e., not performing their intended function).

Violation Risk Factor and Violation Severity Level Justifications

Project 2009-02 Real-time Monitoring and Analysis Capabilities

This document provides the Standard Drafting Team's (SDT) justification for assignment of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for each requirement in Project 2009-02.

Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk

requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities

- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of VRFs corresponding to requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per-violation per-day basis is the "default" for penalty calculations.

VRF Justification

The requirements in IRO-018-1 and TOP-010-1 were developed to address certain issues related to the Real-time monitoring and analysis capabilities used by operators of the BES. IRO-018-1 contains five requirements applicable to Reliability Coordinators (RCs), while TOP-010-1 contains seven analogous requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs). A Medium VRF is proposed for all requirements in both standards according to the guidelines as explained below.

VRF Justifications – IRO-018-1 (R1-R3) and TOP-010-1 (R1-R4)	
Proposed VRF	**Medium**
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report. N/A. The requirements are not directly connected to conclusions from the 2003 Blackout, but rather address specific recommendations from NERC Technical Committees.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The requirements have no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. These are new requirements. The VRFs in IRO-018-1 are consistent with those contained in TOP-010-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. A VRF of Medium is consistent with the NERC VRF definition. The requirements in IRO-018-1 and TOP-010-1 address issues related to the quality and availability of monitoring and analysis capabilities used by RCs, TOPs, and BAs in maintaining reliable operations. Violation of any of these requirements could directly affect the ability to effectively monitor and control the Bulk Electric System. However, violation of any of these requirements is unlikely to lead to Bulk Electric System instability, separation, or cascading failures. Therefore, a VRF of Medium is appropriate.

VRF Justifications – IRO-018-1 (R1-R3) and TOP-010-1 (R1-R4)	
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. Each requirement contains one objective, therefore a single VRF is assigned to each requirement.

VSL Justification

Violation Risk Factor and Violation Severity Level Justifications

Project 2009-02 Real-time Monitoring and Analysis Capabilities

This document provides the Standard Drafting Team's (SDT) justification for assignment of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for each requirement in Project 2009-02.

Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk

requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Violation Risk Factor Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities

- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of VRFs corresponding to requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per-violation per-day basis is the "default" for penalty calculations.

VRF Justification

The requirements in IRO-018-1 and TOP-010-1 were developed to address certain issues related to the Real-time monitoring and analysis capabilities used by operators of the BES. IRO-018-1 contains five requirements applicable to Reliability Coordinators (RCs), while TOP-010-1 contains seven analogous requirements for Transmission Operators (TOPs) and Balancing Authorities (BAs). A Medium VRF is proposed for all requirements in both standards according to the guidelines as explained below.

VRF Justifications – IRO-018-1 (R1-~~R5~~R3) and TOP-010-1 (R1-~~R7~~R4)	
Proposed VRF	**Medium**
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report. N/A. The requirements are not directly connected to conclusions from the 2003 Blackout, but rather address specific recommendations from NERC Technical Committees.
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The requirements have no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. These are new requirements. The VRFs in IRO-018-1 are consistent with those contained in TOP-010-1.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. A VRF of Medium is consistent with the NERC VRF definition. The requirements in IRO-018-1 and TOP-010-1 address issues related to the quality and availability of monitoring and analysis capabilities used by RCs, TOPs, and BAs in maintaining reliable operations. Violation of any of these requirements could directly affect the ability to effectively monitor and control the Bulk Electric System. However, violation of any of these requirements is unlikely to lead to Bulk Electric System instability, separation, or cascading failures. Therefore, a VRF of Medium is appropriate.

VRF Justifications – IRO-018-1 (R1-~~R5~~R3) and TOP-010-1 (R1-~~R7~~R4)	
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. Each requirement contains one objective, therefore a single VRF is assigned to each requirement.

VSL Justification

Proposed VSLs – IRO-018-1, R1			
Lower	**Moderate**	**High**	**Severe**

Order No. 693 Citation	Directive/Guidance	Resolution
P 905-906	Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.	Proposed IRO-018-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the Reliability Coordinator's (RC) monitoring and analysis capabilities. The monitoring and analysis capabilities required by proposed IRO-018-1 and other IRO standards discussed below ensure RCs have the capabilities to maintain Real-time situational awareness. **Monitoring Capabilities** Requirement R1 addresses the quality of the Real-time data needed by the RC to perform its monitoring and Real-time Assessments. Each RC is required to implement a documented procedure for addressing Real-time data quality issues. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to resolve Real-time data quality issues when data quality affects Real-time Assessments. Requirement R3 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring RCs to use an alarm process monitor. Requirements for the RC to perform Real-time monitoring are specified in IRO-002-2, IRO-002-4, and IRO-003-2. ***Proposed IRO-018-1*** **R1.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating the quality of Real-time data; **1.2.** Provisions to indicate the quality of Real-time data to the System Operator; and **1.3.** Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. **R3.** Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***IRO-002-2*** **R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. ***IRO-003-2*** **R1.** Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or

Order No. 693 Citation	Directive/Guidance	Resolution
		unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. ***IRO-002-4*** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **<u>Analysis Capabilities</u>** Requirement R2 addresses the quality of the analysis used by the RC to perform its Real-time Assessments. Each RC is required to implement a documented procedure to address the quality of the analysis used in its Real-time Assessments. The procedure must include criteria for evaluating the quality of analysis used in Real-time Assessments, provisions for indicating the quality of analysis, and actions to resolve analysis quality issues affecting its Real-time Assessments.. Requirements for the RC to perform Real-time Assessments are specified in IRO-008-1 and IRO-008-2. ***Proposed IRO-018-1*** **R2.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include:

Order No. 693 Citation	Directive/Guidance	Resolution
		2.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments; **2.2** Provisions to indicate the quality of analysis used in its Real-time Assessments; and **2.3.** Actions to resolve analysis quality issues affecting its Real-time Assessments. ***IRO-008-1*** **R2.** Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. ***Definition of Real-time Assessment*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***IRO-008-2*** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Order No. 693 Citation	Directive/Guidance	Resolution
P 1660	We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.	Proposed TOP-010-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the monitoring and analysis capabilities used by Transmission Operators (TOPs) and Balancing Authorities (BAs). The monitoring and analysis capabilities required by TOP-010-1 and other TOP standards discussed below ensure TOPs and BAs have the capabilities to maintain Real-time situational awareness. **<u>Monitoring Capabilities</u>** Requirements R1 and R2 address the quality of the Real-time data needed by TOPs and BAs to perform their Real-time monitoring and Real-time analysis. Each TOP and BA is required to implement a documented procedure for addressing Real-time data quality issues. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to resolve Real-time data quality issues when data quality affects analysis. Requirement R4 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring TOPs and BAs to use an alarm process monitor. Requirements for TOPs to perform Real-time monitoring are specified in TOP-001-3 and TOP-006-2. Requirements for BAs to perform Real-time monitoring are specified in TOP-006-2, TOP-001-3k and BAL standards. ***Proposed TOP-010-1*** **R1.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating the quality of Real-time data; **1.2.** Provisions to indicate the quality of Real-time data to the System Operator; and **1.3.** Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. **R2.** Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: **2.1** Criteria for evaluating the quality of Real-time data; **2.2** Provisions to indicate the quality of Real-time data to the System Operator; and **2.3** Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data. **R4.** Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***TOP-006-2*** **R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.

Order No. 693 Citation	Directive/Guidance	Resolution
		1.1. - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2.** - Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. ***TOP-001-3*** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **10.1.** Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and **10.2.** Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. **<u>Analysis Capabilities</u>** Requirement R3 addresses the quality of the analysis used by the TOP to perform its Real-time Assessments. Each TOP is required to implement a documented procedure to address the quality of the analysis used in its Real-time Assessments. The procedure must include criteria for evaluating the quality of

Order No. 693 Citation	Directive/Guidance	Resolution
		analysis used in Real-time Assessments, provisions for indicating the quality of analysis, and actions to resolve analysis quality issues affecting its Real-time Assessments. Requirements for the TOP to perform Real-time Assessments are specified in TOP-003-3. ***Proposed TOP-010-1*** **R3.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: **3.1.** Criteria for evaluating the quality of any analysis used in its Real-time Assessments; **3.2.** Provisions to indicate the quality of analysis used in its Real-time Assessments; and **3.3.** Actions to resolve analysis quality issues affecting its Real-time Assessments. ***Definition of Real-time Assessment*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***TOP-001-3*** **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Order No. 693 Citation	Directive/Guidance	Resolution
P 1875	...[w]e direct the ERO, through its Reliability Standards development process, to modify Reliability Standard VAR-001-1 to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.	The directive was considered in developing the scope of Project 2009-02. NERC believes TOP, IRO, and VAR standards address the directive as discussed below. Accordingly, additional requirements were not developed in Project 2009-02. RCs and TOPs are required to periodically perform Real-time Assessments consisting of an evaluation of system conditions "to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions." Entities must use whatever analysis is necessary to obtain an evaluation of system conditions, which may include real-time voltage stability analysis. Real-time Assessments assist operators in maintaining operations within established SOLs and IROLs, to include voltage stability criteria. Requirements for performing Real-time Assessments are contained in IRO-008-1, IRO-008-2, and TOP-001-3 Reliability Standards as discussed above. VAR-001-1 was revised in Project 2013-04. The resulting standard, VAR-001-4, did not include an explicit requirement for periodic performance of voltage stability analysis because "such analysis would be performed pursuant to the SOL methodology developed under FAC standards."[1] VAR-001-4 requirement R1 specifies the TOP must establish a system voltage schedule as part of its plan to operate within SOLs and IROLs. ***VAR-001-4*** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate

Order No. 693 Citation	Directive/Guidance	Resolution
		within System Operating Limits and Interconnection Reliability Operating Limits. **1.1.** Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

Order No. 693 Citation	Directive/Guidance	Resolution
P 905-906	Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.	Proposed IRO-018-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the Reliability Coordinator's (RC) monitoring and analysis capabilities. The monitoring and analysis capabilities required by proposed IRO-018-1 and other IRO standards discussed below ensure RCs have the capabilities to maintain Real-time situational awareness. **Monitoring Capabilities** Requirement~~s~~ R1 ~~and R2~~ address<ins>es</ins> the quality of the Real-time data needed by the RC to perform its monitoring and Real-time Assessments. Each RC is required to implement a documented procedure for addressing Real-time data quality issues<ins>. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to resolve Real-time data quality issues when data quality affects Real-time Assessments.</ins> ~~, including invalid or time-late data, and must provide System Operators with information to indicate the quality of data received.~~ Requirement ~~R5~~ <ins>R3</ins> addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring RCs to use an ~~independent~~ alarm process monitor. Requirements for the RC to perform Real-time monitoring are specified in ~~currently-enforceable~~ IRO-002-2, <ins>IRO-002-4, and</ins> IRO-003-2~~, and proposed IRO-002-4 from Project 2014-03~~. ***Proposed IRO-018-1***

Standards Announcement

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities IRO-018-1 and TOP-010-1

Formal Comment Period Open through January 25, 2016

Now Available

A 45-day formal comment period for **IRO-018-1 – Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities** and **TOP-010-1 – Real-time Reliability Monitoring and Analysis Capabilities** is open through **8 p.m. Eastern, Monday, January 25, 2016**.

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Commenting

Use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, contact Nasheema Santos. An unofficial Word version of the comment form is posted on the project page.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

Additional ballot for the standards and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **January 15-25, 2016**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities IRO-018-1 and TOP-010-1

Additional Ballot and Non-binding Poll Results

Now Available

Additional ballots for **Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities** and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded **8 p.m. Eastern, January 26, 2016.**

The standards are as follows:

- IRO-018-1 - **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
- TOP-010-1 - **Real-time Reliability Monitoring and Analysis Capabilities**

The standards received sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides the detailed results.

	Ballot	Non-binding Poll
Standard	Quorum / Approval	Quorum / Supportive Opinions
IRO-018-1	82.88 % / 72.13%	81.95% / 81.76%
TOP-010-1	82.18% / 68.01%	81.02% / 76.27%

Next Steps
The drafting team will consider all comments received during the formal comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Comment Report

Project Name:	2009-02 Real-time Reliability Monitoring and Analysis Capabilities | IRO-018-1 & TOP-010-1
Comment Period Start Date:	12/10/2015
Comment Period End Date:	1/26/2016
Associated Ballots:	2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 AB 2 ST 2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 Non-binding Poll AB 2 NB 2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 AB 2 ST 2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 Non-binding Poll AB 2 NB

There were 38 sets of responses, including comments from approximately 33 different people from approximately 31 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the changes made by the SDT to draft standard IRO-018-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

2. Do you agree with the changes made by the SDT to draft standard TOP-010-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

3. Do you agree with the revised Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

5. Provide any additional comments for the SDT to consider, if desired.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	
Comment	

Southern believes that the criteria in R1.1 should be limited to the RC's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools.

Each RC has the inherent responsibility to protect the integrity of the system in its RC area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. The NERC approved IRO-002-4, IRO-010-2, TOP-003-3 and TOP-004 standards requires the RCs and TOPs to have monitoring tools and capabilities to assess system conditions in its area and to perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability. Moreover, Southern asserts that the capability to maintain an accurate model along with the required telemetry is already being assessed at the certification stage, and that maintenance of such capability does not need to be assessed on an ongoing basis as adequate data quality is required to perform the assessments required by the aforementioned standards.

Since the RC is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments, through the same processes demonstrated during certification. Southern believes that the reliability goals of maintaining adequate data, tools and situational awareness are accomplished via the IRO-010 and TOP-003-3 NERC reliability standards and to impose this new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

Given that Southern disagrees with the reliability need for this standard, Southern notes that the detailed requirements (R1.1.1, etc…)regarding assessing data quality, on a point by point basis, was moved to the technical background section of the purposed standard, which is helpful as long as the RSAWs developed doesn't incorporate this "one size fits all" approach for assessing data quality.

Comment	

We continue to disagree with the need to create Reliability Standards (this and TOP-010-1) to stipulate the requirements for having processes in place to ensure data quality and real-time analysis capability, and adequate alarming system to alert operators of suspicious data or analysis capability. These processes are fundamental to enabling the RC, TOP and BA perform their reliability tasks and meet applicable standard requirements. Data quality, real-time analysis capability and alarming system must be demonstrated during the certification process, and maintained at all times. We continue to urge NERC and the SDT to place these requirements in the Organization Certification Requirements, if they are not already explicitly stipulated.

William Temple - William Temple	
Answer	No
Document Name	
Comment	

PJM does not believe this standard is necessary. RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards (i.e., IRO, TOP, & BAL) adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC, BA & TOP shall implement an Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, “Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data.” This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed.

PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have been thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Those investigations did not indicate a lack of continent-wide ability to address those root causes – which would be the basis upon a NERC continent-wide reliability standard is needed to address a reliability "gap". Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to "fix." If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage through standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would, in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other "things" would happen).

Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard.

This proposed project appears to be well-suited for a guideline document as opposed to a Standard as the proposed requirements address the quality and availability aspects of data and tools for system analysis rather than what's needed to monitor and assess system performance (which are already covered by other standards). As written, the standards appears to intend to stipulate "how" not "what" (*i.e.*, they do not appear to be a results-based standards). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data and tools, for assurance that RC, BA and TOPs have the ability to monitor and assess system performance appropriately in accordance with existing, performance-based Standards Requirements.

The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement.

Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others.

Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RFC, Group Name Duke Energy

Answer	No

Document Name	
Comment	

Duke Energy suggests changes to the language of the requirements and sub-requirements which would make the standard less vague, and more concise. We recommend the following revisions:

R1:

-Modify R1 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address…"*

We feel that this closes a gap wherein the standard requires an entity to implement a Process or Procedure, but never requires an entity to develop one in the first place.

We believe that R1.1 and R1.2 are similar in nature, and would be better suited as one requirement. We recommend the same revision for R2.1 and R2.2. We suggest the following:

-Combine R1.1 and R1.2 to state: *"Criteria for and display of quality of Real-time data to System Operator."*

R2:

-Modify R2 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address…"*

We feel that this closes a gap wherein the standard requires an entity to implement a Process or Procedure, but never requires an entity to develop one in the first place.

We believe that R2.1 and R2.2 are similar in nature, and would be better suited as one requirement. We suggest the following:

-Combine R2.1 and R2.2 to state: *"Criteria for and display of quality of Real-time data to System Operator."*

Also, we recommend that the requirement be reworded to more closely resemble the rationale. The rationale points out that the RC shall have Processes or Procedures that address issues related to the quality of analysis results used for Real-time Assessments. The language of R2 states that an RC must have Processes or Procedures to address the quality of analysis used in its Real-time Assessments. We feel that adding the word "results" in the requirement decreases possible ambiguity that is currently present in this standard. It is the quality of the results that is paramount, and should be the focus, rather than the quality of the analysis itself. (See out language suggestion after the comment below.)

