scale wind farms) need to be included in PRC-027 the standard should address that specifically. The most that could reasonably be asked of independent GOs under R1 is to have a valid interconnection service agreement (ISA), since a coordination study is performend by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so a detailed level of evidence could not be asked of the GO.
No
The term Functional Entity needs a definition. It is capitalized in PRC-027 but is not defined in the standard or in the NERC Glossary. It is nonetheless evident that a GO and TO are different Fnctional Entities, but the nature of the Element that joins them and thereby constitutes the Interconnected Element is unclear. Is this the transmission line? If so, would the TO be responsible for the R1 study if the ownership scope of an independent GO ends at the high-side terminals of the GSU or at an HV disconnect switch? Would the responsibility be shared if, as sometimes happens, the ownership split occurs at the fenceline, leaving a small part of the transmission line the property of the GO while the rest belongs to the TO? The definition of a Protection System Study needs to include identification of the party responsible for performing this work. This cannot be the GO if dealing with a deregulated market; since, as explained above, such parties are not allowed access to information about the TO's system.
No
The time frame is not the issue. R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.

We do not feel like 48 months is a reasonable timeframe to meet the minimum requirements for Protection System Studies (PSS). In the current form of the standard, for an existing PSS to be valid, several minimum requirements are given in R1.2. While this is a good requirement for new PSS, it eliminates almost all of our existing PSS as being valid. We have the stance that many of our existing PSS are of a high quality and should be considered valid, but do not meet the minimum requirements from R1.2. We recommend allowing existing PSS to be submitted in their current form between all protection system owners of an Interconnected Element within a reasonable time frame of the standard effective date and allowing the owners to approve the existing PSS as valid if they desire. Then, that existing PSS could be used as the baseline PSS until the 10% change in fault occurs from the existing dated PSS. At that time, a new PSS should be performed to meet the minimum requirements as outlined in R1.2.

No
The purpose of this study should be “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the proper sequence.” The least number of Elements to clear a Fault may not always be the case for some Protection Systems. The TO and TOP are provided with detailed information of the GO’s equipment and therefore perform all interconnection-related studies. Independent generators do not modify Protection Systems in response to changes to the Fault current at an interconnecting bus, generators just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Equipment involving sequencing the tripping of multiple Elements is in the TO’s system. The best approach would be to restrict the applicability of PRC-027 in its entirety exclusively to TOs, with GO obligations remaining as per PRC-001, i.e., reporting changes and addressing any issues raised by the TOP. If GOs that own substations, distribution systems and numerous miles of transmission conductors (e.g. large-scale wind farms) need to be included in PRC-027 the standard should specifically address those GOs, rather than pulling in all GOs. The most that could reasonably be asked of independent GOs under R1 is to have a valid interconnection service agreement (ISA), since a coordination study is performed by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so a detailed level of evidence could not be asked of the GO.
No
As per this version, the standard’s protection study requirement seems excessive. The

definition of a Protection System Study needs to include identification of the party responsible for performing this work, which should be the TO for the reasons discussed above.
No
Sixty months would be more appropriate to study all the interconnections. There has not been a major problem with mis-coordination of Protection Systems associated with Interconnected Elements. Also, the standard does not fully address what all should be included in a Protection System Study. R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.
Yes
There is no clear responsibility in the standard if both parties cannot confirm acceptance.
Yes
Individual
Clay Young
SCE&G
No
SCE&G disagrees with the definition of “Interconnected Element”. More clarity is needed regarding the language “Functional Entities that are part of the same Registered Entity”. Entities that are vertically integrated and more specifically those vertically integrated companies that that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves.
Individual
Daniela Hammons
CenterPoint Energy
No
CenterPoint Energy believes the purpose should use wording similar to that being proposed for the definition of “Protection System Study” instead of developing and utilizing different wording for the purpose statement. CenterPoint Energy recommends the purpose be stated as follows: “To coordinate Protection Systems for Interconnected Elements, such that Protection Systems operate as desired for clearing postulated short circuit Fault events.”
No

CenterPoint Energy recommends the term “Protection System Study “ be defined as follows: “A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing postulated short circuit Fault events.”
No
(a) CenterPoint Energy continues to believe a requirement to have a documented Protection System Study for each existing Interconnected Facility is overly burdensome, unless certain – if not all – existing Interconnected Facilities are exempted; therefore, CenterPoint Energy recommends R1.1.1 be eliminated from PRC-027-1. CenterPoint Energy does not believe a reliability need has been identified to justify that such prescriptive requirements are needed to provide for an adequate level of reliability. The following is stated on page 18 of 28 in PRC-027-1 Draft 2: “records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” The majority of existing Interconnected Facilities have fault-proven, time-proven protection system set points. An existing Interconnected Facility without a documented Protection System Study will eventually be included in a study with system additions and changes, short circuit current increases, and relay panel replacement projects, as well as any analysis of misoperations. (b) While an option has been included in Draft 2 R1.1.3 to allow for a technical justification why a study is not required for certain changes, CenterPoint Energy believes that reasonable thresholds should be established for the changes identified in R3.1. For example, R3.1 requires that “any” change of sequence or mutual coupling impedance must be provided to a Generator Owner. For insignificant changes of sequence or mutual coupling impedance, CenterPoint Energy believes there would be little, if any, reliability benefit of communicating and technically justifying why a study is not required.
No
Providing schedule information and project details by a transmission service provider to a generation entity may be governed by established, regional market rules that provide for what information can be shared with competitive entities. There are many installations in the ERCOT System where the owner of the interconnecting switchyard is not the same entity as the owner of the interconnected generation facility.
Individual

Georgia Transmission Corporation
Yes
Based on the SDT response to our Draft 1 comment regarding the use of ‘coordination’, we understand ‘coordination’ in the Title and Purpose to mean the technical aspect of relay coordination.
Yes
No

Guidelines and Technical Basis Req. R1: "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."... ...These studies may include graphical coordination....; relay scheme simulation studies....; and sensitivity studies using sequence...., and adequate directional polarizing quantities. This activity will be onerous without a full system model and software to perform studies that would check coordination of stacked curves and stepped distance relays. Of particular note is the question of adequate directional polarizing quantities. There should be an expected minimum requirement such as time overcurrent plots and zone distance plots of the existing relay settings for the terminal with the fault points used as the basis. This data would then be used to indicate if the 10% point has been reached that would require a new coordination follow up at the end of the next 24 month fault study.
No
1) The protection criteria and philosophies between entities can differ. For example, one entity may use the practice of coordinating for normal and single worst case contingency conditions, which is included in information/documentation provided to the neighboring entity in such Protection System Studies. The neighboring entity may have a slightly different protection criteria or philosophy, so exceptions may be required on a case by case basis using the “art and science” of protective relaying. Therefore, interpretation of ‘confirming acceptance’ means there may be differences in protection elements used by each entity but that there were no major disagreements and that generally the methods were acceptable and included using industry protection practices. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually agreed upon response time, can be considered as confirmation of acceptance.
Yes
Other comments are being provided which could not be addressed in question 1 - 5 listed above: 1). R2 requires short circuit study every 24 months even though the SDT’s own rationale is that other requirements will trigger Protection System Studies first. Thus R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. 2). Please replace “detect Faults on the BES Transmission System” with “protect the BES Transmission System” in all three places it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 3). VSL escalation in 10 days is not representative of the severity of the violation. The SDT correctly points out in R1 rationale that it “has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements.” Many entities have numerous Interconnected Elements, and recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity’s Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels,

respectively. Specifically, Lower would apply to up to 5% so that even a single Interconnected Element would be a violation. 4). Throughout the 1st and 2nd draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.1.1, R2.1.2, R2-2.2, R4-4.1, R4-4.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. We appreciate the Drafting Teams perspective, but the SERC PCS believes that such cross references are confusing. 5). Under R1 – MI measure wording does not read as a completed statement. Suggest removing 'that' from the first sentence. 6) The process chart is a direct indication that this process and undertaking for entities will be overwhelming. New systems will be required to track many details of timeframe requirements and communication dates. Additional resources will be required placing increased workload for an effort to change the process that already works for us when working with other entities. The Drafting Team indicated, 'there is no evidence there is widespread miscoordination of protection systems.'

The Purpose statement could be improved by striking the phrase "least number of power system Elements are isolated to clear Faults", and inserting the following phrase from the definition of Protection System Study: "Protection Systems operate in the desired sequence for clearing Faults". Some entities may choose to "over-trip" for certain Faults.
Yes
The SDT should consider putting the definition of Interconnected Element in the NERC Glossary.
Yes
Yes
Yes
Additional comment: R2.1.1 refers to "maximum available Fault current values", but it's unclear from the requirement or the Guidelines and Technical Basis how "maximum" is defined. We believe it should be maximum generation and all Facilities in service.

Group

Thomas McElhinney
No
Seems like Interconnect element is too broad and not enough clarity on what a protective system study requires (Ie, is this a setting coordination study? Redundancy studies? Dynamic studies? Duplication of TPL requirements.
Yes
There is no place to put in a comment for R2 so this is for R2. We believe that the requirement to perform an analysis should be changed from once every 24 months to once every 36 months. Whenever changes are done to the system an analysis is done so this for areas that have not changed and we believe that once every 3 years should be sufficient.
Yes
Yes

No
The reliability objective of this standard should be to insure that there is an agreement between two interconnected entities of relay protection schemes and relay protection settings for the interconnected facilities. This is achieved if there is documentation stating that the Interconnected operating companies have reached agreement on protection schemes and protective relay settings. This standard should only require documentation that neighboring owners are talking and agreeing with one another in relation to protection and control. The purpose in the draft standard makes it appear that you are in violation of this standard any time the system has a misoperation because of relay setting regardless of whether both parties have agreed on the settings used, but the measures tend to measure agreement with the other entity. PRC-004 is the standard for misoperation reporting and misoperation mitigation.
No
At our company there is one engineering group doing Protection System Studies for all Functional Entities and for multiple Registered Entities. Reliability is not enhanced by requiring a single engineering group to document and be audited for coordination with itself. An Interconnected Element should be defined as an element that electrically joins facilities that are controlled by separate operating companies and Protection Studies are done by separate engineering groups.

No
Proposed Requirement R1 allows 48 months to do an initial study with the explanation that there is no evidence of widespread miscoordination. We agree that there is no evidence of widespread miscoordination and therefore 60 months is the proper time frame for an initial study. We have also noticed that there is no question on this comment form for any other comments not addressed by the drafting teams questions. As such we note here that Requirement R1, 1.1.2 lists a 10% change in current as an action point. This implies that a 10% decrease requires action. We do not agree with this since most Protection Studies are done with all generation on. Most of the year all generation is not on with the result that normal operating conditions result in fault currents that are 10% below the maximum used in the Protection System Study. We also disagree with action required for a 10% increase in fault current since our standard relay settings no longer trip for instantaneous ground over current elements and the standard does not allow an entity to state a reason not to run this study or perform the calculations. When we did utilize instantaneous ground over current elements we allowed a 40% margin. We utilize other high speed protection elements not directly affected by changes in fault current. We recommend at least a 20% change in fault current to require action per this standard. Requirement R2 requires that a short circuit study be done every 24 months. As noted above 60 months is proper time for initial study and is also proper for subsequent studies done after the initial study is complete.

Western Electricity Coordinating Council
Steve Rueckert
We agree that unnecessary power system Elements should not be isolated to clear Faults, but question the statement that the “least number of power system Elements should be isolated.” Reliability should be the goal. There may be situation where different isolation schemes both work, but perhaps one that isolates one or two more elements is more reliable.
Yes
We agree with the definitions, but question the appropriateness of development of terms for a specific standard. Individual Regions are strongly discouraged from defining terms that only apply in a single region. We see the development of a term that is only applicable to a single standard to be a similar situation, leading to a proliferation of terms. If this approach is acceptable to NERC and FERC, we have no concerns.
No
Creating a Protection System consists of conducting Protection System studies and incorporating the data into an entity’s transmission/generation/distribution system. Protection System studies are not a new concept to entities. In the event that an entity discovers that

certain interconnected elements are not included in the Protection System study the entity should not require 48 months to make the needed changes to the study. From a reliability perspective, entities should already have a basic Protection System study in order to have a Protection System. Allowing an additional 48 months creates a potentially large 4 year reliability gap based on entities existing studies and any needed corrections. From a compliance perspective, allowing a 48 month time frame for entities to have a documented Protection System study effectively pushes mandatory compliance for this standard out for an additional four years beyond the effective date. This time frame is excessive and should be reduced to no more than 24 months from the effective date of the standard.
Yes
Yes
Individual
Angela P Gaines
Portland General Electric Co
No
Portland General Electric Company appreciates the drafting team's consideration of comments. Since there wasn't a general comment section at the end of this form, the discussion of timeframes seems appropriate here. The effective date (the first quarter six months after approval) does not allow sufficient time for compliance. This standard will require that entities include in all interconnection agreements a detailed protection coordination schedule or be subject to the long timelines detailed in the standard. None of the agreements (if they even exist) for projects six months out include a protection coordination schedule, nor do their project schedules accommodate the long durations detailed in the standard. Agreements will also need to be drawn up for smaller projects in order to document a protection coordination schedule, lest the interconnecting utility prevents us from energizing by taking the full 90 days to review the relay settings. In addition, entities may need at least one additional resource to conduct the bi-annual coordination studies and manage the interconnection due dates. PGE suggests an implementation period of 24 months since planning is done more than a year in advance.
Individual

Xcel Energy

Yes
Yes
Yes
No
Requirement 4.2 requires entities to receive evidence confirming acceptance of changes prior to implementing these changes. This coordination already occurs, and we believe this should be a standard practice for all applicable entities. However, we do not agree that this documentation-only requirement is necessary or beneficial to reliability. Instead, we believe this would deter valuable resources to unnecessary compliance evidence activities. Therefore, we recommend that this requirement be eliminated.
No
Since the SDT did not provide a question for “any other comments”, Xcel is using this question for that purpose. 1) We would appreciate some additional clarity as to what transmission fault conditions need to be evaluated by the Generator Owner. Figure 2 does not apply to very many of our units (on most, Breaker A would not exist and Breaker C is part of a breaker-and-a-half scheme). Is the generator supposed to evaluate only faults on the line between the GSU Transformer and the substation or evaluate his protection settings for a fault on any of the transmission lines leaving the substation? Can the drafting team, either as part of the Application Guideline or in a separate document provide a list of protective functions the Generator Owner needs to evaluate or is it the complete suite of protective functions defined in the NERC SPCS Generator – Transmission Protection Coordination Guideline? 2) Requirement 3.1 is onerous as it requires notification for an open ended “when the proposed change modifies the conditions used in the coordination of Protection Systems.” The requirement should be limited and instead provide a simple list of element changes that generally affect coordination with adjacent Elements. 3) Similarly for 3.3, we recommend that this be modified to limit the scope to only changes that result in a change of performance or ratings. For example, settings that change the alarm conditions for a device or a “like-for-like” replacement should not be required to be communicated. Communicating every change would not improve reliability and would instead deter valuable resources to unnecessary compliance evidence activities.

For large entities with hundreds of generators, a longer initial time frame is needed. In addition, consideration should be given to the fact that existing transmission protection and control engineering personnel will be fully engaged in the work associated with FERC order 754 for The next 12+ months.
No
The parties at the opposite ends of an interconnecting facility may not have the same

protection philosophies, and acceptance may not be achievable. It is unclear what it means to confirm acceptance. Does this mean that the two must come to an agreement for each other's protection system settings, or is it acceptable to agree that we disagree?
Yes
We believe that the proposed standard is too prescriptive regarding the specific duties and multiple time frames of each of the parties TO,GO, and DP. Including time frames for each Interconnect Element with regard to effective dates (6 mo), initial studies (48 mo), studies triggered by change of equipment or change of fault current (6mo), TO/GO/DP agreed upon schedules (variable), delivery of studies (90 days) , short circuit studies (24 mo), notification to others of fault current changes (30 days), change detail notification (30 days), and review of summary results (90 days) is unnecessary and unduly burdensome. The process flow chart provided on page 22 of the draft standard is evidence of the complexity of the proposition. Please seriously consider the following simplified three-requirement approach which will similarly accomplish the desired outcome of coordination of the Protection System for Interconnected Elements. R1). Require the two parties of the Interconnecting Element to jointly develop a Protection System Study- initially with X months to complete. R2). Require a review/update of the protection system study for proper coordination anytime a change to the system may upset coordination. R3). Require a review/update of the protection system study for proper coordination every X years. The corresponding measures for each proposed requirement could be... M1: has a protection system study been performed by the initial required date? M2: has a protection system study been reviewed/updated for system changes which impact the coordination? M3: has the protection system study been reviewed/updated every X years? During an audit period these requirements and measures will drive entities to establish and maintain protection system studies. This approach keeps the focus on the protection system study rather than the multiple actions with varying time frame restrictions. We believe that these changes will result in an equally effective driver to establish coordination while keeping the standard as succinct as possible.

Additional Comments:

ATCO Electric (AE) – Requirement R1.1.2 – A 10% change in fault current isn’t much in some areas of AE’s system, perhaps as little as a few hundred amps. This could lead to a burdensome requirement to frequently review the same areas of our system. Ten percent seems fairly restrictive when we typically use safety margins of 40% to 50% in selecting instantaneous overcurrent settings

Southern Company – In general, for protection on the transmission line leaving the plant, the generator owner should be responsible only for coordinating with the first set of line relaying encountered when proceding across the interconnecting element. He should not be responsible for coordinating with relaying at the opposite end of the interconnecting element. For example, in Figure 5 on Page 28 of the draft standard, Generator Owner T should not have to worry about a review of the relaying located at breakers G, F, or E. Another example is Figure 2, Page 25 of the draft standard: Generator Owner R should not be responsible for reviewing the relaying at the breaker C.

We believe that the proposed standard is too prescriptive regarding the specific duties and multiple time frames of each of the parties TO, DP, and GO. Including time frames for each Interconnect Element with regard to effective dates (6 mo), initial studies (48 mo.), studies triggered by change of equipment or change of fault current (6 mo.), TO/GO/DP agreed upon schedules (variable), delivery of studies (90 days), short circuit studies (24 mo.), notification to others of fault current changes (30 days), change detail notification (30 days), and review of summary results (90 days) is unnecessary and unduly burdensome. The process flow chart provided on page 22 of the draft standard is evidence of the complexity of the proposition. Please seriously consider the following simplified three-requirement approach which will similarly accomplish the desired outcome of coordination of the Protection System for Interconnected Elements.

R1) Require the two parties of the Interconnecting Element to jointly develop a Protection System Study - initially with X months to complete.

R2) Require a review / update of the protection system study for proper coordination anytime a change to the system may upset the coordination.

R3) Require a review / update of the protection system study for proper coordination every X years.

The measures for each requirement should simply be M1: has a protection system study been performed by the initial required date?; M2: has a protection system study been reviewed / updated for system changes which impact the coordination?; M3: has the protection system study been reviewed / updated every X years? During an audit period, these requirement and measures will drive entities to establish and maintain protection system studies. This approach keeps the focus on the protection system study rather than the multiple actions with varying time frame restrictions. We believe that these changes will results in an equally effective driver to establish coordination while keeping the standard as succinct as possible.

Consideration of Comments
Project 2007-06 System Protection Coordination

The System Protection Coordination Drafting Team thanks all commenters who submitted comments on draft 2 of PRC-027-1**.** The standard was posted for a 30-day public comment period from November 16, 2012 through December 17, 2012. Stakeholders were asked to provide feedback on the standard through a special electronic comment form. There were 82 sets of comments, including comments from approximately 220 different people from approximately 157 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received

Effective Dates

Based on discussion within the drafting team, the effective date was changed from "…the first day of the first calendar quarter that is six months beyond…" to "…the first day of the first calendar quarter that is 12 months beyond…" since there could be a significant number of Interconnected Elements requiring analysis due to the new requirements.

Definitions

Interconnected Element:

Based on comments related to the use of the term "Functional Entities" and the inclusion of the phrase "a Registered Entity that represents multiple functional entities", the drafting team revised the definition as follows:

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Interconnected Element: A BES Element that electrically joins facilities owned by:

a) separate Registered Entities, or

b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Protection System Coordination Study

Based on the conflict of the abbreviation of a “Protection System Study” vs. a “Power System Study”, the drafting team revised the term to “Protection System Coordination Study”.

Purpose

Many commenters stated that the Purpose should not include the phrase “such that the least number of power system Elements are isolated to clear Faults” or had other suggestions to improve the Purpose. The drafting team changed the Purpose to: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.

Applicability:

PRC-027-1

To add clarity, the drafting team added the following sentence to the 4.2 Facilities: For the purpose of the requirements contained herein, the following Protection Systems owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.

PRC-001-3

The Applicability section was updated to clarify which Protection Systems are applicable to Requirement R1. (The ‘Facilities’ portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)

Background

General updates to reflect recent activities associated with PRC-001 and the statuses of other ongoing projects.

Requirements

The time frame for Requirement R1, Part 1.1.1 was increased to 60 calendar months to allow entities with large numbers of Interconnected Elements enough time to complete the Protection System Coordination Studies.

The drafting team modified the timeframe in Requirement R1, Part 1.1.2 to "…12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2…" due to the fact that with the new requirements, the possibility exists there could be a significant number of Protection System Coordination Studies required.

The drafting team modified Requirement R1, Part 1.1.3 to add a six month timeframe for the notification related to Requirement R3, Part 3.3. It now reads: "According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a study is not required."

The drafting team modified Requirement R1, Part 1.2 for clarity.

Based on comments and drafting team discussions, Requirement R2 was revised to allow a technical justification demonstrating why Fault current does not affect the Protection System coordination, and the timeframe was revised from once every 24 months to once every 60 calendar months.

Based on comments, the equation in Requirement R2, Part 2.2 was restated - "% deviation" was replaced with "% change".

The drafting team modified Requirement R2, Part 2.2.1 for clarity.

The drafting team made minor edits to Requirement R3, Part 3.1 to provide clarity.

To clarify what was expected as a response, the drafting team modified Requirement R4, Part 4.1 as follows: Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Coordination Study (per Requirement R1, Part 1.2) and respond to the other owner(s): Accepting the results, or Rejecting the results, and suggesting modifications to resolve any identified coordination issues.

To clarify what was expected by the phrase 'confirming acceptance' used in the previous draft, the drafting team changed Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues. The drafting team explained in the responses that "accepting results" only indicates that the entity has not identified any potential coordination issues with the proposed Protection System change, not necessarily that they agree with the other entities philosophy.

Measures:
PRC-027-1

A new Measure M3 was added to account for the option of providing a technical justification for not performing a short circuit study. The other measures were renumbered and/or modified to be consistent with the revised requirements.

PRC-001-3

A new Measure M1 was added. The Measure reads as follows: For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel.

Evidence Retention

The drafting team modified the language for consistency.

VSLs

The drafting team modified the VSLs for clarity and consistency with the revised requirements.

Guidelines and Technical Basis

Complementary changes were made to the Guidelines and Technical Basis corresponding to all changes to the standard.

The drafting team updated the process flow chart to align with the revised requirements, as well as updated the Example Process.

In the introductory section for the Diagrams, the drafting team revised the language and added notes to provide clarity.

The Figures were modified to identify the Interconnected Elements, and slightly modified Figure 5 for clarity.

The drafting team revised the description relating to Figure 3 in the “Guidelines and Technical Basis” to clarify that only the Distribution Provider’s Protection Systems installed for the purpose of detecting Faults on BES Elements are a part of the Applicability of this standard.

Unresolved Minority Views
PRC-027-1

- A few commenters disagreed with the 10% deviation trigger. The drafting team recognizes there are variations of margins used throughout the industry; however, believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.

- Several commenters expressed a desire to see the standard drafting team develop and include a conflict resolution process for situations where mutual agreement cannot be reached. The drafting team responded with the following: The drafting team believes that any conflict resolution should be handled through normal business practices.

- A couple of comments indicated that Transmission Owners could not share knowledge of its system with Generator Owners and, as such, Generator Owners should not be included in the Applicability. The drafting team disagreed that Transmission information could not be shared with Generator Owners and that there is a reliability benefit in requiring each entity to ensure proper coordination exists.

- A few commenters requested that the initial study in Requirements R1 part 1.1.1 be moved to the implementation plan. The drafting team investigated this as an option but did not make this change. The drafting team stated that it believes the current structure of Requirement R1, Part 1.1.1., as currently written, achieves this same goal.

- A few commenters believed Requirement R4, Part 4.2 was unnecessary and should be eliminated. The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.

PRC-001-3

- Several commenters asked about revisions to PRC-001. The drafting team noted several things related to this:

    - The drafting team did not modify the purpose.

    - The Applicability section was updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)

    - The drafting team did add Measure M1, which reads: "For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel."

    - The drafting team recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.

Index to Questions, Comments, and Responses

1. Based on stakeholder comments, the drafting team modified the Purpose of this standard to "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults." Do you agree with his Purpose? If not, please provide specific suggestions for change in the comment area. 20
2. The drafting team is proposing two definitions for use only with PRC-027-1 as follows: Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults. Do you agree with these definitions, if not please provide specific suggestions for change in the comment area. 44
3. In Requirement R1, the drafting team modified the time frame to allow entities 48 months to have a documented Protection System Study completed for each Interconnected Element if no Protection System Study exists. Note, the drafting team has allowed inclusion of all previously performed Protection System Studies whose summary of results include, at a minimum, the protective relay settings reviewed, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area. 67
4. In Requirement R4, the drafting team replaced the need to 'reach agreement' with 'confirming acceptance.' Do you agree with this change? If not, please provide specific suggestions for change in the comment area. 68
5. The requirements and associated measures were modified to indicate that information was 'provided' instead of 'demonstrating that each affected entity received notification.' Do you agree with this change? If not, please provide specific suggestions for change in the comment area... 116

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

New York Power Authority	NPCC
California Independent System Operator	The California ISO is in support of, and has signed on with, the comments submitted by the Standards Review Committee (SRC) (ISO/RTO Council).
MISO	MISO supports the comments submitted by the Standards Review Committee (SRC).
JDRJC Associates	Midwest ISO
Georgia System Operations Corporaton	Georgia Transmission Corporation
Brazos Electric Power Cooperative, Inc.	ACES Power Marketing

1. **Based on stakeholder comments, the drafting team modified the Purpose of this standard to "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults." Do you agree with this Purpose? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration:

Many commenters stated that the purpose should not include the phrase "such that the least number of power system Elements are isolated to clear Faults" or had other suggestions to improve the Purpose. The drafting team revised the Purpose to read: "To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults."

Some commenters stated that the definition of "Interconnected Element" needed to be changed. The drafting team changed the definition to:

A BES Element that electrically joins facilities owned by:

a) separate Registered Entities, or

b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Some commenters noted that a Transmission Owner could not share knowledge of its system with Generator Owners, as such; Generator Owners should not be included in the Applicability. The drafting team does not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the Generator Owner to ensure the Protection Systems covered by this standard are properly coordinated.

Others commenters believed that the Generator Owner should be excluded because the Transmission Owner is the entity that maintains that Transmission System Fault studies. While the drafting team agrees that Transmission Owners usually maintain the Fault studies, it believes that both entities have a responsibility to ensure the Protection Systems covered by this standard are properly coordinated.

A commenter believed that the Purpose of PRC-001-3 should be changed. The drafting team did not modify the Purpose, but did add Measure M1. It reads: "For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel."

A few commenters requested more clarity on which Protection System are included in the standard. The drafting team explained that because of differing philosophies among entities, it could not specify all Protection Systems that may require coordination. The drafting team believes the Applicability section gives sufficient guidance.

A commenter indicated that "coordination" is not well-defined. Rather than trying to develop a definition in the NERC Glossary of Terms, the drafting team chose to express what was intended for "coordination" in this standard.

There was a concern that the standard might be expanding into Distribution Elements. The drafting team explained that the Applicability only applies to Distribution Providers that own "Protection Systems installed for the purpose of detecting Faults on BES Elements and that require coordination for isolating those Faulted Elements."

A commenter disagreed with the need to periodically review coordination. The drafting team indicated that it believes there is a reliability benefit in periodically reviewing Protection System coordination.

One comment indicated that the Figures needed more explanation regarding which were the "Interconnected Elements." The drafting team modified the figures to indicate the "Interconnected Elements."

One commenter stated that there was a lack of consistency between the Purpose and Requirement 1, Part 1.2. The drafting team revised the language of both to remove any inconsistencies.

Organization	Yes or No	Question 1 Comment
Nebraska Public Power District	No	It seems the real purpose of this standard is "To coordinate BES Protection Systems for Interconnected Elements". The rest of the statement is already covered as part of the protection systems design which will involve coordination or not depending on any special issues or existing design limits.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults		
ACES Standards Collaborators	No	(1) We disagree with the inclusion of the "least number of power system Elements" in the purpose. The purpose should be to simply coordinate the Protection Systems for Interconnected Elements. While trying to minimize the number of Elements that should be removed from service is a laudable goal, it will create an incentive for auditors to determine if there is a better way to protect the registered entities systems. How else could an auditor know that the absolute minimum of Elements have been determined unless they tried optimize the zone of protection themselves. The use of different but related terms causes confusion. For instance, what is the difference among "power system Elements," "Elements," and "Interconnected Elements"? Based on the definition of "Element," we assume "power system Elements" is intended to be the same. If so, we suggest dropping "power system" to avoid confusion. (2) Similar to the purpose statement, the Applicability Section, (4.2) Facilities is unclear. The statement "Interconnected Elements of the BES that require coordination for isolating those faulted Elements" includes superfluous language. In general, NERC enforces standards against the BES. Thus, it is not necessary to include "of the BES." To ensure absolute clarity, we suggest the definition of Interconnected Element be modified to specifically limit it to the BES as well. Also, we recommend striking everything after Interconnected Elements in the purpose statement as it is unnecessary and provides no additional clarification on the Facilities to which the standard applies. (3) Because no generic questions asking for additional comments was provided, we are providing our concerns that do not fall under one of the specific questions asked of the drafting team here. (4) Please change the wording of Part 1.2 as the current wording has some

Organization	Yes or No	Question 1 Comment
		unintended consequences. We think “to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement” should be changed to “to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of the associated Protection System Study.” The current language literally reads that the TO, GO, and DP shall provide the PSS results to itself. It also reads that all the Protection System Studies for a TO, GO, or DP must be provided to the other protection system owners of all of the Interconnected Elements even if the other owners only own protection systems for one of the TO, GO, or DP’s Interconnected Elements. As an example, consider that TO X shares two separate Interconnected Elements with TO Z and GO A. The Interconnected Element between TO X and TO Z is called Tie-line B and the Interconnected Element between TO X and GO A is GSU C. The requirement would literally require TO X to share its Protection System Study results for both Tie-line B and GSU C with both GO A and TO Z even though, GO A has no interest in Tie-Line B and TO Z has no interest in GSU C. This could be solved with the simple edit described above. (5) We find that addition of “For each Facility associated with an Interconnected Element on its System” in R2 confusing. First, what is an associated Facility? Second what is intended by the use of Facility instead of Element? Considering Interconnected Facility in the last draft was change to Interconnected Element and Facility was used in this requirement, it would appear some delineation is meaning is intended between Element and Facility. Since Element and Facility have nearly the same meaning in the NERC Glossary of Terms that delineation is unclear and we would appreciate further explanation of the intent. (6) We found the inclusion of quotes on the phrase “Protection Systems installed to detect faults on the BES Transmission System” confusing. There is no reference. We suggest removing the quotes as they are superfluous. The meaning is still communicated without them. If they remain, please provide a

Organization	Yes or No	Question 1 Comment
		reference. We assumed it came from section 4.2. If the quote did come from that section, it is not quite correct. It is missing “for the purpose of detecting” and “faults” is not capitalized (7) The purpose statement of PRC-001-3 needs to be further modified. With the deletion of all of the requirements but Requirement R1, the purpose to “ensure system protection is coordinated among operating entities” is no longer achieved.

Response: Thank you for your comments.