Next, Duke Energy recommends that R2 should include a provision that an RC should include in their procedure some specification as to what constitutes a "quality issue" (see R2.3) that an RC must take action to resolve. Without having those specifications, it would be difficult to determine what issues necessitate actions and which ones do not. We suggest the following revision to R2:

-Modify R2 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address the quality analysis results, and include criteria to define levels of material impact, used in its Real-time Assessments."*

Lastly, Duke Energy suggests that R3 should be revised to more closely align with the rationale. When reading the rationale, it is clear that the heart of this requirement is having an alarm process monitor capability, and not necessarily the alarm process monitor itself. We recommend using the language found in the rationale which more clearly state the intent of the requirement. We suggest the following:

-Modify R3 to state: *"Each Reliability Coordinator shall have an alarm process monitoring capability that provides notification(s) to its System Operators…"*

Comment	

The Rational for R3 mentions that the alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

What happens when all procedures and processes are followed properly and SCADA system fails because of an IT problem. In another words, RC must not be attributable when SCADA systems fail because of an IT problem. The standard should also consider accountability of the SCADA supplier.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators	
Answer	No
Document Name	
Comment	

(1) We feel the language within Requirements R1 and R2 are vague and should not require criteria for evaluating data quality and analysis that could be too ambiguous and unenforceable. These requirements need to identify what real-time data and analysis are necessary to perform monitoring and assessment functions, and identify the specifications necessary to maintain reliability. The SDT should clarify the meaning of "quality," and incorporate this explanation in the standard's Guidelines and Technical Basis or Rationale sections. Without a minimum criteria specified, we feel this does not provide enough information to make an objective determination for an auditor. Furthermore, we suggest adding references to Part 1.3 and Part 2.3 that mitigation actions should be initiated within 30 minutes. We feel these references align the failure to implement actions with other mitigation actions required.

(2) Requirement R3 expects the RC to have evidence that it has an alarm process monitor that provides failure notifications to System Operators. We feel this language is redundant with many requirements of Reliability Standard IRO-002-2. For instance, Requirement R4 of IRO-002-2 states the RC "shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas." Moreover, Requirement R7 of IRO-002-2 states "Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area." While requirements R1 and R2 of the proposed standard, IRO-018-1, are concerned with quality expectations of data and analysis, respectively, Requirement R3 identifies a tool or application that the RC must own and operate. In order to meet the various requirements of IRO-002-2, the RC would already be required to own and operate such applications. Hence, we recommend the SDT remove requirement R3 of the proposed standard.

(3) We continue to have concerns that these requirements only focus on System Operators. We feel that an auditor may not interpret the standard to allow other employees, such as EMS Engineers, to mitigate data or analytical errors. According to the NERC Glossary Term, a System Operator is one "who operates or directs the operation of the Bulk Electric System (BES) in Real-time." We recommend the SDT clarify that these requirements can apply to other employees.

Comment	

Comments: ERCOT continues to be concerned that the proposed standard is too prescriptive and goes beyond the associated FERC directive regarding a requirement addressing "capabilities." In particular, these standards were developed to address operator awareness of tool or other outages that could impact real-time monitoring.

Further, several of the requirements involve many more entities beyond the Reliability Coordinators and, absent a requirement for coordination, participation, and action in response to the Reliability Coordinator's identification of an issue, the proposed standard will not achieve its intended objective as written. This is extremely challenging (R1.3) because the majority of issues related to poor data quality or invalid analysis tool solutions can only be resolved by parties outside of the Reliability Coordinator (e.g facility owners, telecom companies, etc.)

Additionally, real-time data and monitoring capabilities are critical to the certification of a Reliability Coordinator and are not "dynamic." Because such "capabilities" are complex, require coordination and inputs from other entities, and are key to the continued performance of a Reliability Coordinator's duties, they are not subject to frequent change and therefore likely do not need continued monitoring and assessment.

Finally, several other reliability standards and associated requirements are contingent upon the availability of real-time tools and data, and these other standards and requirements are subject to the compliance monitoring and enforcement program. ERCOT would recommend that requirements addressing capabilities be utilized as part of certification review and not as a reliability standard subject to the compliance monitoring and enforcement program.

Should NERC continue this project, however, ERCOT recommends the following language adjustments to Requirement R1.3. No matter what the SDT *intends* the language to mean, this requirement language may still be read to mean the RC's Operating Process or Operating Procedure should be written to actively resolve data quality issues even though the ability to resolve data issues may lie with another party. Accordingly, ERCOT recommends:

R1.3 current language: "Actions to resolve Real-time data quality issues with the entity(ies) responsible for proving the data when data quality affects Real-time Assessments."

R1.3 ERCOT suggested language: "Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affecting Real-time Assessments."

This language aligns with the objective communicated by the SDT, aligns with what is in practice today, aligns with the SDT concept that IRO-010 and TOP-005/003 require data providers to address data quality issues, and is within the capability of the Reliability Coordinator to perform. This language is also consistent with the numerous examples within the NERC Reliability Standards where an entity is required to notify other entities that are responsible for or have an obligation to take actions where the notifying entity cannot or does not perform the reliability task.

We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in this section of the rationale box. The review group's opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process and/or Operational Procedure.

In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn't match the proposed language for that particular section of the Requirement. The Rationale information doesn't clearly state what documentation contains the 'scope of data point information' this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive? Our review group would also suggest mentioning the specific document(s) in the rationale section so there will be no misconception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process.

As for Requirement R2, we would suggest to the drafting team to include the examples provided in their presentation to the rationale section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2.

For Requirement R3, we suggest that the drafting team include some proposed language that suggests including the 'alarm process monitor that provide modification' into their Operational Process or Operation Procedure. We feel the current language suggests that this process doesn't need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	Yes

Document Name	
Comment	

In general, Texas RE agrees with the changes made by the SDT to draft standard IRO-018-1. However, Texas RE provides the following comments or suggestions to the proposed standard:

- Texas RE suggests the SDT consider explicitly stating real-time monitoring in addition to real-time assessments in R1.3. For example, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time monitoring and Real-time Assessments. In addition, Texas RE would like to highlight that Texas RE is concerned there is no definitive timeframe provided associated with the actions to resolve issues which may lead to a reliability gap due to a myriad of approaches taken by registered entities. Texas RE supports the RTBPTF recommendations related to real-time monitoring. Specifically, for telemetry data systems:

1) Increase the minimum update frequency for operational reliability data

from once every 10 minutes to once every 10 seconds.16

2) Standardize the procedures, processes, and rules governing key data

exchange issues.17

3) Institute a requirement for data availability from ICCP or other

equivalent systems, based on the ratio of "good" data received (as defined

by data quality codes) to total data received. The ratio must exceed 99

percent for 99 percent of the sampled periods during a calendar month. In

addition, the ratio must not be less than 99 percent for any 30 consecutive

minutes.

4) Establish minimum response times for restoration of data exchange

between control centers following the loss of a data link or other problems

within the source system. As part of this requirement, a trouble-resolution

process standard must be developed that requires all entities responsible

for management and maintenance of ICCP or equivalent systems to

identify, with data recipients that could be affected by a loss of data

exchange capability, a mutually agreeable restoration target time. The

standard process must also include service-restoration escalation

procedures and prioritization criteria.

- Texas RE noticed an inconsistency in language between the standard requirement language and the rationale discussion for Requirement 1 and

Requirement 2 which states, “The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to *operating personnel*.” Unfortunately, “operating personnel”, is not a defined term and the Requirements specifically states “System Operator”. Texas RE recommends that the rational language be changed to be consistent with the standard requirements.

- Texas RE is concerned the data retention for R2 is a rolling 30 days while the retention period for R1 is the current calendar year and one previous calendar year with the exception of operator logs and voice recording which shall be retained or a minimum of 90 calendars days. Texas RE inquires as to why there is a difference in the evidence retention period even though there is very little difference in the measures? Texas RE recommends an evidence retention period of a year for both R1 and R2 because there is no basis to distinguish actions to address errors in data inputs (R1) and the analysis of the data inputs (R2) and the longer time frame of a year would give the entity more time to resolve data issues.

IRO-018-1 is not applicable to Hydro One. However, Hydro One Networks Inc. would like to point out that R1.2 should specify, that the RC's Operating Process or Operating Procedure which is to include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data, should include a mutually agreed upon schedule and actions.

Comments: For purposes of this comment, ERCOT incorporates all of its above comments regarding IRO-018-1. As with R1.3 in IRO-018-1, ERCOT is concerned that certain language in TOP-010-1 could be read to suggest that the RC must resolve Real-time data quality issues, when in fact the ability to resolve data issues may lie with another party. Consistent with its suggested revisions to R1.3 in IRO-018-1, ERCOT recommends the following changes to R1.3 and R2.3 in TOP-010-1:

R1.3 current language: “Actions to resolve Real-time data quality issues with the entity(ies) responsible for proving the data when data quality affects Real-time Assessments.”

R1.3 ERCOT suggested language: “Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affecting Real-time Assessments.”

And

R2.3 current language: “Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions.”

R2.3 ERCOT suggested language: “Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affectings its analysis functions.”

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1

Answer	No
Document Name	

Comment

CenterPoint Energy understands recommendations for the scope of this project originated from the 2011 Southwest Outage Report as well as FERC directives in Order 693, however with the vast improvement in technologies involved with monitoring and analysis capabilities over the last 10 years, these recommendations as well as the scope of this project is potentially outdated. CenterPoint Energy is concerned that compliance with Requirements in TOP-010-1 could represent a documentation burden without providing a measureable benefit to reliability. The main focus of the directives and recommendations referenced above appear to be more related to real-time analysis tools rather than quality of data. CenterPoint Energy believes and feels the industry would benefit more from, reducing the scope of the Standard to those data quality issues that negatively impact real-time analysis and assessments. CenterPoint Energy recommends the SDT delete Parts 1.1, 1.2, 2.1, and 2.2.

The draft version of Requirement R4. reads as follows: *Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.* We believe greater clarity could be brought to this requirement by modifying two awkward terms, "alarm process monitor" and "monitoring alarm processor", as follows: *Each Transmission Operator and Balancing Authority shall monitor its Real-time monitioring alarm system and provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm system has occurred.*

Comment	

The changes made to R1 are helpful in clarifying the scope of data included in this requirement however the term “quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments” would still imply all data specified per TOP-003 as all data specified will be the data used in Real time Assessment and therefore will require TOP to take action on any failed data point. Also the term real time monitoring is not a defined term and should be removed.

In addition to the above comments, ITC Holdings agrees with the comments submitted by the SPP Standards Review Group. A copy of SPP's comments are provided below.

We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in the rationale box of this section. The review group’s opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process or Operational Procedure.

In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn’t match the proposed language for that particular section of the Requirement. The Rationale information doesn’t clearly state what documentation contains the ‘scope of data point information’ this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive. Our review group would suggest mentioning the specific document(s) in the Rationale Section so there will be no miss conception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process.

As for Requirement R2, we would suggest to the drafting team to include the examples provide in their presentation to the Rationale Section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2.

For Requirement R4, we would suggest they drafting team would include some proposed language that suggests including the ‘alarm process monitor that provide modification’ into their Operational Process or Operation Procedure. We feel the current language suggests that this process doesn’t need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.

(1) We feel the language within Requirements R1 and R3 are vague and should not require criteria for evaluating data quality and analysis that could be too ambiguous and unenforceable. These requirements need to identify what real-time data and analysis are necessary to perform monitoring and assessment functions, and identify the specifications necessary to maintain reliability. The SDT should clarify the meaning of "quality," and incorporate this explanation in the standard's Guidelines and Technical Basis or Rationale sections. Without a minimum criteria specified, we feel this does not provide enough information to make an objective determination for an auditor. Furthermore, we suggest adding references to Part 1.3 and Part 3.3 that mitigation actions should be initiated within 30 minutes. We feel these references align the failure to implement actions with other mitigation actions required in other reliability standards.

(2) We understand the SDT interprets the intent of requirement R4 of the industry-approved standard, BAL-005-1, to pertain to only the data necessary to calculate Reportable ACE. Moreover, the SDT feels that the proposed Requirement R2 does not create double jeopardy with BAL-005-1, and that Requirement R2 is necessary to account for other data monitored by a BA. We disagree and feel the SDT should remove this redundant requirement or identify this other data in the rationale of this requirement.

(3) The intent of Requirement R4 requires a TOP or BA to monitor the availability of its real-time monitoring alarm processor. We feel this requirement is unnecessary, as similar actions are accomplished in order to maintain compliance with other reliability requirements. For instance, Requirement R5 of TOP-006-3 states "each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions..." In order to maintain compliance with this requirement, a registered entity is obligated to notify its own personnel when they are unable to use such monitoring equipment. We recommend the SDT remove Requirement R4 from the proposed standard.

(4) We continue to have concerns that these requirements only focus on System Operators. We feel that an auditor may not interpret the standard to allow other employees, such as EMS Engineers, to mitigate data or analytical errors. According to the NERC Glossary Term, a System Operator is one "who operates or directs the operation of the Bulk Electric System (BES) in Real-time." We recommend the SDT clarify that these requirements can apply to other employees.

We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard result in varied interpretations and approachs to “quality” and “adequacy” that do not enhance reliability of the BES.

We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability.

Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We find it problematic when an entity may not “own” the data and is simply receiving a quality flag from a sender. An entity may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

PJM does not believe this standard is necessary. RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards (i.e., IRO, TOP, & BAL) adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC, BA &TOP shall implement an Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed.

PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	

Comment

Southern believes that the criteria in R1.1 should be limited to the BA/TOP's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools.

Each BA/TOP has the inherent responsibility to protect the integrity of the system in its BA/TOP area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. The NERC approved TOP-003-3 and TOP-004 standards requires BAs/TOPs to have monitoring tools and capabilities to assess system conditions in its area and to perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability. Moreover, Southern asserts that the capability to maintain an accurate model along with the required telemetry is already being assessed at the certification stage, and that maintenance of such capability does not need to be assessed on an ongoing basis as adequate data quality is required to perform the assessments required by the aforementioned standards. In addition, there are already NERC approved standards such as TOP-002-2 that currently require the BA/TOP to maintain accurate computer models for analyzing system operations.

Since the TOP is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments, through the same processes demonstrated during certification, Southern believes that the reliability goals of maintaining adequate data, tools and situational awareness are accomplished via the IRO-010 and TOP-003-3 NERC reliability standards and to impose this new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

Given that Southern disagrees with the reliability need for this standard, Southern notes that the detailed requirements (R1.1.1, etc…)regarding assessing data quality, on a point by point basis, was moved to the technical background section of the purposed standard, which is helpful as long as the RSAWs developed doesn't incorporate reapply this "one size fits all" approach for assessing data quality.

Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

While AEP agrees with the overall approach and intent of R1, we believe that sub-Requirement R1.3 goes beyond the scope of its parent Requirement. While R1 focuses on ***addressing*** the quality of Real-time data, R1.3 requires the Transmission Operator's Operating Process or Procedure to include actions to ***"resolve"*** Real-time data quality issues when data quality affects Real-time Assessments. This is especially concerning when the "entity(ies) responsible for providing the data" are external. Neither the Transmission Operator, nor its Operating Procedure, is able to resolve data issues involving points over which they have no direct control. The entity would have control over their own analysis quality (R3), but again, not the quality of external data. In the webinar held on January 11, the drafting team inferred a different interpretation of R1.3 depending on whether or not the data is externally provided. The drafting team seemed to be saying "no, you don't need to resolve data issues for points you do not own, but you still need to document actions to resolve those data issues", etc. That seems to infer that "actions to resolve" might, in some cases, simply be *informing* the data owner of the issue rather than *remediating* issues involving the external data. While the drafting team might interpret R1.3 in this manner, there is no assurance that an auditor would have that same viewpoint. And if that is indeed the drafting team's interpretation , R1.3 does not articulate that. In this same webinar, a drafting team member eventually used the phrase "address the quality" in regards to externally provided data. AEP believes the word "address" is much more appropriate for R1.3 than "resolve", and using it would allow R1.3 to align with R1 (which already uses the word "address"). As a result, we recommend that the word "resolve" in R1.3 be replaced by "address", so that it states "Actions necessary to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments."

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	Yes
Document Name	
Comment	

In general, Texas RE agrees with the changes made by the SDT to draft standard TOP-010-1. However, Texas RE provides the following comments or suggestions to the proposed standard:

- Texas RE recommends adding the Balancing Authority to the applicability of R3. Some BA tools can be considered a Real-time monitoring tool, for example, the use of SCED in this region.
- Texas RE suggests the SDT consider explicitly stating real-time monitoring in addition to real-time assessments in R1.3. For example, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time monitoring and Real-time Assessments. In addition, Texas RE would like to highlight that Texas RE is concerned there is no definitive timeframe provided associated with the actions to resolve issues which may lead to a reliability gap due to a myriad of approaches taken by registered entities. Texas RE supports the RTBPTF recommendations related to real-time monitoring. Specifically, for telemetry data systems:

1) Increase the minimum update frequency for operational reliability data

from once every 10 minutes to once every 10 seconds.16

2) Standardize the procedures, processes, and rules governing key data

exchange issues.17

3) Institute a requirement for data availability from ICCP or other

equivalent systems, based on the ratio of "good" data received (as defined

by data quality codes) to total data received. The ratio must exceed 99

percent for 99 percent of the sampled periods during a calendar month. In

addition, the ratio must not be less than 99 percent for any 30 consecutive minutes.

4) Establish minimum response times for restoration of data exchange between control centers following the loss of a data link or other problems within the source system. As part of this requirement, a trouble-resolution process standard must be developed that requires all entities responsible for management and maintenance of ICCP or equivalent systems to identify, with data recipients that could be affected by a loss of data exchange capability, a mutually agreeable restoration target time. The standard process must also include service-restoration escalation procedures and prioritization criteria.

- Texas RE noticed an inconsistency in language between the standard requirement language and the rationale discussion for Requirement 1 and Requirement 2 which states, "The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to *operating personnel*." Unfortunately, "operating personnel", is not a defined term and the Requirements specifically states "System Operator". Texas RE recommends that the rational language be changed to be consistent with the standard requirements.

- Texas RE is concerned the data retention for R2 is a rolling 30 days while the retention period for R1 is the current calendar year and one previous calendar year with the exception of operator logs and voice recording which shall be retained or a minimum of 90 calendars days. Texas RE inquires as to why there is a difference in the evidence retention period even though there is very little difference in the measures? Texas RE recommends an evidence retention period of a year for both R1 and R2 because there is no basis to distinguish actions to address errors in data inputs (R1) and the analysis of the data inputs (R2) and the longer time frame of a year would give the entity more time to resolve data issues.

- In the Guidelines and Technical Basis documentation there is a statement: "The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel". Texas RE recommends adding: "including the System Operator" or something to that affect. The standard is applicable to the System Operators; the term "operating personnel" is undefined.

Comment
We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in the rationale box of this section. The review group's opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process or Operational Procedure. In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn't match the proposed language for that particular section of the Requirement. The Rationale information doesn't clearly state what documentation contains the 'scope of data point information' this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive. Our review group would suggest mentioning the specific document(s) in the Rationale Section so there will be no misconception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process. As for Requirement R2, we would suggest to the drafting team to include the examples provided in their presentation to the Rationale Section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2. For Requirement R4, we suggest they drafting team include some proposed language that suggests including the 'alarm process monitor that provide modification' into their Operational Process or Operation Procedure. We feel the current language suggests that this process doesn't need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.

SRP believes the current draft of TOP-010-1 is a significant improvement on the former draft. SRP recommends that in R1 Part 1.3, R2 Part 2.3, and R3 Part3.3 the verbiage should be changed from “Actions to resolve” to “Actions to address”. The TOP and BA may not be able to resolve all quality issues for all the data it receives but they can address all the data with quality issues. This change would retain the responsibility for compliance with the TOP and BA.

3. Do you agree with the revised Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP	
Answer	No
Document Name	
Comment	
Xcel Energy appreciates the fact that the SDT added some additional time to the Implementation Plan for these standards, however we still feel that the implementation timeline is too short. We continue to propose a 60 month implementation timeline as suggested previously by the MRO Standards Review Forum which states: The implementation plan is too short if entities need to specify, order and deploy new or modified Energy Management Systems (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and systems. The key is to allow entities the proper time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short term.

As the draft standard is currently written, AEP cannot determine the adequacy of the proposed implementation plan. However, if the drafting team were to replace “resolve” with “address” in R1.3 as suggested above, AEP believes the implementation plan would be sufficient.

Comment	

Southern believes that the implementation date should be pushed back to at least 24 months following regulatory approval to allow time for the industry to determine the appropriate technology that is sufficient for each entity's operations. We also believe that in order to fully comply with the proposed standard, enough time should be allowed for the industry to update their current procedures and/or to create acceptable procedures, provide training to the appropriate System Operators and allow sufficient time for the entities to determine the technology available that is available and appropriate to support their operations, along with the required functionality.

We feel the SDT has made a general assumption that each applicable entity already has the processes, procedures, and infrastructure in place to comply with these requirements. However, we believe entities should have up to 60 months to deploy a new or modified Energy Management System that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. The key is to allow entities adequate time to assess their tools and complete the right enhancements once. While prompt actions are good practices, forcing entities to assess, order, and deploy equipment within 18 months may lead to unintended consequences.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators	
Answer	No
Document Name	
Comment	
We believe that not having good data quality and analysis are a medium risk to BES reliability. However, we disagree that the VRFs for these requirements should be classified as Medium, as the Operating Process or Operating Procedure that support both more falls in-line with the criteria of a low risk violation. Our recommendation is further supported with the definition of a Low VRF, as defined within the NERC Violation Risk Factor and Violation Severity Level Justifications document, which states "administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System." The nonexistence of a related Operating Process or Procedure will have no impact on the state or BES capability.

ATC requests a clarification by the SDT in TOP-010-1 on the phrase "affects Real-time Assessments" which is used in sections R1.1.3 and R2.2.3 and the phrase "affecting its Real-time Assessments" in section R3.3.3. Should "affects" be replaced with "effects" or is this correct as written?

Definitions of "affecting"

· Merriam Webster - causing a feeling of sadness or sympathy - evoking a strong emotional response

· Cambridge - causing a strong emotion, especially sadness

· Dictionary.com - moving or exciting the feelings or emotions.

· TheFreeDictionary.com - Inspiring or capable of inspiring strong emotion - moving or stirring the feelings or emotions. - evoking feelings of pity, sympathy, or pathos

Definitions of Effect and Effecting

· Merriam Webster (effect) - change that results when something is done or happens : an event, condition, or state of affairs that is produced by a cause

· Dictionary.com (effect) - something that is produced by an agency or cause; result; consequence - power to produce results; efficacy; force; validity; influence

· Cambridge (effect) - the result of a particular influence; something that happens because of something else:

On p.12 of the “Guidelines and Technical Basis” document, paragraph 1 defines what is included “Real-time monitoring.” Paragraph 2 goes on to state that there are “functional requirements to perform [Real-time] monitoring… in other standards.” If this is the case, APS recommends the SDT define “Monitoring” as a term in the NERC Glossary as preferable to defining this term in the “Guidelines and Technical Basis” document that is part of the supplemental material in TOP-010.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC	
Answer	
Document Name	
Comment	
The rational for TOP-010-1 R1 and R2 indicates that the data of concern for those requirements is the same data that was determined in TOP-003-3. The TOP-003-3 standard basically specifies what data is necessary for the Real-time Assessments and TOP-010-1 specifies the quality of that data. SRP recommends combining the two standards so that there is one that addresses what data is necessary and also specifies the quality of that data. Combining the two standards would clarify that the data referred to in TOP-010-1 is the same as the data referred to in TOP-003-1.

Oshani Pathirane - Oshani Pathirane	
Answer	
Document Name	
Comment	

Overall, the second draft has simplified the requirements to an extent. Hydro One Networks Inc. believes that some form of oversight or standardization is required to ensure there is a continuous focus on real time monitoring tools. Data quality measures are appropriate; however, decisions to the degree and method of verification should be left to the discretion of each entity as this will, to an extent, depend on the level of system complexity. A simple system can be tuned to a small error (or convergence) while a complicated system may require a larger allowance.

R1 and R2 – Since the functional requirements, VRFs, and Time Horizons are identical, these two requirements could be combined into one requirement and made applicable to both the Transmission Owner and Balancing Authority.

R2.2 - The wording in R2.2 could be modified to align with that of R1.3, and read, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects **Real-time Assessments**.

R4 - The wording could be improved as follows: "*Each Transmission Operator and Balancing Authority shall* ***have alarm process monitoring*** *that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred"*

(1) We request the SDT provide additional rationale on the need to develop new reliability standards, when we feel many current and approved future standards could be enhanced to support the intent of the SAR. Other documentation, such as Reliability Guidelines, could be used to elaborate on specific details and concerns regarding data and analytical qualities.

(2) We thank the SDT for this opportunity to comments on these standards.

Consideration of Comments

Project Name: 2009-02 Real-time Reliability Monitoring and Analysis Capabilities | IRO-018-1 & TOP-010-1

Comment Period Start Date: 12/10/2015

Comment Period End Date: 1/26/2016

Associated Ballots:
2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 AB 2 ST
2009-02 Real-time Monitoring and Analysis Capabilities IRO-018-1 Non-binding Poll AB 2 NB
2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 AB 2 ST
2009-02 Real-time Monitoring and Analysis Capabilities TOP-010-1 Non-binding Poll AB 2 NB

There were 38 sets of responses, including comments from approximately 93 different people from approximately 69 companies representing 7 of the Industry Segments as shown in the table on the following pages.

The Project 2009-02 Standards Drafting Team (SDT) appreciates the careful review and constructive feedback from stakeholders. In response to stakeholder comments, the SDT made only clarifying and non-substantive changes to the proposed standards as follows:

IRO-018-1

- Requirement R1 Part 1.3 and Requirement R2 Part 2.3: changed *resolve* to *address* to more clearly align with the SDT's intent for the required actions
- Revised Rationale boxes and Guidelines Section for clarity

TOP-010-1

- Requirement R1 Part 1.3, Requirement R2 Part 2.3, and Requirement R3 Part 3.3: changed *resolve* to *address* to more clearly align with the SDT's intent for the required actions
- Revised Rationale boxes and Guidelines Section for clarity

Questions

1. **Do you agree with the changes made by the SDT to draft standard IRO-018-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.**

2. **Do you agree with the changes made by the SDT to draft standard TOP-010-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.**

3. **Do you agree with the revised Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.**

4. **Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.**

5. **Provide any additional comments for the SDT to consider, if desired.**

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the changes made by the SDT to draft standard IRO-018-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Summary Consideration: The SDT thanks all commenters. The following changes have been made:

- Requirement R1 Part 1.3: changed *resolve* to *address* to more clearly align with the SDT's intent. The SDT recognizes that the applicable entity may not be able to 'resolve' (as in completely remediate) data issues on their own because, for example, another entity may be responsible for providing the data. The revision clarifies that the Reliability Coordinator's Operating Process or Operating Procedure must include "actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments."
- Rationale for Requirement R1 and related information in the Guidelines and Technical Basis Section: Examples of actions to address Real-time data quality issues were added to the Guidelines section and referenced in the Rationale.
- Requirement R2 Part 2.3: changed *resolve* to *address* to more clearly align with the SDT's intent and maintain consistency with Requirement R1.
- Rationale for Requirement R2: Clarified that operating personnel includes System Operators and staff responsible for supporting Real-time operations.
- Reworded lists of examples in the Guidelines and Technical Basis Section.

Responses to comments are provided below.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No

Comment

Southern believes that the criteria in R1.1 should be limited to the RC's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools.

Each RC has the inherent responsibility to protect the integrity of the system in its RC area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. The NERC approved IRO-002-4, IRO-010-2, TOP-003-3 and TOP-004 standards requires the RCs and TOPs to have monitoring tools and capabilities to assess system conditions in its area and to

perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability. Moreover, Southern asserts that the capability to maintain an accurate model along with the required telemetry is already being assessed at the certification stage, and that maintenance of such capability does not need to be assessed on an ongoing basis as adequate data quality is required to perform the assessments required by the aforementioned standards. Since the RC is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments, through the same processes demonstrated during certification. Southern believes that the reliability goals of maintaining adequate data, tools and situational awareness are accomplished via the IRO-010 and TOP-003-3 NERC reliability standards and to impose this new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability. Given that Southern disagrees with the reliability need for this standard, Southern notes that the detailed requirements (R1.1.1, etc…)regarding assessing data quality, on a point by point basis, was moved to the technical background section of the purposed standard, which is helpful as long as the RSAWs developed doesn't incorporate this "one size fits all" approach for assessing data quality.	
Response. Thank you for your comment. Requirement R1 Part 1.1 applies to Real-time data that the RC has specified are necessary for Real-time monitoring and Real-time Assessments according to IRO-010-2. The SDT believes it is appropriate to have criteria for evaluating the quality of this Real-time data, and not limit the criteria to a subset of the data. However, the proposed requirement specifies that the actions contained in the Operating Process or Operating Procedure are aimed at quality issues affecting Real-time Assessments, which addresses the RCs ability to assess existing and potential system operating conditions. The SDT believes the reliability objectives addressed in this project are closely linked to other Real-time operations requirements and, therefore, they should be maintained on an ongoing basis, in addition to initial certification. Certification ensures the entity has the processes and capabilities to meet the standards, while the requirements themselves ensure the performance is achieved and maintained. The certification process by itself will not ensure these capabilities are maintained. The SDT has provided input on the draft RSAW that is consistent with the changes made to the proposed requirements.

Answer	No
Comment	

We continue to disagree with the need to create Reliability Standards (this and TOP-010-1) to stipulate the requirements for having processes in place to ensure data quality and real-time analysis capability, and adequate alarming system to alert operators of suspicious data or analysis capability. These processes are fundamental to enabling the RC, TOP and BA perform their reliability tasks and meet applicable standard requirements. Data quality, real-time analysis capability and alarming system must be demonstrated during the certification process, and maintained at all times. We continue to urge NERC and the SDT to place these requirements in the Organization Certification Requirements, if they are not already explicitly stipulated.
Response. Thank you for your comment. The proposed requirements are specifically aimed at situational awareness objectives that can impact reliable operations and are not currently addressed in other standards. In particular, the requirements will enhance reliable operations by ensuring operators receive indications of Real-time data quality, have procedures to address Real-time data quality issues that affect Real-time assessments, and are aware when alarming is unavailable. The SDT believes the reliability objectives addressed in this project are closely linked to other Real-time operations requirements and, therefore, they should be maintained on an ongoing basis, in addition to initial certification. Certification ensures the entity has the processes and capabilities to meet the standards, while the requirements themselves ensure the performance is achieved and maintained. The certification process by itself will not ensure these capabilities are maintained.

William Temple - William Temple On Behalf of: Mark Holman, PJM Interconnection, L.L.C.	
Answer	No
Comment	

PJM does not believe this standard is necessary. RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards (i.e., IRO, TOP, & BAL) adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC, BA & TOP shall implement an Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, “Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data.” This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed. PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.	
Likes 1	PSEG - PSEG Energy Resources and Trade LLC, 6, Jara Karla
Response. Thank you for your comment. The proposed requirements are specifically aimed at situational awareness objectives that can impact reliable operations and are not currently addressed in other standards. In particular, the requirements will enhance reliable operations by ensuring operators receive indications of Real-time data quality, have procedures to address Real-time data quality issues that affect Real-time assessments, and are aware when alarming is unavailable. The NERC ORS Reliability Guideline does not conflict with the proposed standards, nor does it address the objectives of Project 2009-02. A Reliability Guideline does not ensure adherence in the same way that a Reliability Standard does. To provide clarity to potentially ambiguous terms, the Guidelines and Technical Basis section describes examples of criteria that can be used for evaluating data quality and examples of data quality indicators. In the Operating Process or Operating Procedures, entities must define appropriate criteria, and have the opportunity to establish appropriate criteria based on their systems.	

Kathleen Goodman - Kathleen Goodman On Behalf of: Michael Puscas, ISO New England, Inc., 2

Comment	
1. The SRC fails to see the reliability risk that this project is intending to address. The August 14 Blackout as well as the 2011 Southwest Outage have been thoroughly and exhaustively investigated, reported upon, and the root causes mitigated appropriately. Those investigations did not indicate a lack of continent-wide ability to address those root causes – which would be the basis upon a NERC continent-wide reliability standard is needed to address a reliability “gap”. Therefore, pointing to the need for this project based on mitigated, historical events falls short of identifying the reliability risk that this is intended to “fix.” If, for example, WECC continues to have a vested interest in further mitigating the 2011 Southwest Outage through standard development, we suggest this project be migrated into a regional standard for WECC. Lastly, the SRC believes that, absent a Standard specific for tools, a RC, TOP, or BA would,	

in fact, have violations of existing operational Requirements if they do not provide adequate monitoring and tools to their operators (i.e. other "things" would happen). Further, the Requirements as written, "…to address the quality of the Real-time data necessary…" are ambiguous, lack consensus about how to measure, and do not rise to the level of a NERC Standard. 2. This proposed project appears to be well-suited for a guideline document as opposed to a Standard as the proposed requirements address the quality and availability aspects of data and tools for system analysis rather than what's needed to monitor and assess system performance (which are already covered by other standards). As written, the standards appears to intend to stipulate "how" not "what" (*i.e.*, they do not appear to be a results-based standards). The SRC believes that the existing Standards (*i.e.*, IRO, TOP and BAL) sufficiently define what needs to be monitored by each entity without defining the tools (*i.e.*, without defining the "how"), which is appropriate. In the alternative, this could be considered a process to be used for Certifying new entities, in line with a methodology developed by the ERO and registered entities for assessing adequacy of tools for addressing the "quality" of real-time data and tools, for assurance that RC, BA and TOPs have the ability to monitor and assess system performance appropriately in accordance with existing, performance-based Standards Requirements. 3. The SRC notes that the tools available to operators have progressed well beyond those available in 2003. If defined tools would have been hardcoded in a standard at that time, it would have limited focus and investment to those things that were in the standard. Further, expanding on our point above, the SRC believes that the "what" regarding tools is more appropriately captured in the certification expectations for BAs, RCs, and TOPs. Additionally, it would be appropriate for Regions to evaluate tools as part of the Registered Entity's Inherent Risk Assessment (IRA). This would include the scope of tools, backups, etc. and would provide an adaptable approach that would encourage continuous improvement. Additionally, the SRC recommends that NERC coordinate with the NATF to encourage inclusion of an ongoing "care and feeding" of tools evaluation and information sharing in their efforts with the provision that they make information on good practices available to the wider NERC community so that non-members can learn from the innovation of others. 4. Finally, to avoid these issues in the future and to support communicating to FERC when a Standard is not needed and another tool is more suitable, the SRC suggests that future SARs be voted on by industry to determine whether they should proceed as a Standards project or another means is a more appropriate method through which to achieve the SAR's objective.
Response. Thank you for your comment.