1. **The Purpose has been revised based on your and others’ comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.**
2. **The definition of Interconnected Element has been revised based on your and others’ comments to read:**
   A BES Element that electrically joins facilities owned by:
   a) separate Registered Entities, or
   b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).
3. **NA**
4. **The suggested change has been made**
5. **The language in Requirement R2 has been clarified**
6. **The phrase you mentioned has been modified to accurately reflect the language in the Figure from which it was taken.**
7. **The large majority of the Standard is a carryover from the standards PRC-001-1 and PRC-001-2. As noted in the background section of PRC-027-1, the drafting team is recommending that Requirement R1 only remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. At that time PRC-001-3 will be retired.**

Organization	Yes or No	Question 1 Comment
Certain Members of the ISO RTO Council	No	Although the SRC agrees that protection systems should strive to interrupt only those elements closest in to a fault to avoid excessive interruptions, there are situations where it is necessary to trip elements beyond those that only interrupt the fault. To set a result for “...the least number of power system Elements are isolated to clear Faults” misses the primary goal for a reliability

Organization	Yes or No	Question 1 Comment
		standard meant to protect the interconnected bulk electric grid. NERC standards should always have the underlying purpose to prevent cascading failures that affect interconnected systems. The stated Purpose must recognize that the "least number of power system Elements are isolated to clear Faults to maintain system integrity". For example, a relay scheme could isolate a fault on a generator connected between two line terminals by opening the breakers on both ends of the line. This would fulfill the Purpose of "least number of power system Elements", however, a protections scheme for that segment of transmission line may require that the next terminal along that line also be interrupted in order to prevent an unintended increase in load to a particular element due to the opening of the breakers closest to the fault.
Response: Thank you for your comment. The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Northeast Power Coordinating Council	No	1. By restricting the coverage to "... Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults" there is a significant gap in reliability created by the exclusion of elements such as loss of field, out-of-step, etc. 2. An incomplete Protection System Study negates all the work needed to satisfy this Standard. Perhaps through referencing the NERC technical reference document entitled "Power Plant and Transmission Protection Coordination", there could be a reference to which protection elements are going to be covered in this Standard and likewise what Standards will cover the protection elements not covered by this Standard. 3. As identified by the Drafting Team, there may be no evidence of mis-coordination between traditional protections that detect faults, but for co-ordination of generator loss of excitation protection settings or out of step relaying during a fault condition - is that meant to be covered in this Standard

Organization	Yes or No	Question 1 Comment
		or elsewhere? 4. The latest draft of PRC-019-1 indicates studies conducted under that standard are for steady state conditions, not fault conditions. PRC-023 provided clear direction on what protection elements to mitigate and even provided options on how to mitigate those elements. PRC-027 should provide the similar effective vehicle to convey at least the "what" for Protection System coordination during faults between entities, and will allow entities to perform and document consistent Protection System Studies. 5. The term "coordination" is not well defined. Does it mean ensuring owners of all terminals of a line, transformer, etc. are aware of each other's protection system design and settings, especially when the design, settings, and physical system changes? Developing a formal definition to be included in the NERC Glossary should be considered.
Response: Thank you for your comments. 1. **The coordination of non-fault-related Protection Systems such as what you describe is not within the scope of this standard.** 2. **Because there are different Protection System designs and philosophies, the drafting team cannot specify which Protection Systems require coordination.** 3. **The drafting team believes that conditions such as those that you suggested are expected to be remedied under other standards. For example, out-of-step conditions should be identified and mitigation coordinated and implemented as a result of a transmission system assessment required in the TPL standards.** 4. **The drafting team believes that the Applicability section regarding Facilities adequately describes which Protection System components need to be coordinated between entities.** 5. **The drafting team agrees that "coordination" is not well-defined. Rather than trying to develop a definition in the NERC Glossary of Terms, the drafting team chose to express what was intended for coordination in this standard.**		
CenterPoint Energy	No	CenterPoint Energy believes the purpose should use wording similar to that being proposed for the definition of "Protection System Study" instead of developing and utilizing different wording for the purpose statement.

Organization	Yes or No	Question 1 Comment
		CenterPoint Energy recommends the purpose be stated as follows: "To coordinate Protection Systems for Interconnected Elements, such that Protection Systems operate as desired for clearing postulated short circuit Fault events."
Response: Thank you for your comment. The Purpose has been revised read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
NV Energy	No	Concerned that the Applicability and Purpose are encroaching upon Distribution elements, outside the statutory authority of the NERC Standards process
Response: Thank you for your comment. Per the Applicability, the standard applies only to Distribution Providers that own "Protection Systems installed for the purpose of detecting Faults on BES Elements and that require coordination for isolating those faulted Elements." This standard does not pertain to distribution (non-BES) Elements.		
Exelon Corporation and its affiliates	No	Exelon agrees with the Purpose statement as stated, however the questions and layout of this comment form doesn't provide an area to provide comments as to why we are voting negative. While requiring periodic coordination studies between entities is laudable, it is unnecessary. The coordination of a protection system, by nature, is tested every time it operates. We already have a standard, PRC-004-2, that requires all transmission protection system operations to be analyzed for correctness and any misoperations reported, along with corrective action plans to mitigate their cause. Our experience indicates the bulk of protection system misoperations are not caused by a lack of coordination studies. This standard, as written, continues to be vague and will lead to an inconsistent application of the requirements. Most importantly, we believe this standard is ill advised. Coordination of protection systems between entities was not a factor in the 2003 blackout. As such it clearly goes beyond the mandate of the 2003 blackout recommendations. Implementation of this standard will add little to the reliability of the bulk electric system while adding substantially to the amount of time and money an entity spends simply on compliance

Organization	Yes or No	Question 1 Comment
		activities. Contrary to the goal of enhancing reliability, this standard will simply dilute available resources to the detriment of reliability.
Response: Thank you for your comment. The drafting team believes there is a reliability benefit to review and ensure proper Protection System coordination on existing Protection Systems associated with Interconnected Elements prior to potentially being identified by a misoperation. The aspects of coordination included in the existing Reliability Standard PRC-001-2 are incorporated and clarified in the proposed Reliability Standard PRC-027-1.		
FirstEnergy	No	In regard to the purpose statement, FirstEnergy supports the response submitted by the RFC Protection Subcommittee which is repeated here for convenience. The purpose should mirror the objectives of the Protection Systems Study. “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence.” The reasons being that an entity may choose to overtrip distribution transformer (non-BES) protection, to employ zone 1 extension schemes, or for other valid reasons trip more than the least number of Elements to clear a Fault.
Response: Thank you for your comment. The Purpose has been revised based on your and others’ comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Pepco Holdings Inc & Affiliates	No	The language in the Statement of Purpose needs to be reworded. The phrase “such that the least number of power system Elements are isolated to clear faults” may restrict certain protection practices in widespread use today, where coordination on tapped distribution facilities is achieved via auto-reclosing rather than via coordinated time delays. For example, a BES line (protected by a high speed DCB or POTT pilot scheme) is tapped by a distribution provider as demonstrated in Figure 3 of the Application Guidelines. Very often for distribution taps like these, rather than requiring the distribution provider to establish a costly transmission class pilot scheme terminal at breaker C with communication links to A & B, it is common to let the pilot scheme reach into

Organization	Yes or No	Question 1 Comment
		(but not thru) the transformer at C. For faults in the transformer the high speed transformer relays will operate to trip and lockout breaker C. However, the pilot scheme at A & B will also trip simultaneously. Breaker C will lockout and A & B will auto-reclose to restore the line. Coordination is achieved via auto-reclosing. For faults on the line, A & B will trip via the pilot scheme, and if generation happens to be running either C will trip, or the generator will trip depending on scheme design. Reclosing at A & B would be delayed and / or voltage supervised to ensure generation has been removed prior to auto-reclosing. In the above scenarios since the line tripped for a fault in the transformer, or the generator tripped for a fault on the line, it would violate the requirement that “the least number of power system Elements are isolated to clear faults”. The language used in the proposed definition of Protection System Study is better; using the phrase “demonstrates ... Protection Systems operate in the desired sequence for clearing faults”. The problem here is who determines what is the “desired sequence”? Would a scheme, which is purposely designed as described above and acknowledged by the Transmission Planner and Transmission Operator, be considered to operate in the “desired sequence” for clearing faults? The language in the standard needs to be re-visited to enable these types of protection interfaces with distribution providers having limited generation resources connected downstream. Also, if system reliability was truly an issue for this example, the interconnection should not have been a simple tap on the line, but rather a ring bus should have been established at the interconnection point. In conclusion, we suggest re-wording the Purpose to read: “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence for clearing Faults.” This statement is consistent with the stated definition of the Protection System Study, on which the measures of this standard are based.

Response: Thank you for your comment. The Purpose has been revised based on your and others’ comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired

Organization	Yes or No	Question 1 Comment
sequence during Faults.		
Florida Municipal Power Agency	No	The primary purpose of protection system coordination is to ensure faults are cleared expeditiously and well under the critical clearing time, with the stated purpose of minimizing the number of elements isolated as a secondary consideration, not a primary consideration. As such, there is no recognition of the importance of remote back-up protection that backs up primary and secondary protection, but, does not necessarily share the same goal of minimizing number of elements tripped, but, does share the goal of clearing a fault within the critical clearing time.
Response: Thank you for your comment. The drafting team agrees with your statement that critical clearing time is important. The drafting team revised the Purpose: however, the team believes that minimizing the elements isolated is simply a part of accomplishing that clearing time. The coordination between the primary and backup protection that you address has to take place, otherwise there would always be isolation of more than is necessary to clear the Faults.		
Bonneville Power Administration	No	The Purpose given assumes that the most important outcome of a protection system operation is that the least number of power system elements are isolated to clear a fault. While it is true that it is usually desirable to prevent parallel paths from opening, in many cases it might be perfectly acceptable for adjacent elements to operate. BPA believes it may be more economical to have a protection system that isolates elements in addition to the faulted element if the isolation of the additional elements does not result in problems for the BES. A suggested Purpose statement that takes this philosophy into account is: To insure that separate Functional Entities properly coordinate with each other the protective systems for elements that interconnect their electrical systems so that only the intended power system elements will be isolated to clear a fault.
Response: Thank you for your comment. The Purpose has been revised read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		

Organization	Yes or No	Question 1 Comment
Essential Power, LLC	No	The purpose is laudable, but the means by which it is to be achieved needs more work. The Application Guidelines section of PRC-027 makes reference to, “the entity performing the Protection System Study [for R1],” but the standard provides no indication of who this should be. This responsibility is simply assigned to, “Each Transmission Owner, Generation Owner, and Distribution provider.” The obligation placed on GOs by use of the word “each” in R1 cannot be fulfilled, however, except under the circumstance of having a vertically-integrated utility. An independent GO does not have knowledge of the TO’s system, and in a deregulated market is not allowed to have such knowledge. The TO and TOP are provided with detailed information of the GO’s equipment, however, and therefore perform all interconnection-related studies. This is as it should be, because changes in the transission don’t matter to a GO. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO’s system. The best approach would be to restrict the applicability of PRC-027 in its entirety exclusively to TOs, with GO obligations remaining as per PRC-001, i.e. reporting changes and addressing any issues raised by the TOP. If GOs that own substations, distribution systems and numerous miles of transmission conductors (e.g. large-scale wind farms) need to be included in PRC-027 the standard should say so, rather than pulling in all GOs regardless of whether or not it makes any sense for them to be involved. The most that could reasonably be asked of independent GOs under R1 is to have a valid interconnection service agreement (ISA), since a coordination study is performend by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so a detailed level of evidence could not be asked of the GO.
Response: Thank you for your comment. The drafting team does not believe that the Transmission Owner is restricted in providing		

Organization	Yes or No	Question 1 Comment
the Protection System data necessary for the Generator Owner to ensure the Protection Systems covered by this standard are properly coordinated.		
Cogentrix Energy Power Management, LLC	No	The purpose is laudable, but the means by which it is to be achieved needs more work. The Application Guidelines section of PRC-027 makes reference to, "the entity performing the Protection System Study [for R1]," but the standard provides no indication of who this should be. This responsibility is simply assigned to, "Each Transmission Owner, Generation Owner, and Distribution provider." The obligation placed on GOs by use of the word "each" in R1 cannot be fulfilled, however, except under the circumstance of having a vertically-integrated utility. An independent GO does not have knowledge of the TO's system, and in a deregulated market is not allowed to have such knowledge. The TO and TOP are provided with detailed information of the GO's equipment, however, and therefore perform all interconnection-related studies. This is as it should be, because changes in the transission don't matter to a GO. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO's system. The best approach would be to restrict the applicability of PRC-027 in its entirety exclusively to TOs, with GO obligations remaining as per PRC-001, i.e. reporting changes and addressing any issues raised by the TOP. If GOs that own substations, distribution systems and numerous miles of transmission conductors (e.g. large-scale wind farms) need to be included in PRC-027 the standard should address that specifically. The most that could reasonably be asked of independent GOs under R1 is to have a valid interconnection service agreement (ISA), since a coordination study is performend by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so a detailed level of evidence could not be asked of the GO.

<table>

Organization	Yes or No	Question 1 Comment
System components operate in the desired sequence during Faults. **2. The drafting team believes that although the Transmission Owner may provide the majority of the data and work associated with this standard, the Generator Owner shares the responsibility of ensuring the Protection Systems covered by this standard are properly coordinated.**		
Wisconsin Electric Power Company	No	The purpose should mirror the objectives of the Protection System Study: "To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence." There are cases where industry practice is to "overtrip", for example, for a tapped non-BES distribution transformer fault by tripping BES line breakers and reclosing. Also it may be a common practice to use zone 1 extension or acceleration schemes. There can be good reasons for intentionally tripping more than "the least number of Elements to clear a Fault". The Purpose statement as currently written is in conflict with these valid industry practices, and needs to be modified.
Response: Thank you for your comment. The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Kansas City Power & Light	No	1. The reliability objective of this standard should be to insure that there is an agreement between two interconnected entities of relay protection schemes and relay protection settings for the interconnected facilities. This is achieved if there is documentation stating that the Interconnected operating companies have reached agreement on protection schemes and protective relay settings. This standard should only require documentation that neighboring owners are talking and agreeing with one another in relation to protection and control. 2. The purpose in the draft standard makes it appear that you are in violation of this standard any time the system has a misoperation because of relay setting regardless of whether both parties have agreed on the settings used, but the measures tend to measure agreement with

Organization	Yes or No	Question 1 Comment
		the other entity. PRC-004 is the standard for misoperation reporting and misoperation mitigation.
Response: Thank you for your comment. 1. **The drafting team does not see a conflict between the language in the standard and your statement "This standard only requires documentation that neighboring owners are talking and agreeing with one another in relation to protection and control." The measures provide examples of documentation that demonstrate compliance with the requirements.** 2. **A Misoperation is not a violation of PRC-027-1.**		
US Bureau of Reclamation	Yes	1) We agree to isolate the least number of power system elments during a fault. However, PRC-027 & PRC-001 are lack of a statement which elements be reviewed by entities. It seems like it is upto utilities to decide wchich elements to be reviewed and studied for. For the comliance purpose, how does Autority judge the reviews/documents were meeting PRC-027? 2) Pg. 2- Definitions of Terms Used in Standard- "Interconnected Element: An Element that electrically joins separate Functional Entities, includingthose Functional Entities that are a part of the same Registered Entity." -The Interconnected Element definition should be expanded upon and attached figures added showing what is and is not an interconnected element relative to the generator and generation owner. 3) Page 2 - The term "Functional Entities" as used in the definitions for "Interconnected Element" should include a definition. 4) Pg. 4- A.5 -"Other Aspects of coordination of Protection Systems addressed by other Projects: Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects." -The paragraph should be more specific as to whether the "fault clearing" referenced is used for primary

Organization	Yes or No	Question 1 Comment
		transmission line protection or primary generator/generator step-up transformer protection. Namely, does what is addressed in PRC-027-1 exclude fault clearing used for primary generator/generator step-up transformer protection? 5) Pg. 8- R3.- 3.1- " o New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios."- The sentence should be changed to read- " o New installation, replacement with different types, or modification of: fault clearing protective relays or protective function settings, related communication systems, related current transformer ratios and voltage transformer ratios." 6) Last paragraph on page 26 starting with "Protection Systems installed to detect faults on the BES..." has some great examples (especially the last sentence of that paragraph) of the intent of PRC-027. I think it would be useful to move or copy this type of verbiage to the beginning of the document and use it in the definitions to accomplish what Pete has commented on below.

Response: Thank you for your comments

1. **The drafting team believes that the "elements be reviewed by entities" are clearly identified in the definitions and Applicability sections.**
2. **The figures have been modified to indicate the "Interconnected Element'.**
3. **The definition of Interconnected Element has been changed to: A BES Element that electrically joins facilities owned by:**
   a) separate Registered Entities, or
   b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).
4. **This standard does include those aspects of "primary generator/generator step-up transformer protection" which may require coordination with other owners. An example would be back-up distance protection or ground overcurrent protection.**
5. **The drafting team believes the definition of Protection Systems (NERC Glossary of Terms) provides adequate clarity with regards to these components. The drafting team therefore declines to incorporate your suggested changes.**

Organization	Yes or No	Question 1 Comment
6. The drafting team declines to make the suggested change.		
Manitoba Hydro	Yes	Although Manitoba Hydro agrees with question 1, we have the following general comment: The purpose statement and R1.2 refers to Elements within the 'power system' which is not defined, while the 'Facilities' refers to 'Elements of the BES' and the 'Requirements' reference Interconnected Element on a particular entities' 'System' or 'transmission system'. Should these be consistent or has this been done purposefully?
Response: Thank you for your comments. The drafting team modified the language to make it consistent.		
SERC Protection and Controls Subcommittee (PCS	Yes	Based on the SDT response to our Draft 1 comment regarding the use of 'coordination', we understand 'coordination' in the Title and Purpose to mean the technical aspect of relay coordination.
Response: Thank you for your comments. The drafting team agrees with your statement.		
Georgia Transmission Corporation	Yes	Based on the SDT response to our Draft 1 comment regarding the use of 'coordination', we understand 'coordination' in the Title and Purpose to mean the technical aspect of relay coordination.
Response: Thank you for your comments. The drafting team agrees with your statement.		
Dominion	Yes	1). Dominion appreciates the SDT's agreement that in PRC 001 there were different interpretations of the term "coordination. Based on the SDT response to our Draft 1 comment regarding "coordination", we now understand that 'coordination' in PRC 027 Title and Purpose is referring to the technical aspects of coordinating relay settings. 2). Please reconsider Dominion previous recommendations to change the Title. "Protection System Interconnected Element Coordination for Performance

Organization	Yes or No	Question 1 Comment
		During Faults" or "Protection System Coordination for Interconnected Elements" have more specificity and meaning to the standards intent for coordinating relays on interconnections.
Response: Thank you for your comments. **1. The drafting team agrees with your statement.** **2. The drafting team declines to make the suggested change.**		
American Transmssion Company, LLC	Yes	However, ATC recommends that the Purpose statement in the Standard be modified by adding the word "intended" :"To coordinate Protection Systems for Interconnected Elements, such that the least number of intended power system Elements are isolated to clear Faults."
Response: The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration agrees that it is appropriate that PRC-027-1 is self-contained throughout. Even though the Purpose statement is not necessarily mandatory and effective, it is conceivable that the previous version would lead a Compliance Enforcement Authority to require evidence that fault studies account for relay performance governed by other NERC standards. This could result in the assessment of two penalties for the same violation - a double jeopardy condition that should be avoided.
Response: Thank you for your support. The Purpose has been revised to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Duke Energy	Yes	The Purpose statement could be improved by striking the phrase "least number of power system Elements are isolated to clear Faults", and inserting the following phrase from the definition of Protection System Study: "Protection Systems operate in the desired sequence for clearing Faults". Some entities

Organization	Yes or No	Question 1 Comment
		may choose to "over-trip" for certain Faults.
Response: Thank you for your comment. The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		
Independent Electricity System Operator	Yes	We agree with the purpose statement, but suggest to add "settings" after protection system (with the "s" removed") to make it clear that it is the coordination of the settings, not the design of protection systems.
Response: Thank you for your comment. The drafting team believes that 'settings' are not the only aspect of Protection Systems that can impact the stated purpose.		
Hydro One Networks Inc.	Yes	We agree with this Purpose statement and we commend the drafting team for moving this standard in the right direction. 1. However, in line with our previous comments from the first posting, there still seems to be a significant gap in reliability by not identifying what elements of the Protection System need to be co-ordinated between entities. Perhaps this can even reside in the Application Guide. 2. A poor or incomplete Protection System Study is worthless and negates all the work needed to satisfy this standard. 3. As identified by the drafting team, there may be no evidence of mis-coordination between traditional protections that detect faults, but for co-ordination of say generator loss of excitation protection settings or out of step relaying during a fault condition - is that meant to be covered in this standard or elsewhere? 4. The latest draft of PRC-019-1 indicates studies conducted under that standard are for steady state conditions - not fault conditions. PRC-023 provided clear direction on what protection elements to mitigate and even

Organization	Yes or No	Question 1 Comment
		provided options on how to mitigate those elements. We feel PRC-027 is an effective vehicle to convey at least the "what" for Protection System co-ordination during faults between entities and will allow entities to perform and document consistent Protection System Studies.
Response: Thank you for your comments and support. **1. Because there are different Protection System designs and philosophies, the drafting team cannot specify which Protection Systems require coordination.** **2. The drafting team agrees with your comment.** **3. The drafting team believes that conditions such as those that you suggested are expected to be remedied under other standards. For example, out-of-step conditions should be identified and mitigation coordinated and implemented as a result of a transmission system assessment required in the TPL standards.** **4. The drafting team believes that the Applicability section regarding Facilities adequately describes which Protection System components need to be coordinated between entities.**		
Ameren	Yes	We are voting negative for three reasons, one provided below and two are included in response to Question #3. Ameren also supports the SERC Protection & Control Subcommittee (PCS) comments and hereby includes them by reference rather than repeating them all. (1) We request that the SDT replace "detect Faults on the BES Transmission System" with "protect the BES Transmission System" in all three places where it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry.
Response: Thank you for your comment. The drafting team used the term 'detect Faults on the BES Transmission System' to indicate those Protection Systems that may require review with other owners Protection Systems. The drafting team revised the phrase to read "installed for the purpose of detecting Faults on BES Elements" for consistency with the Facilities section of the Applicability. It is also noted that the identified interpretation was for the term 'transmission Protection Systems' which is not used in this Standard.

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

Response: Thank you for your support.

The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did

Organization	Yes or No	Question 1 Comment
revise some of the VSLs.		
Western Electricity Coordinating Council		We agree that unnecessary power system Elements should not be isolated to clear Faults, but question the statement that the "least number of power system Elements should be isolated." Reliability should be the goal. There may be situation where different isolation schemes both work, but perhaps one that isolates one or two more elements is more reliable.
Response: Response: Thank you for your comment. The Purpose has been revised based on your and others' comments to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.		

2. The drafting team is proposing two definitions for use only with PRC-027-1 as follows: Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults. Do you agree with these definitions, if not please provide specific suggestions for change in the comment area.

Summary Consideration:

<u>Interconnected Element</u>

The following two items represent the majority of the comments: A) the use of the term Functional Entities; and B) the inclusion of a Registered Entity that represents multiple functional entities. As such, the drafting team revised the definition of Interconnected Element to:

Interconnected Element: A BES Element that electrically joins facilities owned by:
a) separate Registered Entities, or
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

<u>Power System Study</u>

Several commenters disagreed with the definition of "Power System Study" and provided the following input: The term Power System Study (PSS) conflicts with a commonly used phrase for power system stabilizer used in generator excitation controls. The drafting team revised the term was revised to "Protection System Coordination Study". Some additional items were as follows:

1. The study is primarily for transmission facilities and Generator Owners should not be in the Applicability Section. The standard drafting team disagrees and stated in the reply that both entities are responsible and have a role in establishing Protective System coordination.
2. Figures 2 and 5 should be revised to clarify the scope of generator protection to be checked for proper coordination. The standard drafting team revised the language in Figure 2 and 5 to provide clarity.

3. Commenters requested additional clarification to identify the information required to properly demonstrate compliance of a study. The standard drafting team responded by indicating that Requirement R1 Section R1.2 was revised to state that the owner performing the PSCS must provide "a summary of the results of each Protection System Coordination Study performed pursuant to this requirement, (including, at a minimum, the Protection Systems reviewed, any issues identified, and any revisions proposed)." Along with the Protection Systems reviewed, the drafting team believes the minimum information that must be provided in a PSCS summary is the issues that were identified in the PSCS and any proposed revisions that were recommended as a result of the PSCS. Because most owners have their own unique Protection System setting philosophies and methods for performing a PSCS the drafting team believes providing a list of all the information that would comprise a PSCS would not be appropriate to include in Application Guidelines of this standard.

Organization	Yes or No	Question 2 Comment
Kansas City Power & Light	No	At our company there is one engineering group doing Protection System Studies for all Functional Entities and for multiple Registered Entities. Reliability is not enhanced by requiring a single engineering group to document and be audited for coordination with itself. An Interconnected Element should be defined as an element that electrically joins facilities that are controlled by separate operating companies and Protection Studies are done by separate engineering groups.
Response: Thank you for your comment. **The drafting team disagrees with your suggested definition of Interconnected Element.** **The drafting team added the following note to the rationale box for Requirement 1: Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study would be sufficient for use by both Registered Entities.**		
ACES Standards Collaborators	No	We recommend modifying the definition of Interconnected Element such that is dependent on actual registered entity ownership rather than functional entities. As an example, a generation Element would only be considered an Interconnection Element if the GO and TO were separate corporate entities. If the functions were the same registered entity, coordination would already occur and the generation Elements should not be considered an Interconnected

Organization	Yes or No	Question 2 Comment
		Element. To do otherwise will only cause significant compliance problems that may not support reliability. A utility that owns generation and transmission may not have a clear point of interconnection. This would be especially true for units installed prior to the advent of open access in the mid-1990s. If the point of interconnection is not well defined, how can an Interconnected Element be defined? It would be arbitrary to pick the GSU or an Element in the switchyard. Furthermore, focusing on ownership would actually make the proposed standard consistent with the existing PRC-001-2. That standard does not explicitly require coordination among different function entities within the same registered entity. Interconnection Element definition is proposing an administrative burden of having to coordinate within the same registered function. Documenting coordination efforts made to external functions is reasonable for reliability; however, keeping records of internal coordination is unnecessary. What would an entity be required to show if there was only one protection system engineer in the organization? Would that single person be required to document coordination among him/her self? We feel that this portion of the definition should be struck - it is more appropriate to clarify the coordination of protection system elements should be among external registered entities in the requirements. There should not be any requirement for internal protection system coordination, especially not in a definition.

Response: Thank you for your comment.

The drafting team revised the definition of Interconnected Element; however, we disagree with your example - just because the Transmission Owner and Generator Owner are part of the same Registered Entity does not necessarily mean the same technical groups are involved in the required Protection System Coordination Studies.

The drafting team added the following note to the rationale box for Requirement 1: Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study would be sufficient for use by both Registered Entities.

Organization	Yes or No	Question 2 Comment
American Electric Power	No	1. AEP recommends replacing all references to "generator Protection Systems" with "Generator Owner equipment that provides backup system protection", and suggest adding language to the standard for clarification. The scope of Generator Owner Protection Systems applicable to this standard is not clear from the verbiage within the standard or the definition of Interconnected Element. AEP believes that the SDT did not intend to require the GO to include all generator Protection Systems under this standard (as shown in Figure 2 on page 25 and Figure 5 on page 28 of the clean draft), but instead meant to limit the scope of relaying to be coordinated to only the Generator Owner equipment that provides backup system protection. 2. AEP agrees with the definition of Protection System Study, however, we disagree with using the acronym PSS within the standard as PSS is also the recognized acronym for Power System Stabilizer. Usage of this acronym (for example, in the Process Flow Chart) would cause unnecessary confusion.
Response: Thank you for your comments. **1. The drafting team believes that the Applicability section regarding Facilities adequately describes which Protection System components need to be coordinated between entities.** **2. The term Protection System Study (PSS) has been changed to Protection System Coordination Study (PSCS).**		
PPL Corporation NERC Registered Affiliates	No	As per this version, the standard's protection study requirement seems excessive. The definition of a Protection System Study needs to include identification of the party responsible for performing this work, which should be the TO for the reasons discussed above.
Response: Thank you for your comment. The drafting team believes that although the Transmission Owner may provide the majority of the data and work associated with this standard; however, the drafting team believes the Generator Owner shares the responsibility of ensuring the Protection Systems covered by this standard are properly coordinated.		

Organization	Yes or No	Question 2 Comment
CenterPoint Energy	No	CenterPoint Energy recommends the term “Protection System Study “ be defined as follows: “A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing postulated short circuit Fault events.”
Response: Thank you for your comment. The drafting team believes the definition as noted is sufficient.		
Sacramento Municipal Utility District	No	Clarification is necessary for the definition of “Interconnected Element” which requires the TO and GO function within a company to treat each other as if they were unrelated entities and apply all of this standard’s requirements.
Response: Thank you for your comment. **The drafting team revised the definition of Interconnected Element for clarity. A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).** **The drafting team added the following note to the rationale box for Requirement 1: Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study would be sufficient for use by both Registered Entities.**		
FirstEnergy	No	FirstEnergy supports the proposed definition for Protection System Study but believes the Interconnected Element definition requires some modification. As presently written the Interconnected Element definition appears to inadvertently omit coordination of two transmission owners that have tie-lines to each others systems. The two transmission owners are not "separate Functional Entities" but rather two Registered Entities performing the same functional entity (transmission owner) obligations. Additionally, it is understood that the intent is to also require Protection System

Organization	Yes or No	Question 2 Comment
		coordination at interconnection points where the point of interconnection may entail facilities owned by the same NERC Registered Entity having multiple functional entity classifications. FirstEnergy proposes the following definition for Interconnected Element: "Interconnected Element - An Element that electrically joins and interconnects facilities owned by a)separate Registered Entities, or b) the same Registered Entity, but includes those representing multiple functional entity (DP, GO or TO) responsibilities."
Response: Thank you for your comments. **The definition of Interconnected Element has been revised based on your and others comments to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
Hydro One Networks Inc.	No	For Protection System Study: Suggest adding a phrase:"A study between two or more interconnected power system Elements that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults".
Response: Thank you for your comments. **The drafting team believes the existing definition is sufficient and declines to make the suggested change.**		
Liberty Electric Power LLC	No	Functional entity is not defined. System Studies should be defined as "a study performed by a TO that demonstrates.....etc."
Response: Thank you for your comments. **The definition of Interconnected Element has been revised based on your and others comments to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or**		

Organization	Yes or No	Question 2 Comment
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). The drafting team believes the existing definition of a PSCS is sufficient and that both parties have responsibility to coordinate.		
Northeast Power Coordinating Council	No	In the proposed definition of Interconnected Element "Functional Entities" is capitalized even though it is not in the NERC Glossary.
Response: Thank you for your comments. **The definition of Interconnected Element has been revised based on your And others comments to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
SCE&G	No	SCE&G disagrees with the definition of "Interconnected Element". More clarity is needed regarding the language "Functional Entities that are part of the same Registered Entity". Entities that are vertically integrated and more specifically those vertically integrated companies that that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves.
Response: Thank you for your comments. **The definition of Interconnected Element has been revised to provide more clarity based on your and others comments to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		

Organization	Yes or No	Question 2 Comment
The drafting team added the following note to the rationale box for Requirement 1: Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study would be sufficient for use by both Registered Entities.		
seattle city light	No	Seattle City Light does not agree with the use of Functional Entity in the definition of Interconnected Element. Seattle has several objections. First, although “Functional Entity” is capitalized in the draft Standard, this term is not defined in the NERC Glossary of Terms. A second objection is that “Functional Entity” in this role does not add clarity to the Standard. “Functional Entity” is defined in the NERC Reliability Functional Model as “the term used in the Functional Model which applies to a class of entity that carries out the Tasks within a Function.” This definition refers to other terms defined only with the Functional Model document (“Task,” “Function”). It is not illuminating as to defining the bodies joined by Elements. The third and strongest objection is that use of the term “Functional Entity” in the proposed definition is incorrect and inconsistent with the NERC Functional Model, and as such creates confusion about Standard obligations for entities registered for more than one function. The NERC Functional Mode Version 5 (November 30, 2009) explicitly does not require any particular organization or assignment of functional Tasks or ownership of Elements for any multi-function entity. Functional tasks and Elements exist undifferentiated across an entity as a whole, and the NERC Functional Model document states clearly that no further differentiation is expected, required, or implied. (See, for example, p. 7 “The Functional Model describes a functional entity envisioned to ensure that all of the Tasks related to its Function are performed. The Model, while using the term ‘functional entity’, is a guideline and cannot prescribe responsibility” and p.8 “The Model is independent of any particular organization or market structure.”) Seattle City Light, for example, is a vertically integrated municipal utility registered for 11 functions: BA, DP, GO, GOP, LSE, PC, PSE, RP, TO, TOP, and TP.