1. The proposed requirements are specifically aimed at situational awareness objectives that can impact reliable operations and are not currently addressed in other standards. These objectives apply to reliable operations on a continent-wide basis. In particular, the requirements will enhance reliable operations by ensuring operators receive indications of Real-time data quality, have procedures to address Real-time data quality issues that affect Real-time assessments, and are aware when alarming is unavailable.

2. The SDT believes the reliability objectives addressed in this project are closely linked to other Real-time operations requirements and, therefore, they should be maintained on an ongoing basis, in addition to initial certification. Certification ensures the entity has the processes and capabilities to meet the standards, while the requirements themselves ensure the performance is achieved and maintained. The certification process by itself will not ensure these capabilities are maintained.

3. The proposed standard does not specify tools (i.e. does not tell entities 'how'). The suggestion for coordination with NATF is not in scope for Project 2009-02.

4. Stakeholder voting on SARs is not part of the Standards Processes Manual. The Project 2009-02 SAR Drafting Team addressed all comments received during SAR development and the Standards Committee authorized moving forward with Project 2009-02.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RFC, Group Name Duke Energy

Answer	No

Comment

Duke Energy suggests changes to the language of the requirements and sub-requirements which would make the standard less vague, and more concise. We recommend the following revisions:

1. R1:

-Modify R1 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address…"*

We feel that this closes a gap wherein the standard requires an entity to implement a Process or Procedure, but never requires an entity to develop one in the first place.

We believe that R1.1 and R1.2 are similar in nature, and would be better suited as one requirement. We recommend the same revision for R2.1 and R2.2. We suggest the following:

-Combine R1.1 and R1.2 to state: *"Criteria for and display of quality of Real-time data to System Operator."*

R2:

-Modify R2 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address…"*

We feel that this closes a gap wherein the standard requires an entity to implement a Process or Procedure, but never requires an entity to develop one in the first place.

We believe that R2.1 and R2.2 are similar in nature, and would be better suited as one requirement. We suggest the following:

-Combine R2.1 and R2.2 to state: *"Criteria for and display of quality of Real-time data to System Operator."*

2. Also, we recommend that the requirement be reworded to more closely resemble the rationale. The rationale points out that the RC shall have Processes or Procedures that address issues related to the quality of analysis results used for Real-time Assessments. The language of R2 states that an RC must have Processes or Procedures to address the quality of analysis used in its Real-time Assessments. We feel that adding the word "results" in the requirement decreases possible ambiguity that is currently present in this standard. It is the quality of the results that is paramount, and should be the focus, rather than the quality of the analysis itself. (See out language suggestion after the comment below.)

Next, Duke Energy recommends that R2 should include a provision that an RC should include in their procedure some specification as to what constitutes a "quality issue" (see R2.3) that an RC must take action to resolve. Without having those specifications, it would be difficult to determine what issues necessitate actions and which ones do not. We suggest the following revision to R2:

-Modify R2 to state: *"Each Reliability Coordinator shall develop and implement an Operating Process or Operating Procedure to address the quality analysis results, and include criteria to define levels of material impact, used in its Real-time Assessments."*

3. Lastly, Duke Energy suggests that R3 should be revised to more closely align with the rationale. When reading the rationale, it is clear that the heart of this requirement is having an alarm process monitor capability, and not necessarily the alarm process monitor

itself. We recommend using the language found in the rationale which more clearly state the intent of the requirement. We suggest the following: -Modify R3 to state: *"Each Reliability Coordinator shall have an alarm process monitoring capability that provides notification(s) to its System Operators…"*
Response. Thank you for your comment. 1. The SDT does not believe it is necessary to revise the language of Requirement R1 and R2 to explicitly require development of an Operating Process or Operating Procedure because development is a prerequisite to implementing the Operating Process or Operating Procedure. The SDT does not believe the suggestion to combine the parts in Requirement R1 and Requirement R2 as suggested by the commenter improves the clarity or quality of the proposed standard. 2. The SDT included descriptive details in the rationale for R2 to provide clarity, including examples of analysis and explanation of the requirement objective. The rationale will be retained in the final standard in the Supplemental Material section. Additionally, the SDT believes a specification for 'what constitutes an analysis quality issue' could be addressed in the criteria for evaluating the quality of analysis used in Real-time Assessments required by Part 2.1. Therefore, the suggested changes are not necessary. 3. The SDT does not believe the suggested change adds clarity.

Si Truc Phan - Hydro-Quebec TransEnergie - 1 - NPCC **Nicolas Turcotte - Hydro-Quebec TransEnergie - 1**	
Answer	No
Comment	
The Rational for R3 mentions that the alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.	

What happens when all procedures and processes are followed properly and SCADA system fails because of an IT problem. In another words, RC must not be attributable when SCADA systems fail because of an IT problem. The standard should also consider accountability of the SCADA supplier.

Response. Thank you for your comment. The objective of Requirement R3 is to ensure the System Operator has awareness when failure of Real-time monitoring alarm functions has occurred, regardless of the reason for failure of the alarming functions.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators

Answer	No

Comment

(1) We feel the language within Requirements R1 and R2 are vague and should not require criteria for evaluating data quality and analysis that could be too ambiguous and unenforceable. These requirements need to identify what real-time data and analysis are necessary to perform monitoring and assessment functions, and identify the specifications necessary to maintain reliability. The SDT should clarify the meaning of “quality,” and incorporate this explanation in the standard’s Guidelines and Technical Basis or Rationale sections. Without a minimum criteria specified, we feel this does not provide enough information to make an objective determination for an auditor. Furthermore, we suggest adding references to Part 1.3 and Part 2.3 that mitigation actions should be initiated within 30 minutes. We feel these references align the failure to implement actions with other mitigation actions required.

(2) Requirement R3 expects the RC to have evidence that it has an alarm process monitor that provides failure notifications to System Operators. We feel this language is redundant with many requirements of Reliability Standard IRO-002-2. For instance, Requirement R4 of IRO-002-2 states the RC “shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas.” Moreover, Requirement R7 of IRO-002-2 states “Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area.” While requirements R1 and R2 of the proposed standard, IRO-018-1, are concerned with quality expectations of data and analysis, respectively, Requirement R3 identifies a tool or application that the RC must own and operate. In order to meet the various requirements of IRO-002-2, the RC would already be required to own and operate such applications. Hence, we recommend the SDT remove requirement R3 of the proposed standard.

(3) We continue to have concerns that these requirements only focus on System Operators. We feel that an auditor may not interpret the standard to allow other employees, such as EMS Engineers, to mitigate data or analytical errors. According to the NERC Glossary

Term, a System Operator is one “who operates or directs the operation of the Bulk Electric System (BES) in Real-time.” We recommend the SDT clarify that these requirements can apply to other employees.
Response. Thank you for your comments. 1. The proposed standard does not require the RC to determine what data is required for Real-time monitoring or Real-time Assessments because the RC is obligated to do so in IRO-010-2. To provide clarity to potentially ambiguous terms, the Guidelines and Technical Basis section describes examples of criteria that can be used for evaluating data quality and examples of data quality indicators. The SDT does not believe minimum ‘one size fits all’ criteria for data quality or timeframe for addressing data quality issues can be established as part of a continent-wide standard requirement. The requirement provides entities with the flexibility to establish appropriate timeframes for addressing data quality issues based on reliability needs and system considerations. 2. The SDT does not agree that requirements in IRO-002-2 require entities to own or operate an application to provide operator notification when alarming functions have failed. Proposed Requirement R3 clearly establishes requirements to provide operator notification when alarming functions have failed and addresses Recommendation S7 from the Real-time Tools Best Practices Task Force report. 3. The SDT has revised the Rationale for Requirement R2 to clarify that operating personnel includes System Operators or other personnel responsible for supporting Real-time operations. Requirements specifically include System Operators where appropriate for reliability. Entities have flexibility to expand notification and actions to other operating personnel and support staff in their Operating Process or Operating Procedure.

Comment	

Comments: ERCOT continues to be concerned that the proposed standard is too prescriptive and goes beyond the associated FERC directive regarding a requirement addressing “capabilities.” In particular, these standards were developed to address operator awareness of tool or other outages that could impact real-time monitoring.

Further, several of the requirements involve many more entities beyond the Reliability Coordinators and, absent a requirement for coordination, participation, and action in response to the Reliability Coordinator’s identification of an issue, the proposed standard will not achieve its intended objective as written. This is extremely challenging (R1.3) because the majority of issues related to poor data quality or invalid analysis tool solutions can only be resolved by parties outside of the Reliability Coordinator (e.g facility owners, telecom companies, etc.)

Additionally, real-time data and monitoring capabilities are critical to the certification of a Reliability Coordinator and are not “dynamic.” Because such “capabilities” are complex, require coordination and inputs from other entities, and are key to the continued performance of a Reliability Coordinator’s duties, they are not subject to frequent change and therefore likely do not need continued monitoring and assessment.

Finally, several other reliability standards and associated requirements are contingent upon the availability of real-time tools and data, and these other standards and requirements are subject to the compliance monitoring and enforcement program. ERCOT would recommend that requirements addressing capabilities be utilized as part of certification review and not as a reliability standard subject to the compliance monitoring and enforcement program.

Should NERC continue this project, however, ERCOT recommends the following language adjustments to Requirement R1.3. No matter what the SDT *intends* the language to mean, this requirement language may still be read to mean the RC’s Operating Process or Operating Procedure should be written to actively resolve data quality issues even though the ability to resolve data issues may lie with another party. Accordingly, ERCOT recommends:

R1.3 current language: "Actions to resolve Real-time data quality issues with the entity(ies) responsible for proving the data when data quality affects Real-time Assessments." R1.3 ERCOT suggested language: "Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affecting Real-time Assessments." This language aligns with the objective communicated by the SDT, aligns with what is in practice today, aligns with the SDT concept that IRO-010 and TOP-005/003 require data providers to address data quality issues, and is within the capability of the Reliability Coordinator to perform. This language is also consistent with the numerous examples within the NERC Reliability Standards where an entity is required to notify other entities that are responsible for or have an obligation to take actions where the notifying entity cannot or does not perform the reliability task.
Response. Thank you for your comments. The SDT recognizes that resolving data quality issues may require action from entities in addition to the applicable RC. By requiring the RC to have an Operating Procedure or Operating Process that includes steps to address data quality issues affecting its Real-time Assessment, the proposed standard provides flexibility for the RC to accomplish the reliability objective in a manner that accounts for authorities and agreements that are in place. For example, IRO-010-2 Requirement R3 Part 3.2 specifies that entities receiving a data specification shall satisfy their obligations in the data specification using a mutually-agreeable process for resolving data conflicts. To clarify this, the SDT has included examples of actions to address data quality issues in the Guidelines section for Requirement R1. The SDT believes the reliability objectives addressed in this project are closely linked to other Real-time operations requirements and, therefore, they should be maintained on an ongoing basis, in addition to initial certification. Certification ensures the entity has the processes and capabilities to meet the standards, while the requirements themselves ensure the performance is achieved and maintained. The certification process by itself will not ensure these capabilities are maintained.

We support the draft standard IRO-018-1.	

R2 2.3 Instead of "Action to resolve analysis quality issues affecting its Real-time Assessments", suggest change the language to "Action to resolve quality analysis issues affecting its Real-time Assessments."	
Response. Thank you for your comments. The SDT carefully considered the suggested change and does not believe it provides additional clarity.	
Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - SPP, Group Name SPP Standards Review Group	
Answer	Yes
Comment	
1. We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in this section of the rationale box. The review group's opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process and/or Operational Procedure. In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn't match the proposed language for that particular section of the Requirement. The Rationale information doesn't clearly state what documentation contains the 'scope of data point information' this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive? Our review group would also suggest mentioning the specific document(s) in the rationale section so there will be no misconception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process. 2. As for Requirement R2, we would suggest to the drafting team to include the examples provided in their presentation to the rationale section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2. For Requirement R3, we suggest that the drafting team include some proposed language that suggests including the 'alarm process monitor that provide modification' into their Operational Process or Operation Procedure. We feel the current language suggests that this process doesn't need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.	

Response. Thank you for your comment.

1. The example criteria are included in the Guidelines and Technical Basis section. Requirement R1 Part 1.3 requires RCs to include steps to address data quality issues affecting Real-time Assessments. This is a more limited scope than all of the data points being monitored by the RC. If a data point does not affect Real-time Assessment, then no action is required by Requirement R1 Part 1.3.

2. The examples of types of analysis used in Real-time assessments and quality criteria are included in the Guidelines and Technical Basis section.

3. The SDT does not intend to require RCs to address alarm process monitoring in an Operating Procedure or Operating Process that is implemented to meet requirements of the proposed standard.

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	Yes
Comment	

In general, Texas RE agrees with the changes made by the SDT to draft standard IRO-018-1. However, Texas RE provides the following comments or suggestions to the proposed standard:

- Texas RE suggests the SDT consider explicitly stating real-time monitoring in addition to real-time assessments in R1.3. For example, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time monitoring and Real-time Assessments. In addition, Texas RE would like to highlight that Texas RE is concerned there is no definitive timeframe provided associated with the actions to resolve issues which may lead to a reliability gap due to a myriad of approaches taken by registered entities. Texas RE supports the RTBPTF recommendations related to real-time monitoring. Specifically, for telemetry data systems:

1) Increase the minimum update frequency for operational reliability data from once every 10 minutes to once every 10 seconds.16

2) Standardize the procedures, processes, and rules governing key data exchange issues.17

3) Institute a requirement for data availability from ICCP or other equivalent systems, based on the ratio of "good" data received (as defined by data quality codes) to total data received. The ratio must exceed 99 percent for 99 percent of the sampled periods during a calendar month. In addition, the ratio must not be less than 99 percent for any 30 consecutive minutes.

4) Establish minimum response times for restoration of data exchange between control centers following the loss of a data link or other problems within the source system. As part of this requirement, a trouble-resolution process standard must be developed that requires all entities responsible for management and maintenance of ICCP or equivalent systems to identify, with data recipients that could be affected by a loss of data exchange capability, a mutually agreeable restoration target time. The standard process must also include service-restoration escalation procedures and prioritization criteria.

- Texas RE noticed an inconsistency in language between the standard requirement language and the rationale discussion for Requirement 1 and Requirement 2 which states, "The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to *operating personnel*." Unfortunately, "operating personnel", is not a defined term and the Requirements specifically states "System Operator". Texas RE recommends that the rational language be changed to be consistent with the standard requirements.
- Texas RE is concerned the data retention for R2 is a rolling 30 days while the retention period for R1 is the current calendar year and one previous calendar year with the exception of operator logs and voice recording which shall be retained or a minimum of 90 calendars days. Texas RE inquires as to why there is a difference in the evidence retention period even though there is very little difference in the measures? Texas RE recommends an evidence retention period of a year for both R1 and R2 because there is no basis to distinguish actions to address errors in data inputs (R1) and the analysis of the data inputs (R2) and the longer time frame of a year would give the entity more time to resolve data issues.

Response. Thank you for your comments.

1. The SDT does not agree that all data quality issues affecting Real-time monitoring need to be addressed in the Operating Procedure or Operating Process specified by Requirement R1. The scope of Requirement R1 Part 1.3 addresses data quality issues that could impact reliability by affecting Real-time Assessments. The SDT does not believe adding a prescriptive time requirement to Part 1.3 is feasible or necessary for reliability. Entities should exercise judgment to address data quality issues in appropriate timeframes to satisfy obligations for the performance of Real-time Assessments.

2. The SDT has revised the Rationale for Requirement R2 to clarify that operating personnel includes System Operators or other personnel responsible for supporting Real-time operations. Requirements specifically include System Operators where appropriate for reliability. Entities have flexibility to expand notification and actions to other operating personnel and support staff in their Operating Process or Operating Procedure. 3. The evidence retention period for Requirement R2 is aligned with the evidence retention period for Real-time Assessments contained in IRO-008-2 Requirement R4. The SDT's intent is to maintain consistency within the TOP and IRO family of standards.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Comment

IRO-018-1 is not applicable to Hydro One. However, Hydro One Networks Inc. would like to point out that R1.2 should specify, that the RC’s Operating Process or Operating Procedure which is to include actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data, should include a mutually agreed upon schedule and actions.

Response. Thank you for your comments. The proposed requirement provides flexibility for the RC's Operating Process or Operating Procedure to include whatever actions are appropriate to address data quality issues. The actions and schedule could be based on the RCs authority or agreements with other entities.

2. Do you agree with the changes made by the SDT to draft standard TOP-010-1? If you do not agree, or if you agree but have comments or suggestions for the proposed standard provide your recommendation and explanation.

Summary Consideration: The SDT thanks all commenters. The following changes have been made:

- Requirement R1 Part 1.3: changed *resolve* to *address* to more clearly align with the SDT's intent. The SDT recognizes that the applicable entity may not be able to ‘resolve’ (as in completely remediate) data issues on their own because, for example, another entity may be responsible for providing the data. The revision clarifies that the Transmission Operator's Operating Process or Operating Procedure must include "actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments."
- Requirement R2 Part 2.3: changed *resolve* to *address* to more clearly align with the SDT's intent. The SDT recognizes that the applicable entity may not be able to ‘resolve’ (as in completely remediate) data issues on their own because, for example, another entity may be responsible for providing the data. The revision clarifies that the Balancing Authority's Operating Process or Operating Procedure must include "actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions."

- Rationale for Requirements R1 and R2 and related information in the Guidelines and Technical Basis Section: Examples of actions to address Real-time data quality issues were added to the Guidelines section and referenced in the Rationale.
- Requirement R3 Part 3.3: changed *resolve* to *address* to more clearly align with the SDT's intent and maintain consistency with Requirement R1.
- Rationale for Requirement R3: Clarified that operating personnel includes System Operators and staff responsible for supporting Real-time operations.
- Reworded lists of examples in the Guidelines and Technical Basis Section.

Responses to comments are provided below.

Scott McGough - Georgia System Operations Corporation - 3

Answer	No

Comment

The language is too ambiguous.

Response. Thank you for your comment. The SDT has addressed stakeholder comments and suggestions to enhance clarity.

Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2

Answer	No

Comment

Comments: For purposes of this comment, ERCOT incorporates all of its above comments regarding IRO-018-1. As with R1.3 in IRO-018-1, ERCOT is concerned that certain language in TOP-010-1 could be read to suggest that the RC must resolve Real-time data quality issues, when in fact the ability to resolve data issues may lie with another party. Consistent with its suggested revisions to R1.3 in IRO-018-1, ERCOT recommends the following changes to R1.3 and R2.3 in TOP-010-1:

R1.3 current language: "Actions to resolve Real-time data quality issues with the entity(ies) responsible for proving the data when data quality affects Real-time Assessments."

R1.3 ERCOT suggested language: "Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affecting Real-time Assessments." And R2.3 current language: "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions." R2.3 ERCOT suggested language: "Actions to notify the entity(ies) responsible for providing data of any Real-time data quality issue affectings its analysis functions."
Response. Thank you for your comments. Response is provided in the previous section.

John Brockhan - CenterPoint Energy Houston Electric, LLC - 1	
Answer	No
Comment	
CenterPoint Energy understands recommendations for the scope of this project originated from the 2011 Southwest Outage Report as well as FERC directives in Order 693, however with the vast improvement in technologies involved with monitoring and analysis capabilities over the last 10 years, these recommendations as well as the scope of this project is potentially outdated. CenterPoint Energy is concerned that compliance with Requirements in TOP-010-1 could represent a documentation burden without providing a measureable benefit to reliability. The main focus of the directives and recommendations referenced above appear to be more related to real-time analysis tools rather than quality of data. CenterPoint Energy believes and feels the industry would benefit more from, reducing the scope of the Standard to those data quality issues that negatively impact real-time analysis and assessments. CenterPoint Energy recommends the SDT delete Parts 1.1, 1.2, 2.1, and 2.2.	
Response. Thank you for your comments. Requirements R1 and R2, Parts 1.1, 1.2, 2.1, and 2.2 are included for operator situational awareness in line with the Project 2009-02 objectives. The SDT believes these provisions are important for complete and effective Operating Processes or Operating Procedures addressing Real-time monitoring and analysis capabilities.

See comments from question 1 but replacing RC for TOP and BA

What happen when all procedures and processes are followed properly and SCADA system fails because of an IT problem? In another words, BA or TOP must not be attributable when SCADA systems fail because of an IT problem. The standard should also consider accountability of the SCADA supplier

Response. Thank you for your comments. Response is provided in the previous section.

Daniel Mason - City and County of San Francisco - 1,5	
Answer	No

The draft version of Requirement R4. reads as follows:

Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred.

We believe greater clarity could be brought to this requirement by modifying two awkward terms, "alarm process monitor" and "monitoring alarm processor", as follows:

Each Transmission Operator and Balancing Authority shall monitor its Real-time monitioring alarm system and provide notification(s) to its System Operators when a failure of its Real-time monitoring alarm system has occurred.

Response. Thank you for your comments. Requirement R4 is aimed at ensuring TOPs and BAs have an alarm process monitoring capability. The SDT does not believe the commenter's suggested change would clearly achieve this objective.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1	
Answer	No
Comment	

The changes made to R1 are helpful in clarifying the scope of data included in this requirement however the term "quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments" would still imply all data specified per TOP-003 as all data specified will be the data used in Real time Assessment and therefore will require TOP to take action on any failed data point. Also the term real time monitoring is not a defined term and should be removed.

In addition to the above comments, ITC Holdings agrees with the comments submitted by the SPP Standards Review Group. A copy of SPP's comments are provided below.

We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in the rationale box of this section. The review group's opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process or Operational Procedure.

In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn't match the proposed language for that particular section of the Requirement. The Rationale information doesn't clearly state what documentation contains the 'scope of data point information' this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive. Our review group would suggest mentioning the specific document(s) in the Rationale Section so there will be no miss conception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process.

As for Requirement R2, we would suggest to the drafting team to include the examples provide in their presentation to the Rationale Section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2.

For Requirement R4, we would suggest they drafting team would include some proposed language that suggests including the 'alarm process monitor that provide modification' into their Operational Process or Operation Procedure. We feel the current language

suggests that this process doesn't need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.	
Response. Thank you for your comments. The SDT does not agree that all data specified in TOP-003-3 is used for Real-time Assessments, and consequently views proposed Requirement R1 Part 1.3 to be appropriately scoped to address the set of data that impacts Real-time Assessments. Also see response to SPP.	
Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators	
Answer	No
Comment	

(1) We feel the language within Requirements R1 and R3 are vague and should not require criteria for evaluating data quality and analysis that could be too ambiguous and unenforceable. These requirements need to identify what real-time data and analysis are necessary to perform monitoring and assessment functions, and identify the specifications necessary to maintain reliability. The SDT should clarify the meaning of "quality," and incorporate this explanation in the standard's Guidelines and Technical Basis or Rationale sections. Without a minimum criteria specified, we feel this does not provide enough information to make an objective determination for an auditor. Furthermore, we suggest adding references to Part 1.3 and Part 3.3 that mitigation actions should be initiated within 30 minutes. We feel these references align the failure to implement actions with other mitigation actions required in other reliability standards.

(2) We understand the SDT interprets the intent of requirement R4 of the industry-approved standard, BAL-005-1, to pertain to only the data necessary to calculate Reportable ACE. Moreover, the SDT feels that the proposed Requirement R2 does not create double jeopardy with BAL-005-1, and that Requirement R2 is necessary to account for other data monitored by a BA. We disagree and feel the SDT should remove this redundant requirement or identify this other data in the rationale of this requirement.

(3) The intent of Requirement R4 requires a TOP or BA to monitor the availability of its real-time monitoring alarm processor. We feel this requirement is unnecessary, as similar actions are accomplished in order to maintain compliance with other reliability requirements. For instance, Requirement R5 of TOP-006-3 states "each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating

conditions...” In order to maintain compliance with this requirement, a registered entity is obligated to notify its own personnel when they are unable to use such monitoring equipment. We recommend the SDT remove Requirement R4 from the proposed standard. (4) We continue to have concerns that these requirements only focus on System Operators. We feel that an auditor may not interpret the standard to allow other employees, such as EMS Engineers, to mitigate data or analytical errors. According to the NERC Glossary Term, a System Operator is one “who operates or directs the operation of the Bulk Electric System (BES) in Real-time.” We recommend the SDT clarify that these requirements can apply to other employees.	
Response. Thank you for your comments. 1. See response 1 to ACES comments in previous section. The TOP is obligated to determine what data is required for Real-time monitoring and Real-time Assessments by TOP-003-3 Operational Reliability Data. 2. Requirement R2 addresses the BA analysis functions and Real-time monitoring obligations for maintaining Demand and resource balance as described in the NERC Functional Model and TOP-001-3. Requirement R2 applies to data specified by the BA per TOP-003-3 Requirement R2. 3. TOP-006-3 is approved for retirement. The SDT does not agree that other Reliability Standards address the objective of proposed TOP-010-1 Requirement R4. 4. The SDT has revised the Rationale for Requirement R3 to clarify that operating personnel includes System Operators or other personnel responsible for supporting Real-time operations. Requirements specifically include System Operators where appropriate for reliability. Entities have flexibility to expand notification and actions to other operating personnel and support staff in their Operating Process or Operating Procedure.

How is quality defined? This is too ambiguous as written and internal discussions resulted in multiple opinions. Quality needs to be better defined within the requirement.	

Response. Thank you for your comments. To provide clarity to potentially ambiguous terms, the Guidelines and Technical Basis section describes examples of criteria that can be used for evaluating data quality and examples of data quality indicators. The SDT does not believe minimum 'one size fits all' definition of quality can be established as part of a continent-wide standard requirement.

Duke Energy recommends the same changes to the language in TOP-010-1 that it does for IRO-018-1.	
Response. Thank you for your comments. See response in previous section.	
Jamison Cawley - Nebraska Public Power District - 1 **Don Schmidt**	
Answer	No
Comment	
We do not believe the issues addressed by the FERC directive rise to the level of requiring a reliability standard. The intent of the directive and the resulting actions to be taken by the various entities would be better served by an official Guideline rather than a generic standard. Forcing this into a Standard result in varied interpretations and approachs to "quality" and "adequacy" that do not enhance reliability of the BES. We believe the requirements in general could be improved to be more results based. As written, they largely will only result in identifying deficiencies after the fact when doing event analysis. An entity may have a process or procedure as required, but they could miss a piece of data or fail to identify fully the impact a quality issue may have upon their situational awareness. Simply having the process does not result in increased reliability. Most entities already have a process in place to alarm or indicate data quality as needed to maintain reliability. Entities are already required to operate reliably, within SOLs and IROLs, etc. The creation of this standard as written would serve only to document that	

process and put it under auditable enforcement – with no discernible impact to maintaining reliability. In order to make this standard truly results based, there needs to be some identification of the quality level, or data quality thresholds that must be maintained in order for reliability to be maintained. Then that level (or quality of the data measurements) must be maintained per the standard.

We suggest that there needs to be more direction given by the Standard in a few areas. One is that the applicable entity should be determining a data range, time periods, number of manually entered values, etc. that can degrade analysis to the point reliability is threatened (R1.1.1-R1.1.4).

We find it problematic when an entity may not "own" the data and is simply receiving a quality flag from a sender. An entity may not receive an accurate quality flag or the quality flag is corrupted in translation over ICCP. Also, there is no requirement that the measurement devices even be of a particular accuracy. For example the quality threshold may be more narrow than the accuracy of the device.

Response. Thank you for your comments. The SDT believes the Operating Processes or Operating Procedures required by the proposed standard should be developed to support Real-time operations, not just event analysis functions. Because entities have different systems, tools, and capabilities, the proposed standard provides needed flexibility rather than imposing prescriptive requirements that would not be effective in a continent-wide standard. Determining data range, time periods, or number of manually entered values, as suggested, could be part of the criteria an entity uses in the Operating Process or Operating Procedure. An objective of an entity's Operating Procedure or Operating Process should be to establish criteria that will identify potentially bad ICCP data points that affect Real-time Assessments so that actions can be taken by entities responsible for providing the data. Measurement device accuracy requirements necessary for reliable operations will vary and therefore are not addressed in the proposed continent-wide standard.

William Temple - William Temple On Behalf of: Mark Holman, PJM Interconnection, L.L.C., 2	
Answer	No
Comment	

PJM does not believe this standard is necessary. RC, BA & TOP entities currently have adequate tools for real-time monitoring and analysis. The existing Standards (i.e., IRO, TOP, & BAL) adequately define what needs to be monitored by each entity without defining the tools. Creating new requirements will not increase the reliability of the BES.

Additionally, some of the new proposed requirements (IRO-018-1 Req. 1, TOP-010-1 Req. 1) state:

Each RC, BA &TOP shall implement an Operating Process to address the *quality* of the Real-time data… the term *quality* is ambiguous and subjective. This term needs to be defined. Similar to Requirement 2, the terms *indications of quality* needs to be defined. If not defined, it could result in varying interpretations throughout the industry.

Lastly, the NERC Operating Reliability Subcommittee (ORS) has drafted a Reliability Guideline, "Loss of Real-Time Reliability Tools Capability / Loss of Equipment Significantly Affecting ICCP Data." This guideline will help ensure that tools are adequate and if they are degraded for any reason, the potentially impacted entities are aware and can take action if needed.

PJM supports the comments submitted by the ISO/RTO Council Standards Review Committee.

Response. Thank you for your comments. Response provided in previous section.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No

Comment

Southern believes that the criteria in R1.1 should be limited to the BA/TOP's ability to monitor and assess the current/expected condition of its RC area within the capabilities of its monitoring tools.

Each BA/TOP has the inherent responsibility to protect the integrity of the system in its BA/TOP area and contribute to the overall integrity of Interconnection as required by other approved reliability standards. The NERC approved TOP-003-3 and TOP-004 standards requires BAs/TOPs to have monitoring tools and capabilities to assess system conditions in its area and to perform next day and real time reliability assessments to identify/mitigate potential issues that could have an adverse impact on reliability. Moreover, Southern asserts that the capability to maintain an accurate model along with the required telemetry is already being assessed at the certification stage, and that maintenance of such capability does not need to be assessed on an ongoing basis as adequate data quality is required to perform the assessments required by the aforementioned standards. In addition, there are already NERC approved standards such as TOP-002-2 that currently require the BA/TOP to maintain accurate computer models for analyzing system operations.

Since the TOP is constantly evaluating the quality of data received to ensure it has an accurate state of system conditions to perform real time assessments, through the same processes demonstrated during certification, Southern believes that the reliability goals of maintaining adequate data, tools and situational awareness are accomplished via the IRO-010 and TOP-003-3 NERC reliability standards and to impose this new standard focusing on data quality would only serve as administrative in nature and would not provide any substantial increases in reliability.

Given that Southern disagrees with the reliability need for this standard, Southern notes that the detailed requirements (R1.1.1, etc…)regarding assessing data quality, on a point by point basis, was moved to the technical background section of the purposed standard, which is helpful as long as the RSAWs developed doesn't incorporate reapply this "one size fits all" approach for assessing data quality.

Response. Thank you for your comment.