Organization	Yes or No	Question 2 Comment
		Registration is made without differentiation: no particular sub-organization within Seattle City Light is identified as owning GO Elements, TO Elements, and so on. The Model is simply that Seattle City Light or any other multi-function entity owns a set of Elements s a unit. By contrast the draft definition relies upon differentiation of ownership of Elements within a multi-function entity, so that it can be determined if the proper studies were undertaken or not. Such differentiation is outside the Model and introduces complexities and unintended consequences not envisioned by the Functional Model and the term "Functional Entity." The same confusion about the term Functional Entity occurs in draft Standard COM-003-1. Seattle suggests that NERC immediately clarify the use of this term. Until the definition of the Functional Model is changed and changed significantly, the use of Functional Entity to define obligations within a Standard or definition (other than in the Applicability section) should be eliminated. As is it is simply a misreading, tempting as it may be, to presume that Functional Entity Tasks are assigned with greater granularity than to an organization as a whole. And it is a misreading that does not promote high quality Standards that can be consistently enforced across auditors and across regions. You can do better, and should do better. Seattle apologies that it does not have a suggested fix at this time, because the Functional Entity approach is so fundamentally wrong. Entitly (entirely?) new wording would be required to capture Elements existing within the same registerd Entity.
Response: Thank you for your comment. **The definition of Interconnected Element has been revised based on your and others comments to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
JEA	No	Seems like Interconnect element is too broad and not enough clarity on what a

Organization	Yes or No	Question 2 Comment
		protective system study requires (Ie, is this a setting coordination study? Redundancy studies? Dynamic studies? Duplication of TPL requirements.
Response: Thank you for your comment. **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).** **The drafting team changed the name from Protection System Study to Protection System Coordination Study.** **Note: The Guidelines and Technical Basis section of the Standard provides more information on the scope of a Protection System Coordination Study.**		
Imperial Irrigation District (IID)	No	Suggest replacing Protection System Study with Coordinated Protection System Study.
Response: Thank you for your comment. **The drafting team changed the name from Protection System Study to Protection System Coordination Study.**		
Certain Members of the ISO RTO Council	No	The definition of Interconnected Element is confusing since there are a mix of Functional Entities and Registered Entities, and some in the industry equate Functional Entities to Registered Entities. To avoid this confusion, we suggest replacing “Functional Entities” with “asset owners” or “facility owners.” If deemed desirable, the asset owners can be qualified by Transmission Owners, Generator Owners and Distribution Providers in parentheses The SRC asks if the definition for “Interconnected Facility” needs to be expanded to include situations where a Functional Entity may cross regional boundaries and have facilities that interconnect between the two, which may or may not be the same Registered Entity.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
Independent Electricity System Operator	No	The definition of Interconnected Element is confusion since there is a mixture of Functional Entities and Registered Entities, and some in the industry equate Functional Entities to Registered Entities. To avoid this confusion, we suggest to replace Functional Entities with asset owners or facility owners. If deemed desirable, the asset owners can be qualified by Transmission Owners, Generator Owners and Distribution Providers in parentheses
Response: Thank you for your comment **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
Florida Municipal Power Agency	No	The definition of Interconnected Element limits the scope of the standard too much. The standard only requires coordination between neighboring entities and not of protection of other BES equipment within the same entity, e.g., one TO's transmission line protection with the protection of another transmission line owned by that same TO is not within the definition of Interconnected Element. It would seem that such a requirement would be necessary, e.g., each entity ensures that their protection internal to their system coordinates with itself, and that they coordinate at the boundaries with its neighbors. That would ensure coordination across the BES. Protection System Study definition should have a time element and a consideration for the critical clearing time, e.g., "and demonstrates that the resulting clearing time meets or beats the clearing time

Organization	Yes or No	Question 2 Comment
		used in studies to comply with the TPL standards" or something to that effect
Response: Thank you for your comment. **The drafting team has no evidence that there is widespread miscoordination of Protection Systems associated the BES and therefore the necessity of ensuring that Protection Systems internal to an owner's system should not be included in this standard. However, the drafting team believes that the scope of the standard should require that the individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination at the Interconnected Element.**		
ITC	No	1. The general idea of the Interconnected Element is acceptable. However, when one Registered Entity takes care of coordination between two Functional Entities, or coordinates all protection coordination between the two systems, the documentation will become onerous and not enhance the reliability of the BES. 2. The definition of the Protection System Study still needs further clarification. It is not clear what calculations/documentation must be kept to properly demonstrate compliance with the requirement of a "study." Past practice may have kept calculations and correspondence, which adequately demonstrate "evidence of coordination," but might or might not be adequate to a "protection system study" for future coordination efforts.
Response: Thank you for your comment. 1. **Just because the Transmission Owner and Generator Owner are part of the same Registered Entity does not necessarily mean the same technical groups are involved in the required Protection System Coordination Studies. The drafting team added the following note to the rationale box for Requirement 1: Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study would be sufficient for use by both Registered Entities.** 2. **The standard only requires that a summary of the results of each Protection System Coordination Study performed be provided; as such this would be the item to retain.**		

Organization	Yes or No	Question 2 Comment
American Transmssion Company, LLC	No	The Interconnected Element definition should be expanded to clarify that PRC-027 is applicable to only BES Elements as demonstrated in Figure 4 of the Standard's Application Guidelines on pg. 27. o ATC recommends that the SDT please modify the definition of Interconnected Element as follows:"A Bulk Electric System Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity" If "Functional Entity" is used and capitalized in the definition above, the term should be defined in the standard or be made part of the "Glossary of Terms Used in NERC Reliability Standards." Furthermore, NERC's "Reliability Functional Model version 5" states: "The following terms are used in the Functional Model and do not appear in the NERC Glossary. Functional Entity. The term used in the Functional Model which applies to a class of entity that carries out the Tasks within a Function."
Response: Thank you for your comment **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by:** **a) separate Registered Entities, or** **b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).**		
Essential Power, LLC	No	1. The term Functional Entity needs a definition. It is capitalized in PRC-027 but is not defined in the standard or in the NERC Glossary. It is nonetheless evident that a GO and TO are different Functional Entities, but the nature of the Element that joins them and thereby constitutes the Interconnected Element is unclear. Is this the transmission line? If so, would the TO be responsible for the R1 study if the ownership scope of an independent GO ends at the high-side terminals of the GSU or at an HV

Organization	Yes or No	Question 2 Comment
		disconnect switch? Would the responsibility be shared if, as sometimes happens, the ownership split occurs at the fenceline, leaving a small part of the transmission line the property of the GO while the rest belongs to the TO? 2.The definition of a Protection System Study needs to include identification of the party responsible for performing this work. This cannot be the GO if dealing with a deregulated market; since, as explained above, such parties are not allowed access to information about the TO's system.
Response: Thank you for your comment 1. **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).** 2. **The drafting team does not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the Generator Owner to ensure the Protection Systems covered by this standard are properly coordinated.**		
Cogentrix Energy Power Management, LLC	No	1.The term Functional Entity needs a definition. It is capitalized in PRC-027 but is not defined in the standard or in the NERC Glossary. It is nonetheless evident that a GO and TO are different Functional Entities, but the nature of the Element that joins them and thereby constitutes the Interconnected Element is unclear. Is this the transmission line? If so, would the TO be responsible for the R1 study if the ownership scope of an independent GO ends at the high-side terminals of the GSU or at an HV disconnect switch? Would the responsibility be shared if, as sometimes happens, the ownership split occurs at the fenceline, leaving a small part of the transmission line the property of the GO while the rest belongs to the TO?

Organization	Yes or No	Question 2 Comment
		2.The definition of a Protection System Study needs to include identification of the party responsible for performing this work. This cannot be the GO if dealing with a deregulated market; since, as explained above, such parties are not allowed access to information about the TO's system.
Response: Thank you for your comments. 1. **The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).** 2. **The drafting team does not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the GO to ensure proper coordination of the protection systems covered by this proposed standard.**		
GP Strategies	No	We do not believe that the drafting team appropriately identified the correct Applicable Functional Entities for this Standard. We also believe existing Standards could be modified to resolve any reliability gap rather than creating a new Standard. As a result, while the Purpose of this standard may seem to be reasonable, we feel that the drafting team should either 1) Change the Purpose to state "To conduct necessary studies to ensure Protection Systems for Interconnected Elements are studied, such that the least number or power system Elements are isolated to clear Faults." 2) And change the Applicable Functional Entities to the Transmission Planner or modify existing Standards, instead, as described below. The short-circuit studies should be conducted by the Transmission Planner. From Appendix 5B of the Registration Criteria the: o Transmission Planner is the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area." o Distribution Provider is the entity that provides and operates the

Organization	Yes or No	Question 2 Comment
		"wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."TPL-001, TPL-002, and TPL-003 already require the system studies are conducted. These Standards should be modified to include any additional studies that the drafting team feels are a gap. As noted in the drafting teams Rational for Part R2.1 "Short circuit databases are customarily updated annually so the drafting team believes 24 months provides entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation." That being said, there is no current Requirement for the Distribution Provider to provide the information to the databases so that the Transmission Planner can conduct the studies on the Interconnection Facilities. We recommend that MOD-010 and MOD-012 should be modified to include the Distribution Provider instead. For new facilities, FAC-002-1 already requires the coordination of changes in the Facilities.
Response: Thank you for your comment. 1. **The drafting team revised the Purpose statement to: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.** 2. **The drafting team believes the Applicability as noted is correct. Although is some cases, some of the identified activities may be conducted by the Transmission Planner or other entities, it is the owners that are responsible for ensuring their Protection Systems are coordinated with others.**		
Public Service Enterprise Group	No	What information comprises a Protection System Study (PSS)? In the Application Guidelines, from Figure 1 on p. 24, each owner that receives a PSS is "to review the Protection System setting" associated with the other owner's breaker that would operate to clear a Fault on the transmission line that connects each

Organization	Yes or No	Question 2 Comment
		Interconnected Element. Is this (Protection System settings) the ONLY information that needs to be transmitted in a PSS by each owner? The SDT should itemize ALL of the information it believes needs to be included in a PSS that is to be transmitted between owners of an Interconnected Element and include that information in the examples in the Application Guideline. This information should also be listed into the PSS definition, thereby defining its scope.
Response: Thank you for your comments. **Requirement R1 Part R 1.2 of the standard has been revised to state that after completion of each Protection System Coordination Study (PSCS) the owner performing the PSCS must provide "a summary of the results of each Protection System Coordination Study performed pursuant to this requirement, (including, at a minimum, the Protection Systems reviewed, any issues identified, and any revisions proposed)." Along with the Protection Systems reviewed, the drafting team believes that the minimum information that must be provided in a PSCS summary are the issues that were identified in the PSCS and any proposed revisions that were recommended as a result of the PSCS. Because most owners have their own unique Protection System setting philosophies and methods for performing a PSCS the drafting team believes providing a list of all the information that would comprise a PSCS would not be appropriate to include in Application Guidelines of this standard.**		
Tacoma Power	No	1.Where is the term Functional Entity defined? 2.Consider changing the term Protection System Study to Protection System Coordination Study. There are two reasons for this recommendation. First, the abbreviation for Protection System Study is PSS, which is also the common abbreviation for power system stabilizer. Second, the term Protection System Coordination Study emphasizes the primary purpose of PRC-027-1: to coordinate Protection Systems.
Response: Thank you for your comment. **1. The definition of Interconnected Element has been revised to read: A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or**		

Organization	Yes or No	Question 2 Comment
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). 2. The term Protection System Study (PSS) has been changed to Protection System Coordination Study (PSCS).		
Bonneville Power Administration	No	1.With regard to the definition of Interconnected Element, BPA believes the term should be interconnecting element, because the element is not interconnected, rather the systems of the functional entities are interconnected by the element. The point of interconnection between two functional entities is typically where two elements meet, such as between a line and a switch, and it is not a clear which element is the interconnected element. For example, suppose that a line from one entity terminates through a breaker at the bus of another entity's substation. Which is the interconnected element, the line, the breaker, or the bus? In another example, a generator ties to a transmission providers BES through a step-up transformer. Which is the interconnected element, the step-up transformer or the transmission line? Additionally, if a distribution provider taps off of a transmission provider's 230kV line through a disconnect switch, is the disconnect switch the interconnected element? BPA asks that the definition of Interconnecting Element be further clarified to provide the specific criteria that entities are expected to apply to come up with a consistent response in all such instances. The SDT attempted to illustrate the concept of the interconnected element through some examples in the Application Guidelines; however, the selection of the interconnected element in these examples neither follows logically from the standard nor provides the additional clarity necessary to enable industry participants to apply it in a manner that enables all users to come up with the same answers.. BPA believes the standard needs a clearer definition of an interconnected element. 2.With regard to the definition of a protection system study, the definition given

Organization	Yes or No	Question 2 Comment
		is too vague to provide a clear understanding of what is required by the standard.
Response: Thank you for your comments. 1. **The drafting team has provided examples of the applicable Interconnected Elements in the Figures at the end of the standard. This standard applies to the Protection Systems associated with the Interconnected Element installed for the purpose of detecting Faults on BES Elements and that require coordination for isolating those faulted Elements.** 2. **The term Protection System Study (PSS) has been changed to Protection System Coordination Study (PSCS) for clarity.**		
Manitoba Hydro	Yes	Although Manitoba Hydro agrees with question 2, we have the following general comments: (1) Please clarify why definitions are to remain with standard upon approval and not be moved to the Glossary. Are these definitions applicable only to this particular standard? If this is the case, this could lead to uncertainty if similar terms are going to be used or defined elsewhere. (2) Compliance 1.1 - The word 'Compliance' in the first line should not be capitalized and (CEA) should follow the word 'authority'. Since 'Regional Entity' is a defined term, 'Entity' needs to be capitalized. (3) Compliance 1.2 - The second paragraph should begin with 'Each', not 'The'. We suggest that the reference to an 'Interconnected Facility' in the second paragraph should be changed to 'a Facility associated with an Interconnected Element' to make it consistent with the rest of the standard, including the third paragraph of 1.2.
Response: Thank you for your comments. 1. **Yes, the definitions are intended for use only in this standard.** 2. **The noted corrections have been made.** 3. **The noted corrections have been made.**		

Organization	Yes or No	Question 2 Comment
Texas Reliablity Entity	Yes	The SDT may want to consider additional language for the Protection System Study definition, to clarify that the study demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults as well as clear the Faults within the maximum time frame defined by the Transmission Planner in order to maintain System Stability. Another consideration would be that the study incorporates all of the applicable Fault contingencies (Category B and C) as defined in the NERC Reliability Standards (TPL-002 and TPL-003) or any Regional standards.
Response: Thank you for your comments **The drafting team believes the definition as stated is sufficient.**		
Duke Energy	Yes	The SDT should consider putting the definition of Interconnected Element in the NERC Glossary.
Response: Thank you for your comment; **The drafting team intends for this definition to be used only with this standard.**		
Southwest Power Pool Reliability Standards Development Team	Yes	1. Under figure 2 in the application guidelines the example need to be reviewed and text added to clearly identify the intent of the drafting team. For example is the scope for Generator Owners in figure 2 just the backup system protection for the Transmission Owners system? It's not clear in the examples given. This issue is also present in figure 5. We agree that if the scope is just for the backup system protection it is ok but the wording does not clearly state this. 2. Also using PSS as an acronym for Protection System Study could be confused in the flowchart of this standard with power system stabilizers since there isn't any text to spell out that it is referring to Protection System Study.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. 1. **The drafting team believes that the Applicability section regarding Facilities adequately describes which Protection System components need to be coordinated between entities.** 2. **The term Protection System Study (PSS) has been changed to Protection System Coordination Study (PSCS) for clarity.**		
Western Electricity Coordinating Council	Yes	We agree with the definitions, but question the appropriateness of development of terms for a specific standard. Individual Regions are strongly discouraged from defining terms that only apply in a single region. We see the development of a term that is only applicable to a single standard to be a similar situation, leading to a proliferation of terms. If this approach is acceptable to NERC and FERC, we have no concerns.
Response: Thank you for your comment. **This approach is consistent with NERCs standards drafting guidelines.**

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

Response: Response: Thank you for your support.

The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise some of the VSLs.

3. In Requirement R1, the drafting team modified the time frame to allow entities 48 months to have a documented Protection System Study completed for each Interconnected Element if no Protection System Study exists. Note, the drafting team has allowed inclusion of all previously performed Protection System Studies whose summary of results include, at a minimum, the protective relay settings reviewed, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area.

Summary Consideration:

Some commenters stated that 48 months in Requirements R1 part 1.1.1 was not enough time for the initial study to be complete. The drafting team revised the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.

A few commenters stated that checking Fault currents and calculating a percent deviation in Requirements R2 part 2.1 ever 24 months was too often. The drafting team revised the timeframe to 60 calendar months, and added the provision that this was not necessary if there was a technical justification why periodic Fault current studies are not necessary for the coordination of Protection Systems associated with Interconnected Elements.

A few commenters requested that the percent deviation trigger in Requirements R1 Part 1.1.2 and Requirement R2 Part 2.2 be changed to 20%. The drafting team left the 10% trigger as an appropriate value.

A few commenters requested that the initial study in Requirements R1 Part 1.1.1 be moved to the implementation plan. The drafting team investigated this as an option but did not make this change. The drafting team stated that it believes the structure of Requirement R1, Part 1.1.1., as currently written, achieves this goal.

A request was made to clarify that an entity was only responsible for performing studies on their Protection System. The drafting team has modified the language of the requirement to read: “Perform a Protection System Coordination Study for each of its Interconnected Elements…”

A request was made to clarify where the 10% threshold in Requirement R1 Part 1.1.2 and calculated in Requirement R2 Part 2.1.2 is applied. The drafting team responded that Requirement R2, Part 2.1.1 refers to maximum available current at the interconnecting bus (total bus fault current). The drafting team has included clarifying language in the Rationale for Requirement R2, Part 2.1 and in the language of Requirement R2, Part 2.1.2 to indicate the need to compare both line-to-ground and three-phase fault current values when performing the calculation to check for a ±10% deviation.

There was a comment asking if a study was performed as a collaborated effort would the acceptance of the results of the study be acceptable. The drafting team stated they recognize that in many cases the owners may do joint studies; but both entities would need to agree with the results of the Protection System Coordination Study for it to be acceptable.

A commenter stated that confirmation from both parties that coordination has been reviewed should be adequate evidence that an entity is in compliance with the standard. The drafting team stated that they believe all Requirements included in this standard support its reliability objective, however Requirement R4 Part 4.2 the standard has been modified to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.

A few commenters stated that Requirement R1 should not apply to Generator Owners. Because Generator Owners are not allowed to have the Transmission Owners information needed for a system study under market rules. The drafting team stated that they do not believe that the Transmission Owner is restricted from providing the Protection System data necessary for the Generator Owner to ensure proper coordination of Protection Systems applicable to this proposed standard.

A few commenters requested clarification as to what comprises a valid PSS. In response, the drafting team has refined the examples given in Requirement R1, Part 1.2 of the minimum information required in a summary of the results of a Protection System Coordination Study (PSCS).

One commenter asked if previous studies were satisfactory to meet the requirements. The drafting team stated that they believe that a previous study can be used as a basis of a summary that includes all the needed information and send it to the other party to review after the effective date of the standard?

Organization	Yes or No	Question 3 Comment
Kansas City Power & Light	No	1. Proposed Requirement R1 allows 48 months to do an initial study with the explanation that there is no evidence of widespread miscoordination. We agree that there is no evidence of widespread miscoordination and therefore 60 months is the proper time frame for an initial study. 2. We have also noticed that there is no question on this comment form for any

Organization	Yes or No	Question 3 Comment
		other comments not addressed by the drafting teams questions. As such we note here that Requirement R1, 1.1.2 lists a 10% change in current as an action point. This implies that a 10% decrease requires action. We do not agree with this since most Protection Studies are done with all generation on. Most of the year all generation is not on with the result that normal operating conditions result in fault currents that are 10% below the maximum used in the Protection System Study. We also disagree with action required for a 10% increase in fault current since our standard relay settings no longer trip for instantaneous ground over current elements and the standard does not allow an entity to state a reason not to run this study or perform the calculations. When we did utilize instantaneous ground over current elements we allowed a 40% margin. We utilize other high speed protection elements not directly affected by changes in fault current. We recommend at least a 20% change in fault current to require action per this standard. 3. Requirement R2 requires that a short circuit study be done every 24 months. As noted above 60 months is proper time for initial study and is also proper for subsequent studies done after the initial study is complete.
Response: Thank you for your comment. 1. **Based on stakeholder comments, the drafting team revised the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.** 2. **The drafting team believes, as noted in the rationale, that the ±10 % change is an appropriate threshold to trigger investigation of the need for a review of Protection Systems. This does not require a new Protection System Coordination Study if an entity provides a technical justification demonstrating why a new study is not necessary.** 3. **The drafting team revised Requirement R2 to require, at least once every 60 calendar months, Transmission Owners perform a short circuit study and calculation of fault current deviation for its Interconnected Elements or provide a technical justification why periodic fault current studies are not necessary for the coordination of Protection Systems associated with Interconnected Elements.**		
ACES Standards Collaborators	No	(1) While we do not disagree with the time frame, we question if it should be

Organization	Yes or No	Question 3 Comment
		part of the requirement. It makes more sense to include the time frame for initial compliance of a requirement in the implementation plan. In that way, the initial compliance time frame does not persist in the standard long after it is no longer needed. It is common to utilize the implementation plan to describe initial compliance dates, especially when the requirement is asking for documented studies. After the studies are complete, there is not a need for a timeframe. Furthermore, FERC approves implementation plans as part of the standards package so there is no issue with whether the implementation plan is enforceable. (2) Conceptually, we agree with the intent of the standard and this requirement as it is presented in the application guidelines. However, more refinement is needed to make this requirement mirror what is explained in the application guidelines. For instance, we recommend clearly stating in Requirement R1 that the responsible entity is only responsible for performing Protection System Studies (PSS) for only those breakers it owns and are protecting the Interconnection Element. The standard is close to capturing this intent with the statement “its System” in Part 1.1. It would be better it if was changed to “Perform a Protection System Study for each of its Protection Systems that are protecting an Interconnected Element.” A GO and DP do not really have systems so the current language is not appropriate for these functions. The application guidelines provide this clarity and would be helpful if the intent was clearly stated in the requirements.

Response: Thank you for your comment.

1. **The drafting team agrees your suggestion provides one way of addressing initial requirements to have documented Protections System Coordination Studies for each Interconnected Element. However, the drafting team believes the structure of Requirement R1, Part 1.1.1, as currently written, achieves this goal. Further, NERC performs periodic review of standards and the requirement can be removed at that time, if appropriate.**
2. **Based on your suggestion, the drafting team has modified the language of the requirement to read: “Perform a Protection**

Organization	Yes or No	Question 3 Comment
System Coordination Study for each of its Interconnected Elements…".		
CenterPoint Energy	No	(a) CenterPoint Energy continues to believe a requirement to have a documented Protection System Study for each existing Interconnected Facility is overly burdensome, unless certain - if not all - existing Interconnected Facilities are exempted; therefore, CenterPoint Energy recommends R1.1.1 be eliminated from PRC-027-1. CenterPoint Energy does not believe a reliability need has been identified to justify that such prescriptive requirements are needed to provide for an adequate level of reliability. The following is stated on page 18 of 28 in PRC-027-1 Draft 2: "records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations." The majority of existing Interconnected Facilities have fault-proven, time-proven protection system set points. An existing Interconnected Facility without a documented Protection System Study will eventually be included in a study with system additions and changes, short circuit current increases, and relay panel replacement projects, as well as any analysis of misoperations. (b) While an option has been included in Draft 2 R1.1.3 to allow for a technical justification why a study is not required for certain changes, CenterPoint Energy believes that reasonable thresholds should be established for the changes identified in R3.1. For example, R3.1 requires that "any" change of sequence or mutual coupling impedance must be provided to a Generator Owner. For insignificant changes of sequence or mutual coupling impedance, CenterPoint Energy believes there would be little, if any, reliability benefit of communicating and technically justifying why a study is not required.

Response: Thank you for your comment.

a) **The drafting team believes that there is a reliability benefit in ensuring that all existing Protection Systems on Interconnected Elements have been reviewed. The drafting team acknowledges the fact that no immediate reliability concern has been identified and, as such, has allocated an extended time to complete this work.**

Organization	Yes or No	Question 3 Comment
b) The drafting team believes that information about any change (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element.		
FirstEnergy	No	A) FirstEnergy supports the 48 month timeframe to complete initial Protection System Studies. However, based on the fact that the drafting team may have overlooked system tie points of two transmission systems (see our response to Q2) the completion of Protection Studies may require additional time. B) FE could support a 48 month implementation and encourages the drafting team to consider a staggered plan that requires earlier completion for higher voltage systems. For example, 1) systems operated at 300kV and higher within 24 months, 2) systems operated at 200kV and higher up to 300kV within 36 months and 3) systems operated at 100kV and higher up to 200kV within 48 months. C) As expressed in FirstEnergy's Draft 1 comments, we do not support requirement text that is better placed in an Implementation Plan. A requirement should be written such that it is everlasting. As written, R1 part 1.1.1. has no meaning after the 48 month period expires. D) It is FirstEnergy's experience that the Transmission Owner would likely have the expertise and staff to perform the desired Protection System Study. The team should consider whether or not the DP and GO would typically be performing their own independent study or collaborating with the TO in a supporting role by providing data and reviewing study results. In regard to items B) and C) FirstEnergy proposes the following for Requirement R1. **Start of proposed requirement R1 text **R1. Each Transmission Owner shall perform a Protection System Study for each Interconnected Element on its System associated with a Generator Owner, Distribution Provider or another Transmission Owner. Each study shall include at a minimum: [Violation Risk

Organization	Yes or No	Question 3 Comment
		Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning] - the protective relay settings reviewed - power system Elements to be isolated - contingencies evaluated - Fault currents used - any issues identified - any revisions proposed 1.1. Each Transmission Owner shall update its Protection System Study: 1.1.1 Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required. 1.1.2 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required. 1.2. Within 90 calendar days after the completion of each Protection System Study the Transmission Owner shall provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement.**End of proposed requirement R1 text ** E) FirstEnergy recommends that for ease of ordered reading that the numbering of Measures be tied to the Requirement number. For example Requirement R1 has two measures M1 and M2. Consider renumbering to M1.1 and M1.2.

Response: Thank you for your comment.

A) The drafting team does not agree that it has overlooked the Transmission Owner to Transmission Owner interconnections in the Interconnected Element definition. However, it has been modified as follows: A BES Element that electrically joins facilities owned by:
a) separate Registered Entities, or
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

B) Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar

Organization	Yes or No	Question 3 Comment
months. The drafting team chose not to prescribe how an entity achieves compliance with this requirement; however, an entity may implement its own phased in approach within the confines of a 60 calendar month maximum time frame. C) The drafting team recognizes that your suggestion provides one way of addressing the requirement to have documented Protections System Coordination Studies for each Interconnected Element. However, the drafting team believes the structure of Requirement R1, Part 1.1.1, as currently written, achieves this goal. Further, NERC performs periodic reviews of standards and the requirement can be removed at that time, if appropriate. D) The drafting team recognizes that in many cases the Protection System Coordination Study may be a collaborated effort; but, ultimately it is the owner's responsibility. E) The format used in this standard is consistent with the current NERC standards development process.		
Sacramento Municipal Utility District	No	"The results based objective is that the registered entities communicate and coordinate with each other. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard is met." Performance of a PSS is an intermediate step toward achieving coordination. It does not improve reliability if an entity does not act on it. Only in the final step - when agreed upon changes are made - does system reliability actually improve. The standard should consist of R3.1 (one side makes a change which triggers a review), followed by R4.2 (all parties agree to the changes to be implemented). Documenting the process steps between these two points in time does not improve system reliability.
Response: Thank you for your comment. **The drafting team believes all requirements included in this standard support its reliability objective.**		
American Electric Power	No	AEP believes that 48 months to complete a Protection System Study is too short of a time frame, especially for Interconnected Elements which do not have an existing study. NERC's rationale for R1 states that "the drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame." If this is the case, then there should be no issue with extending this timeframe. AEP believes

Organization	Yes or No	Question 3 Comment
		that 72 months is a more reasonable timeframe for the following reasons: * The Transmission Owner will need to complete their own studies, as well as provide data to the entities they interconnect with (i.e. TO's, GO's, and DP's). This dependency would effectively shorten the amount of time the functional entity has to complete their studies to less than 48 months. * Before the work of the first bullet point above can be completed, entities must develop an agreed-upon list of Interconnected Elements and associated owners of the Protections System(s) associated with each Element. Once again, the time required to complete this task erodes into the entire time allowed to perform the study. In short, much of this work must be sequentially rather than in parallel, further justifying the need for an increased timeframe. * The resources needed to complete the required studies will also be impacted by a number of other standards currently in draft including: PRC-006-1, PRC-019-1, PRC-024-1, PRC-025-1 and PRC-004-3. The work required to perform both the proposed studies of this standard, as well as the other standards listed above, requires a Subject Matter Expert possessing a specific skillset gained from years of protection experience. Due to the limited number of such SMEs, industry will be very challenged in meeting all the proposed requirements given the limited number of such resources. In addition, the demand for qualified outside resources might be greater than their actual availability due to the time constraints involved.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team revised the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Salt River Project	No	Agree with timing, but confirmation from both parties that coordination has been reviewed should be adequate evidence.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
The drafting team stated that they believe all requirements included in this standard support its reliability objective, however Requirement R4 Part 4.2 the standard has been modified to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.		
Florida Municipal Power Agency	No	As worded, R1 seems to require two neighboring entities to perform independent studies. We would hope that the intent of the drafting team is to allow any one entity to do a study and then the neighboring entity accept the results of that study, or to perform a joint study. We suggest the drafting team make conforming changes to allow this.
Response: Thank you for your comment. **The drafting team recognizes that in many cases the owners may do joint studies; but both entities would need to agree with the results of the Protection System Coordination Study. After the initial assessment, the Transmission Owner is the entity required to perform future, periodic fault current studies.** **It is also recognized that, in most cases, it will require a collaborative effort to complete the studies; but ultimately, it is the owners' responsibility to ensure that the requirements of this standard are met.**		
ATCO Electric	No	ATCO Electric (AE) has an existing protection review program that runs on 5 year cycle. Each year, AE review approximately 20% of AE's transmission system to ensure the protection is in place or needs adjustment. Can the drafting team increase 48 month duration to 60 months?
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Bonneville Power Administration	No	BPA believes that the requirement to provide a protection system study for each interconnected element is onerous, and as a result, any amount of time is too

Organization	Yes or No	Question 3 Comment
		short.
Response: Thank you for your comment. **The drafting team believes that there is a reliability benefit in ensuring that all existing Protection Systems on Interconnected Elements have been reviewed. The drafting team acknowledges the fact that no immediate reliability concern has been identified and as such has allocated an extended time to complete this work.**		
Luminant	No	Comment on Requirement R1.2. The time frame listed may not be adequate under all circumstances or situations. Luminant recommends that the language be changed in this requirement as follows: "... Protection System Study performed pursuant to this requirement (including at a minimum, the Protection System(s) reviewed, any issued identified, and any revisions proposed) shall be within 90 days or in accordance to an agreed-upon schedule with a Transmission Owner, Generation Owner, or Distribution Provider." This would align with R4.1 that also provides the same time frame. The corresponding measures will also need to be modified if this language is accepted.
Response: Thank you for your comment. **Requirement R1, Part 1.2 requires entities to provide a summary of results of a Protection System Coordination Study (PSCS) to affected entities within 90 days of completion of such a study. Requirement R4, Part 4.1 provides an additional 90 days (or according to an agreed upon schedule) for the recipient of the summary results to review and respond. Considering the 90-day time frame begins after the completion of a PSCS, and only addresses the amount of time allotted to provide a summary of the study to another entity, the drafting team believes there is no need to add the caveat of "an agreed upon schedule" to the 90-day time limit.**		
Western Electricity Coordinating Council	No	Creating a Protection System consists of conducting Protection System studies and incorporating the data into an entity's transmission/generation/distribution system. Protection System studies are not a new concept to entities. In the event that an entity discovers that certain interconnected elements are not included in the Protection System study the entity should not require 48 months

Organization	Yes or No	Question 3 Comment
		to make the needed changes to the study. From a reliability perspective, entities should already have a basic Protection System study in order to have a Protection System. Allowing an additional 48 months creates a potentially large 4 year reliability gap based on entities existing studies and any needed corrections. From a compliance perspective, allowing a 48 month time frame for entities to have a documented Protection System study effectively pushes mandatory compliance for this standard out for an additional four years beyond the effective date. This time frame is excessive and should be reduced to no more than 24 months from the effective date of the standard.
Response: Thank you for your comment. **Based on stakeholder comments, and recognizing there is no evidence of widespread miscoordination of Protection Systems associated with Interconnected Elements, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Northeast Power Coordinating Council	No	Due to the extensive documentation, coupled with the collaboration between entities associated with this requirement, NPCC believes 60 months is a more appropriate time frame to comply. This timeframe is also more in line with the timeframe proposed in the draft PRC-019-1 in Project 2007-09. An alternative to the "static" time frame discussed above, which would also be acceptable, would be to base the timeframe on a formula that factors in the number of interconnected power system elements that the entity must contend with.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Pepco Holdings Inc & Affiliates	No	Each owner should already possess information demonstrating that their protective devices are set to “coordinate” with adjacent protection systems. However, the documentation that presently exists may not be in the form of a

Organization	Yes or No	Question 3 Comment
		formal “coordination study” in a format suitable for audit purposes. Some guidance should be provided indicating what form of documentation is expected, especially by the TO. For instance, on transmission tie lines between different TO’s coordination of zone distance elements is fairly straightforward and can be accomplished without a traditional “coordination study”. Also settings on pilot schemes need to be exchanged in order to allow for proper operation, but this is also not what is considered a traditional “coordination study”. On the other hand, coordination between GO’s and TO’s is even more complicated. Without some direction as to what specific documentation is required it is difficult to estimate how many existing interconnection points would have to be re-visited in order to produce the required auditable documentation. Some specific examples of what specific type of documentation is required would be helpful. To be safe, most likely all interconnection points would be revisited to ensure adequate compliance documentation. Also, for each revised Protection Study produced (per R1.1) a formal review (R1.2) and approval (R4.1) would be required. As such, with the large number of interconnection points on the system a 60 month time frame would be more appropriate. The drafting team acknowledged that they had no evidence that there is widespread miscoordination between Interconnected Facilities when establishing the arbitrary 48 month requirement.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.** **Note: Acceptable evidence (per Measure M1) is a Protection System Coordination Study (PSCS) or a summary of the results of the PSCS.**		
Southern Company	No	For large entities with hundreds of generators, a longer initial time frame is needed. In addition, consideration should be given to the fact that existing transmission protection and control engineering personnel will be fully engaged

Organization	Yes or No	Question 3 Comment
		in the work associated with FERC order 754 for The next 12+ months.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Georgia Transmission Corporation	No	Guidelines and Technical Basis Req. R1: "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."......These studies may include graphical coordination....; relay scheme simulation studies....; and sensitivity studies using sequence...., and adequate directional polarizing quantities. This activity will be onerous without a full system model and software to perform studies that would check coordination of stacked curves and stepped distance relays. Of particular note is the question of adequate directional polarizing quantities. There should be an expected minimum requirement such as time overcurrent plots and zone distance plots of the existing relay settings for the terminal with the fault points used as the basis. This data would then be used to indicate if the 10% point has been reached that would require a new coordination follow up at the end of the next 24 month fault study.
Response: Thank you for your comment. **Acceptable evidence (per Measure M1) is a Protection System Coordination Study (PSCS) or a summary of the results of the PSCS. The ±10% threshold relates to the fault current at the interconnected bus; not individual relay tolerances.**		
National Grid and Niagara Mohawk (A National Grid Company)	No	How would "fault currents used" be presented for coordination of distance relays ? Also if the above items must be included, at a minimum, they need to be enumerated in requirement R1.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
Each company must determine proper use of fault currents for their particular Protection System components. The language of the Requirement R1, Part 1.2 has been modified to indicate "(including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions proposed)".		
Hydro One Networks Inc.	No	Hydro One believes 60 months is a more appropriate time frame to conduct, document and obtain consensus for a protection system study. This timeframe is also more in line with the timeframe proposed in the draft PRC-019-1 in Project 2007-09. Large entities and small entities have the same time frame to complete this work which seems unreasonable. Alternatively, an extended period should be provided based on a formula that factors the quantity of interconnected power system elements.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Ingleside Cogeneration LP	No	Ingleside Cogeneration, like many other Generator Owners, does not typically perform fault studies unless we have made material changes to our transmission system interconnection. Even then, we provide modeling data to the appropriate Transmission Owners and Transmission Planners, who execute the assessments on a Regionally-standardized platform. We are not convinced that we can add value to this process - other than to demonstrate that the information required by the TO and TP was provided, and the study took place. In our view, the requirement should clearly accommodate this working arrangement. As it reads now, it seems like both the GO and the TO must perform separate assessments. The extra costs that we will incur to commission external consultants is difficult to justify when there are so many other pressing priorities (e.g.; cold weather preparedness).
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
The drafting team recognizes that in many cases the owners may do joint studies; but both entities would need to agree with the results of the Protection System Coordination Study. After the initial assessment, the Transmission Owner is the entity required to perform future, periodic Fault current studies. **It is also recognized that, in most cases, it will require a collaborative effort to complete the studies; but ultimately, it is the owners' responsibility to ensure that the requirements of this standard are met.**		
Dynegy	No	Perhaps R1 could be reworded to answer the following question: "If an entity registered only as a GO owns relays that trip the generator alone (and not relays detecting a fault on any transmission lines), does this Standard apply?"
Response: Thank you for your comment. **Per the Applicability section of the standard, if the Generator Owner owns no Protection Systems that require coordination with other owners, then the standard would not apply to those Protection Systems.**		
Portland General Electric Co	No	Portland General Electric Company appreciates the drafting team's consideration of comments. Since there wasn't a general comment section at the end of this form, the discussion of timeframes seems appropriate here. The effective date (the first quarter six months after approval) does not allow sufficient time for compliance. This standard will require that entities include in all interconnection agreements a detailed protection coordination schedule or be subject to the long timelines detailed in the standard. None of the agreements (if they even exist) for projects six months out include a protection coordination schedule, nor do their project schedules accommodate the long durations detailed in the standard. Agreements will also need to be drawn up for smaller projects in order to document a protection coordination schedule, lest the interconnecting utility prevents us from energizing by taking the full 90 days to review the relay settings. In addition, entities may need at least one additional resource to conduct the bi-annual coordination studies and manage the interconnection due dates. PGE suggests an implementation period of 24

Organization	Yes or No	Question 3 Comment
		months since planning is done more than a year in advance.
Response: Thank you for your comment. **The drafting team believes the elements of Requirement R3 provide sufficient flexibility for project scheduling with regard to achieving proper Protection System Coordination prior to energization.** **Based on stakeholder comments, the drafting team has extended the timeframe for Requirement R1, Part 1.1.1 and the periodic Fault current study to 60 calendar months.**		
Liberty Electric Power LLC	No	R1 should not apply to GOs. GOs are not allowed to have the TO information needed for a system study under market rules.
Response: Thank you for your comment. **The drafting team does not believe that the Transmission Owner is restricted from providing the Protection System data necessary for the Generator Owner to ensure proper coordination of Protection Systems applicable to this proposed standard.**		
ReliabilityFirst	No	ReliabilityFirst abstains and offers the following comments for consideration: 1. Requirement R1, Part 1.1.1a. ReliabilityFirst questions the rationale for the 48 calendar month window to perform a Protection System Study if NO study exists. ReliabilityFirst believes that a Protection System Study is one of the fundamental reasons for the standard and believes if NO study had ever been performed, one should be performed as soon as possible (12 months). Within the rationale section, the drafting team states: "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame." With no widespread mis-coordination of protection systems, ReliabilityFirst questions the actual need for the standard itself. 2. It is not clear where the 10% threshold in Part 1.1.2 and calculated in Part 2.1.2 is applied. Does the 10% threshold apply to the total bus Fault current at the interconnecting bus or the contributing Elements? If it is the total, then

Organization	Yes or No	Question 3 Comment
		there are situations where some of the sources into the bus may change their contribution quite a bit more than the 10% threshold but yet the total change could be less than 10%. Protective relaying is set in reference to the Element it is protecting or, to be more precise, the instrument transformers associated with an Element. The 10% threshold should be applied to the Interconnecting Element as its contributing quantities could change significantly even if the total Fault current stayed nearly the same. It is the Fault quantities on the Element that the interconnection protection sees - not the total bus Fault current (unless the Interconnecting Element is a bus). It is also not clear which phase or sequence currents are being used in the %Deviation calculation. Is it 3I0 (3 times zero sequence) current for single line to ground Faults and I1 (positive sequence) current for 3-phase Faults? It should be noted that if variations in Fault current of 10% are acceptable, then entities may need to adjust their criteria to use margins of 15% or more to consider other sources of error such as relay and instrument transformer accuracy.
Response: Thank you for your comment. 1. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months. Additionally, the drafting team believes there is a reliability benefit to require that all interconnected Elements have a valid Protection System Coordination Study in order to ensure coordination between owners of interconnected Elements.** 2. **Requirement R2, Part 2.1.1 refers to maximum available current at the interconnecting bus (total bus fault current). The drafting team has included clarifying language in the Rationale for Requirement R2, Part 2.1 and in the language of Requirement R2, Part 2.1.2 to indicate the need to compare both line-to-ground and three-phase fault current values when performing the calculation to check for a ±10% deviation.**		
Entergy Services, Inc. (Transmission)	No	Request consideration in replacing the time increment of 48 months with 4 years for the time frame.
Response: Thank you for your comment. **The drafting team has retained the use of months; however, the drafting team has modified the timeframe for Requirement R1,**		

Organization	Yes or No	Question 3 Comment
Part 1.1.1 to 60 calendar months.		
PPL Corporation NERC Registered Affiliates	No	Sixty months would be more appropriate to study all the interconnections. There has not been a major problem with mis-coordination of Protection Systems associated with Interconnected Elements. Also, the standard does not fully address what all should be included in a Protection System Study.R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
ITC	No	The amount of work required to comply with this requirement may be significant and may impact ongoing efforts to upgrade and improve the system. The above items that need to be documented can often be discussed and agreed to verbally between parties and are were often not part of a permanent record. The additional record keeping required may be significant and not add to the reliability of the BES.
Response: Thank you for your comment. **The drafting team does not believe a verbal agreement is measurable or auditable.**		
Western Small Entity Comment Group	No	The comment group agrees that Protection Systems associated with Interconnected Elements must be coordinated. However, the reliability goal should be strictly focused on documenting the associated owners (parties) are cooperating, and in agreement with protection settings to achieve proper coordination. A requirement to have a documented Protection System Study completed will not improve on a simple statement from the parties that proper coordination has been agreed upon. Provision of a Protection System Study as

Organization	Yes or No	Question 3 Comment
		compliance evidence (in whole or a summary) implies recourse to check its completeness or accuracy. For complex systems, this is very subjective. However, the Standard as written intends to make no effort to verify the completeness or accuracy of a Protection System Study; the intent is to simply verify that it exists. Since the Protection System Study is not subject to review, its production as compliance evidence is nothing more than added bulk.
Response: Thank you for your comment. **Acceptable evidence (per Measure M1) is a Protection System Coordination Study (PSCS) or a summary of the results of the PSCS. Minimum elements required in the summary results are provided in Requirement R1, Part 1.2. It is the responsibility of the respective owners to ensure the accuracy and completeness of the study results.**		
Public Service Enterprise Group	No	The issue is consistency in what comprises a valid PSS. For example, for "contingencies evaluated," it seems that each owner should evaluate a core set of the same contingencies as opposed to this being an owner-by-owner decision. The lack of specificity as to what is required for a PSS is the issue.
Response: Thank you for your comment. **A Protection System Coordination Study (PSCS), by definition within PRC-027, must demonstrate that existing or proposed Protection Systems operate in the desired sequence for clearing Faults. Most entities have internal procedures regarding the performance of coordination studies that produce the results required, but may not involve the exact same process or procedures that another entity follows to achieve Protection System coordination. The drafting team chose not to specifically dictate the elements of this process, but rather to continue to allow entities to "demonstrate that existing or proposed Protection Systems operate in the desired sequence for clearing Faults" according to their own internal procedures.** **The examples of information required in a "summary" of the results of a PSCS represent a minimum set of data that must be provided so the receiving entity can effectively assess coordination of the system. The drafting team has revised the examples to add clarity and the particular example provided in your comment has been removed.**		
Midwest Reliability Organization	No	The NSRF recommends that this Standard be filtered through the paragraph 81

Organization	Yes or No	Question 3 Comment
NERC Standards Review Forum		criteria. If not, the NSRF recommends the following items. 1. Although supportive of the extended timeframe in R1, the NSRF is concerned that the proposed Part 1.2 is overly prescriptive. Considering the sheer quantity of microprocessor relay settings that could potentially be reviewed as part of a Protection System Study, having to provide associated owner(s) the results of every protective relay setting reviewed would be unnecessarily burdensome with little benefit to reliability. Recommend the drafting team revise Part 1.2 to require entities to only provide information related to settings being proposed for change and have all other settings be made available upon request. 2. Please clarify the application of R1, Part 1.2 in the event that both ends of the Interconnected Element are owned by the same entity. In consideration that final settings and internal documentation would provide proof that everything was looked at accordingly, would the entity still need to develop and distribute a summary internally as well? Recommend revising Part 1.2 to only require functionally separate entities to provide documentation of the results of the Protection System Study. 3. Rather than specify the details to be shared as a result of a Protection System Study, recommend Part 1.2 be modified to remove “power system Elements to be isolated, contingencies evaluated” as a minimum requirement. Having entities share their evaluation methods with other Entities appears to be unnecessary administrative work. Considering that it is the responsibility of the individual entity to perform their studies correctly, another entity should not have to worry about, nor does it have the responsibility for keeping tabs on, whether an external study was done to a single or double contingency level, what external Facilities become isolated, etc. Additionally, the NSRF is concerned with the phrase “Fault current used” as it applies to R1, Part 1.2. In consideration that Fault current values do not necessarily mean that two entities are using

Organization	Yes or No	Question 3 Comment
		like models, recommend a comparison of boundary equivalents be used instead to ensure that the models are comparable between entities. If not, entities would potentially be sharing every value for every iteration to ensure like models. Suggested revisions to R1, Part 1.2 in support of the above comments are as follows: 1.2. Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with Interconnected Element(s) that include two or more Registered Entities, a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, proposed revisions to the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, boundary equivalents at necessary buses Fault currents used, any issues identified, and any additional revisions proposed). If existing documentation does not include enough detail to meet the requirement for an acceptable Protection System Study, utilities will be forced to add to the existing documentation for compliance purposes even though the existing settings coordination is adequate. This will place additional compliance burden on utilities while not necessarily improving reliability. Since there is no evidence of widespread mis-coordination of Protection Systems associated with Interconnection Elements, it would seem reasonable to have this standard apply to any changes made to an existing Protection System or all new Protection Systems.

Response: Thank you for your comment.

1. **In response to stakeholder comments, the drafting team has refined the examples given in Requirement R1, Part 1.2 of the minimum information required in a summary of the results of a Protection System Coordination Study (PSCS).**
2. **The drafting team believes, even for functional entities under the umbrella of a single company, there is a reliability benefit associated with the provision for the information required in a summary of results of a PSCS from Transmission Owner to**

Organization	Yes or No	Question 3 Comment
Generator Owner. The drafting team does acknowledge that in the cases where a single person is doing the overall coordination for a given interconnection; a single document that provides the requirements for a summary of the results of the Protection System Coordination Study should be sufficient for use by both owners. **3. In response to stakeholder comments, the drafting team has refined the examples given in Requirement R1, Part 1.2 of the minimum information required in a summary of the results of a Protection System Coordination Study. The particular items you mentioned were removed from the requirement.**		
American Transmssion Company, LLC	No	The drafting team states that there is no evidence of wide spread misoperation due to lack of coordination. However, R1 requires a utility to establish an evidence package of legacy coordination that predates PRC-001's effective date. While 48 months is an improvement to PRC-027, that timeframe still imposes a significant burden on utilities, especially those that are not vertically integrated. ATC recommends that the drafting team consider changing the implementation period for R1 from 48 months to 72 months.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Essential Power, LLC	No	The time frame is not the issue. R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.
Response: Thank you for your comment. **The drafting team believes that the Generator Owner is an appropriate Applicable Entity for this Standard since they often apply Protection Systems that require coordination with other owners' Protection Systems.**		
Cogentrix Energy Power Management, LLC	No	The time frame is not the issue. R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. **The drafting team believes that the Generator Owner is an appropriate Applicable Entity for this Standard since they often apply Protection Systems that require coordination with other owners' Protection Systems.**		
Nebraska Public Power District	No	To mitigate compliance risks for various types of data formats for existing studies and studies older than June 2007 this standard will likely require utilities to go back and update all data so that it meets the requirements and description of evidence in the application guidelines when the requirements become enforceable. This could likely take longer than 3 years. I would recommend more time such as 6 years based on two audit periods (time depends on the number of applicable system ties as well).
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Southwest Power Pool Reliability Standards Development Team	No	We are concerned that 48 months could still not be sufficient for these studies. We would ask that the team consider 72 months. There is a concern that with all the companies having new standards to comply with, the Transmission Owners/Generation Owners are being overloaded and have the same resources.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months.**		
Tennessee Valley Authority	No	We do not feel like 48 months is a reasonable timeframe to meet the minimum requirements for Protection System Studies (PSS). In the current form of the standard, for an existing PSS to be valid, several minimum requirements are given in R1.2. While this is a good requirement for new PSS, it eliminates almost all of our existing PSS as being valid. We have the stance that many of our

Organization	Yes or No	Question 3 Comment
		existing PSS are of a high quality and should be considered valid, but do not meet the minimum requirements from R1.2. We recommend allowing existing PSS to be submitted in their current form between all protection system owners of an Interconnected Element within a reasonable time frame of the standard effective date and allowing the owners to approve the existing PSS as valid if they desire. Then, that existing PSS could be used as the baseline PSS until the 10% change in fault occurs from the existing dated PSS. At that time, a new PSS should be performed to meet the minimum requirements as outlined in R1.2.
Response: Thank you for your comment. **The drafting team recognizes that entities approach the process of protection system coordination according to individual entity policy and procedure, yet still achieve the same high quality results in the end. Based on your and others' comments, the drafting team has modified the timeframe associated with Requirement R1, Part 1.1.1 to 60 calendar months and revised the minimum information required in a summary of the results of a Protection System Coordination Study. The drafting team believes that a previous study can be used as a basis of a summary that includes all the needed information and send it to the other party to review after the effective date of the standard.**		
Wisconsin Electric Power Company	No	1.We strongly believe that 60 months would be a more achievable time frame to study the many interconnections that an entity may have. This will also allow Generator Owners the time needed to gain the resources required to perform these studies, since they may not be presently so equipped. As stated by the drafting team in the rationale for R1 there is no evidence of wide spread mis-coordination of Protection Systems associated with Interconnected Elements. 2.It would also be helpful to provide a better description of what is required to be included in a Protection System Study. For example, is the study required to include pilot scheme timing and element coordination, breaker failure coordination, coordination under minimum and maximum fault current cases, etc?
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
1. Based on stakeholder comments, the drafting team has modified the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months. 2. A Protection System Coordination Study (PSCS), by definition within PRC-027, must demonstrate that existing or proposed Protection Systems operate in the desired sequence for clearing Faults. Most entities have internal procedures regarding the performance of coordination studies that produce the results required, but may not involve the exact same process or procedures that another entity follows to achieve Protection System coordination. The drafting team chose not to specifically dictate the elements of this process, but rather to continue to allow entities to "demonstrate that existing or proposed Protection Systems operate in the desired sequence for clearing Faults" according to their own internal procedures. The examples of information required in a "summary" of the results of a PSCS represent a minimum set of data that must be provided so the receiving entity can effectively assess coordination of the system. The drafting team has revised the examples to add clarity and the particular example provided in your comment has been removed.		
Ameren	Yes	Note- No. 1 objection is above in Question 1 (2) Requirement R2 requires short circuit study every 24 months even though the drafting team's own rationale is that other requirements will trigger Protection System Studies first. Thus we believe that R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. (3) VSL escalation in 10 days is not representative of the severity of the violation. The drafting team correctly points out in R1 rationale that it "has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements." We have about 500 Interconnected Elements per our present understanding of Draft 2 definitions and guidance. We recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity's Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels, respectively. Specifically, Lower would apply to up to

Organization	Yes or No	Question 3 Comment
		5% so that even a single Interconnected Element would be a violation.
Response: Thank you for your comment. 1. **The drafting team revised Requirement R2 to require, at least once every 60 calendar months, Transmission Owners perform a short circuit study and calculation of Fault current deviation for its Interconnected Elements or provide a technical justification why periodic fault current studies are not necessary for the coordination of Protection Systems associated with Interconnected Elements.** 2. **Some of the VSL increments have been increased but the drafting team believes the 10-day increments are appropriate in some cases. The use of percentages in the VSLs for this standard is not permitted because the requirements in the standard are specific to each Interconnected Element.**		
Manitoba Hydro	Yes	Although Manitoba Hydro agrees with question 3, we have the following general comments: (1) R2, 2.1.1 - Reference to the Protection System Study should be the most recent Protection System Study to be consistent with the rest of the requirement and the use of the word 'available' is a little problematic. What if no study exists? As we read it, the requirement to do a study is within 48 months of the effective date of the standard, while the requirement to do a short circuit study is at least every 24 months. If the Protection System Study is not available, is there no requirement to do the short circuit study? (2) R2, 2.2 - For clarity, we suggest rewording the first sentence to read 'Within 30 calendar days after identification, through the calculation performed pursuant to Requirement R2, Part 2.1.2, of a deviation in...' (3) R3, 3.1 - No time frame is given and it is unclear as to whether these details are to be only for proposed or future changes or additions, or whether it can be 'notice after the fact' (when read with the remaining requirements, it would be assumed it is 'prior notice', but that's not clear on the face of this part 3.1). In addition, should 'facilities' be capitalized in 3.1? Also, there needs to be consistent references to 'changes and additions' or just 'changes' within this R3

Organization	Yes or No	Question 3 Comment
		as currently there are references to both made. (4) R3, 3.2 - We suggest moving the time frame to the start of the Part for consistency with the drafting of other Parts and for ease of reading. (5) R3, 3.3 - We believe that the timeline is incomplete. Assuming that the timeline is meant to be 'within 30 calendar days of the (proposed?) changes or additions being made'. (6) VSLs/VRF table: R1, R3 - For consistency, the references should read 'less than or equal to 10 calendar days' instead of '10 calendar days or less'. (7) VSLs/VRF table: R4 - All of the references to 4.1 appear to be incorrect because 4.1, as currently drafted, does not require confirmation of acceptance of the summary results.
Response: Thank you for your comment. 1. **If you do not have a Protection System Coordination Study, you cannot perform a Fault current comparison.** 2. **The drafting team considered this alternate language; however, we believe the existing language is sufficient.** 3. **The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The drafting team capitalized "Facilities" but believes the other language is appropriate as written.** 4. **The drafting team believes the overall language of the requirement is appropriate as written.** 5. **The changes noted in Requirement R3, Part 3.3 are not proposed changes, they are indentified as 'changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components'.** 6. **The drafting team made the suggested changes for consistency in the VSL language.** 7. **The VSLs have been modified for consistency with the Requirement 4, Part 4.1 language.**		
Operational Compliance	Yes	It would be great if NERC provided a common format for all of us to use when providing this information
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
Acceptable evidence (per Measure M1) is a Protection System Coordination Study (PSCS) or a summary of the results of the PSCS. **The examples of information required in a "summary" of the results of a PSCS represent a minimum set of data that must be provided so the receiving entity can effectively assess coordination of the system. The drafting team has revised the examples to add clarity.**		
JEA	Yes	There is no place to put in a comment for R2 so this is for R2. We believe that the requirement to perform an analysis should be changed from once every 24 months to once every 36 months. Whenever changes are done to the system an analysis is done so this for areas that have not changed and we believe that once every 3 years should be sufficient.
Response: Thank you for your comment. **Based on stakeholder comments, the drafting team extended the 24 month review of Fault currents to 60 calendar months.**

Idaho Power Co.	Yes	
Exelon Corporation and its affiliates	Yes	
Xcel Energy	Yes	
City of Tallahassee	Yes	
Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

Response: Thank you for your support.

The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and

Organization	Yes or No	Question 3 Comment
communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise some of the VSLs.		

4. **In Requirement R4, the drafting team replaced the need to 'reach agreement' with 'confirming acceptance.' Do you agree with this change? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration:

The majority of the commenters agreed with the change from 'reach agreement' to 'confirming acceptance'.

Several commenters felt the change made the requirement more ambiguous and were unclear what 'confirming acceptance' means. The confirming acceptance indicates that the entity has not identified any potential coordination issues with the proposed Protection System change, not necessarily that they agree with the other entities philosophy. The drafting team modified Requirement 4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.

A few commenters felt Requirement R4, Part 4.2 was unnecessary and should be eliminated. The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.

A few commenters felt the standard should include a conflict resolution process for situations when 'acceptance' cannot be reached. The drafting team believes that any conflict resolution should be handled through normal business practices.

Organization	Yes or No	Question 4 Comment
Manitoba Hydro	No	(1) R4, 4.2 - The concept of 'accept' the changes are problematic. We are unclear as to what exactly this means? Is it something more than acknowledging that the changes are occurring? Does it go so far as 'agreement' with the changes? What happens if the owner does not 'accept' the changes? (2) R4, 4.1 - For consistency with wording the in R3, 'planned change' should be 'proposed change' or 'addition'.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. 1. **Based on stakeholder comments, the drafting team modified Requirement 4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.** 2. **The suggested change has been made.**		
Georgia Transmission Corporation	No	1) The protection criteria and philosophies between entities can differ. For example, one entity may use the practice of coordinating for normal and single worst case contingency conditions, which is included in information/documentation provided to the neighboring entity in such Protection System Studies. The neighboring entity may have a slightly different protection criteria or philosophy, so exceptions may be required on a case by case basis using the "art and science" of protective relaying. Therefore, interpretation of 'confirming acceptance' means there may be differences in protection elements used by each entity but that there were no major disagreements and that generally the methods were acceptable and included using industry protection practices. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually agreed upon response time, can be considered as confirmation of acceptance.
Response: Thank you for your comment. 1. **The drafting team acknowledges that entities may have differing protection philosophies. The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the**		

Organization	Yes or No	Question 4 Comment
affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues. 2. The drafting team believes that any conflict resolution should be handled through normal business practices.		
Bonneville Power Administration	No	According to this standard, something as simple as changing a CT ratio must now be communicated to all interconnected functional entities and documented. The interconnected functional entities must then “confirm acceptance” of the CT ratio change before the change can be made. The acceptance must then also be documented. This level of bureaucracy is unnecessary and counterproductive. The change from “reach agreement” to “confirming acceptance” is irrelevant.
Response: Thank you for your comment. **Yes, current transformer ratios are listed as one of the changes listed in Requirement R3, Part 3.1 that must be communicated. The drafting team does not understand any circumstance where a current transformer ratio in a Protection System would be changed that would not result in a change to the Protection System settings.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
FirstEnergy	No	FirstEnergy proposes that R4 Part 4.2 be deleted. The requirement is overly burdensome and R4 part 4.1 should provide sufficient evidence of whether or not the entity receiving study results believed any further action was required. Absent any such notification, the party would by default be accepting of the information. In regard to need for "acceptance" prior to planned changes FirstEnergy does not believe this is necessary. The drafting team in its rationale provided for Requirement R1 indicated "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements" therefore we do not believe R4 part 4.2 is a necessary reliability requirement. Furthermore, other changes (R3 part 3.3) potentially

Organization	Yes or No	Question 4 Comment
		trigger upgraded Protection System Studies being communicated without “acceptance” prior to their implementation.
Response: Thank you for your comment. **The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Nebraska Public Power District	No	Getting acceptance within the required time frame is not in the control of the requestor. The concern is the numerous timelines in this standard that require timely responses will create an overly complex standard that will be difficult implement and to audit. The starting points for the timelines will be difficult to audit as well since much of this must be determined between two or more entities. How will enforcement view a requesting utility that sends a timely request but the response is a late confirmation of acceptance? The numerous time lines will create significant confusion and very complex data retention practices that will be difficult to track and difficult to audit. It appears the focus is more on time lines and the likely result is the content of the shared information will likely suffer due to the burden of tracking dated communications between entities. This draft standard includes time lines ranging from “prior to in service date, 30 days, 90 days, 6 months, 2 years and 4 years”. There should be fewer and simpler time lines with the focus on if the sharing of information took place and not on when did it take place. The SDT statement below should be generalized to the standard as a whole:”The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in

Organization	Yes or No	Question 4 Comment
		a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date,"At a minimum remove the calendar day references and make them all 6 months for simplicity so the option is to use and agreed upon time or 6 months. Possible Suggestions: A simpler method would be after the initial 4 years to perform a study then every 24 months perform a short circuit study to determine the present maximum available fault current values (single line to ground and 3-phase) at the interconnecting bus per Requirement R1 and demonstrate that the fault model was provided to the interconnecting entities within this time period along with the settings so the receiving entity can review against their design. Auditing would verify this data was sent on a two year schedule. For new protection interfaces verify protection studies or relay settings or summaries of studies were exchanged for review prior to the equipment going in service.
Response: Thank you for your comment. **The drafting team believes the timeframes in the standard, as revised, are necessary and appropriate.**		
Ingleside Cogeneration LP	No	Ingleside Cogeneration still holds to the position that a dispute resolution process needs to be defined should we reach an impasse with the TO. R4 still requires that both parties "accept" the proposed change - which means that one or the other could unreasonably demand an Protection System-related expenditure without any need to demonstrate that a corresponding reliability benefit will be realized. It is not apparent to us that this situation is already addressed in NERC's Rules of Procedure, which ultimately is the governing document for continent-wide Reliability Standards.
Response: Thank you for your comment. **The drafting team believes that any conflict resolution should be handled through normal business practices.**		

Organization	Yes or No	Question 4 Comment
National Grid and Niagara Mohawk (A National Grid Company)	No	It is not clear where the old text "reach agreement" and the new text "confirming acceptance" were/are used. Also, "confirming acceptance" is vague in meaning.
Response: Thank you for your comment. **The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Midwest Reliability Organization NERC Standards Review Forum	No	R4, Part 4.2: In consideration that R4, Part 4.1 already requires entities to review the results of a Protection System Study and provide any related feedback, recommend Part 4.2 be removed from the standard. Without additional guidance within the standard specifying the timeframe in which an entity must provide its confirmation, the entity implementing the planned change could potentially be left waiting indefinitely for confirmation despite the study already being reviewed and accepted as part of Part 4.1. If part 4.2 is not removed, recommend that additional guidance be provided concerning time frames (90 days?).
Response: Thank you for your comment. **The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Xcel Energy	No	Requirement 4.2 requires entities to receive evidence confirming acceptance of changes prior to implementing these changes. This coordination already occurs,

Organization	Yes or No	Question 4 Comment
		and we believe this should be a standard practice for all applicable entities. However, we do not agree that this documentation-only requirement is necessary or beneficial to reliability. Instead, we believe this would deter valuable resources to unnecessary compliance evidence activities. Therefore, we recommend that this requirement be eliminated.
Response: Thank you for your comment. **The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Wisconsin Electric Power Company	No	The current draft standard lacks any clear responsibility for performing the complete Protection System Study, especially if the interconnected parties cannot accept or reach an agreement. The recommended change is to make the Transmission Owner accountable for the overall Protection System Study, at least at the Generator-Transmission interconnections. The other entities such as Generator Owners should be responsible to provide the necessary data required for the overall study. This makes the most sense based on limited resources and capabilities, as well as access to all data. This is especially true for independent Generator Owners that operate in the deregulated market. It is not feasible to make all entities somehow responsible for the study.
Response: Thank you for your comment. **The drafting team believes that the Generator Owner is an appropriate Applicable Entity for this standard since they often apply Protection Systems that require coordination with other owners' Protection Systems.**		
Southern Company	No	The parties at the opposite ends of an interconnecting facility may not have the same protection philosophies, and acceptance may not be achievable. It is

Organization	Yes or No	Question 4 Comment
		unclear what it means to confirm acceptance. Does this mean that the two must come to an agreement for each other's protection system settings, or is it acceptable to agree that we disagree?
Response: Thank you for your comment. **The drafting team acknowledges that entities may have differing protection philosophies.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
City of Tallahassee	No	These phrases do not appear to be contained within draft two.
Response: Thank you for your comment. **The drafting team intent was to indicate the thought behind the fact that language was changed in R4.2 to indicate 'confirm the owner(s) of each Facility associated with the affected Interconnected Element accept...'** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Northeast Power Coordinating Council	No	This change is more ambiguous than reach agreement. How can changes to Protection Systems occur unless agreement is reached via a signed off Protection System Study? What does it mean to confirm acceptance?
Response: Thank you for your comment. **The confirming acceptance indicated that the entity had not identified any potential coordination issues with the proposed Protection System change, not necessarily that they agreed with the other entities philosophy.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications**		

Organization	Yes or No	Question 4 Comment
associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.		
Hydro One Networks Inc.	No	This change seems more ambigious than "reach agreement". How can changes to Protection Systems occur unless agreement is reached via a signed off Protection System Study? What does it mean to "confirm acceptance"?
Response: Thank you for your comment. **The confirming acceptance indicates that the entity has not identified any potential coordination issues with the proposed Protection System change, not necessarily that they agree with the other entities philosophy.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Texas Reliablity Entity	No	TRE agrees with the need to notify the Facility Owner of the proposed changes. However, if the receiving entity does not agree with the proposed changes, there needs to be a venue to reach consensus. The receiving entity should be able to suggest changes based on technical rationale to resolve the disparities. A provision for dispute resolution needs to be provided. TRE suggests re-wording R4.2 to - "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, notify the Facility owner(s) associated with the affected Interconnected Element. If consensus cannot be reached on the proposed Protection System(s) changes, each entity shall document the technical rationale for its position on each disputed issue prior to implementation."
Response: Thank you for your comment.		