Requirement R1 Part 1.1 and R2 Part 2.1 apply to Real-time data that the TOP and BA have specified are necessary for Real-time monitoring and Real-time Assessments according to TOP-003-3. The SDT believes it is appropriate to have criteria for evaluating the quality of this Real-time data, and not limit the criteria to a subset of the data. However, the proposed requirement specifies that the actions contained in the Operating Process or Operating Procedure are aimed at data quality issues affecting Real-time Assessments, which addresses the TOP and BA's ability to assess existing and potential system operating conditions. The SDT believes the reliability objectives addressed in this project are closely linked to other Real-time operations requirements and, therefore, they should be maintained on an ongoing basis, in addition to initial certification. Certification ensures the entity has the processes and capabilities to meet the standards, while the requirements themselves ensure the performance is achieved and maintained. The Certification process by itself will not ensure these capabilities are maintained.	
John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1	
Answer	No
Comment	
Requirements R1 and R2 apply to monitoring system conditions. Therefore Tacoma Power believes both requirements should be included in TOP-006-2. Additionally Tacoma Power believes Requirement R4 is unnecessarily redundant, providing no foreseeable improvement to reliable operation of the bulk electric system.	
Response. Thank you for your comments. TOP-006-2 has been approved for retirement and requirements for Real-time monitoring are addressed in other standards including TOP-001-3 and IRO-008-2. The SDT determined the development of new proposed reliability standards was appropriate for accomplishing the objectives of Project 2009-02. Requirement R4 addresses recommendations from the Real-time Tools Best Practices Task Force 2008 report and lessons learned from the 2003 Blackout.	
Thomas Foltz - AEP - 5	
Answer	No
Comment	

While AEP agrees with the overall approach and intent of R1, we believe that sub-Requirement R1.3 goes beyond the scope of its parent Requirement. While R1 focuses on ***addressing*** the quality of Real-time data, R1.3 requires the Transmission Operator's Operating Process or Procedure to include actions to ***"resolve"*** Real-time data quality issues when data quality affects Real-time Assessments. This is especially concerning when the "entity(ies) responsible for providing the data" are external. Neither the Transmission Operator, nor its Operating Procedure, is able to resolve data issues involving points over which they have no direct control. The entity would have control over their own analysis quality (R3), but again, not the quality of external data. In the webinar held on January 11, the drafting team inferred a different interpretation of R1.3 depending on whether or not the data is externally provided. The drafting team seemed to be saying "no, you don't need to resolve data issues for points you do not own, but you still need to document actions to resolve those data issues", etc. That seems to infer that "actions to resolve" might, in some cases, simply be *informing* the data owner of the issue rather than *remediating* issues involving the external data. While the drafting team might interpret R1.3 in this manner, there is no assurance that an auditor would have that same viewpoint. And if that is indeed the drafting team's interpretation , R1.3 does not articulate that. In this same webinar, a drafting team member eventually used the phrase "address the quality" in regards to externally provided data. AEP believes the word "address" is much more appropriate for R1.3 than "resolve", and using it would allow R1.3 to align with R1 (which already uses the word "address"). As a result, we recommend that the word "resolve" in R1.3 be replaced by "address", so that it states "Actions necessary to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments."
Response. Thank you for your comments. The SDT has changed *resolve* to *address*, and added clarifying details to the Guidelines section.

Michelle Amarantos - APS - Arizona Public Service Co. - 1	
Answer	No
Document Name	AZPS-Comments_Question-2_Project-2009-02_Draft-2.docx
Comment	
Where the current requirements, R1.3, R2.3, and R3.3, state that there need to be "actions to resolve…quality issues affecting Real-Time Assessments," APS recommends this language be modified to only when "quality issues **adversely** affecting Real-Time Assessments."	

APS does not agree with the use of the word "resolve" in requirements, R1.3, R2.3, and R3.3, as there will be times when the quality issues arise from data that is being provided by an external resource, thereby limiting an entities' ability to "resolve" the issue. APS recommends replacing the word "resolve" with "**address**."

In addition, APS appreciates the time and effort spent by the SDT to provide the rationale for Requirements and the "Guidelines and Technical Basis" as these sections provide insight as to what is compliant. That said, APS believes the content in these sections needs to be limited to an explanation of what is in the requirements and not expand the scope of the requirements by using words such as "must" or "shall."

There are multiple instances where the current rationale for Requirements and the "Guidelines and Technical Basis" document add requirements to those contained in the base standard via the use of ***definitive examples*** that are then subsequently incorporated into the proposed RSAW for TOP-010. Specific examples are provided under the Analysis of "Guidelines and Technical Basis" Supplemental Material below.

APS recommends the SDT review each example and consider either rewriting the standard to include the additional provisions introduced in the supplemental material into the requirement or rewrite the rationale/"Guidelines and Technical Basis" as illustrative (versus definitive) examples.

Analysis of "Guidelines and Technical Basis" Supplemental Material

	Existing Language	APS Proposed Language
Introduction	"Real-time monitoring ***includes*** the following activities performed in Real-time:…"	"Real-time monitoring ***may include*** activities performed in Real-time such as:…"
Requirement, R1	The criteria support identification of ***applicable*** data quality issues, such as:" (paragraph 2)	"The criteria support identification of data quality issues, ***which may include items*** such as:"

	"The Operating Process or Operating Procedure must clearly identify to ***operating personnel how to determine the data that affects the quality*** of the Real-time Assessment so that effective actions can be taken to resolve data quality issues ***in an appropriate timeframe***" (paragraph 5) The existing language changes the scope of R1.2 and R1.3 in three ways: 1) Changes "System Operator" to "operating personnel" 2) Shifts the burden of determining the quality of data to operating personnel (as opposed to providing quality indicators to the System Operator) 3) Introduces a new requirement to resolve issues in an appropriate timeframe	"The Operating Process or Operating Procedure must describe ***how the quality of Real-time data is indicated to System Operators*** so that actions can be taken to resolve Real-time data quality issues **adversely** affecting the quality of Real-time Assessments."
R2	Same as comments to R1	Same as comments to R1
Requirement, R3	"Examples of the types of analysis used in Real-time Assessments ***include***, as applicable, …" (paragraph 1)	"Examples of the types of analysis used in Real-time Assessments ***may include***, as applicable, …" (paragraph 1)
	"The entity ***must use appropriate*** quality criteria based on the analysis capabilities used to perform Real-time Assessments, ***such as***:…" (paragraph 2)	"***Examples of the type*** of criteria used to evaluate the quality of the analysis used in Real-time Assessments ***may include*** items such as:"
	"The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessments will be shown to operating personnel." (paragraph 3)	To clarify: "The Operating Process or Operating Procedure must describe how the quality of analysis used in Real-time Assessments is indicated and provided."

Requirement, R4	"The alarm process monitor ***must not*** fail with a simultaneous failure of the Real-time monitoring alarm processor." (Rationale for Requirement R4, paragraph 2)	"The alarm process monitor ***should be designed and implemented such that*** a failure of the alarm process monitor does not cause a simultaneous failure of the Real-time monitoring alarm processor."
	"A stalled Real-time monitoring alarm processor **should not** cause a failure of the alarm process monitor." (paragraph 2)	"A Real-time monitoring alarm processor ***should be designed and implemented such that*** a stall of the Real-time monitoring alarm processor does not cause a simultaneous failure of the alarm process monitor."

Response. Thank you for your comments. The SDT does not believe the suggested change to "adversely affecting Real-time Assessments" provides additional clarity. The SDT has changed *resolve* to *address*, and added clarifying details to the Guidelines section. The SDT has reviewed all proposed revisions to the Guidelines section and made several changes per your recommendations.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Answer	Yes

Comment

In general, Texas RE agrees with the changes made by the SDT to draft standard TOP-010-1. However, Texas RE provides the following comments or suggestions to the proposed standard:

- Texas RE recommends adding the Balancing Authority to the applicability of R3. Some BA tools can be considered a Real-time monitoring tool, for example, the use of SCED in this region.

- Texas RE suggests the SDT consider explicitly stating real-time monitoring in addition to real-time assessments in R1.3. For example, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time monitoring and Real-time Assessments. In addition, Texas RE would like to highlight that Texas RE is concerned there is no definitive timeframe provided associated with the actions to resolve issues which may lead to a reliability gap due to a myriad of approaches taken by registered entities. Texas RE supports the RTBPTF recommendations related to real-time monitoring. Specifically, for telemetry data systems:

1) Increase the minimum update frequency for operational reliability data from once every 10 minutes to once every 10 seconds.16

2) Standardize the procedures, processes, and rules governing key data exchange issues.17

3) Institute a requirement for data availability from ICCP or other equivalent systems, based on the ratio of "good" data received (as defined by data quality codes) to total data received. The ratio must exceed 99 percent for 99 percent of the sampled periods during a calendar month. In addition, the ratio must not be less than 99 percent for any 30 consecutive minutes.

4) Establish minimum response times for restoration of data exchange between control centers following the loss of a data link or other problems within the source system. As part of this requirement, a trouble-resolution process standard must be developed that requires all entities responsible for management and maintenance of ICCP or equivalent systems to identify, with data recipients that could be affected by a loss of data exchange capability, a mutually agreeable restoration target time. The standard process must also include service-restoration escalation procedures and prioritization criteria.

- Texas RE noticed an inconsistency in language between the standard requirement language and the rationale discussion for Requirement 1 and Requirement 2 which states, "The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to *operating personnel*." Unfortunately, "operating personnel", is not a defined term and the Requirements specifically states "System Operator". Texas RE recommends that the rational language be changed to be consistent with the standard requirements.

- Texas RE is concerned the data retention for R2 is a rolling 30 days while the retention period for R1 is the current calendar year and one previous calendar year with the exception of operator logs and voice recording which shall be retained or a minimum of 90 calendars days. Texas RE inquires as to why there is a difference in the evidence retention period even though there is very little difference in the measures? Texas RE recommends an evidence retention period of a year for both R1 and R2 because there is no basis

to distinguish actions to address errors in data inputs (R1) and the analysis of the data inputs (R2) and the longer time frame of a year would give the entity more time to resolve data issues. • In the Guidelines and Technical Basis documentation there is a statement: "The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel". Texas RE recommends adding: "including the System Operator" or something to that affect. The standard is applicable to the System Operators; the term "operating personnel" is undefined.	
Response. Thank you for your comments. See responses in the previous section. BAs are not required to perform Real-time Assessments, as defined in the NERC Glossary and specified in other standards. Accordingly, the SDT did not include them in Requirement R3. BA analysis functions and capabilities are addressed in other standards including BAL-005.	

Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - SPP, Group Name SPP Standards Review Group	
Answer	Yes
Comment	
We suggest to the drafting team to mention more information in the rationale box pertaining to Requirement R1 and its sub-part 1.1 on the expectations for the criteria in reference to evaluating the quality of the real-time data. Additionally, our review group would suggest mentioning the criteria examples spoken of in the drafting team's webinar in the rationale box of this section. The review group's opinion of this is….the criteria examples will give the industry a foundation on how to use various Real-time scenarios to structure their Operational Process or Operational Procedure. In our opinion, Requirement R1 sub-part 1.3 rationale box information (last paragraph) doesn't match the proposed language for that particular section of the Requirement. The Rationale information doesn't clearly state what documentation contains the 'scope of data point information' this proposed language will help clarify. We would ask are you referring to the SAR, or the RTBPTF Report or could it be the FERC Directive. Our review group would suggest mentioning the specific document(s) in the Rationale Section so there will be no misconception on what documentation contains the scope in reference to the data points and how those points should be addressed when providing evidence during an auditing process.	

As for Requirement R2, we would suggest to the drafting team to include the examples provided in their presentation to the Rationale Section. We feel this information will help give some clarity on what the expectations are for the industry pertaining to Requirement R2.

For Requirement R4, we suggest they drafting team include some proposed language that suggests including the ‘alarm process monitor that provide modification’ into their Operational Process or Operation Procedure. We feel the current language suggests that this process doesn’t need to be included in the previously mentioned documentation which could lead to interpretation issues from our perspective.

Response. Thank you for your comments. See response in previous section.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Answer	Yes

Comment

Revisions to remove much of the very specific requirements is a good change and Hydro One Networks Inc. supports this. In particular, Hydro One Networks Inc. supports the removal of the list of criteria previously stipulated in Draft 1’s R1.1 and R2.1 for evaluating the quality of Real-time data.

Response. Thank you for your comments.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Answer	Yes

Comment

SRP believes the current draft of TOP-010-1 is a significant improvement on the former draft. SRP recommends that in R1 Part 1.3, R2 Part 2.3, and R3 Part3.3 the verbiage should be changed from “Actions to resolve” to “Actions to address”. The TOP and BA may not be able to resolve all quality issues for all the data it receives but they can address all the data with quality issues. This change would retain the responsibility for compliance with the TOP and BA.

Response. Thank you for your comments. The SDT has changed *resolve* to *address*, and added clarifying details to the Guidelines section.

3. Do you agree with the revised Implementation Plan for the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the Implementation Plan provide your recommendation and explanation.
Summary Consideration. The SDT thanks all commenters. The SDT did not make any changes to the proposed Implementation Plan. Comment responses are provided below.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP	
Answer	No
Comment	

Xcel Energy appreciates the fact that the SDT added some additional time to the Implementation Plan for these standards, however we still feel that the implementation timeline is too short. We continue to propose a 60 month implementation timeline as suggested previously by the MRO Standards Review Forum which states:

The implementation plan is too short if entities need to specify, order and deploy new or modified Energy Management Systems (EMS) that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. Entities should be given an implementation plan with up to 60 months for new EMS software and systems.

The key is to allow entities the proper time to assess their tools and complete the right upgrades once. While prompt actions are good, forcing entities to assess, order, and deploy equipment in 12 or 18 months will lead to errors and possibly more risk of serious outages and problems in the short term.

Response. Thank you for your comments. Based on industry feedback, the SDT believes the 18-month period for implementation provides the necessary time for entities to implement procedures and capabilities to comply with the proposed requirements and addresses the reliability objectives with appropriate urgency. The SDT acknowledges that procurement of a new EMS takes considerable time; however, meeting the requirements in the proposed standard should not require extensive hardware changes, if any.

Thomas Foltz - AEP - 5

Answer	No
Comment	

As the draft standard is currently written, AEP cannot determine the adequacy of the proposed implementation plan. However, if the drafting team were to replace "resolve" with "address" in R1.3 as suggested above, AEP believes the implementation plan would be sufficient.

Response. Thank you for your comments.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Comment	

Southern believes that the implementation date should be pushed back to at least 24 months following regulatory approval to allow time for the industry to determine the appropriate technology that is sufficient for each entity's operations. We also believe that in order to fully comply with the proposed standard, enough time should be allowed for the industry to update their current procedures and/or to create acceptable procedures, provide training to the appropriate System Operators and allow sufficient time for the entities to determine the technology available that is available and appropriate to support their operations, along with the required functionality.

Response. Thank you for your comments. Based on industry feedback, the SDT believes the 18-month period for implementation provides the necessary time for entities to implement procedures and capabilities to comply with the proposed requirements and addresses the reliability objectives with appropriate urgency.

Hydro One Networks Inc. proposes that a period of at least 18 months be provided for entities to implement Operating Processes or Operating Processes. Such an effort is onerous and multiple business units and entities would have to align their practices with one another.

Response. Thank you for your comments. The SDT agrees and has proposed an implementation period of 18 months.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators

Answer	No

Comment

We feel the SDT has made a general assumption that each applicable entity already has the processes, procedures, and infrastructure in place to comply with these requirements. However, we believe entities should have up to 60 months to deploy a new or modified Energy Management System that can monitor, track, and report real-time data quality and availability in accordance with IRO-018 and TOP-010. The key is to allow entities adequate time to assess their tools and complete the right enhancements once. While prompt actions are good practices, forcing entities to assess, order, and deploy equipment within 18 months may lead to unintended consequences.

Response. Thank you for your comments. Based on industry feedback, the SDT believes the 18-month period for implementation provides the necessary time for entities to implement procedures and capabilities to comply with the proposed requirements and addresses the reliability objectives with appropriate urgency. Meeting the requirements in the proposed standard should not require procurement of new EMS or extensive hardware or software changes.

4. Do you agree with the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for the requirements in the proposed standards? If you do not agree, or if you agree but have comments or suggestions for the VRFs and VSLs your recommendation and explanation.

Summary Consideration. The SDT thanks all commenters. The SDT did not make any changes to the VRFs and VSLs. Comment responses are provided below.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators

Answer	No

Comment

We believe that not having good data quality and analysis are a medium risk to BES reliability. However, we disagree that the VRFs for these requirements should be classified as Medium, as the Operating Process or Operating Procedure that support both more falls in-line with the criteria of a low risk violation. Our recommendation is further supported with the definition of a Low VRF, as defined within the NERC Violation Risk Factor and Violation Severity Level Justifications document, which states "administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System." The nonexistence of a related Operating Process or Procedure will have no impact on the state or BES capability.

Response. Thank you for your comments. Implementation of an Operating Process or Operating Procedure should not be regarded as administrative in nature. Assignment of Medium VRF is appropriate since failure to implement effective procedures for data and analysis quality could impact "the ability to effectively monitor and control the BES."

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Answer	No

Comment

Hydro One Networks Inc. does not support the VSLs, as they are not consistent with the changes made to Draft 2 of the standard. For example, the VSL for R1 assumes that entities would implement one or more of the criteria for evaluating Real-time data quality that have now been removed in Draft 2.	
Response. Thank you for your comments. For assessing degrees of compliance with Requirement R1, the VSL includes the three Requirement Parts as described in the current draft of the standard. Degrees of compliance are not based on specific examples of criteria, which were removed from the requirement and moved to the Guidelines and Technical Basis section in Draft 2.