Organization	Yes or No	Question 4 Comment
The drafting team believes that any conflict resolution should be handled through normal business practices. **Note: Prior to implementing any proposed change(s) associated with Requirement R3, Part 3.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
Pepco Holdings Inc & Affiliates	No	We find that changing the wording from "confirming acceptance" to "reaching agreement" does little to address the root problem associated with mandating mutual agreement. We suggest Requirement R4 be removed entirely or extensively re-written to address the concerns outlined below: Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What I f agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is

Organization	Yes or No	Question 4 Comment
		reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. It is unreasonable and unfair to hold one party non-compliant due to the failure of another party to reach agreement. Furthermore, in the example provided above, it is a detriment to reliability to delay implementation of the setting change on breaker D just because mutual agreement could not be reached.It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the "Protection System Study" and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing a clear division of responsibilities and assignment of who will be held non-compliant if agreement cannot be reached is unfair to either party.

Response: Thank you for your comment.

The drafting team believes that any conflict resolution should be handled through normal business practices.

The drafting team believes that Requirement R4, Part 4.2 is integral to the intent of this standard.

Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications

Organization	Yes or No	Question 4 Comment
associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.		
ACES Standards Collaborators	Yes	(1) We had no issues with the use of agreement in the previous version. Coordination of protection systems is important enough to obtain agreement. Furthermore, we believe confirming acceptance and reaching agreement are synonymous. If two entities need to "resolve differences and confirm acceptance that their Protection Systems are coordinated," that is the same as stating that the entities need to reach an agreement.
Response: Thank you for your comment and support. **The changes were made based on previous comments from those that believed agreement was too strong. They indicated that confirming acceptance indicates that the entity has not identified any potential coordination issues with the proposed Protection System change, not necessarily that they agreed with the other entity's philosophy.** **Note: The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**		
SERC Protection and Controls Subcommittee (PCS	Yes	1) The protection criteria and philosophies between entities can differ. For example, one entity may use the practice of coordinating for normal and single worst case contingency conditions, which is included in information/documentation provided to the neighboring entity in such Protection System Studies. The neighboring entity may have a slightly different protection criteria or philosophy, so exceptions may be required on a case by case basis using the "art and science" of protective relaying. Therefore, interpretation of 'confirming acceptance' means there may be differences in protection elements used by each entity but that there were no major disagreements and that generally the methods were acceptable and included

Organization	Yes or No	Question 4 Comment
		using industry protection practices. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually agreed upon response time, can be considered as confirmation of acceptance.
Response: Thank you for your comment and support. **1. The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.** **2. The drafting team believes that any conflict resolution should be handled through normal business practices.**		
Dominion	Yes	1) Dominion interprets the wording "confirming acceptance" to mean that there are no major disagreements and that generally the methods between entities are acceptable using industry protection practices even if different protection setting philosophies' exists. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually agreed upon response time, can be considered as confirmation of acceptance. The initiating party should not be restricted from applying appropriate settings due to the lack of acceptance confirmation from the other entity.
Response: Thank you for your comment and support.		

Organization	Yes or No	Question 4 Comment
1. The drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues. 2. The drafting team believes that any conflict resolution should be handled through normal business practices.		
ReliabilityFirst	Yes	ReliabilityFirst abstains and offers the following comments for consideration: 2. Requirement R4 Violation Severity Level a. During the previous comment period, ReliabilityFirst recommended that VRF for R4 be changed to "High" since this is dealing with interconnection protection systems. The SDT response by indicating they "...believes the VRF for Requirement R4 more aligns with the NERC criteria for a medium risk. " After reading the NERC criteria for a medium risk, ReliabilityFirst would agree only if the Time Horizon of this requirement is changed to "Long Term Planning"
Response: Thank you for your comment. The drafting team believes that the Time Horizon for Requirement R4 is assigned correctly at "Operations Planning" and also believes the VRF of "Medium" is correct. No changes were made.		
PPL Corporation NERC Registered Affiliates	Yes	There is no clear responsibility in the standard if both parties cannot confirm acceptance.
Response: Thank you for your comment and support. The drafting team believes that any conflict resolution should be handled through normal business practices.		
Independent Electricity System Operator	Yes	We agree with the intent of the proposed changes, but believe some editorial changes are necessary for more clarity. We suggest the following wording for the SDT's consideration: 1. "Confirm with the owner(s) of each Facility associated with the affected Interconnected Element that it accepts (or acceptance of) the resulting

Organization	Yes or No	Question 4 Comment
		Protection System(s) changes." 2. In fact, Part 4.1 could also be worded to add clarity:"Within 90 calendar days after receipt of the proposed Protection System(s) changes,"

Response: Thank you for your comment and support.

1. **Based on stakeholder comments, the drafting team revised Requirement R4, Part 4.2 to read: Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.**
2. **The "receipt" in Requirement R4, Part 4.1 is referencing the summary results of the Protection System Coordination Study. The drafting team believes this is clear and unambiguous and declines to make the suggested change.**

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

Response: Thank you for your comment.

The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly

Organization	Yes or No	Question 4 Comment
based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise some of the VSLs.		

5. **The requirements and associated measures were modified to indicate that information was 'provided' instead of 'demonstrating that each affected entity received notification.' Do you agree with this change? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration:

Some commenters identified that a few of the Measures did not synch up with the Requirements. The drafting team made the measures consistent with the Requirements. Some commenters noted that the format of the verbiage in several similar Measures was not consistent. The drafting team made the format consistent.

Several commenters asked about revisions to PRC-001. The drafting team noted several things related to this:

- The drafting team did not modify the purpose.
- The Applicability section was updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)
- The drafting team did add Measure M1, which reads: "For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel."
- The drafting team recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database..

A few commenters had questions about the 'agreed to time frames' provide in the standard. The drafting team noted that an agreed upon schedule is the schedule all involved parties agree to. In most cases, the drafting team believes the mutually agreed upon schedule would be of a longer time frame than the maximum days specified in the requirement; however, entities are free to agree to an earlier timeframe.

A few commenters wanted clarification on which Protection Systems were subject to the requirements of the standard. The drafting team stated that the relays to be considered are identified in the Facilities Section of the standard, which reads: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements." The conditions under which the Protection System Coordination Study is performed are dependent upon the owner's philosophies and practices. The drafting team recognizes that philosophies and practices may vary from owner to owner, and that is why it is important to share the results of studies with the other owners.

A few commenters pointed out that, in some cases, fault current variations do not impact coordination. The drafting team noted that Requirement R2 was revised to allow a technical justification demonstrating why Fault current does not affect the Protection System coordination.

A few commenters expressed concerns about entities needing to document that the other entity had received the notification. The drafting team noted that Requirement R4, Part 4.1 was modified as follows: Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Coordination Study (per Requirement R1, Part 1.2) and respond to the other owner(s): Accepting the results, or Rejecting the results, and suggesting modifications to resolve any identified coordination issues.

Several commenters noted the need for a conflict resolution process. The drafting team responded that any conflict resolution should be handled through normal business practices. Measure M9 (now M10) was modified as follows: Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted. The drafting team believes the requestor cannot be held accountable when the other party does not respond.

Several commenters requested changes in the flow chart and/or examples. The drafting team corrected errors in the flow chart and updated the examples and diagrams based on comments.

Several commenters had questions about the term “interconnected bus”. The drafting team noted that the diagrams were revised to clearly indicate the drafting team’s meaning of interconnected bus.

There were various grammatical suggestions for improvement in this section. The drafting team considered them all and made many of the suggested changes.

Organization	Yes or No	Question 5 Comment
ACES Standards Collaborators	No	(1) The measures do not match the requirements. For example, R4 requires entities to confirm acceptance, which would demonstrate that each affected entity received notification. Again, the drafting team is using synonyms that produce the same result as the prior draft. To show evidence that the

Organization	Yes or No	Question 5 Comment
		information was “provided” would have to be some sort of notification of receipt. (2) Does the drafting team intend further actions for coordination beyond providing the studies to applicable entities? (3) We recommend the drafting team develop an RSAW to better explain how compliance would be measured against this standard. Thank you for the opportunity to comment.
Response: Thank you for your comment. 1. **The drafting team intends that information is “provided” (synonymous with “sent”) and receipt of delivery is not required.** 2. **Yes, the drafting team intends for the receiving entity to review the Protection System(s) changes and identify any coordination issues.** 3. **The drafting team agrees with this approach and will work with NERC Compliance staff to develop an RSAW.**		
Independent Electricity System Operator	No	(1) We do not have a strong view one way or the other with respect to “provided” versus “demonstrating”. However, the wording used among Measures needs to be consistent. For example, in M1 the wording is “Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated Protection System Study, or the summary results of...” seems reasonable since it shows the examples for “acceptable evidence”. The examples listed illustrate what constitute “acceptable evidence”. However, in M2, the wording “Acceptable evidence for Requirement R1, Part 1.2 demonstrating that the summary results of each Protection System Study (hard copy or electronic file formats) was provided....” Does not illustrate what constitutes “acceptable evidence”, thereby leaving that to interpretation. We suggest M2 (and M4) be reworded along the same line as that for the other Measures (M1, M3, M5 to M9). (2) The Comment Form does not have a question on “Do you have any other comments?” Therefore, we are submitting the following comment under this

Organization	Yes or No	Question 5 Comment
		Question. We reiterate our concerns previously expressed with respect to PRC-001:We do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. If this is a training requirement, it should be transferred to the appropriate PER standards. c. Measures M1 is removed from the standard. This does not conform with the Elements of a Reliability Standard template, specifically those specified in the "Mandatory and Enforceable Sections of a Standard". d. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. However, leaving this not measurable and unnecessary requirement in PRC-001-3 is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT could have proposed a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee's advice/direction for appropriate actions. The SDT's response to our previous comment was "This subject is outside the scope of this drafting team; however, your comment will be forwarded to NERC staff." We do not believe that the staff has brought this to the Standards Committee's attention. Note that the Standards Committee is responsible for managing the

Organization	Yes or No	Question 5 Comment
		standards development process and as such, can make an informed decision to either request the SDT to expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel. Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. Once again, we urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.
Response: Thank you for your comment. 1. **The drafting team modified the Measures to address your comment.** 2. **The drafting team made several modifications to PRC-001, including the addition of Measure M1, which reads: "For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel." The drafting team also recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.**		
seattle city light	No	Because there is no "other comments" section included in this comment form, the following comments about the timelines for specific actions are appended here. 1. (R3.2) "Data Requests . . . . 30 Days or agreed to schedule' Seattle requests that "agreed to schedule" be clarified, in particular the limits in determining this schedule. If no further clarity is added, Seattle suggests that "or agreed to schedule" simply be deleted. 2. (R2.1) Short Circuit Study . . . . . . 24 months SCL recommends that the time line of 24 months be removed and that the 10% change in fault current criteria serve as the replacement for this requirement. 3. (R4.1) "Review PS Study . . . . .90 Days or agreed upon schedule" Seattle is concerned that, depending upon the complexity of the study, a lot of back and

Organization	Yes or No	Question 5 Comment
		forth communication between the utility entities may be required. 4. Please clarify a. if each response to, or revision of the study trigger another 90 day review period and b. the limits as the defining an "agreed to schedule." If no further clarity is added regarding agreed to schedules, Seattle suggests that "or agreed to schedule" simply be deleted.

Response: Thank you for your comment.

1. **The drafting team intends that an agreed upon schedule is the schedule all involved parties agree to. In most cases, the drafting team believes the mutually agreed upon schedule would be of a longer time frame than the maximum days specified in the requirement; however, entities are free to agree to an earlier timeframe.**
2. **Since the 10% threshold cannot be determined unless the study has been done, the drafting team believes it is appropriate for there to be a requirement to do the study. Note: the time frame has been changed to 60 calendar months.**
3. **The 90 days or the agreed upon schedule only pertains to the initial review and response of the Protection System Coordination Study. The drafting team realizes that there could be a lot of back and forth after the initial review and response but there is no associated time frame.**

4a. Technically, your statement could be correct; however, the drafting team believes both parties will have an incentive to complete the process as soon as practical.

4b. The drafting team intends that an agreed upon schedule is the schedule all involved parties agree to. In most cases, the drafting team believes the mutually agreed upon schedule would be of a longer time frame than the maximum days specified in the requirement; however, entities are free to agree to an earlier timeframe.

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration	No	1. BPA believes that the requirements and measures are onerous and should be eliminated. The change in wording is irrelevant. Additional Comments 2. R1.1 requires a protection system study to be performed, but does not explain what is required for a protection system study.R1.2 lists some minimum requirements of a protection system study, but leaves many unanswered

Organization	Yes or No	Question 5 Comment
		questions, for example: Which relays must be included in the study? Where are the faults to be applied? What contingencies should be applied for the study? How many buses back into the system must be reviewed? 3. R1.1.2 introduces the term “interconnecting bus” with no definition of what it is. 4. R2 is a requirement that pertains to each facility associated with an interconnected element. The use of the word “associated” is too vague and leaves the interpretation of this requirement wide open. 5. In R2, the need to perform a new protection system study is based on a 10% or greater increase in fault current. Since many relays are based on impedance or differential methods, the value of fault current has no bearing on their need for a coordination review. R2, therefore, results in an unnecessary and useless burden when applied to elements protected with these relays.

Response: Thank you for your comment.

1. **The drafting team believes the requirements and measures support the reliability intent of the standard.**
2. **The drafting team believes the relays to be considered are identified in the Facilities Section of the standard which reads: “Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.” The conditions under which the PSCS is performed are dependent on the owner’s philosophies and practices. The drafting team recognizes that philosophies and practices vary depending on the owner and that is why it is important to share the results with the other owners.**
3. **Based on your comment, the drafting team has designated the interconnecting bus in the example figures to provide clarity.**
4. **The drafting team believes the word “associated” in the context used is clear.**
5. **The drafting team revised Requirement R2 to allow a technical justification explaining why Fault current does not affect the Protection System coordination.**

Organization	Yes or No	Question 5 Comment
Florida Municipal Power Agency	No	First, there should be an "any other comments" question. Seeing that there isn't one, we are adding our other comments here. 1. R3 - There should be thresholds of change to the bullets. For instance, changing the no-load tap changer of a GSU does minimally change the impedance of the GSU). transmission line neighbor installing a long chain link fence along the ROW will have a minimal impact on mutual coupling. These minimal changes do not require redoing the study, so, what percentage change in impedance requires redoing the study?
Response: Thank you for your comment. **The drafting team believes that information about any change (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element.**		
Imperial Irrigation District (IID)	No	IID believes the affected entity need to demonstrate it received notification.
Response: Thank you for your comment. **Based on yours and others comments, R 4.1 has been modified as follows: Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Coordination Study (per Requirement R1, Part 1.2) and respond to the other owner(s): Accepting the results, or Rejecting the results, and suggesting modifications to resolve any coordination issues.**		
Nebraska Public Power District	No	Measurement 9 for R4 requires confirmation of acceptance prior to implementation of any planned protection system changes. This appears to be similar to 'demonstrating that each affected entity received notification.' The concern is holding one company responsible for actions of another that is not under the requestor's control. It is recommended that there be clarification that if the requestor does not get confirmation of acceptance in the proper time line

Organization	Yes or No	Question 5 Comment
		then the requestor is not accountable or subject to violations. Another option is to remove R4.2.
Response: Thank you for your comment. **The drafting team believes that any conflict resolution should be handled through normal business practices. The old Measure M9 (new Measure M10) has been modified as follows: Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted. The drafting team believes the requestor cannot be held accountable when the other party does not respond.**		
CenterPoint Energy	No	Providing schedule information and project details by a transmission service provider to a generation entity may be governed by established, regional market rules that provide for what information can be shared with competitive entities. There are many installations in the ERCOT System where the owner of the interconnecting switchyard is not the same entity as the owner of the interconnected generation facility.
Response: Thank you for your comment. **The drafting team does not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the Generator Owner to ensure proper coordination of the Protection Systems covered by this proposed standard.**		
Salt River Project	No	Receipt of confirmation should be required to confirm coordination.
Response: Thank you for your comment. **The old Measure M9 (new Measure M10) has been modified as follows: Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted.**		

Organization	Yes or No	Question 5 Comment
NextEra Energy	No	See page 19 of the redline PRC-027 Guidelines and Technical Basis. " System condition used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions."Please clarify that "single contingency conditions" refers to breaker failure or protective system failure. It is not intended to mean single contingency operating conditions such as line or transformers out of service.
Response: Thank you for your comment. **The use of 'single contingency conditions' in this context is to indicate facility outages. e.g. line out.**		
Xcel Energy	No	Since the SDT did not provide a question for "any other comments", Xcel is using this question for that purpose. 1) We would appreciate some additional clarity as to what transmission fault conditions need to be evaluated by the Generator Owner. Figure 2 does not apply to very many of our units (on most, Breaker A would not exist and Breaker C is part of a breaker-and-a-half scheme). Is the generator supposed to evaluate only faults on the line between the GSU Transformer and the substation or evaluate his protection settings for a fault on any of the transmission lines leaving the substation? 2) Can the drafting team, either as part of the Application Guideline or in a separate document provide a list of protective functions the Generator Owner needs to evaluate or is it the complete suite of protective functions defined in the NERC SPCS Generator - Transmission Protection Coordination Guideline? 3) Requirement 3.1 is onerous as it requires notification for an open ended "when the proposed change modifies the conditions used in the coordination of Protection Systems." The requirement should be limited and instead provide a simple list of element changes that generally affect coordination with adjacent

Organization	Yes or No	Question 5 Comment
		Elements. 4) Similarly for 3.3, we recommend that this be modified to limit the scope to only changes that result in a change of performance or ratings. For example, settings that change the alarm conditions for a device or a “like-for-like” replacement should not be required to be communicated. Communicating every change would not improve reliability and would instead deter valuable resources to unnecessary compliance evidence activities.
Response: Thank you for your comment. 1. In the situation cited, the Transmission Owner would review the data to ensure there are no coordination issues with the settings provided by the Generator Owner. Conversely, the Generator Owner would be responsible to ensure the settings provided by the Transmission Owner for breaker B does not result in coordination issues with generation Protection Systems. Example: that a Transmission Owner back-up relay does not operate before a Protection System designed to isolate a station service bus. 2. The drafting team has decided not to reference the subject document; however, the drafting team recognizes that it would be a good reference. 3. The drafting team believes that the bulleted items in Requirement 3, Part 3.1 provide the ‘list’ suggested. 4. The drafting team believes that although these circumstances will be rare, the noted information should be shared with the other entity so that they can update their records and provide any needed feedback.		
City of Austin dba Austin Energy	Yes	(1) Austin Energy (AE) notes an inconsistency in R1.1.3 and the flowchart on page 22 of the clean version of Draft #2. R1.1.3 states that a Protection System Study is required “according to an agreed upon time frame” whereas the flowchart on page 22 says “perform the PSS within 6 months.” AE asks the SDT to update the flowchart to match the requirement language. (2) AE believes the VSLs for R4 are not consistent with the language of the standard, specifically R4.1 and R4.2. For example, the Severe VSL language should read “The responsible entity reviewed the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and responded as to whether further action is required, all per R4, Part 4.1, but was

Organization	Yes or No	Question 5 Comment
		late by more than 30 calendar days. OR The responsible entity failed to review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required, all per R4, Part 4.1. OR The responsible entity failed to confirm acceptance of any resulting Protection System(s) changes prior to implementing any planned change(s) associated with Requirement R3, Part 3.1 per R4, Part 4.2." AE is concerned about the current VSL language because it indicates the need to confirm acceptance of planned changes (e.g., new installation) instead of the resulting Protection System(s) changes.
Response: Thank you for your comment. **1. Based on your comment, the flowchart has been revised.** **2. The VSLs have been revised to match the revised requirements.**		
Dominion	Yes	1). Please replace "detect Faults on the BES Transmission System" with "protect the BES Transmission System" in all three places it appears in Figure 3. This proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 2). Dominion respectfully disagrees with the SDT feedback comment on Draft 1 where it was recommended to remove references from one Requirement to another Requirement. Dominion was not challenging consistency with the recommendation but were stating the need to simplify the wording in the standard. Each Requirement can stand on its own without the additional Requirement reference. By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement due to the fact that that it causes you to read between Requirements. Isn't this the purpose of the Process chart in the guidelines? 3). Under R1 - MI measure wording does not read as a completed statement.

Organization	Yes or No	Question 5 Comment
		Dominion suggests removing ‘that’ from the first sentence to “....demonstrating time frames”. 4). Dominion respectfully disagrees with the SDT feedback that in R2 the term “deviation” is synonymous with “change”. Deviation refers to variation from a standard, norm or mean. This is not a statistical calculation but a simple measure of change 5). In R3- 3.2, there appears to be a formatting issue. Any Requirement that references a calendar day is worded where the Calendar date is at the beginning of the statement; for example R3- 3.3. Need to change wording in R3- 3.2 for consistency throughout document to read “Within 30 calendar days of receiving a request or according to an agreed upon schedule, requested information related to coordination....”). 6) In Draft #1 Dominion wrote: “Throughout this Draft 1 of the standard, there are references that illustrate documentation requirements that are inconsistent. Recommend all be written as “(hard copy or electronic file formats)”. The SDT responded saying “Each measurement in the standard (M1 through M10) has as evidence the statement “dated documentation (hardcopy or electronic file formats).” This is not the case; the point was that M1 reads “either in hardcopy or electronic file formats”. This is minor but needs to be changed for consistency.

Response: Thank you for your comment.

1. **The drafting team used the term ‘detect Faults on the BES Transmission System’ to indicate those Protection Systems that may require review with other owners Protection Systems. The drafting team revised the phrase to read “installed for the purpose of detecting Faults on BES Elements” for consistency with the Facilities section of the Applicability. It is also noted that the identified interpretation was for the term ‘transmission Protection Systems’ which is not used in this Standard. Figure 3 has been modified to provide consistent language.**
2. **The drafting team still believes the references to other requirements in the standard are the best way to both maintain consistency and to describe the requirements. This approach has been approved through the Quality Review process and is**

Organization	Yes or No	Question 5 Comment
used in other NERC Reliability Standards. **3. Measure M1 was revised based on your comment.** **4. The drafting team made the suggested change.** **5. The drafting team believes Requirement R3, Part 3.2 is appropriate as written.** **6. The drafting team made the suggested change.**		
Western Small Entity Comment Group	Yes	The comment group has no comments regarding this question. This form provides no general comment area, so we are providing our additional comments here. We referenced the WECC Position Paper in the last round of comments, but now see that WECC did not submit comments. We urge the SDT to take a look at the paper. We received our copy from steve@wecc.biz . We can also forward a copy if an email address is provided. For the team's convenience, here is the relevant text: "WECC staff and WECC subject matter experts have reviewed the proposed standard and agree with the purpose of the standard. WECC staff and WECC subject matter experts agree that Protection Systems must be coordinated. However some subject matter experts believe that the proposed standard requires more documentation than is necessary and that the requirement to provide a hard copy or an electronic copy of each Protection System Study is administratively burdensome and not reflective of the intent of Results Based Standards. These subject matter experts believe that evidence that studies are coordinated and that entities have agreed to the results of System Protections Studies is adequate." We see that the SDT responded to Salt River Project's and other's similar concerns regarding hard copies by stating that that only summaries are needed, but we still see the standard as overly burdensome compared with the possible benefit. Tennessee Valley Authority, Dominion Power, Southwest Power Pool, the Nebraska Public Power District, Dairyland Power Cooperative, the Bonneville Power Administration, and the SERC Protection and Control Subcommittee provided some specific suggestions to reduce documentation burden which were all rejected. We urge the SDT to review these recommendations again.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. **The drafting team believes the requirements in the standard accomplish the reliability objective of this standard and are not overly burdensome.**		
Duke Energy	Yes	Additional comment: R2.1.1 refers to "maximum available Fault current values", but it's unclear from the requirement or the Guidelines and Technical Basis how "maximum" is defined. We believe it should be maximum generation and all Facilities in service.
Response: Thank you for your comment. **The drafting team has included in the Guidelines and Technical Basis section the following which it believes answers this question: 'These studies are typically performed assuming maximum generation and all Facilities in service.'**		
Tacoma Power	Yes	Additional Comments: 1. Why is there a version 4 for PRC-001 (under Version History) when the standard being balloted is version 3 (PRC-001-3). 2. PRC-027-1 does not appear to impose any requirements as to how quickly issues identified in a Protection System Study are addressed. It may be difficult to impose such a timeframe since some issues may just require a relay setting change, while others may require more drastic scheme modification, including design, procurement, installation, and commissioning. Perhaps requirements could be added to develop, within a specified timeframe, and then implement a mutually agreeable Corrective Action Plan. As written, it appears that an entity can be compliant with Protection System Studies that always indicate existing coordination issues, which does not completely achieve the purpose of the standard. Without a mechanism to close the loop, PRC-027-1 appears to require a lot of documentation and coordination without any guarantee that

Organization	Yes or No	Question 5 Comment
		existing coordination issues will ultimately be resolved. R4.1 really only requires entities to come to terms on the Protection System Study, but does not explicitly require any other course of action on existing coordination issues. 3. In M1, the sentence ending in "...demonstrating that the time frames specified in Parts 1.1.1 and 1.1.2" in a fragmented sentence. Also, should this sentence have "and 1.1.3" at the end? 4. M2 is a fragmented sentence. 5. M4 is a fragmented sentence. 6. As written, it may be difficult to audit parts of R3.1. Some of the language seems to be subjective and implicitly left to engineering judgment. a) First, it is not completely clear what the drafting team intended by the wording "associated with" or how an auditor might interpret that wording. b) Second, please consider changing "...or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s)" to "...or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s), as stipulated in the existing Protection System Study." This should make it easier to audit this aspect of R3.1. c) Third, regarding the second through fourth bullets, engineering judgment will be required to determine when impedances need to be changed. For example, minor modifications could be made to a transmission line that, in a purely academic sense, could change the impedance; however, an entity may opt not to update the impedance based upon engineering judgment that the change is not significant to the impedance model. 7. For emphasis, under R3.2, considering changing "...within 30 calendar days of receiving a request or according to an agreed-upon schedule" to "...within 30

Organization	Yes or No	Question 5 Comment
		calendar days of receiving a request or according to an agreed-upon schedule, which may be longer or shorter than 30 calendar days." 8. R4.2 does not seem to explicitly require that a Protection System Study be completed before implementing changes indicated in R3.1, only that the changes are accepted. 9. R1.1.3 seems to suggest that the Protection System Study must be completed prior to implementation. However, according to the flow chart, it appears that a Protection System Study could be produced (in theory) six months after the changes were made. Furthermore, the flow chart applies the six-month timeframe even to R1.1.3, which does not match the text in R1.1.3.

Response: Thank you for your comment.

1. **Thank you for pointing out this mistake. The drafting team made the correction.**
2. **The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements. Requirement R4, Part 4.1 requires entities to 'respond as to whether any coordination issues were identified through a review of the summary results of a Protection System Coordination Study and if any further action is required'. The drafting team believes any coordination issues discovered through the periodic review will ultimately be resolved by the Protection System owners at the Interconnected Element.**
3. **The drafting team made the correction.**
4. **The drafting team made the correction.**
5. **The drafting team made the correction.**

6a. The drafting team made a change to the Guidelines and Technical Basis for Requirement R3 to clarify what is meant by the term 'associated with'. It now reads: "The drafting team recognizes that Facility changes at other locations can impact the Protection System Coordination Study of the Facility associated with the Interconnected Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the Interconnected Element."

6b. The drafting team believes the existing wording is sufficient and declines to make the suggested change.

6c. The drafting team added the following language to the Rationale box for Requirement R3: "The drafting team believes that information about any change (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element." The language

Organization	Yes or No	Question 5 Comment
contained in the Rationale box will remain as part of the standard. 7. The drafting team believes the existing wording is sufficient and declines to make the suggested change. If the time frame is shorter than the minimum 30 days, there would be no need to be 'agreed upon'. 8. Requirement R1, Part 1.1.3 requires that a Protection System Coordination Study be performed "according to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3". Requirement R4, Part 4.2 requires confirmation that other owners of each Facility associated with the affected Interconnected Element have completed a review of the Protection System changes and any identified coordination issues were resolved prior to implementing any proposed change(s) associated with Requirement R3, Part 3.1. 9. The drafting team revised the flowchart to indicate that a study must be performed before any changes are made. The flowchart was also modified to reflect that the 6 month timeframe is not associated with Requirement R1, Part 1.1.3.		
Manitoba Hydro	Yes	Although Manitoba Hydro agrees with question 5, we have the following general comments: (1) M1 - The word 'that' in the third line should be deleted and we believe that the words 'is dated documentation' are missing after 'Acceptable evidence for Requirement R1, 1.2. (2) M3 - For consistency, the word 'formula' should be replaced with calculation in Requirement R2, 2.1.2. (3) M4 - For clarity and consistency with the other Measures, we suggest rewording the opening sentence to read 'Acceptable evidence for Requirement R2, Part 2.2 is dated documentation (hard copy or electronic file formats) demonstrating that the updated Fault current values were provided within....'. (4) M5 - The wording of this section does not match the wording of the requirement. The words 'in hard copy or electronic file formats' should follow the word summary, not after the word settings.
Response: Thank you for your comment. 1. The drafting team made the suggested changes in Measures M1 and M2. 2. Measure M4 (old Measure M3) has been modified to include the following: determined by the equation.		

Organization	Yes or No	Question 5 Comment
3. The drafting team made the suggested change. **4. The drafting team made the suggested change.**		
Sacramento Municipal Utility District	Yes	Although this is unrelated to Question 5 there was no other space allocated for the for “any other comments.” While this is most likely a clerical error, we feel it is not appropriate to post a standard without making such a question available.
Response: Thank you for your comment. **The standards development process does not require a ‘catch-all’ question be included in every posting of a draft standard. The drafting team asked specific questions in order to gather specific answers to those questions.**		
American Electric Power	Yes	Because the comment form provides no section to provide “general comments”, AEP offers them below. AEP would like to inform the drafting team that our negative vote on this standard is primarily driven by A) the lack of clarify in regards to its scope (as discussed in the response to Q2) and B) the timeframe allotted to perform the Protection System Study (as discussed in the response to Q3). C) It would be more appropriate for R 1.1.1 to be included in the implementation plan, rather than embedded within the standard itself. D) The proposed standard is difficult to follow, in the way that it jumps back and forth among requirements. We would encourage any changes which might increase the readability of the proposed standard.
Response: Thank you for your comment. **A) The drafting team believes that the Applicability section regarding Facilities adequately describes which Protection System**		

Organization	Yes or No	Question 5 Comment
components need to be coordinated between entities. B) Based on stakeholder comments, the drafting team revised the timeframe for Requirement R1, Part 1.1.1 to 60 calendar months. C) The drafting team agrees your suggestion provides one way of addressing the requirements to have documented Protections System Coordination Studies for each Interconnected Element. However, the drafting team believes the structure of Requirement R1, Part 1.1.1, as currently written, achieves this goal. Further, NERC performs periodic review of standards and the requirement can be removed at that time, if appropriate. D) The drafting team believes the revised 'draft 3' of the standard is more readable.		
ITC	Yes	1. Figures 1-5 designate a preferred responsibility of coordination on either entity which contradicts with intent of R3. R3 details all the changes which must be provided to the adjacent utility, seemingly so they can coordinate their protection over yours. However, Figures 1-5 place the coordination responsibility on the utility which does not own the Protection System. I agree that R3 should remain almost as-is. However, the coordination responsibilities in Figures 1-5 should be reversed or preferably removed. Owner R should be responsible for coordinating Breaker A relays. Only the owner should be responsible for coordinating this relay. 2. SDT needs to define the term "interconnecting bus" and perhaps identify the interconnecting bus in Figures 1-5. 3. In Figures 1-4 the Interconnected Element is a line.
Response: Thank you for your comment. 1. The Figures and associated processes are examples of options that may be used to achieve coordination and are not intended to be all inclusive. The drafting team believes the owner proposing changes in Figure 5, e.g. Transmission Owner S, would not necessarily have the Protection System information and setting to ensure that coordination will be achieved; therefore, the procedures noted for Figure 5 ensure that Transmission Owner R and Generator Owner T can verify that changes made by Transmission Owner S can be coordinated. The drafting team believes the Figures do not contradict the intent of Requirement R3. 2. Based on your comment, the drafting team has designated the interconnecting bus in the example figures to provide clarity.		

Organization	Yes or No	Question 5 Comment
3. As noted in Figure 4 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.		
FirstEnergy	Yes	FirstEnergy supports the change described by Question 5. Other comments from FirstEnergy in addition to the specific questions asked by the drafting team: A) PRC-001-3 EFFECTIVE DATE: The PRC-001-3 standard needs to be edited to match what is stated in the Implementation Plan. The Implementation Plan indicates that both PRC-027-1 and PRC-001-3 will become effective at the same time which is stated as being the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. However, the PRC-001-3 standard in its Effective Date section indicates the first day of the first calendar quarter twelve months following applicable regulatory approval. B) PRC-001-3 VERSION HISTORY: The Version History of the PRC-001-3 standard needs some clean-up. The table reflects a "version 4" however this project creates version 3. Looks l+A74ike the fix is to delete the row labeled version 3 and change the version 4 to reflect 3. The description text in that row is correct. C) PRC-001 VERSION CHANGES: NERC needs to consider what it plans to do with the existing NERC BoT Approved versions PRC-001-1.1 and PRC-001-2 which have yet to be filed with FERC. It is recommended that NERC suspend the filing of those standards, keep it simple and file PRC-001-3 with this project. This will avoid undo industry confusion and transition. D) PRC-001-3 MISC CLEAN-UP: Section D, Part 1.1 revise Compliance enforcement authority" to read "Compliance Enforcement Authority (CEA)". This is a defined glossary term and is shown capitalized in other areas of the standard. In the second sentence, capitalize "entity" in the reference to "Regional entity".

Organization	Yes or No	Question 5 Comment
		E) PRC-001-3 R1: Seems odd to have a standard with only one requirement. The requirement states "Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area." FE proposes that R1 or an alternate be moved to PER-005.
Response: Thank you for your comment. **A) The drafting team made the change to the Effective Date language.** **B) The drafting team made the change to the Version History.** **C) Based on the projected approval date of this Standard your suggestion may not be possible; however, this will be investigated based on the results of the next posting.** **D) The suggested change has been made.** **E) The drafting team did add Measure M1, which reads: “For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel.” The drafting team recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.**		
National Grid and Niagara Mohawk (A National Grid Company)	Yes	National Grid offers the following additional comments that do not pertain to Question 5. The comments are included here since the Comment Form did not have an additional question concerning if we had additional comments. 1. Page 4: Other Aspects of coordination of Protection Systems addressed by other Project needs to be included in the final standard since it delineates what is not included in this one. 2. Page 8: Para.R2.1.2 should be reworded as it allows for a series of increments in fault current each less than 10% but which when summed over a number of review periods could collectively exceed 10%. 3. Application Guidelines: a. Page 21: “Data used to determine Fault currents....” is essentially the short

Organization	Yes or No	Question 5 Comment
		circuit model and the associated data base of line, transformer and generator impedances and connections. If that what is expected then it should be so stated otherwise “data” leaves a lot open to the reader’s conjecture. b. Page 25: Decision point regarding R2.1.2 has the same issue as identified above in comment 2. c. Diagrams Fig. 1, 2, 3, 4, 5: The text that goes with these diagrams is inappropriate in its assignment of responsibilities for who reviews what coordination and the change of wording from “verify” to “review” does not resolve this problem. It is a protection system owner’s responsibility to coordinate their system with adjacent systems and it is the same owner’s responsibility to model adjacent systems in sufficient detail to enable that owner to perform that coordination. 4. Fig . 2, 5: The text refers to “generator protection” which can mean a wide range of protection functions such as but not limited to those related to voltage, frequency, loss of field, over-excitation and more. These were excluded on page 4 of the standard and their exclusion here should be emphasized. 5. Fig. 3, Notes following figure 3 exclude reverse power as being a protection system installed to detect faults on the BES Transmission System. We disagree. In our system and other systems in NE reverse power was historically installed specifically to detect and clear backfeed to a faulted transmission system.

Response: Thank you for your comment.

1. **Those are included in the Background Section of the standard and will remain in the BOT approved version of the standard.**
2. **The drafting team modified the Rationale box for Requirement R2 for clarification in response to your comment.**

3a **The drafting team revised the language by removing the phrase “Data used to determine Fault currents…” for clarification in response to your comment.**

3b **The drafting team revised the diagram for clarification.**

3c **The drafting team revised the Figures for clarification.**

4. **The drafting team revised the Figures and the text for clarification**

Organization	Yes or No	Question 5 Comment
5. Per the note in the referenced figure, reverse power relays are 'often' installed for purposes other than that you describe. In your case where the reverse power relays are installed to provide the protective function, they should be included in the coordination review.		
Certain Members of the ISO RTO Council	Yes	NERC must continue to correct such requirements, as it is not the responsibility of the entity subject to a requirement to ensure another party acts.
Response: Thank you for your comment. The SDT modified the language to better clarify the intent.		
SERC Protection and Controls Subcommittee (PCS	Yes	Other comments (not associated with Question 5) are being provided which could not be addressed in the questions listed above: 1). R2 requires short circuit study every 24 months even though the SDT's own rationale is that other requirements will trigger Protection System Studies first. Thus R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. 2). Please replace "detect Faults on the BES Transmission System" with "protect the BES Transmission System" in all three places it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 3). VSL escalation in 10 days is not representative of the severity of the violation. The SDT correctly points out in R1 rationale that it "has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements." Many entities have numerous Interconnected Elements, and recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity's Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels, respectively.

Organization	Yes or No	Question 5 Comment
		Specifically, Lower would apply to up to 5% so that even a single Interconnected Element would be a violation. 4). Throughout the 1st and 2nd draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.1.1, R2.1.2, R2-2.2, R4-4.1, R4-4.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. We appreciate the Drafting Teams perspective, but the SERC PCS believes that such cross references are confusing. 5). Under R1 - MI measure wording does not read as a completed statement. Suggest removing ‘that’ from the first sentence. 6) The process chart is a direct indication that this process and undertaking for entities will be overwhelming. New systems will be required to track many details of timeframe requirements and communication dates. Additional resources will be required placing increased workload for an effort to change the process that already works for us when working with other entities. The Drafting Team indicated, ‘there is no evidence there is widespread miscoordination of protection systems.’

Response: Thank you for your comment.

1. **The drafting team does not see the direct correlation between the studies required in this standard and the noted studies in the TPLs. However, the drafting team revised Requirement R2 to 60 calendar months to align with Requirement R1.**
2. **The drafting team declines to make the suggested change; however the wording in the figure has been modified for consistency.**
3. **The drafting team revised the VSLs for Requirement R2.**
4. **The references that you indicate have been approved as appropriate way of accomplishing the objective of this standard.**
5. **The drafting team revised Measure M1 as you suggested.**
6. **The drafting team believes the requirements, as written, contribute to the reliability of the BES by requiring entities to**

Organization	Yes or No	Question 5 Comment
coordinate their Protection Systems associated with Interconnected Elements.		
Texas Reliablity Entity	Yes	OTHER COMMENTS (not responsive to any specific question asked above): 1. R2.2: We suggest a minor change "...indicates a deviation in ***single line to ground or 3-phase*** Fault current of 10% or greater ....” 2. R3.1: Based on recent work by the Protection System Misoperation Task Force (PSMTF), changes in logic settings should also be included (e.g. directionality V/Q logic, trip equations, carrier echo logic and coordination timers, carrier dip switch settings, etc.). We would suggest modifying the first bullet to say”...modification of: protective relays or protective function or logic settings, communication systems,....” 3. The SDT may also want to consider adding an item to the list - “Changes to the transmission system topology that change the equivalent impedance or fault current.”
Response: Thank you for your comment. **1. The drafting team made the suggested change.** **2. The drafting team believes the protective ‘logic settings’ used for Protection System coordination are included in the “protective function settings” and declines to make the suggested change.** **3. The drafting team believes that “Changes to the transmission system topology that change the equivalent impedance or fault current” would be captured by the periodic short circuit studies. The drafting team believes the second bullet addresses the situation as well, it reads: “Changes to a transmission system Element that alter any sequence or mutual coupling impedance.”**		
Georgia Transmission Corporation	Yes	Repeat of SERC PCS Other comments are being provided which could not be addressed in question 1 - 5 listed above: 1). R2 requires short circuit study every 24 months even though the SDT’s own rationale is that other requirements will trigger Protection System Studies first. Thus R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for

Organization	Yes or No	Question 5 Comment
		FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. 2). Please replace “detect Faults on the BES Transmission System” with “protect the BES Transmission System” in all three places it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 3). VSL escalation in 10 days is not representative of the severity of the violation. The SDT correctly points out in R1 rationale that it “has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements.” Many entities have numerous Interconnected Elements, and recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity’s Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels, respectively. Specifically, Lower would apply to up to 5% so that even a single Interconnected Element would be a violation. 4). Throughout the 1st and 2nd draft of this standard, there are Requirements that make reference to another Requirement. 		entities will be overwhelming. New systems will be required to track many details of timeframe requirements and communication dates. Additional resources will be required placing increased workload for an effort to change the process that already works for us when working with other entities. The Drafting Team indicated, 'there is no evidence there is widespread miscoordination of protection systems.'
Response: Thank you for your comment. 1. **The drafting team does not see the direct correlation between the studies required in this standard and the noted studies in the TPLs. However, the drafting team revised Requirement R2 to 60 calendar months to align with Requirement R1.** 2. **The drafting team declines to make the suggested change; however, the language in the noted figure has been updated for consistency.** 3. **The drafting team revised the VSLs for Requirement R2.** 4. **The references that you indicate have been approved as appropriate way of accomplishing the objective of this standard.** 5. **The drafting team revised Measure M1 as you suggested.** 6. **The drafting team believes the requirements, as written, contribute to the reliability of the BES by requiring entities to coordinate their Protection Systems associated with Interconnected Elements.**		
Idaho Power Co.	Yes	1. R1 The requirement is written to be applicable to Transmission Owners. In our case we have several lines where we do not own the Interconnecting Element, but operate the Protection System at one terminal. Based on the Glossary, we believe this makes us a Transmission Operator. If this interpretation is accurate, there would seem to be a gap in the Applicability of the Standard, as it does not include the Operator. 2. R2 We are wondering why this Requirement is only applicable to the Transmission Owner. Should it not be applicable to all the functional entities similar to the language used in R1, R3, and R4? General comments 3. In reviewing the Standard, there was confusion related to the Protection System Study and what the 10% was measured against. We believe that the

Organization	Yes or No	Question 5 Comment
		Protection System Study referred to in the Standard is that group of faults and contingencies used to create the in-service settings of the relay. Could this be clarified? 4. Additionally, the exchange of information between Functional Entities is a critical part of PRC-027, however, no mechanism is in place to ensure proper contact information is available. Employee movement within a utility may render contact information obsolete. In addition, Independent Power Producers, such as wind farms, are not typically staffed by local personnel or by individuals with a knowledge of System Protection. Because PRC-027 relies so heavily on the exchange of information it is not sufficient to simply place time lines on the transfer of data between Functional Entities. Additional controls to ensure that these data requests reach the appropriate people is needed.
Response: Thank you for your comment. **1. If you are a registered Transmission Owner and own the Protection System, you are responsible for the coordination of the Protection System.** **2. As noted in the Guidelines and Technical Basis section: In Requirement R2, the Transmission Owner is identified as the Functional Entity responsible for performing the Fault current studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.** **3. The intent is that the 10% be measured against the Fault currents that were available at the interconnected bus at the time the last Protection System Coordination Study was done.** **4. The drafting team agrees that entities must have accurate contact information for this standard as well as the existing requirements in PRC-001 but ensuring contact information is kept current is beyond the scope of this standard.**		
Northeast Power Coordinating Council	Yes	We agree with the change. However, we are adding a comment on the VRFs. The VRFs should be High, not Medium. There are similar requirements in PRC-023-2 Transmission Relay Loadability, and TPL-001-2 Transmission System

Organization	Yes or No	Question 5 Comment
		Planning Performance Requirements which have a High VRF. Also, from the Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 - Protection System Coordination for Performance During Faults, the FERC VRF G4 Discussion reads “Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Study for each Interconnected Facility to verify that Protection Systems coordinate such that the least number of power system Elements are isolated to clear Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC’s definition of a Medium VRF.” Poor protection system coordination during a disturbance can create severe system conditions faster than Operators can respond to them, leading to system instability or a cascading failure. These circumstances are consistent with the NERC definition of a High VRF.
Response: Thank you for your comment. **The drafting team assigned the VRFs in accordance with the NERC criteria and FERC guidelines for establishing VRFs, and believes the assigned risk factors are appropriate.**		
Pepco Holdings Inc & Affiliates	Yes	We agree with this change. However, we have several other comments concerning this standard in addition to those expressed in response to Questions 1 thru 5. Usually there is a space on the comment form to enter these additional comments. Absent one, we offer these additional comments as an addendum to Question 5. 1) Requirement R2: The phrase “Facility associated with an” contained in R2 is confusing and unnecessary and should be eliminated. R2 should simply read “For each Interconnected Element on its System, the Transmission Owner

Organization	Yes or No	Question 5 Comment
		shall:" 2) Requirement R2, Parts 2.1.1 and 2.1.2: Remove the term "interconnecting bus" and replace it with the phrase "point of interconnection between the Entities." The point of interconnection between the entities is more descriptive in that the interconnection point may not be a physical "bus", but rather the terminals of a line disconnect switch, terminals of a breaker, specific transmission pole, etc. Even though the point of interconnection is often modeled in a short circuit program as a "bus", the term "interconnecting bus" has no physical meaning. 3) Requirement R3, Part 3.3: A footnote should be added stating that this requirement does not apply to those temporary setting changes that sometimes are applied during commissioning, maintenance, or investigative testing activities to verify performance of individual protective elements, provided the original settings were returned upon the conclusion of the testing activity. For example, in multifunction relays when testing backup time delayed protective elements (i.e., zone distance or time overcurrent elements) it may be necessary to temporarily disable high speed elements (i.e., pilot or zone 1 elements). 4) The SDT states that "the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays". However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of "the appropriate use of time delays in relays" in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped

Organization	Yes or No	Question 5 Comment
		(exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS's during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although we support the overall desire to ensure that protective systems are "properly coordinated"; we see little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry.The above comment was also submitted with Draft 1 of the standard. In their response the SDT stated that PRC-027 was being developed in response to FERC Order 693. However, Order 693 only directs NERC to address specific deficiencies in PRC-001 surrounding certain measures and levels of non-

Organization	Yes or No	Question 5 Comment
		compliance relating to the notification and response to the detection of failures in relay protection systems. As such, we believe PRC-027 goes well beyond what is was directed by FERC, and the stated purpose of the SAR. We urge the SDT to revisit FERC Order 693 and revise this standard as appropriate to address only the stated FERC directives.
Response: Thank you for your comment. 1. **The drafting team made the suggested change.** 2. **The drafting team considered this alternative previously; however the "point of interconnection between the Entities' can sometimes be at a given point on the line and in some cases neither entity may own the line itself. Therefore the present language was deemed sufficient.** 3. **The drafting team believes temporary settings changes are addressed in TOP-002, which incorporated Requirements R5 and R6 from PRC-001-1. Temporary settings applied (or changed) to perform maintenance testing of a relay would not have an effect upon overall coordination of the Protection System, as the relay would likely be taken out of service for such testing.** 4. **Although the drafting team does not necessarily disagree with your assessment of the language in the "Final Report on the August 14, 2003 Blackout in the United States and Canada" the drafting team does believe that the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the subject result, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination. The drafting team is operating within the scope the approved SAR, which includes recommendations in addition to those in FERC Order 693, and declines to remove the reference to Recommendation 21C from the Background section of the draft standard.**		
Southern Company	Yes	1. We believe that the proposed standard is too prescriptive regarding the specific duties and multiple time frames of each of the parties TO,GO, and DP. Including time frames for each Interconnect Element with regard to effective dates (6 mo), initial studies (48 mo), studies triggered by change of equipment or change of fault current (6mo), TO/GO/DP agreed upon schedules (variable), delivery of studies (90 days) , short circuit studies (24 mo), notification to others of fault current changes (30 days), change detail notification (30 days), and review of summary results (90 days) is unnecessary and unduly burdensome. The process flow chart provided on page 22 of the draft standard is evidence of

Organization	Yes or No	Question 5 Comment
		the complexity of the proposition. Please seriously consider the following simplified three-requirement approach which will similarly accomplish the desired outcome of coordination of the Protection System for Interconnected Elements. R1). Require the two parties of the Interconnecting Element to jointly develop a Protection System Study- initially with X months to complete. R2). Require a review/update of the protection system study for proper coordination anytime a change to the system may upset coordination. R3). Require a review/update of the protection system study for proper coordination every X years. The corresponding measures for each proposed requirement could be... M1: has a protection system study been performed by the initial required date? M2: has a protection system study been reviewed/updated for system changes which impact the coordination? M3: has the protection system study been reviewed/updated every X years? During an audit period these requirements and measures will drive entities to establish and maintain protection system studies. This approach keeps the focus on the protection system study rather than the multiple actions with varying time frame restrictions. We believe that these changes will result in an equally effective driver to establish coordination while keeping the standard as succinct as possible. 2. In general, for protection on the transmission line leaving the plant, the generator owner should be responsible only for coordinating with the first set of line relaying encountered when proceding across the interconnecting element. He should not be responsible for coordinating with relaying at the opposite end of the interconnecting element. For example, in Figure 5 on Page 28 of the draft standard, Generator Owner T should not have to worry about a

Organization	Yes or No	Question 5 Comment
		review of the relaying located at breakers G, F, or E. Another example is Figure 2, Page 25 of the draft standard: Generator Owner R should not be responsible for reviewing the relaying at the breaker C.
Response: Thank you for your comment. **1. The drafting team believes the standard, as written, is necessary to ensure the reliability objectives are met.** **2. The drafting team agrees with your statement. Figure 5 is included for the unique situation that the owner of the interconnecting bus may not be the owner of the Protection System. The following note has been added to Figure 5: Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.**

ATCO Electric		Additional comments from AE that does not fit any specific question: (1) Timelines: There are too many hard timelines that aren’t consistent between

Organization	Yes or No	Question 5 Comment
		individual requirements (24 months, 6 months, 90 days, 30 days, agreed upon time frame, prior to implementation, etc.). Keeping track of these timelines and evidence gathering will take considerable time and effort. Can the drafting team reduce the amount of timelines to make this standard manageable? Can the drafting team anticipate how to audit this standard during the standard development process? (2) There are requirements referred to other requirements and vice versa. Can the drafting team not to refer the requirements back and forth? Can the drafting team anticipate how to audit this standard during the standard development process?
Response: Thank you for your comment. 1. **The drafting team believes the timelines are necessary to ensure the reliability objectives of the standard are met. The drafting team can't anticipate audit procedures; however, members of the drafting team will be involved in the development of the RSAW.** 2. **The drafting team can't anticipate audit procedures; however, members of the drafting team will be involved in the development of the RSAW.**		
Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and**		

Organization	Yes or No	Question 5 Comment
communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise some of the VSLs.		
Midwest Reliability Organization NERC Standards Review Forum		In addition to the previous comments outlined above, the NSRF offers the following comments for the drafting team's consideration. 1. Recommend the timeframes in R1.1.1 and R2.1 be stated in calendar years. The NSRF is concerned that a utility would be found in violation of this standard if one study was done in February of 2012 and the next one in March 2014 based on the current wording. The intent of a results-based standard is not to have these types of technicalities built into them. 2. An entity cannot study a part of the system that they do not own. The examples at the end of the draft in the Application Guidelines appear to imply that they should. Settings should be obtained from remote ends of a tie line only to be used in conjunction with studying the settings for which an entity has direct control. If an entity can't issue setting changes for a relay, then the entity can't study it to see what the settings should be. If both ends need adjustment then an iterative coordination back and forth between Entities should be performed. The majority of utilities would not feel comfortable accepting an external entity's settings changes for their own equipment. Recommend additional wording be added to the Application Guidelines to the further clarify the drafting team's intent. 3. R2, Part 2.1.1: Recommend R2, Part 2.1.1 be revised to only require short circuit values be 'studied' at buses for which the entity in question specifically owns. For Interconnected Facilities between two entities, fault current values should be 'requested' by the neighboring utility. This would be beneficial to ensure that both entities are comparing models to keep them as up to date as possible. Better yet are boundary equivalents as discussed in previous

Organization	Yes or No	Question 5 Comment
		comments. 4. R2, Part 2.2: Similar to our previous comment for R1, Part 1.2, the proposed language in Part 2.2 appears to indicate that internal Interconnected Elements would require additional documentation and notification beyond what is necessary. This should only be required of Interconnected Elements in which there are two or more owners. Proof of study should be adequate for internal situations. 2.2 Within 30 calendar days after identification where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in Fault current of 10% or greater, provide each owner of the Protection System associated with the Interconnected Element, that include two or more Registered Entities, the updated Fault current values (Iscs).
Response: Thank you for your comment. 1. **The drafting team increased the timeframes for both requirement parts to 60 calendar months; however declines to make the suggested change to calendar years.** 2. **The drafting team does not agree with the issue as stated. Settings obtained from remote ends of a tie line would be used to ensure no coordination issues exist with other setting on its system. If coordination issues are identified, then the drafting team agrees that it may be an iterative process for the two entities to come to a mutual solution.** 3. **Requirement R2 has been revised. The drafting team believes that the Requirement R2, Part 2.1 indicates that the entity is conducting the study at their interconnecting bus: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus.** 4. **Requirement R2 has been revised. The drafting team believes that Requirement R2, Part 2.1 indicates that the entity is conducting short circuit studies only for their interconnecting bus(s).**		
PJM Interconnection		PJM supports revising the language in Requirement 1 of PRC-001 by replacing the term 'familiar.' This word is ambiguous and confusing in terms of the specific expectations of the applicable functional entities regarding the purpose and limitations of protection system schemes applied in its area.
Response: Thank you for your support.		

Organization	Yes or No	Question 5 Comment
The drafting team is not revising the language of the remaining requirement of PRC-001, but is providing a measure.		
ReliabilityFirst		ReliabilityFirst offers the following comments on the VSLs for consideration: 1. Requirement R3 VSL a. ReliabilityFirst believes VSL for Requirement R3 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement." Requirement R3, Part 3.1 and 3.1 requires the entity to provide "details" and the associated VSLs references "information". ReliabilityFirst recommends the SDT modify the VSL to be consistent with the language in the requirement. b. It is unclear which requirement the last VSL under the "Severe" category is referring to. ReliabilityFirst recommends adding the Part number in which the VSL is associated with. 2. Requirement R4 VSL a. ReliabilityFirst believes VSL for Requirement R4, Part 4.1 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement." The VSLs associated with Part 4.1 use the language "confirmed acceptance" though the language in the actual Part talks about review of summary results and response as to whether further action is required. ReliabilityFirst recommends the SDT modify the VSL to be consistent with the language in the requirement as follows: "The responsible entity reviewed the summary results of a Protection System Study and responded as to whether further action is required per R4, Part 4.1, but was late by 10 calendar days or less"
Response: Thank you for your comment. **1a The drafting team made the suggested change.** **1.b The drafting team made the suggested change**		

Organization	Yes or No	Question 5 Comment
2.a. The VSL language has been modified to be consistent with the revised Requirement 4, Part 4.1.		
Consumers Energy		The following comments are unrelated to Question 5. However, there has not been a question/section added for other/general comments. 1) In the process flow chart (page 22) the R2.2 box which states "Within 30 days, provide each owner of the Protection System associated with the Interconnected Element", we believe the key element, "the updated Fault current values" was not included in this statement. 2) In reading the Example Process on page 23, we were expecting to be able to follow it through the process flow chart on page 22 as one possible example to guide you through the standard process. As it started off as a request for information, we assumed the flow process started in the R3 box "Data request" which indicates no further action. Yet the example process continues on. We would suggest an improved explanation paragraph be added to the "Example Process" to better clarify what the example is intended to illustrate.
Response: Thank you for your comment. **1. The drafting team revised the flow chart to be consistent.** **2. The drafting team revised the flow chart to be consistent.**		
ATCO Electric (AE)		Requirement R1.1.2 – A 10% change in fault current isn't much in some areas of AE's system, perhaps as little as a few hundred amps. This could lead to a burdensome requirement to frequently review the same areas of our system. Ten percent seems fairly restrictive when we typically use safety margins of 40% to 50% in selecting instantaneous overcurrent settings
Response: Thank you for your comment. **As noted in the Guidelines and Technical Basis section: The drafting team investigated various inputs that would trigger a review of the existing Protection System Studies and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an**		

Organization	Yes or No	Question 5 Comment
appropriate indicator that an updated Protection System Coordination Study may be necessary. In the situation that you described, the standard provides the entities the opportunity to 'technically justify why such a study is not required'. Also note that the requirement to conduct the review has been modified to 60 [calendar] months.		

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1,with the stated purpose 'to coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.' This standard incorporates and clarifies the coordination aspects of Requirements R2 and R3 from PRC-001-2 (formerly R3 and R4 of PRC-001-1). The SPC SDT is requesting a posting for stakeholder comments for a 30-day formal comment period with a parallel successive ballot.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period with Parallel Successive Ballot	June 2013
Conduct Recirculation Ballot	August 2013
BOT Adoption	November 2013

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: A BES Element that electrically joins facilities owned by:

a) separate Registered Entities, or
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2 **Facilities:** For the purpose of the requirements contained herein, the following Protection Systems owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.

   4.2.1 Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults."*

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPC SDT revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)

Other Aspects of Coordination of Protection Systems Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.

- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed in PRC-019-1 by Project 2007-09.
- Transmission relay loadability is addressed in PRC-023-2.
- Generator relay loadability will be addressed in PRC-025-1 by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.
- Protective relay response during power swings will be addressed by Phase 3 of Project 2010-13.3, Relay Loadability.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new Interconnected Elements. The drafting team defines the term "Interconnected Element" as "A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner)."

Part 1.1.1 The drafting team believes 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team believes that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required, e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.

Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations. The drafting team believes that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnected Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s).

Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its Interconnected Elements as follows:

1.1.1 Within 60 calendar months after the effective date of this standard, if no PSCS for that Interconnected Element exists.

1.1.2 Within 12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each PSCS, provide to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s), a summary of the results of each PSCS performed pursuant to Requirement R1, Part 1.1, (including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed).

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated PSCS, or the summary results of each PSCS (hard copy or electronic file formats) demonstrating the time frames specified or agreed to in Parts 1.1.1, 1.1.2, and 1.1.3 were achieved. Acceptable evidence of a technical justification for not performing a PSCS as specified in Parts 1.1.2 and 1.1.3 may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspects of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary results of each PSCS (hard copy or electronic file formats) were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing the results to the applicable entities when changes occur that meet the criteria of Requirement R2. It is important that interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes 60 calendar months provides the entities flexibility to either technically justify why Fault current does not affect the Protection System coordination, or schedule and perform the activities specified in Requirement R2, Parts 2.1 and 2.2.

The drafting team recognizes the coordination of some types of Protection Systems is unaffected by changes in Fault current and, where technically justified, can be exempted from the short circuit review.

Part 2.1 The drafting team believes maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination.

Part 2.2 The drafting team is including this equation to assure a consistent approach is used by each Transmission Owner when calculating the percent change in Fault current values.

Part 2.2.1 The drafting team believes the 30-calendar day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the Interconnected Element. The drafting team determined that a change in Fault current of 10% indicates an appropriate point at which to provide this information, based on the fact that Protection Systems are typically set with margins above 10%.

R2. For each Interconnected Element on its System, the Transmission Owner shall, once every 60 calendar months, technically justify why Fault current does not affect the Protection System coordination, or: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Coordination Study (PSCS) is available per Requirement R1.

2.2. Calculate the percent change between the Fault current values (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\ Change = \left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent PSCS

2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System associated with the Interconnected Element.

M3. Acceptable evidence of technical justification for not performing a short circuit study as specified in Requirement R2, could be documented engineering analyses or assessments that demonstrate why Fault current does not impact any aspects of coordination.

M4. Acceptable evidence for Requirement R2, Parts 2.1 and 2.2 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and identifies the percent change from the Fault current values used in the most recent PSCS determined by the equation.

M5. Acceptable evidence for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the Interconnected Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element. The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, and 1.1.3. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnected Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnected Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

- New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

M6. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) as identified in the bulleted list, was provided to each responsible entity connected to the same Interconnected Element.

M7. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

M8. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements affirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.

Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a PSCS and respond. Note: Per Requirement R1, Part 1.2, at a minimum, the summary results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate acceptance with the review results/conclusions; or rejection of or disagreement with the review results/conclusions and offer of suggestions/modifications to resolve any identified coordination issues. The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they accept the proposed changes since no coordination issues were identified.

Part 4.2 The drafting team believes that proposed changes or modifications (including project schedules) to Facilities associated with the Interconnected Element, as described in Requirement R3, Part 3.1, or modifications suggested in Requirement R4, Part 4.1 must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a PSCS (per Requirement R1, Part 1.2) and respond to the other owner(s):

- Accepting the results, or
- Rejecting the results and suggesting modifications to resolve any identified coordination issues.

4.2. Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the

Protection System(s) changes including the resolution of any identified coordination issues.

M9. Acceptable evidence for Requirement R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

M10. Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes or modifications, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System associated with an Interconnected Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures M1 through M10, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider that owns a Protection System at a Facility associated with an Interconnected Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing Interconnected Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with Interconnected Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the desired sequence for internal and external Faults on the Interconnected Element.

Requirement R1:

This requirement directs the applicable entities to perform a Protection System Coordination Study (PSCS) for every Interconnected Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current changes of 10% or more have occurred. In developing the language to define a PSCS, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and

sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The drafting team believes applicable entities should have a documented PSCS for each Interconnected Element to validate the Protection Systems associated with those Interconnected Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that 60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Parts 1.1.2 and 1.1.3 further direct that PSCSs must be completed under the following two circumstances:

1. After notification of an identified 10% or greater change in Fault current (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new PSCS of the Interconnected Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater change in Fault current may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 60-calendar month Fault current review.
2. After proposing or being notified of a change at a Facility associated with the Interconnected Element, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule

and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2. The drafting team believes that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed, when details of changes are provided associated with Requirement R3 Part 3.3.