Although Southern is encouraged that the SDT has now added some low VRFs/VSLs to the proposed standards, we still maintain that the VRFs and VSLs are too high and should be modified additionally.	
Response. Thank you for your comments. The SDT has carefully reviewed NERC and FERC guidelines and determined that the proposed VRFs and VSLs are in agreement.	

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1	
Answer	No
Comment	
The VSL for TOP-010-1 Requirement R4 requires the entity to prove the negative for compliance. It is unknown how an entity would prove the alarm process monitor did not fail unless a tertiary monitor was implemented. Tacoma Power does not believe that this is the intent of the standard.	

Response. Thank you for your comments. The draft RSAW provides compliance guidance including a description of evidence that may be used. Examples of evidence include a system specification for the alarm process monitor, and logs or other evidence that the monitor provided indication during those times (if any) when the Real-time monitoring alarm processor failed.

Comment

ATC requests a clarification by the SDT in TOP-010-1 on the phrase “affects Real-time Assessments” which is used in sections R1.1.3 and R2.2.3 and the phrase “affecting its Real-time Assessments” in section R3.3.3. Should “affects” be replaced with “effects” or is this correct as written?

Definitions of “affecting”

· Merriam Webster - causing a feeling of sadness or sympathy - evoking a strong emotional response

· Cambridge - causing a strong emotion, especially sadness

· Dictionary.com - moving or exciting the feelings or emotions.

· TheFreeDictionary.com - Inspiring or capable of inspiring strong emotion - moving or stirring the feelings or emotions. - evoking feelings of pity, sympathy, or pathos

Definitions of Effect and Effecting

· Merriam Webster (effect) - change that results when something is done or happens : an event, condition, or state of affairs that is produced by a cause

· Dictionary.com (effect) - something that is produced by an agency or cause; result; consequence - power to produce results; efficacy; force; validity; influence

· Cambridge (effect) - the result of a particular influence; something that happens because of something else:

Response. Thank you for your comments. The SDT does not agree with the suggested change.

Thomas Foltz - AEP - 5

Comment

AEP has chosen to vote negative on TOP-010-1, driven by our concerns regarding R1.3, as expressed in our response to Q2.

Response. Thank you for your comments.

Michelle Amarantos - APS - Arizona Public Service Co. - 1

Comment

On p.12 of the “Guidelines and Technical Basis” document, paragraph 1 defines what is included “Real-time monitoring.” Paragraph 2 goes on to state that there are “functional requirements to perform [Real-time] monitoring… in other standards.” If this is the case, APS recommends the SDT define “Monitoring” as a term in the NERC Glossary as preferable to defining this term in the “Guidelines and Technical Basis” document that is part of the supplemental material in TOP-010.

Response. Thank you for your comments. The SDT determined that defining 'Monitoring' in the NERC Glossary of terms was not necessary to meet the objectives of Project 2009-02 and could have an unintended impact on other standards where the term is used.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Comment

The rational for TOP-010-1 R1 and R2 indicates that the data of concern for those requirements is the same data that was determined in TOP-003-3. The TOP-003-3 standard basically specifies what data is necessary for the Real-time Assessments and TOP-010-1 specifies the quality of that data. SRP recommends combining the two standards so that there is one that addresses what data is necessary and also specifies the quality of that data. Combining the two standards would clarify that the data referred to in TOP-010-1 is the same as the data referred to in TOP-003-1.

Response. Thank you for your comment. Recent revisions to TOP and IRO standards have resulted in significant changes to these families of standards. The SDT determined when Project 2009-02 was resumed in 2015 that it was straightforward to address the project objectives with new standards.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Comment

Overall, the second draft has simplified the requirements to an extent. Hydro One Networks Inc. believes that some form of oversight or standardization is required to ensure there is a continuous focus on real time monitoring tools. Data quality measures are appropriate; however, decisions to the degree and method of verification should be left to the discretion of each entity as this will, to an extent, depend on the level of system complexity. A simple system can be tuned to a small error (or convergence) while a complicated system may require a larger allowance.

R1 and R2 – Since the functional requirements, VRFs, and Time Horizons are identical, these two requirements could be combined into one requirement and made applicable to both the Transmission Owner and Balancing Authority.

R2.2 - The wording in R2.2 could be modified to align with that of R1.3, and read, "Actions to resolve Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects **Real-time Assessments**.

R4 - The wording could be improved as follows: "*Each Transmission Operator and Balancing Authority shall **have alarm process monitoring** that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred*"

Response. Thank you for your comments. The SDT agrees that more prescriptive requirements will not be effective in addressing the project's objectives. Requirement R2 is unique to BAs because they do not perform Real-time Assessments as defined in the NERC Glossary and specified in other standards. The SDT does not believe the suggested change to R4 provides additional clarity.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators	
Comment	
(1) We request the SDT provide additional rationale on the need to develop new reliability standards, when we feel many current and approved future standards could be enhanced to support the intent of the SAR. Other documentation, such as Reliability Guidelines, could be used to elaborate on specific details and concerns regarding data and analytical qualities. (2) We thank the SDT for this opportunity to comments on these standards.	
Response. Thank you for your comments. Recent revisions to TOP and IRO standards have resulted in significant changes to these families of standards. The SDT determined when Project 2009-02 was resumed in 2015 that a straightforward approach to address the project objectives would be through the development of new standards.	

End of Report

Standard Development Timeline

The drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the third posting of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 15, 2015
SAR posted for comment	July 16 - August 17, 2015
45-day formal comment period with initial ballot	September 24 - November 9, 2015
45-day formal comment period with additional ballot	December 9, 2015 - January 26, 2016

Anticipated Actions	Date
10-day final ballot	February 2016
NERC Board (Board) adoption	May 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **IRO-018-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Reliability Coordinator (RC) uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform Real-time monitoring and Real-time Assessments appear in other Reliability Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the RC shall include actions to address Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process used to resolve data conflicts required by IRO-010-2 Requirement R3 Part 3.2 provided that this process addresses Real-time data quality issues.

The revision in Part 1.3 to address Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator or supporting logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel. Operating personnel includes System Operators and staff responsible for supporting Real-time operations.

R2. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

2.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

2.3. Actions to address analysis quality issues affecting its Real-time Assessments.

M2. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R2. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R3. Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. Each Reliability Coordinator shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R1 and R3 and Measures M1 and M3 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirement R2 and Measure M2 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO Reliability Standards. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring may include the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The RC uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform monitoring and Real-time Assessments appear in other Reliability Standards.

The RC's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed IRO-018-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, which may include:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the RC shall include actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. Requirement R1 Part 1.3 is focused on addressing data point quality issues affecting Real-time Assessments. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R1 Part 1.3.

The RC's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the RC to meet its obligations for performing the Real-time Assessment. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the RC;

- Following processes established for resolving data conflicts as specified in IRO-010-1a, IRO-010-2, or other applicable Reliability Standards;
- Taking corrective actions on the RC's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the RC's Real-time Assessment; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to address data quality issues in an appropriate timeframe.

Requirement R2

Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

Examples of the types of criteria used to evaluate the quality of analysis used in Real-time Assessments may include solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must describe how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R3

Requirement R3 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. An alarm process monitor should be designed and implemented such that a stall of the Real-time monitoring alarm processor does not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

~~This~~ The drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the ~~second~~ third posting of the proposed standard.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **IRO-018-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Reliability Coordinator (RC) uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform Real-time monitoring and Real-time Assessments appear in other Reliability ~~standards~~Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the RC shall include actions to ~~resolve~~address Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process used to resolve data conflicts required by IRO-010-2 Requirement R3 Part 3.2 provided that this process addresses~~resolves~~ Real-time data quality issues.

The revision in Part 1.3 to ~~resolve~~address Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to ~~resolve~~ address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator or supporting logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: Requirement R2 ensures RCs have procedures ~~-~~to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability ~~standards~~Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel. Operating personnel includes System Operators and staff responsible for supporting Real-time operations.

R2. Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

2.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

2.3. Actions to ~~resolve~~address analysis quality issues affecting its Real-time Assessments.

M2. Each Reliability Coordinator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R2. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Reliability Coordinator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R3. Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M3. Each Reliability Coordinator shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show it was compliant for the full-time period since the last audit.

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirements R1 and R3~~–~~ and Measures M1 and M3 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reliability Coordinator shall retain evidence of compliance for Requirement R2 and Measure M2 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1. Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO Reliability ~~standards~~Standards. As used in TOP and IRO Reliability ~~standards~~Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring may include~~s~~ the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The RC uses a set of Real-time data identified in IRO-010-1a Requirement R1 and IRO-010-2 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Requirements to perform monitoring and Real-time Assessments appear in other Reliability ~~standards~~Standards.

The RC's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed IRO-018-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, which may include~~such as~~:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the RC shall include actions to ~~resolve~~address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. Requirement R1 Part 1.3 is focused on addressing data point quality issues affecting Real-time Assessments. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R1 Part 1.3.

The RC's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the RC to meet its obligations for performing the Real-time Assessment. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the RC;
- Following processes established for resolving data conflicts as specified in IRO-010-1a, IRO-010-2, or other applicable Reliability Standards;
- Taking corrective actions on the RC's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the RC's Real-time Assessment; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to ~~resolve~~address data quality issues in an appropriate timeframe.

Requirement R2

Requirement R2 ensures RCs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability ~~standards~~Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

Examples of the type of criteria used to evaluate the quality of analysis used in Real-time Assessments may include~~The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as~~ solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must ~~include provisions for~~describe how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R3

Requirement R3 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. An alarm process monitor should be designed and implemented such that ~~stall~~a stall~~ed~~ of the Real-time monitoring alarm processor ~~must~~ does not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

The drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the third posting of the proposed standard.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **TOP-010-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.
4. **Applicability:**
   4.1. Functional Entities:
   4.1.1. Transmission Operators
   4.1.2. Balancing Authorities
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Transmission Operator (TOP) uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform Real-time monitoring and Real-time Assessments appear in other Reliability Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the TOP shall include actions to address Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process used to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2, provided that this process addresses Real-time data quality issues.

The revision in Part 1.3 to address Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Transmission Operator shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: The Balancing Authority (BA) uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other Reliability Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 of this standard specifies the BA shall include actions to address Real-time data quality issues affecting its analysis functions in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2 provided that this process addresses Real-time data quality issues.

The revision in Part 2.3 to address Real-time data quality issues *when data quality affects its analysis functions* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R2. Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of Real-time data;

2.2. Provisions to indicate the quality of Real-time data to the System Operator; and

2.3. Actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions.

M2. Each Balancing Authority shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Balancing Authority implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel. Operating personnel includes System Operators and staff responsible for supporting Real-time operations.

R3. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

3.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

3.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

3.3. Actions to address analysis quality issues affecting its Real-time Assessments.

M3. Each Transmission Operator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R3. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R3; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R4: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R4. Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. Each Transmission Operator and Balancing Authority shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain evidence of compliance for Requirements R1, R2, and R4, and Measures M1, M2, and M4 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Operator shall retain evidence of compliance for Requirement R3 and Measure M3 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO Reliability Standards. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring may include the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The TOP uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform monitoring and Real-time Assessments appear in other Reliability Standards.

The TOP's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, which may include:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the TOP shall include actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. Requirement R1 Part 1.3 is focused on addressing data point quality issues affecting Real-time Assessments. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R1 Part 1.3.

The TOP's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the TOP to meet its obligations for performing the Real-time Assessment. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the TOP;
- Following processes established for resolving data conflicts as specified in TOP-003-3, or other applicable Reliability Standards;
- Taking corrective actions on the TOP's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the TOP's Real-time Assessment; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to address data quality issues in an appropriate timeframe.

Requirement R2

The BA uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other Reliability Standards.

The BA's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R2 Part 2.1. The criteria supports identification of applicable data quality issues, which may include:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 specifies the BA shall include in its Operating Process or Operating Procedure actions to address Real-time data quality issues when data quality affects its analysis functions. Requirement R2 Part 2.3 is focused on addressing data point quality issues affecting analysis functions. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R2 Part 2.3.

The BA's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the BA to meet its obligations for performing its analysis functions. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the BA;

- Following processes established for resolving data conflicts as specified in TOP-003-3 or other applicable Reliability Standards;
- Taking corrective actions on the BA's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the BA's analysis functions; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the analysis quality so that effective actions can be taken to address data quality issues in an appropriate timeframe.

Requirement R3

Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability Standards. Examples of the types of analysis used in Real-time Assessments may include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

Examples of the types of criteria used to evaluate the quality of analysis used in Real-time Assessments may include solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must describe how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R4

Requirement R4 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. An alarm process monitor should be designed and implemented such that a stall of the Real-time monitoring alarm processor does not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

~~This~~The drafting team maintained this section while developing the standard. It will be removed when the standard becomes effective.

Description of Current Draft

This draft is the ~~second~~ third posting of the proposed standard.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 15, 2015
SAR posted for comment	July 16 - August 17, 2015
45-day formal comment period with initial ballot	September 24 - November 9, 2015
45-day formal comment period with additional ballot	December 9, 2015 - January 26, 2016

Anticipated Actions	Date
~~45-day formal comment period with additional ballot~~	~~December 2015~~[MO1]
10-day final ballot	February 2016
NERC Board (Board) adoption	May 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s): None

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Real-time Reliability Monitoring and Analysis Capabilities**
2. **Number:** **TOP-010-1**
3. **Purpose:** Establish requirements for Real-time monitoring and analysis capabilities to support reliable System operations.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Transmission Operators
     - **4.1.2.** Balancing Authorities
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

Rationale for Requirement R1: The Transmission Operator (TOP) uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform Real-time monitoring and Real-time Assessments appear in other Reliability ~~standards~~Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 of this standard specifies the TOP shall include actions to ~~resolve~~address Real-time data quality issues affecting its Real-time Assessments in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process used to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2, provided that this process ~~resolves~~ addresses Real-time data quality issues.

The revision in Part 1.3 to ~~resolve~~address Real-time data quality issues *when data quality affects Real-time Assessments* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R1. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

1.1. Criteria for evaluating the quality of Real-time data;

1.2. Provisions to indicate the quality of Real-time data to the System Operator; and

1.3. Actions to ~~resolve~~address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments.

M1. Each Transmission Operator shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time monitoring and Real-time Assessments. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R1; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R2: The Balancing Authority (BA) uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other Reliability ~~standards~~Standards.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 of this standard specifies the BA shall include actions to ~~resolve Real~~address Real-time data quality issues affecting its analysis functions in its Operating Process or Operating Procedure. Examples of actions to address Real-time data quality issues are provided in the Guidelines and Technical Basis section. These actions could be the same as the process to resolve data conflicts required by TOP-003-3 Requirement R5 Part 5.2 provided that this process ~~resolves~~ addresses Real-time data quality issues.

The revision in Part 2.3 to ~~resolve~~address Real-time data quality issues *when data quality affects its analysis functions* clarifies the scope of data points that must be covered by the Operating Process or Operating Procedure.

R2. Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating

Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

2.1. Criteria for evaluating the quality of Real-time data;

2.2. Provisions to indicate the quality of Real-time data to the System Operator; and

2.3. Actions to ~~resolve~~address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects its analysis functions.

M2. Each Balancing Authority shall have evidence that it implemented its Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R2; and 2) evidence the Balancing Authority implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R3: Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability ~~standards~~Standards. Examples of the types of analysis used in Real-time Assessments include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

The Operating Process or Operating Procedure must include provisions for how the quality of analysis results used in Real-time Assessment will be shown to operating personnel. Operating personnel includes System Operators and staff responsible for supporting Real-time operations.

R3. Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

3.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments;

3.2. Provisions to indicate the quality of analysis used in its Real-time Assessments; and

3.3. Actions to ~~resolve~~address analysis quality issues affecting its Real-time Assessments.

M3. Each Transmission Operator shall have evidence it implemented its Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments as specified in Requirement R3. This evidence could include, but is not limited to: 1) an Operating Process or Operating Procedure in electronic or hard copy format meeting all provisions of Requirement R3; and 2) evidence the Transmission Operator implemented the Operating Process or Operating Procedure as called for in the Operating Process or Operating Procedure, such as dated operator logs, dated checklists, voice recordings, voice transcripts, or other evidence.

Rationale for Requirement R4: The requirement addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

The requirement in Draft Two of the proposed standard has been revised for clarity by removing the term *independent*. The alarm process monitor must be able to provide notification of failure of the Real-time monitoring alarm processor. This capability could be provided by an application within a Real-time monitoring system or by a separate component used by the System Operator. The alarm process monitor must not fail with a simultaneous failure of the Real-time monitoring alarm processor.