Requirement R1, Part 1.2 directs the entity performing the PSCS to provide a summary of the study results to the affected Interconnected Element owner(s). The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s). (Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) As guidance, the drafting team lists the following inputs and results of a PSCS that may be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner either provide a technical justification stating why Fault current does not affect the Protection System coordination of a specific Interconnected Element or perform a periodic review of Fault currents.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:

- Loss of potential condition
- Some communication assisted tripping
- Switch-Onto-Fault (SOTF)

4. Reverse power, definite time &/or time overcurrent elements:
    - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.
    - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

The short circuit study provides the Fault current values used to calculate the percent change between the most recent PSCS and the present Fault current values indicated by the short circuit study performed pursuant to Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes that 60 calendar months is an appropriate interval for technically justifying why Fault currents do not affect the Protection System coordination of a specific Interconnected Element, or for reviewing Fault currents. The drafting team believes studies associated with changes that would affect the coordination in less than 60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnected Element when short circuit studies indicate that 10% changes in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnected entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the Interconnected Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the PSCS of the Facility associated with the Interconnected Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the Interconnected Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed-upon coordination when changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

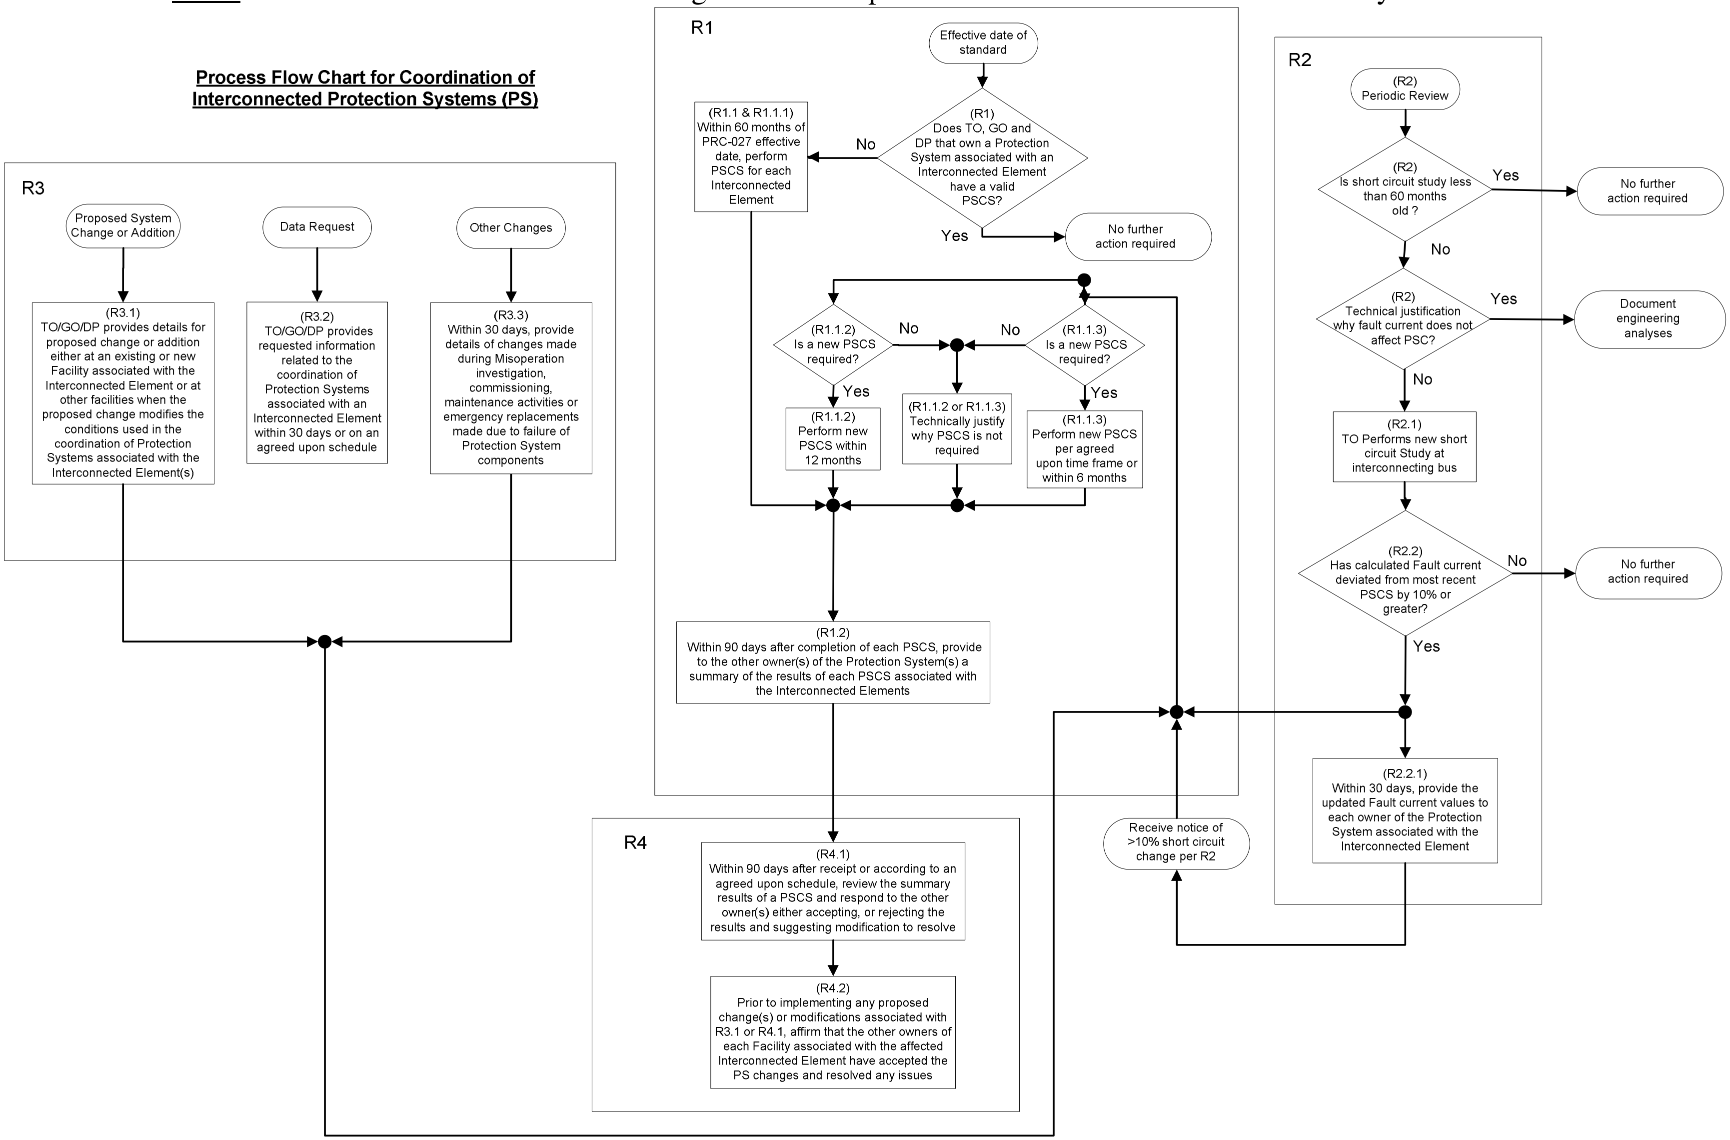
Requirement R4:

The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS, as described in Requirement R1, Part 1.2; and respond as to whether they accepting or rejecting the results, and if rejecting, suggesting modifications to resolve any identified coordination issues. The drafting team believes 90 calendar days after receipt of the results of a PSCS provides a reasonable time for the owners of Facilities to review the summary results of a PSCS.

Requirement R4, Part 4.2 directs entities to affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes as described in Requirement 3, Part 3.1 and Requirement 4, Part 4.1 prior to the in-service date of those changes. Any coordination issues identified during the review must be resolved prior to implementing the proposed changes. The purpose of Requirement 4, Part 4.2 is to assure the effects the proposed changes have on Protection Systems at a Facility associated with the Interconnected Element have been considered by all affected entities.

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:
Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes.



Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and provide details of the proposed change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, respond as to whether any coordination issues were identified, and if any further action is required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

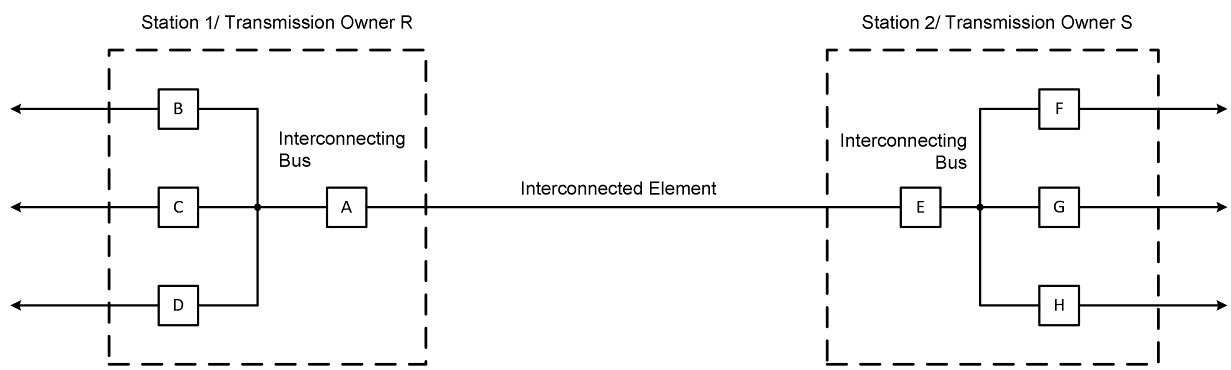
Diagrams

Introduction: The diagrams below are intended to provide guidance, to the owners of Facilities associated with the affected Interconnected Element, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable Interconnected Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of changes, the owners must work together to resolve any coordination issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".

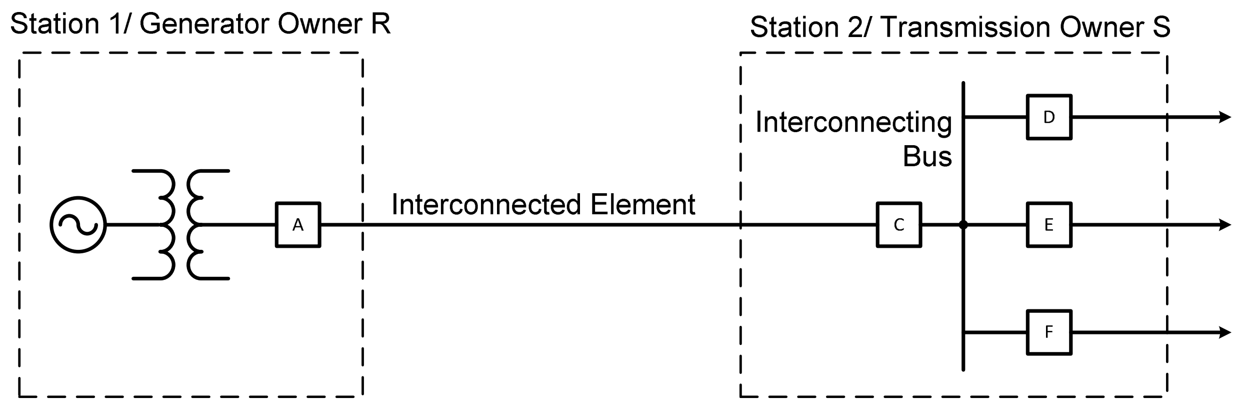
Figure 1



In Figure 1 above, the Interconnected Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner S is to develop proposed Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

<u>Figure 2</u>

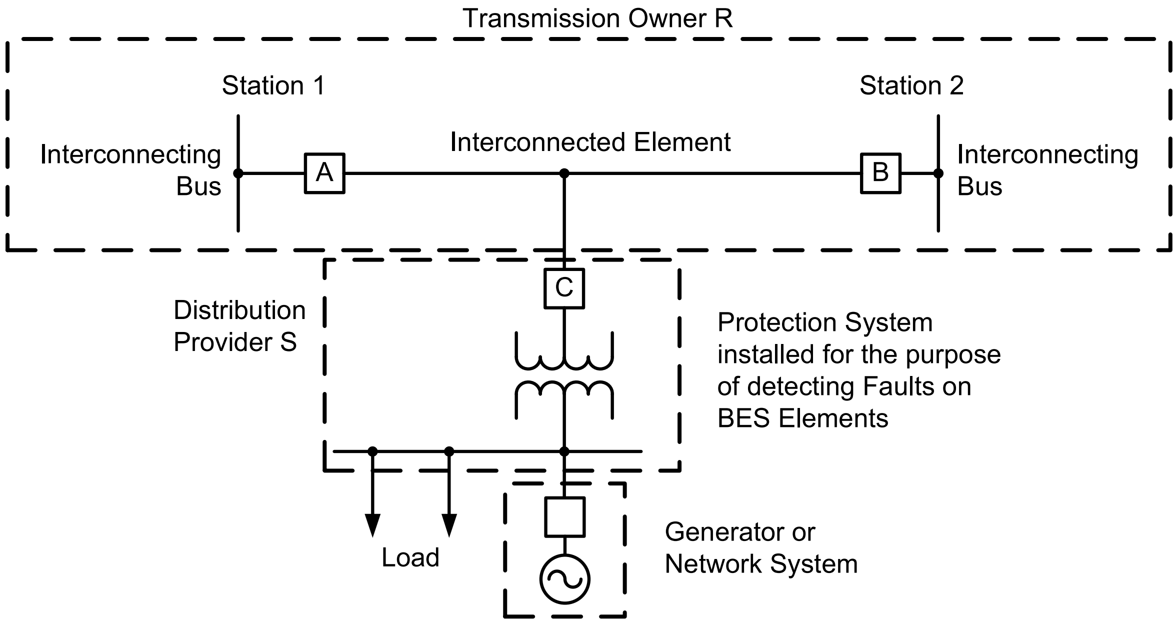


In Figure 2 above, the Interconnected Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 2, Owner R is to develop proposed Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop proposed Protection System settings associated with Breaker C. Generation Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3



In Figure 3 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between Breaker C and the point of connection to the line between Breakers A and B.

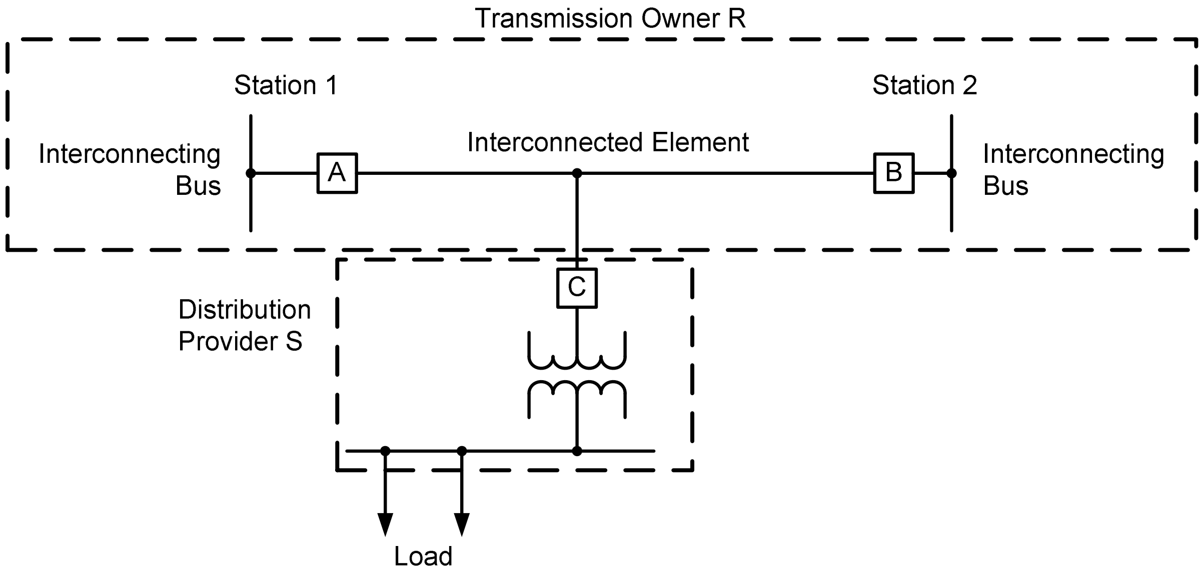
Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop proposed Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is installed for the purpose of detecting Faults on BES Elements.

Protection Systems installed for the purpose of detecting Faults on BES Elements do not include relays that, though they may operate for such Faults, are not installed specifically for that purpose. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized (for whatever reason) while the distribution bank remains energized from a source on the low-voltage side. In this case, the settings of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not specifically installed for the purpose of detecting that Fault.

Figure 4



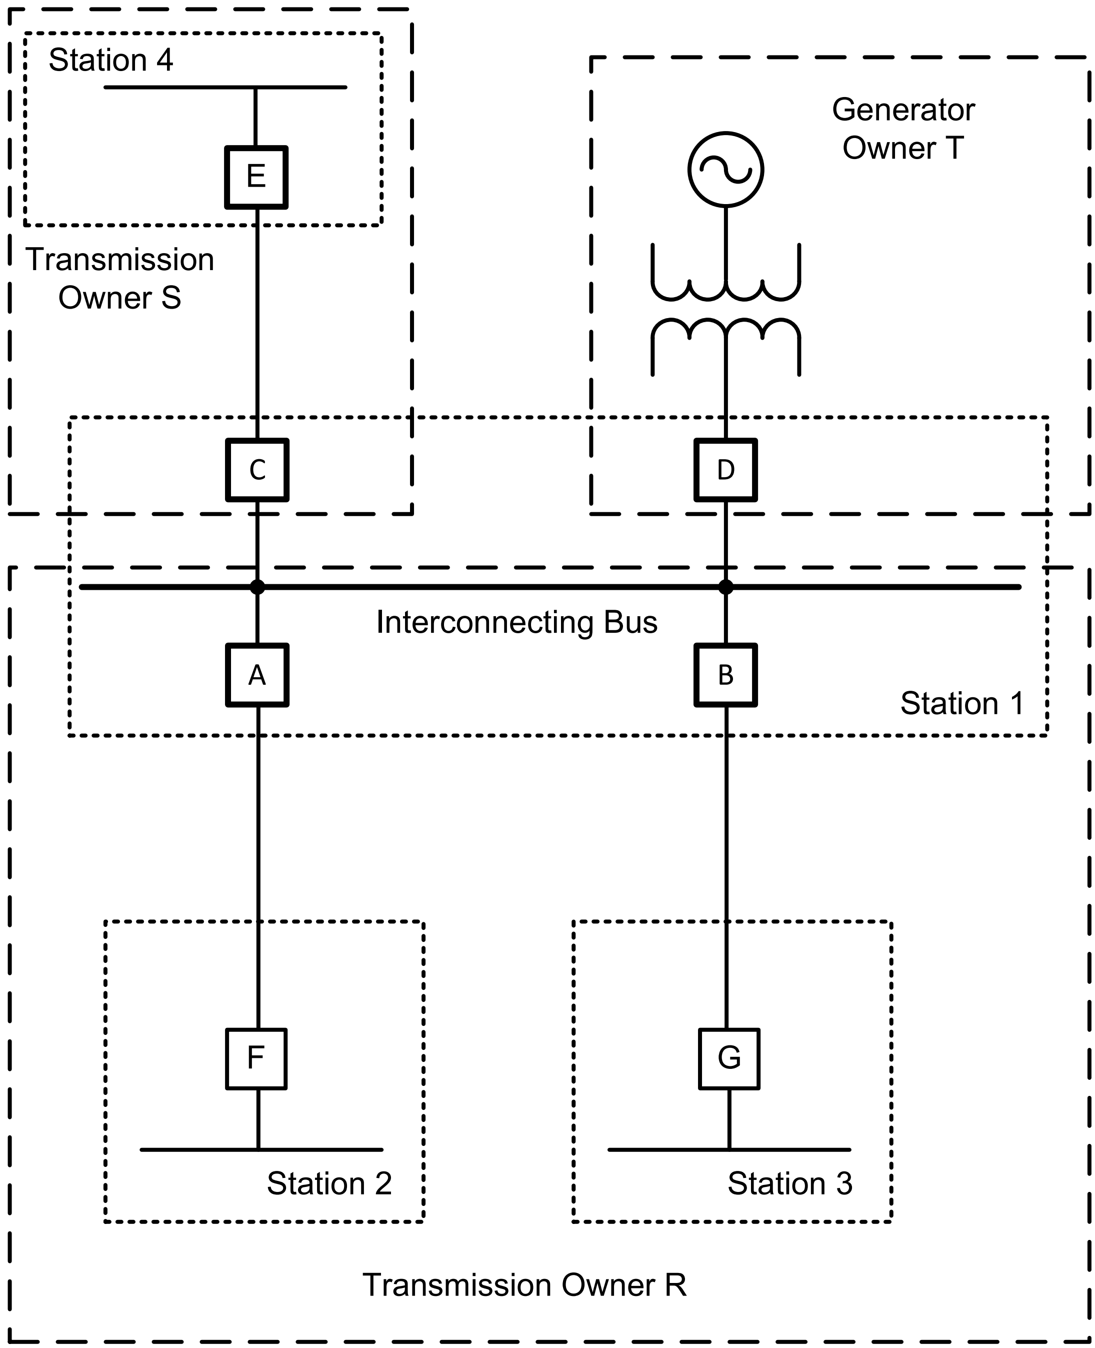
In Figure 4 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.

Note: No specific PSCS is required per this standard for this example since the Protection System at the Distribution Provider's substation is not installed for the purpose of detecting Faults on BES Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.



In Figure 5 above, the Interconnected Element between the Transmission Owners R and S and Generator Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at Station 1. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 5:

Owner S is to develop proposed Protection System settings associated with Breakers C and E.

Owner T is to develop proposed Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop proposed Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the generator Protection System. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
~~5.~~6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1, with the stated purpose 'to coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the ~~least number of power system Elements are isolated to clear~~desired sequence during Faults.'~~.~~ This standard incorporates and ~~enhances~~ clarifies the coordination aspects of Requirements ~~R3~~ R2 and ~~R4~~ R3 from PRC-001-~~1~~ 2 (~~now~~ formerly ~~R2~~ R3 and ~~R3~~ R4 of PRC-001-~~2~~1). The SPC SDT is requesting a posting for stakeholder comments ~~under~~ for a 30-day formal comment period with a parallel successive ballot.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period with Parallel Successive Ballot	~~November 2012~~June 2013
Conduct Recirculation Ballot	~~January~~August 2013
BOT Adoption	~~August~~November 2013

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: ~~An~~A BES Element that electrically joins facilities owned by:
a) separate ~~Functional~~Registered Entities, ~~including those Functional Entities that are a part of~~or
b) the same Registered Entity~~.~~ that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for Interconnected Elements, such that ~~the least number of power system Elements are isolated to clear~~Protection System components operate in the desired sequence during Faults.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

~~**4.2 Facilities:**~~

4.2 Facilities: For the purpose of the requirements contained herein, the following Protection Systems owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.

4.2.1 Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and ~~enhanced~~ clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Elements, such that ~~the least number of power system Elements are isolated to clear~~Protection System components operate in the desired sequence during Faults."*

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in ~~the proposed~~ Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPC SDT revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)~~The SPC SDT is incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 in a new standard (as recommended by the SPCTF assessment), and focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1. The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard.~~

~~Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.~~

Other Aspects of ~~c~~Coordination of Protection Systems ~~a~~Addressed by ~~o~~Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency Load shedding programs are addressed ~~by~~in PRC-006-1~~ (Project 2007-01 Underfrequency Load Shedding – pending FERC approval) and generator~~. Generator performance during frequency excursions is being addressed ~~by~~in PRC-024-1 ~~in~~by Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed ~~by~~in PRC-024-1 ~~in~~by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed ~~by~~in PRC-019-1 ~~in~~by Project 2007-09.
- Transmission relay loadability is addressed in PRC-023-~~1 and, pending FERC approval, PRC-023-~~2.
- Generator relay loadability will be addressed in PRC-025-1 by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.
- Protective relay response during power swings will be addressed ~~in~~by Phase 3 of Project 2010-13.3, Relay Loadability.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (
for existing and new Interconnected Elements. Th
BES Element that electrically joins facilities owne
Entity that represents multiple functional entity res
Transmission Owner)."

performed in accordance with Requirement R1, Pa
with the Interconnected Element(s).

Note: In cases where a single group performs an o
single document that provides the requirements for
by both Registered Entities.

~~Rationale for R1:~~

~~Part 1.1 Protection System Studies are necessary to verify coordination of Protection Systems for existing and new Interconnected Element. The drafting team defines the term "Interconnected Element" as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."~~

~~Part 1.1.1 The drafting team believes 48 months is an appropriate period of time for entities to perform the Protection System Studies required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.~~

~~Part 1.1.2 The drafting team believes that 6 months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current deviation at an interconnecting bus, where such conditions may warrant a new Protection System Study, or to technically justify why no such study is required, i.e., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.~~

~~Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.~~

~~Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnected Element(s), all entities need to share the summary of results of a Protection System Study (PSS) and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSS performed in accordance with Requirement R1 to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).~~

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its Interconnected ~~Element on its System~~Elements as follows:

1.1.1 Within ~~48~~60 calendar months after the effective date of this standard, if no ~~Protection System Study~~PSCS for that Interconnected Element exists.

1.1.2 Within ~~six~~12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1~~ or Part 3.3,~~, or within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each ~~Protection System Study~~PSCS, provide to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s~~)~~), a summary of the results of each ~~Protection System Study~~PSCS performed pursuant to ~~this requirement~~Requirement R1, Part 1.1, (including, at a minimum, the ~~protective relay settings~~Protection Systems reviewed, ~~power system Elements to be isolated, contingencies evaluated,~~the associated Fault currents used, any issues identified, and any revisions or actions proposed).

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated ~~Protection System Study~~PSCS, or the summary results of each ~~Protection System Study (either in~~ PSCS (hard copy or electronic file formats) demonstrating ~~that~~ the time frames specified or agreed to in Parts 1.1.1~~ and,~~ 1.1.2~~.~~, and 1.1.3 were achieved. Acceptable evidence of a technical justification for not performing a ~~Protection System Study~~PSCS as specified in Parts 1.1.2 and 1.1.3 ~~could be~~may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspects of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary results of each ~~Protection System Study~~PSCS (hard copy or electronic file formats) ~~was~~were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing ~~to~~ the results to the applicable entities when ~~deviations~~changes occur that meet the criteria of Requirement R2 ~~criteria~~. It is important that interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. ~~The drafting team determined that 10% was an appropriate point to provide this information based on the fact that Protection Systems are typically set with margins above 10%.~~Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

~~Part 2.1 Short circuit databases are customarily updated annually, so the~~The drafting team believes ~~24~~60 calendar months provides the entities flexibility to either technically justify why Fault current does not affect the Protection System coordination, or schedule and perform the ~~new~~ activities specified in Requirement R2, Parts 2.1 and 2.2.

The drafting team recognizes the coordination of some types of Protection Systems is unaffected by changes in Fault current and, where technically justified, can be exempted from the short circuit ~~studies and calculate the percent deviation.~~ review.

Part 2.1 The drafting team believes ~~studies associated with changes that would affect~~maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination ~~in less time would be triggered by other requirements in this standard.~~.

Part 2.2 The drafting team is including this ~~formula~~equation to assure a consistent approach is used by each Transmission Owner when calculating the percent ~~deviation~~change in Fault current values.

R2. For each ~~Facility associated with an~~ Interconnected Element on its System, the Transmission Owner shall, once every 60 calendar months, technically justify why Fault current does not affect the Protection System coordination, or: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

~~**2.1.** At least once every 24 months:~~

~~2.2.~~2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Coordination Study (PSCS) is available per Requirement R1.

~~2.3.~~2.2. Calculate the percent ~~deviation~~change between the Fault current values (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent ~~Protection System Study~~PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.~~1~~.1, using the following equation:

$$\%\ \cancel{Deviation}Change = \cancel{\left|\frac{Iscs - Ipss}{Ipss}\right|}\left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent ~~Protection System Study~~PSCS

2.2.1 Within 30 calendar days after identification ~~where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates~~of a ~~deviation in Fault current~~change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System associated with the Interconnected Element ~~the updated Fault current values (I_{scs}).~~.

M3. Acceptable evidence of technical justification for not performing a short circuit study as specified in Requirement R2, could be documented engineering analyses or assessments that demonstrate why Fault current does not impact any aspects of coordination.

~~**M3.**~~**M4.** Acceptable evidence for Requirement R2, ~~Part~~ Parts 2.1 and 2.2~~.1~~ is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and ~~that~~ identifies the percent ~~deviation~~change from the ~~most recent Protection System Study~~ Fault current values used in the most recent PSCS determined by the ~~formula~~equation.

~~**M4.**~~**M5.** Acceptable evidence ~~that the updated Fault current values (I_{scs}), along with~~for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) ~~for Requirement R2, Part 2.2 was~~that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the Interconnected Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element. The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in R… believes 30 calendar days after receipt of the request is a su… requirement also provides some flexibility for the parties in… appropriate.

Part 3.3 The drafting team believes 30 calendar days is suffi…

~~Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.~~

~~Part 3.1 The reliability objective of this requirement is to enable the process of conducting Protection System Studies by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Part 1.1.~~

~~Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a Protection System Study, as required in Parts 1.1.1, 1.1.2, and 1.1.3. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.~~

~~Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.~~

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnected Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition~~s~~ listed below; either at an existing or new Facility associated with the

Interconnected Element; or at other ~~f~~Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

- New installation, replacement with different types, or modification of ~~:~~ protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that ~~change~~alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

~~M5.~~M6. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited~~,~~ to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) ~~in hard copy or electronic file formats~~ as identified in the bulleted list ~~for Requirement R3, Part 3.1,~~ was provided to each responsible entity connected to the same Interconnected Element.

~~M6.~~M7. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

~~M7.~~M8. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements affirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.

Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a PSCS and respond. Note: Per Requirement R1, Part 1.2, at a minimum, the summary results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate acceptance with the review results/conclusions; or rejection of or disagreement with the review results/conclusions and offer of suggestions/modifications to resolve any identified coordination issues. The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they accept the proposed changes since no coordination issues were identified.

Part 4.2 The drafting team believes that proposed changes or modifications (including project schedules) to Facilities associated with the Interconnected Element, as described in Requirement R3, Part 3.1, or modifications suggested in Requirement R4, Part 4.1 must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

> ~~Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements confirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.~~
>
> ~~Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a Protection System Study. If any issues are identified that require changes then respond whether further action is required.~~
>
> ~~Part 4.2 The drafting team believes that proposed modifications (including project schedules) to Facility changes associated with the Interconnected Element, as described in Requirement R3, Part 3.1, must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.~~

4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a ~~Protection System Study, as described in~~PSCS (per Requirement R1, Part 1.2~~,~~) and respond ~~as~~ to ~~whether further action is required.~~ the other owner(s):

- Accepting the results, or
- Rejecting the results and suggesting modifications to resolve any identified coordination issues.

4.2. Prior to implementing any ~~planned~~proposed change(s) or modifications associated with Requirement R3, Part 3.1~~, confirm the~~ or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element ~~accept any resulting~~have accepted the Protection System(s) changes including the resolution of any identified coordination issues.

~~M8.~~**M9.** Acceptable evidence for Requirement R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

~~M9.~~**M10.** Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that ~~confirmation of acceptance was achieved,~~ prior to implementation of any ~~planned~~proposed Protection System(s) changes or modifications, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System ~~at~~associated with an Interconnected ~~Facility~~Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures M1 through ~~M9~~M10, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner ~~and~~or Distribution Provider that owns a Protection System at a Facility associated with an Interconnected Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing Interconnected Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with Interconnected Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the desired sequence for internal and external Faults on the Interconnected Element.

Requirement R1:

This requirement directs the ~~performance of~~applicable entities to perform a Protection System ~~Studies~~Coordination Study (PSCS) for every Interconnected Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current ~~deviations~~changes of 10% or more have occurred. In developing the language to define ~~Protection System Study~~a PSCS, the System Protection Coordination Standard Drafting Team (~~SPC SDT~~SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

~~Protection System Studies~~PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in ~~Protection System Studies~~PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The drafting team believes applicable entities should have a documented ~~Protection System Study~~PSCS for each Interconnected Element to validate the Protection Systems associated with those Interconnected Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that ~~48~~60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Parts 1.1.2 and 1.1.3 further direct that ~~Protection System Studies~~PSCSs must be completed under the following two circumstances:

1. After notification of an identified 10% or greater ~~deviation~~change in Fault current~~,~~ (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new ~~Protection System Study~~PSCS of the Interconnected Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater ~~deviation~~change in Fault current may not necessitate a new ~~Protection System Study~~PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the ~~six~~ 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the ~~24~~ 60-calendar month Fault current review.