R4. Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

M4. Each Transmission Operator and Balancing Authority shall have evidence of an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. This evidence could include, but is not limited to, operator logs, computer printouts, system specifications, or other evidence.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show~~–~~ it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The applicable entity shall retain evidence of compliance for Requirements R1, R2, and R4, and Measures M1, M2, and M4 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Operator shall retain evidence of compliance for Requirement R3 and Measure M3 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Real-time monitoring, or *monitoring* the Bulk Electric System (BES) in Real-time, is a primary function of Reliability Coordinators (RCs), Transmission Operators (TOPs), and Balancing Authorities (BAs) as required by TOP and IRO Reliability ~~standards~~Standards. As used in TOP and IRO Reliability ~~standards~~Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. Real-time monitoring may include~~s~~ the following activities performed in Real-time:

- Acquisition of operating data;
- Display of operating data as needed for visualization of system conditions;
- Audible or visual alerting when warranted by system conditions; and
- Audible or visual alerting when monitoring and analysis capabilities degrade or become unavailable.

Requirement R1

The TOP uses a set of Real-time data identified in TOP-003-3 Requirement R1 to perform its Real-time monitoring and Real-time Assessments. Functional requirements to perform monitoring and Real-time Assessments appear in other Reliability ~~standards~~Standards.

The TOP's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R1 Part 1.1. The criteria support identification of applicable data quality issues, ~~such as~~which may include:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R1 Part 1.3 specifies the TOP shall include actions to ~~resolve~~address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. Requirement R1 Part 1.3 is focused on addressing data point quality issues affecting Real-time Assessments. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R1 Part 1.3.

The TOP's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the TOP to meet its obligations for performing the Real-time Assessment. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the TOP;
- Following processes established for resolving data conflicts as specified in TOP-003-3, or other applicable Reliability Standards;
- Taking corrective actions on the TOP's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the TOP's Real-time Assessment; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the quality of the Real-time Assessment so that effective actions can be taken to ~~resolve~~address data quality issues in an appropriate timeframe.

Requirement R2

The BA uses a set of Real-time data identified in TOP-003-3 Requirement R2 to perform its analysis functions and Real-time monitoring. Requirements to perform monitoring appear in other Reliability ~~standards~~Standards.

The BA's Operating Process or Operating Procedure must contain criteria for evaluating the quality of Real-time data as specified in proposed TOP-010-1 Requirement R2 Part 2.1. The criteria supports identification of applicable data quality issues, ~~such as~~which may include:

- Data outside of a prescribed data range;
- Analog data not updated within a predetermined time period;
- Data entered manually to override telemetered information; or
- Data otherwise identified as invalid or suspect.

The Operating Process or Operating Procedure must include provisions for indicating the quality of Real-time data to operating personnel. Descriptions of quality indicators such as display color codes, data quality flags, or other such indicators as found in Real-time monitoring specifications could be used.

Requirement R2 Part 2.3 specifies the BA shall include in its Operating Process or Operating Procedure actions to ~~resolve~~address- Real-time data quality issues when data quality affects its analysis functions. Requirement R2 Part 2.3 is focused on addressing data point quality issues affecting analysis functions. Other data quality issues of a lower priority are addressed according to an entity's operating practices and are not covered under Requirement R2 Part 2.3.

The BA's actions to address data quality issues are steps within existing authorities and capabilities that provide awareness and enable the BA to meet its obligations for performing its analysis functions. Examples of actions to address data quality issues include, but are not limited to, the following:

- Notifying entities that provide Real-time data to the BA;

- Following processes established for resolving data conflicts as specified in TOP-003-3 or other applicable Reliability Standards;
- Taking corrective actions on the BA's own data;
- Changing data sources or other inputs so that the data quality issue no longer affects the BA's analysis functions; and
- Inputting data manually and updating as necessary.

The Operating Process or Operating Procedure must clearly identify to operating personnel how to determine the data that affects the analysis quality so that effective actions can be taken to ~~resolve~~address data quality issues in an appropriate timeframe.

Requirement R3

Requirement R3 ensures TOPs have procedures to address issues related to the quality of the analysis results used for Real-time Assessments. Requirements to perform Real-time Assessments appear in other Reliability ~~standards~~Standards. Examples of the types of analysis used in Real-time Assessments may include, as applicable, state estimation, Real-time Contingency analysis, Stability analysis or other studies used for Real-time Assessments.

Examples of the type of criteria used to evaluate the quality of analysis used in Real-time Assessments may include ~~The entity must use appropriate quality criteria based on the analysis capabilities used to perform Real-time Assessments, such as~~ solution tolerances, mismatches with Real-time data, convergences, etc.

The Operating Process or Operating Procedure must ~~include provisions for~~describe how the quality of analysis results used in Real-time Assessment will be shown to operating personnel.

Requirement R4

Requirement R4 addresses recommendation S7 of the Real-time Best Practices Task Force report concerning operator awareness of alarm availability.

An alarm process monitor could be an application within a Real-time monitoring system or it could be a separate system. 'Heartbeat' or 'watchdog' monitors are examples of an alarm process monitor. An alarm process monitor should be designed and implemented such that a stall~~ed~~ of the -Real-time monitoring alarm processor ~~should~~ does not cause a failure of the alarm process monitor.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon NERC Board of Trustees adoption, the text from the rationale text boxes will be moved to this section.

Implementation Plan

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Requested Approvals

- IRO-018-1 - Reliability Coordinator Real-time Reliability Monitoring and Analysis Capabilities
- TOP-010-1 - Real-time Reliability Monitoring and Analysis Capabilities

Requested Retirements

- None

Prerequisite Approval

Rationale: Due to regulatory approval of TOP-003-3, the prerequisite approval from the initial draft Implementation Plan has been satisfied.

- None

Revisions to Defined Terms in the NERC Glossary

None

Applicable Entities

- Reliability Coordinators
- Transmission Operators
- Balancing Authorities

Effective Date

Rationale: The Implementation Plan has been revised and simplified such that all requirements become effective 18 months following regulatory approval. The implementation period provides entities time to implement Operating Processes or Operating Procedures and enhance functions of their Real-time monitoring systems, as necessary.

IRO-018-1

- All Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

TOP-010-1

- All Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or

as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

TOP-010-1

- All Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is approved by an applicable governmental authority or

as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, all Requirements shall become effective on the first day of the first calendar quarter that is 18 months after the date that this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Order No. 693 Citation	Directive/Guidance	Resolution
P 905-906	Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.	Proposed IRO-018-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the Reliability Coordinator's (RC) monitoring and analysis capabilities. The monitoring and analysis capabilities required by proposed IRO-018-1 and other IRO standards discussed below ensure RCs have the capabilities to maintain Real-time situational awareness. **Monitoring Capabilities** Requirement R1 addresses the quality of the Real-time data needed by the RC to perform its monitoring and Real-time Assessments. Each RC is required to implement a documented procedure for addressing Real-time data quality issues. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to address Real-time data quality issues when data quality affects Real-time Assessments. Requirement R3 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring RCs to use an alarm process monitor. Requirements for the RC to perform Real-time monitoring are specified in IRO-002-2, IRO-002-4, and IRO-003-2. ***Proposed IRO-018-1*** **R1.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating the quality of Real-time data; **1.2.** Provisions to indicate the quality of Real-time data to the System Operator; and **1.3.** Actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. **R3.** Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***IRO-002-2*** **R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. ***IRO-003-2*** **R1.** Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or

Order No. 693 Citation	Directive/Guidance	Resolution
		unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area. ***IRO-002-4*** **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. **<u>Analysis Capabilities</u>** Requirement R2 addresses the quality of the analysis used by the RC to perform its Real-time Assessments. Each RC is required to implement a documented procedure to address the quality of the analysis used in its Real-time Assessments. The procedure must include criteria for evaluating the quality of analysis used in Real-time Assessments, provisions for indicating the quality of analysis, and actions to address analysis quality issues affecting its Real-time Assessments. Requirements for the RC to perform Real-time Assessments are specified in IRO-008-1 and IRO-008-2. ***Proposed IRO-018-1*** **R2.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include:

Order No. 693 Citation	Directive/Guidance	Resolution
		2.1. Criteria for evaluating the quality of analysis used in its Real-time Assessments; **2.2** Provisions to indicate the quality of analysis used in its Real-time Assessments; and **2.3.** Actions to address analysis quality issues affecting its Real-time Assessments. ***IRO-008-1*** **R2.** Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. ***Definition of Real-time Assessment*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***IRO-008-2*** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Order No. 693 Citation	Directive/Guidance	Resolution
P 1660	We adopt our proposal to require the ERO to develop a modification [to TOP standards] related to the provision of a minimum set of analytical tools. In response to LPPC and others, we note that our intent was not to identify specific sets of tools, but rather the minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System.	Proposed TOP-010-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the monitoring and analysis capabilities used by Transmission Operators (TOPs) and Balancing Authorities (BAs). The monitoring and analysis capabilities required by TOP-010-1 and other TOP standards discussed below ensure TOPs and BAs have the capabilities to maintain Real-time situational awareness. **<u>Monitoring Capabilities</u>** Requirements R1 and R2 address the quality of the Real-time data needed by TOPs and BAs to perform their Real-time monitoring and Real-time analysis. Each TOP and BA is required to implement a documented procedure for addressing Real-time data quality issues. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to address Real-time data quality issues when data quality affects analysis. Requirement R4 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring TOPs and BAs to use an alarm process monitor. Requirements for TOPs to perform Real-time monitoring are specified in TOP-001-3 and TOP-006-2. Requirements for BAs to perform Real-time monitoring are specified in TOP-006-2, TOP-001-3k and BAL standards. ***Proposed TOP-010-1*** **R1.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating the quality of Real-time data; **1.2.** Provisions to indicate the quality of Real-time data to the System Operator; and **1.3.** Actions to address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. **R2.** Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring. The Operating Process or Operating Procedure shall include: **2.1** Criteria for evaluating the quality of Real-time data; **2.2** Provisions to indicate the quality of Real-time data to the System Operator; and **2.3** Actions to coordinate resolution of Real-time data quality discrepancies with the entity(ies) responsible for providing the data. **R4.** Each Transmission Operator and Balancing Authority shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***TOP-006-2*** **R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.

Order No. 693 Citation	Directive/Guidance	Resolution
		1.1. - Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use. **1.2.** - Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. ***TOP-001-3*** **R10.** Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: **10.1.** Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and **10.2.** Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems. **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. **Analysis Capabilities** Requirement R3 addresses the quality of the analysis used by the TOP to perform its Real-time Assessments. Each TOP is required to implement a documented procedure to address the quality of the analysis used in its Real-time Assessments. The procedure must include criteria for evaluating the quality of

Order No. 693 Citation	Directive/Guidance	Resolution
		analysis used in Real-time Assessments, provisions for indicating the quality of analysis, and actions to address analysis quality issues affecting its Real-time Assessments. Requirements for the TOP to perform Real-time Assessments are specified in TOP-003-3. ***Proposed TOP-010-1*** **R3.** Each Transmission Operator shall implement an Operating Process or Operating Procedure to address the quality of analysis used in its Real-time Assessments. The Operating Process or Operating Procedure shall include: **3.1.** Criteria for evaluating the quality of any analysis used in its Real-time Assessments; **3.2.** Provisions to indicate the quality of analysis used in its Real-time Assessments; and **3.3.** Actions to address analysis quality issues affecting its Real-time Assessments. ***Definition of Real-time Assessment*** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) ***TOP-001-3*** **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.

Order No. 693 Citation	Directive/Guidance	Resolution
P 1875	...[w]e direct the ERO, through its Reliability Standards development process, to modify Reliability Standard VAR-001-1 to include requirements to perform voltage stability analysis periodically, using online techniques where commercially-available, and offline simulation tools where online tools are not available, to assist real-time operations.	The directive was considered in developing the scope of Project 2009-02. NERC believes TOP, IRO, and VAR standards address the directive as discussed below. Accordingly, additional requirements were not developed in Project 2009-02. RCs and TOPs are required to periodically perform Real-time Assessments consisting of an evaluation of system conditions "to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions." Entities must use whatever analysis is necessary to obtain an evaluation of system conditions, which may include real-time voltage stability analysis. Real-time Assessments assist operators in maintaining operations within established SOLs and IROLs, to include voltage stability criteria. Requirements for performing Real-time Assessments are contained in IRO-008-1, IRO-008-2, and TOP-001-3 Reliability Standards as discussed above. VAR-001-1 was revised in Project 2013-04. The resulting standard, VAR-001-4, did not include an explicit requirement for periodic performance of voltage stability analysis because "such analysis would be performed pursuant to the SOL methodology developed under FAC standards."[1] VAR-001-4 requirement R1 specifies the TOP must establish a system voltage schedule as part of its plan to operate within SOLs and IROLs. ***VAR-001-4*** **R1.** Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate

[1] Reliability Standard VAR-001-4.1, Guidelines and Technical Basis section, page 13. Available at: http://www.nerc.com/pa/Stand/Reliability%20Standards/VAR-001-4.1.pdf

Order No. 693 Citation	Directive/Guidance	Resolution
		within System Operating Limits and Interconnection Reliability Operating Limits. **1.1.** Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

Order No. 693 Citation	Directive/Guidance	Resolution
P 905-906	Further, consistent with the NOPR, the Commission directs the ERO to modify IRO-002-1 to require a minimum set of tools that must be made available to the reliability coordinator. We believe this requirement will ensure that a reliability coordinator has the tools it needs to perform its functions. [t]he Commission clarifies that the Commission's intent is to have the ERO develop a requirement that identifies capabilities, not actual tools or products. The Commission agrees that the latter approach is not appropriate as a particular product could become obsolete and technology improves over time.	Proposed IRO-018-1 addresses issues identified by the NERC Operating Committee's Real-time Tools Best Practices Task Force (RTBPTF) related to the availability and quality of the Reliability Coordinator's (RC) monitoring and analysis capabilities. The monitoring and analysis capabilities required by proposed IRO-018-1 and other IRO standards discussed below ensure RCs have the capabilities to maintain Real-time situational awareness. **<u>Monitoring Capabilities</u>** Requirement R1 addresses the quality of the Real-time data needed by the RC to perform its monitoring and Real-time Assessments. Each RC is required to implement a documented procedure for addressing Real-time data quality issues. The procedure must include criteria for evaluating Real-time data quality, provisions for indicating data quality to the System Operator, and actions to ~~resolve~~address Real-time data quality issues when data quality affects Real-time Assessments. Requirement R3 addresses capabilities for operator awareness of failures in Real-time monitoring alarm processes by requiring RCs to use an alarm process monitor. Requirements for the RC to perform Real-time monitoring are specified in IRO-002-2, IRO-002-4, and IRO-003-2. ***Proposed IRO-018-1*** **R1.** Each Reliability Coordinator shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its Real-time

Order No. 693 Citation	Directive/Guidance	Resolution
		monitoring and Real-time Assessments. The Operating Process or Operating Procedure shall include: **1.1.** Criteria for evaluating the quality of Real-time data; **1.2.** Provisions to indicate the quality of Real-time data to the System Operator; and **1.3.** Actions to ~~resolve~~address Real-time data quality issues with the entity(ies) responsible for providing the data when data quality affects Real-time Assessments. **R3.** Each Reliability Coordinator shall have an alarm process monitor that provides notification(s) to its System Operators when a failure of its Real-time monitoring alarm processor has occurred. ***IRO-002-2*** **R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. ***IRO-003-2*** **R1.** Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or

		within System Operating Limits and Interconnection Reliability Operating Limits. **1.1.** Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

Standards Announcement

2009-02 Real-time Reliability Monitoring and Analysis Capabilities IRO-018-1 and TOP-010-1

Final Ballots Open through February 26, 2016

Now Available * UPDATED

Final ballots for **IRO-018-1 - Reliability Coordinator Real-time Monitoring and Analysis Capabilities** and **TOP-010-1 - Real-time Reliability Monitoring and Analysis Capabilities** are open through **8 p.m. Eastern, Friday, February 26, 2016**.

Balloting

In the final ballots, votes are counted by exception. Only members of the ballot pools may cast a vote. All ballot pool members may change their previously cast votes. A ballot pool member who failed to vote during the previous ballot period may vote in the final ballot period. If a ballot pool member does not participate in the final ballot, the member's vote from the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pools associated with this project may log in and submit their votes for the standards here. If you experience any difficulties in using the Standards Balloting & Commenting System (SBS), contact Nasheema Santos.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error message, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The voting results for the standards will be posted and announced after the ballots close. If approved, the standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Mark Olson (via email), or at (404) 446-9760.

Standard Drafting Team Roster

Project 2009-02 Real-time Monitoring and Analysis Capabilities

	Participant	Entity
Chair	Saad Malik	Peak Reliability
Vice Chair	Andrew Pankratz	Florida Power & Light
Members	Charles Abell	Ameren
	Scott Aclin	Southwest Power Pool
	Phil Hart	AECI
	T.J. (Tim) Kucey	PSEG Fossil, LLC
	Alan Martin	Southern Company Transmission
	Bert Peters	Arizona Public Service
	Sarma Nuthalapati	Electric Reliability Council of Texas
	Jim Useldinger	Kansas City Power and Light
NERC Staff	Mark Olson – Senior Standards Developer	North American Electric Reliability Corporation
	Lauren Perotti – NERC Legal	North American Electric Reliability Corporation