2. After proposing or being notified of a change at a Facility associated with the Interconnected Element, entities must perform a new ~~Protection System Study~~PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new ~~Protection System Study~~PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with ~~this requirement~~performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of

conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2. The drafting team believes that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed, when details of changes are provided associated with Requirement R3 Part 3.3.

Requirement R1, Part 1.2 directs the entity performing the ~~Protection System Study~~PSCS to provide a summary of the study results to the affected Interconnected Element owner(s). The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s). (Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) As guidance, the drafting team lists the following inputs and results of a ~~Protection System Study~~PSCS that may be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. ~~Data used to determine Fault currents in performing the study, along with a~~A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing ~~Protection System Studies~~PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated ~~Protection System Study~~PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner either provide a technical justification stating why Fault current does not affect the Protection System coordination of a specific Interconnected Element or perform a periodic review of Fault currents.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
    - Loss of potential condition
    - Some communication assisted tripping
    - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
    - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and ~~includes the calculation of the percent deviation between the~~ under single contingency conditions regardless of Fault current.
    - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

The short circuit study provides the Fault current values used ~~in the~~ to calculate the percent change between the most recent ~~Protection System Study~~PSCS and the present Fault current values indicated by the short circuit study performed pursuant to ~~this requirement~~Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

~~Polling of~~The drafting team ~~membership and various protection engineering committees indicates~~believes that ~~short circuit databases are customarily updated annually. Based on this information, the drafting team believes that requiring a 24-month periodic review of~~60 calendar months is an appropriate interval for technically justifying why Fault currents ~~provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation, as described in Requirement R2, Part 2.1.~~ do not affect the Protection System coordination of a specific Interconnected Element, or for reviewing Fault currents. The drafting team believes studies associated with changes that would affect the coordination in less than ~~24~~60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnected Element when short circuit studies indicate that 10% ~~deviations~~changes in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnected entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the ~~Functional Entity~~functional entity responsible for performing the ~~Fault current~~short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the Interconnected Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its ~~Protection System Studies~~PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the ~~Protection System Study~~PSCS of the Facility associated with the Interconnected Element; e.g., the addition of a large autotransformer bank or generator not directly ~~associated with~~connected to the Interconnected Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a ~~Protection System Study~~PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed-upon coordination when changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

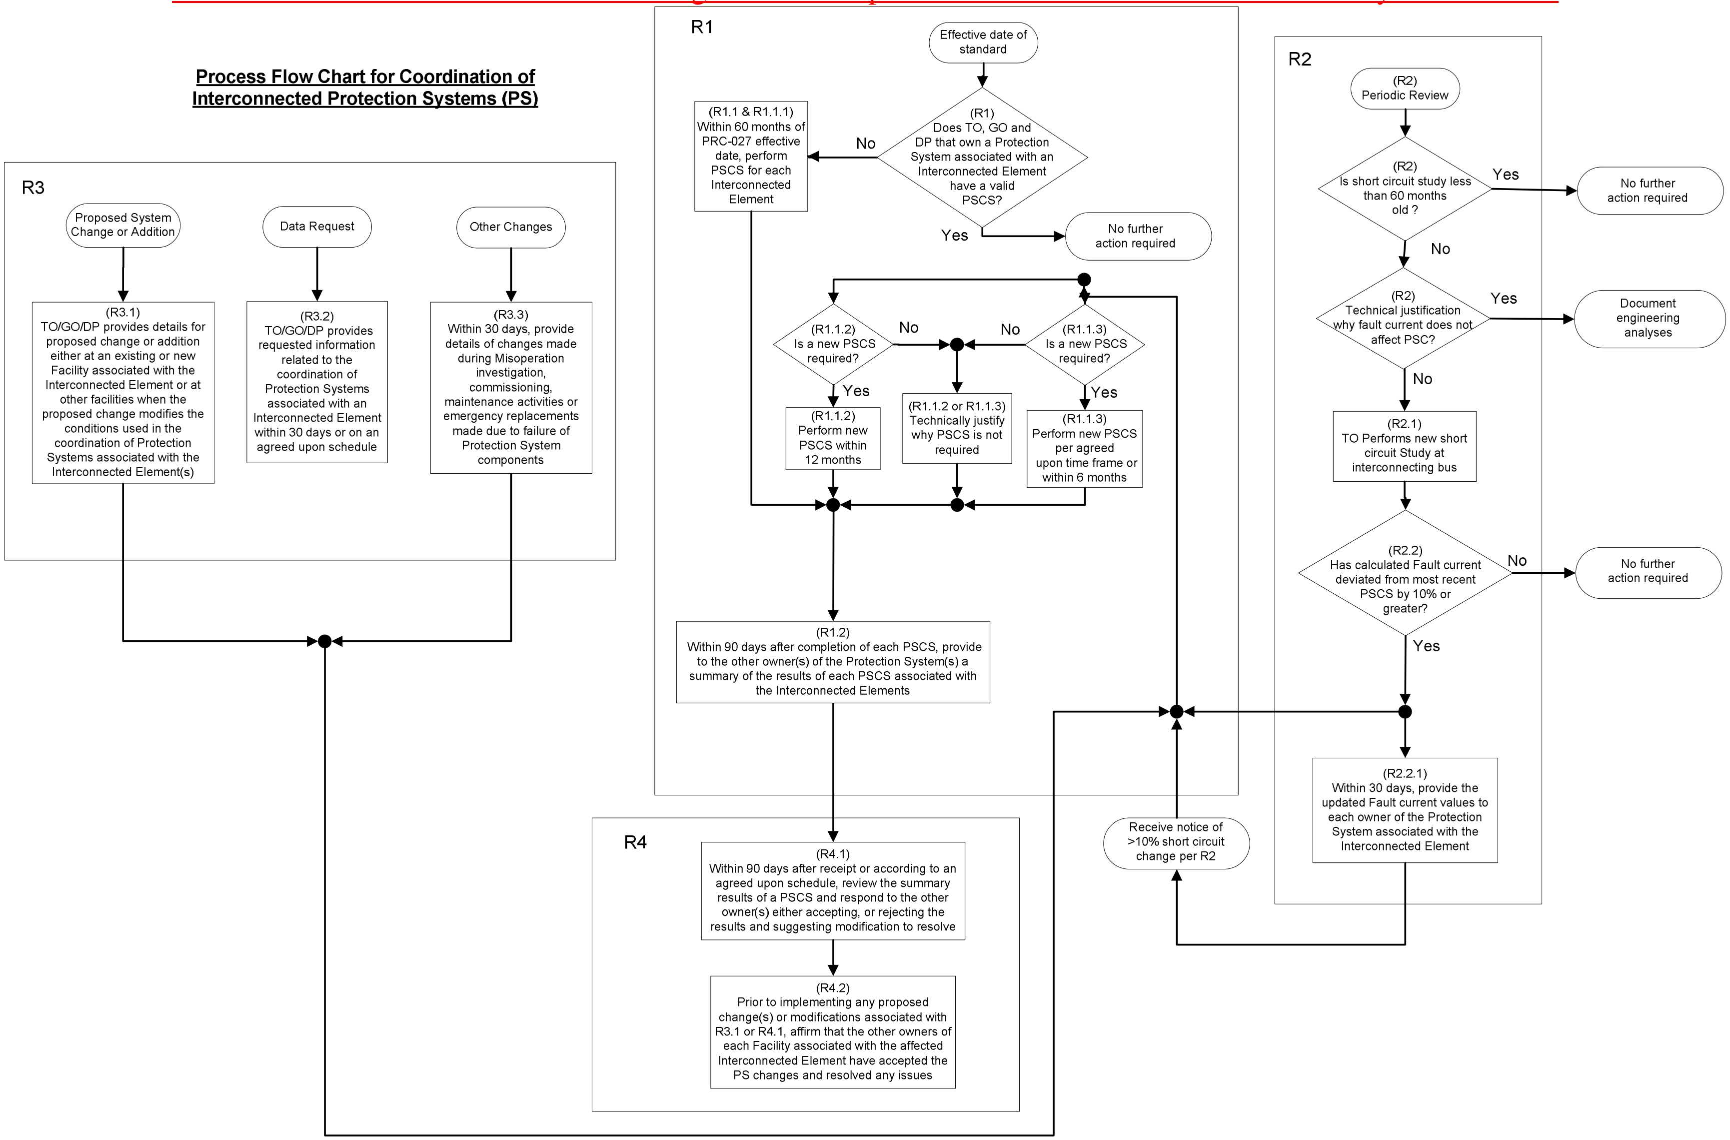
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

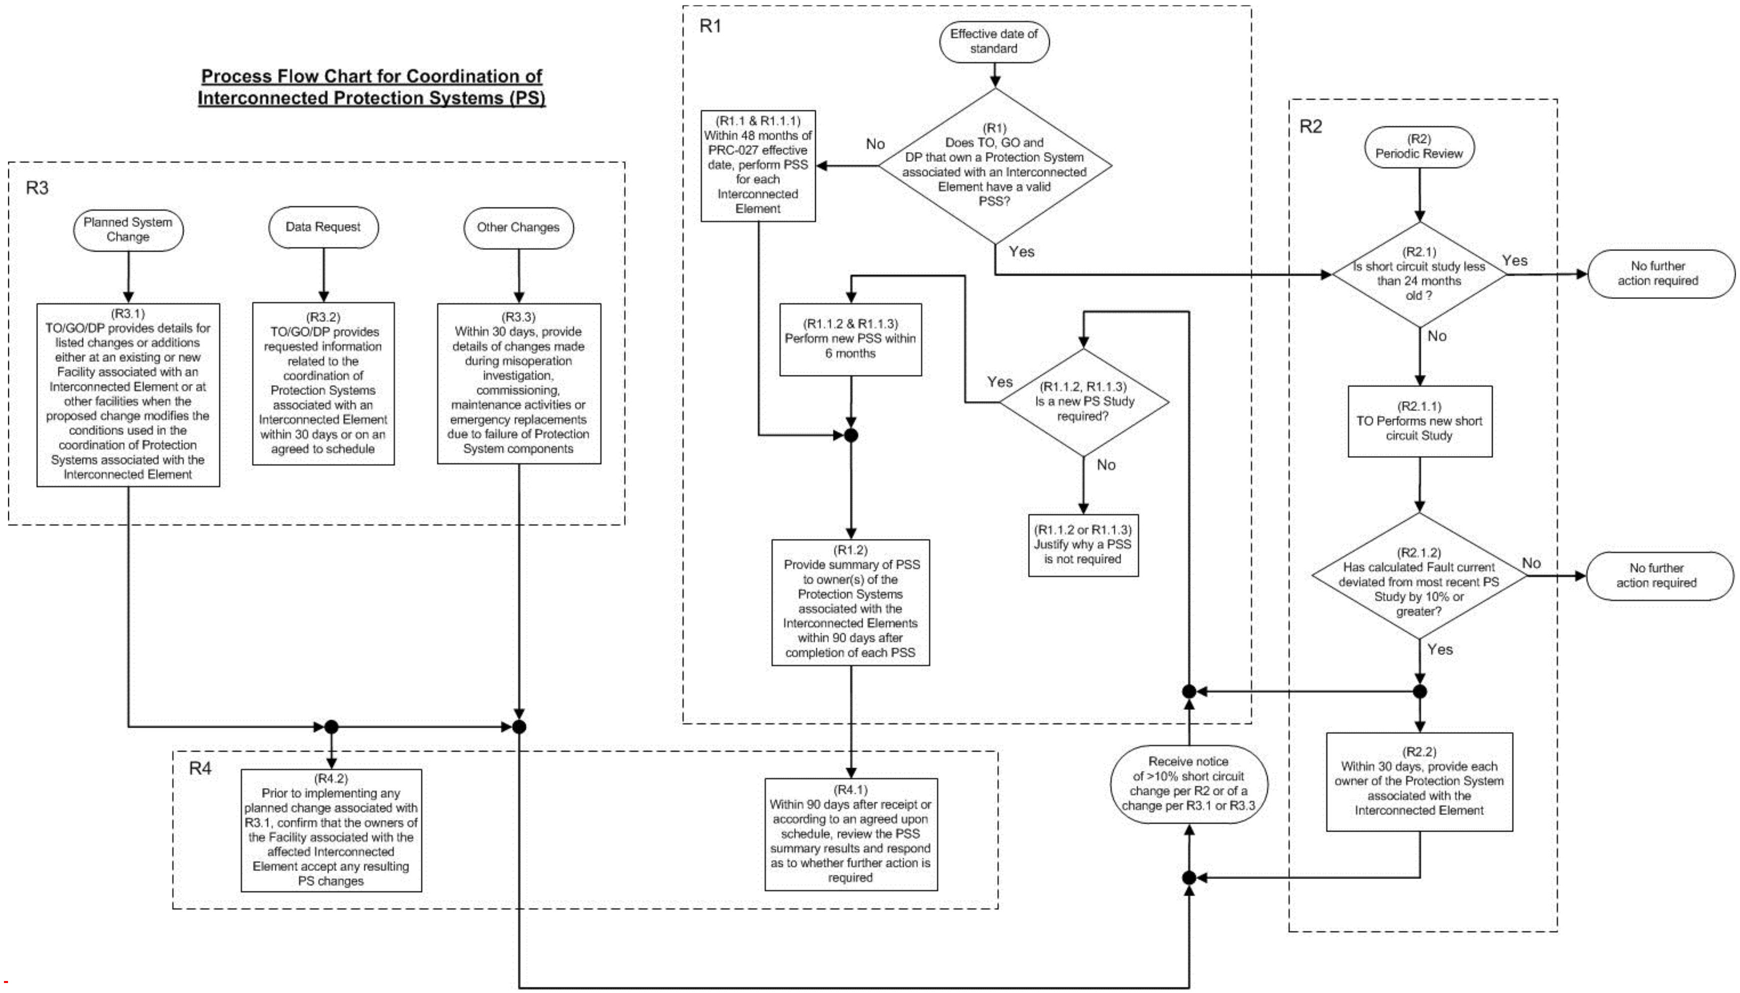
Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a ~~Protection System Study~~PSCS, as described in Requirement R1, Part 1.2; ~~or absent acceptance propose revisions~~and respond as to ~~achieve acceptable results.~~whether they accepting or rejecting the results, and if rejecting, suggesting modifications to resolve any identified coordination issues. The drafting team believes 90 calendar days after receipt of the results of a ~~Protection System Study~~PSCS provides a reasonable time for the owners of Facilities to ~~resolve differences and confirm acceptance that their Protection Systems are coordinated~~review the summary results of a PSCS.

Requirement R4, Part 4.2 directs entities to ~~con~~affirm that ~~planned~~the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes as described in Requirement 3, Part 3.1 ~~are acceptable~~and Requirement 4, Part 4.1 prior to the in-service date of those changes. Any coordination issues identified during the review must be resolved prior to implementing the proposed changes. The purpose of ~~this requirement~~Requirement 4, Part 4.2 is to assure the effects ~~that planned~~the proposed changes have on Protection Systems at a Facility associated with the ~~affected~~ Interconnected Element have been considered by all affected entities.

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:

Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes.





Process Flow Chart for Coordination of Interconnected Protection Systems (PS)
R1
Effective date of standard
(R1) Does TO, GO and DP that own a Protection System associated with an Interconnected Element have a valid PSS?
No
(R1.1 & R1.1.1) Within 48 months of PRC-027 effective date, perform PSS for each Interconnected Element
Yes
(R1.1.2 & R1.1.3) Perform new PSS within 6 months
Yes
(R1.1.2, R1.1.3) Is a new PS Study required?
No
(R1.1.2 or R1.1.3) Justify why a PSS is not required
(R1.2) Provide summary of PSS to owner(s) of the Protection Systems associated with the Interconnected Elements within 90 days after completion of each PSS
R2
(R2) Periodic Review
(R2.1) Is short circuit study less than 24 months old ?
Yes
No further action required
No
(R2.1.1) TO Performs new short circuit Study
(R2.1.2) Has calculated Fault current deviated from most recent PS Study by 10% or greater?
No
No further action required
Yes
(R2.2) Within 30 days, provide each owner of the Protection System associated with the Interconnected Element
Receive notice of >10% short circuit change per R2 or of a change per R3.1 or R3.3
R3
Planned System Change
Data Request
Other Changes
(R3.1) TO/GO/DP provides details for listed changes or additions either at an existing or new Facility associated with an Interconnected Element or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element
(R3.2) TO/GO/DP provides requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 days or on an agreed to schedule
(R3.3) Within 30 days, provide details of changes made during misoperation investigation, commissioning, maintenance activities or emergency replacements due to failure of Protection System components
R4
(R4.2) Prior to implementing any planned change associated with R3.1, confirm that the owners of the Facility associated with the affected Interconnected Element accept any resulting PS changes
(R4.1) Within 90 days after receipt or according to an agreed upon schedule, review the PSS summary results and respond as to whether further action is required

Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is ~~below~~provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and provide details of the proposed change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a ~~Protection System Study~~PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the ~~Protection System Study~~PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, ~~confirm agreement that~~respond as to whether any coordination issues were identified, and if any further action is ~~achieved~~required.
  - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
- ~~Documentation of the final agreement is required prior to implementation of planned changes.~~
  - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

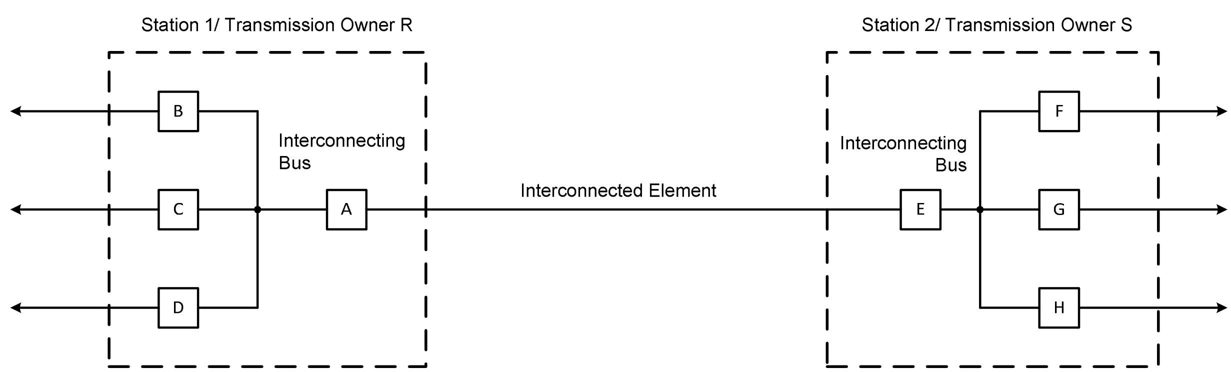
Diagrams

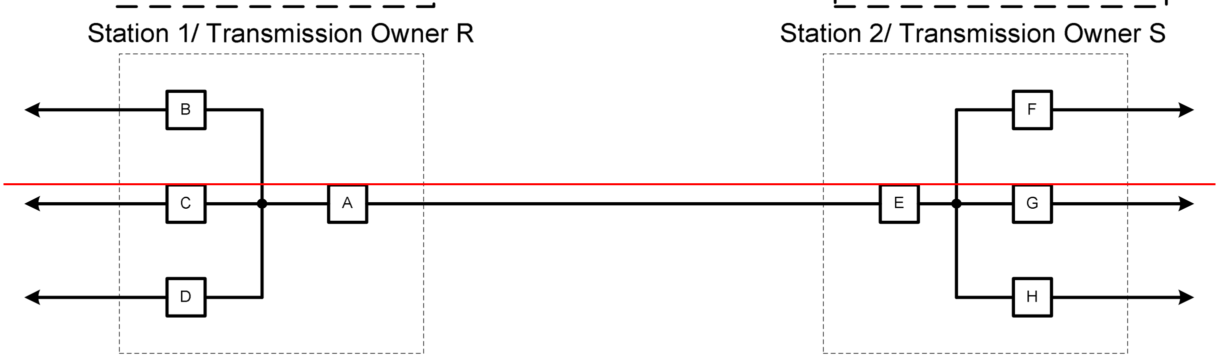
Introduction: The diagrams below are intended to provide guidance~~ related~~, to the ~~purpose of this standard between~~ owners of Facilities associated with the affected Interconnected Element~~.~~, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable Interconnected Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of ~~the~~ changes, the owners must ~~reach agreement on the final settings to achieve~~work together to resolve any coordination ~~of the Protection Systems.~~ issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".

Figure 1

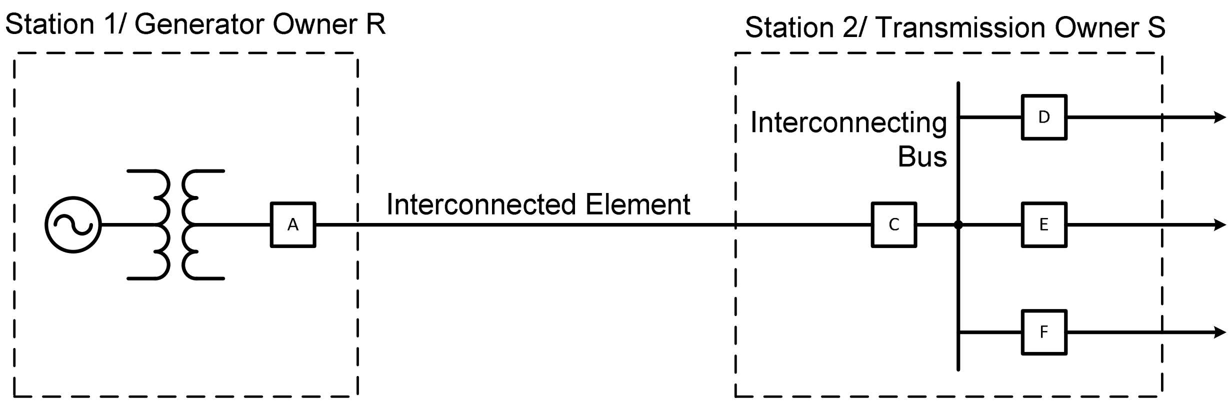


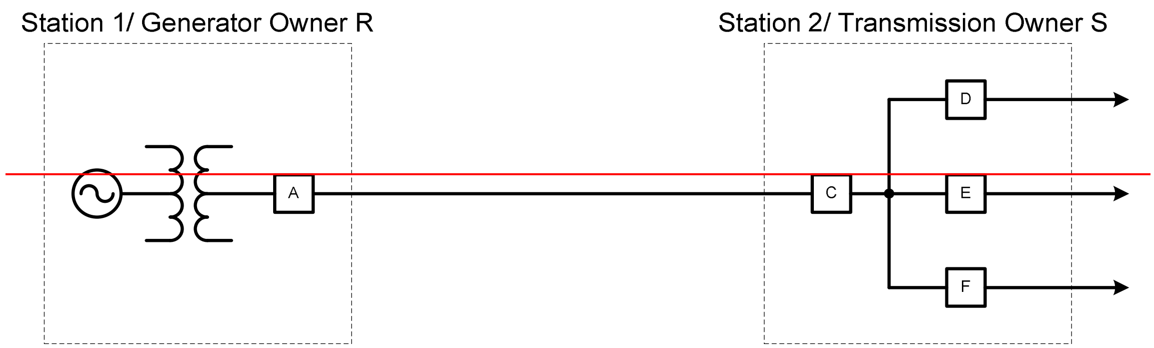


In Figure 1 above, the Interconnected Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. ~~Likewise,~~ Likewise, Owner S is to develop proposed Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2



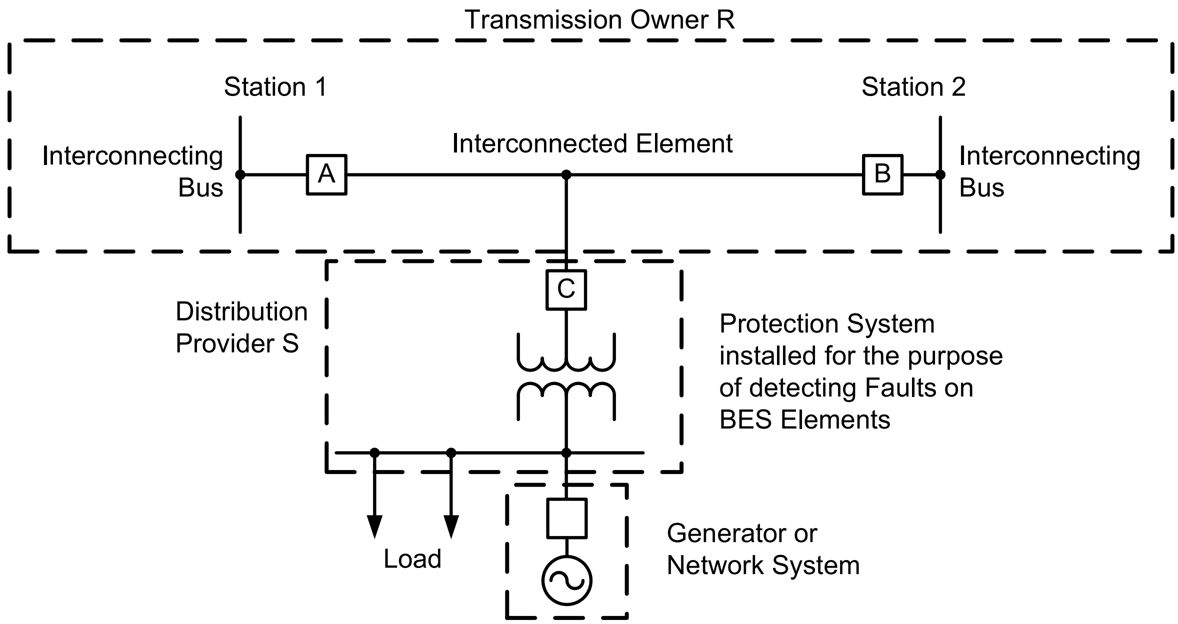


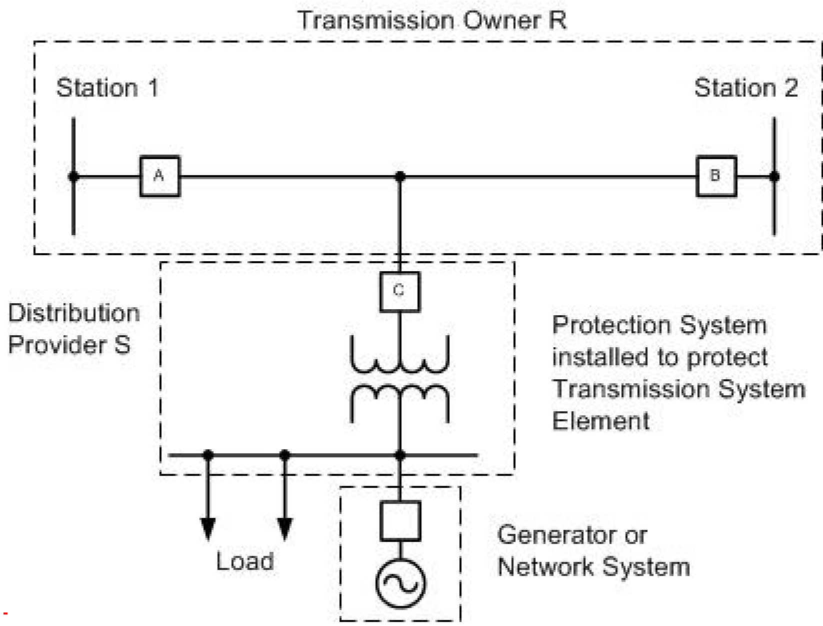
In Figure 2 above, the Interconnected Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, ~~breaker~~Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 2, Owner R is to develop proposed Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. ~~Likewise,~~Likewise, Owner S is to develop proposed Protection System settings associated with Breaker C. Generation Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3





In Figure 3 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between Breaker C and the point of connection to the line between Breakers A and ~~Breaker C~~B.

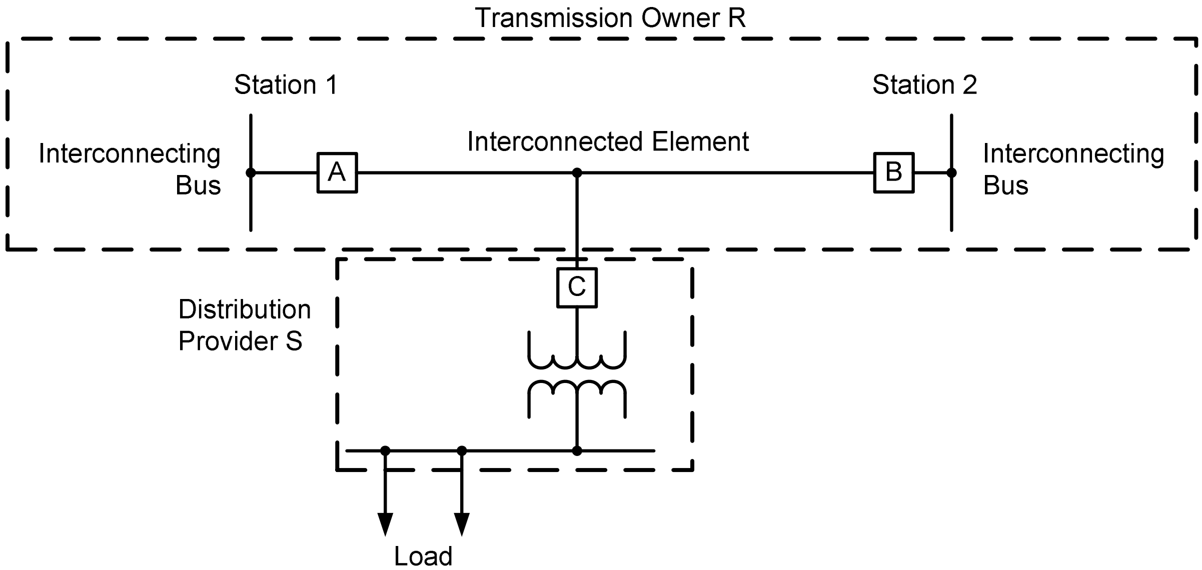
Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop proposed Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

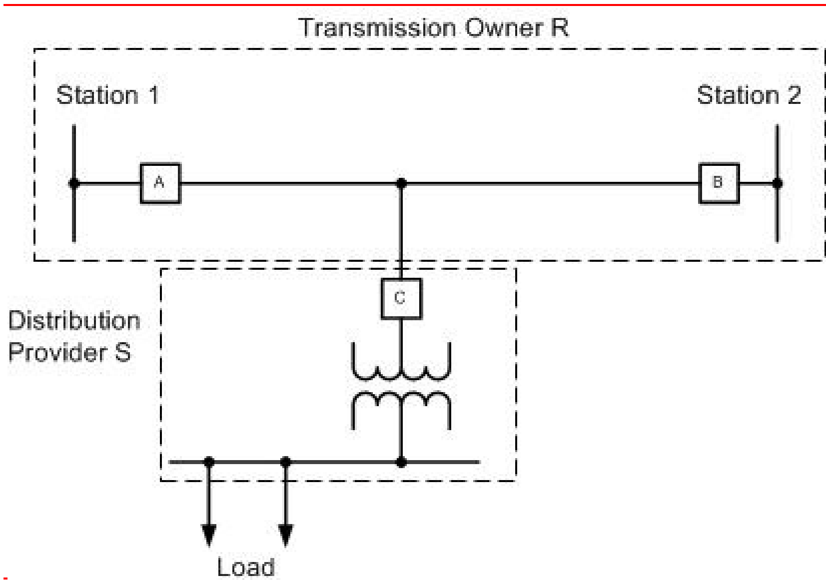
Notes:

~~A Protection System Study~~A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is ~~designed to detect~~installed for the purpose of detecting Faults on ~~the~~ BES ~~Transmission System~~Elements.

~~"~~Protection Systems installed ~~to detect faults on~~ for the purpose of detecting Faults on BES ~~Transmission System" are~~Elements do not ~~inclusive of those~~include relays that, though they may operate for such ~~faults, but~~Faults, are not installed specifically for that purpose ~~(i.e. transformer overcurrent, reverse power, etc.).~~. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized ~~and~~(for whatever reason) while the distribution bank remains energized from a source on the low-voltage side ~~of the transformer and~~. In this case, the settings ~~are~~of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although ~~these~~ relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not ~~"~~specifically installed ~~to detect faults on~~for the ~~BES Transmission System."~~purpose of detecting that Fault.

Figure 4





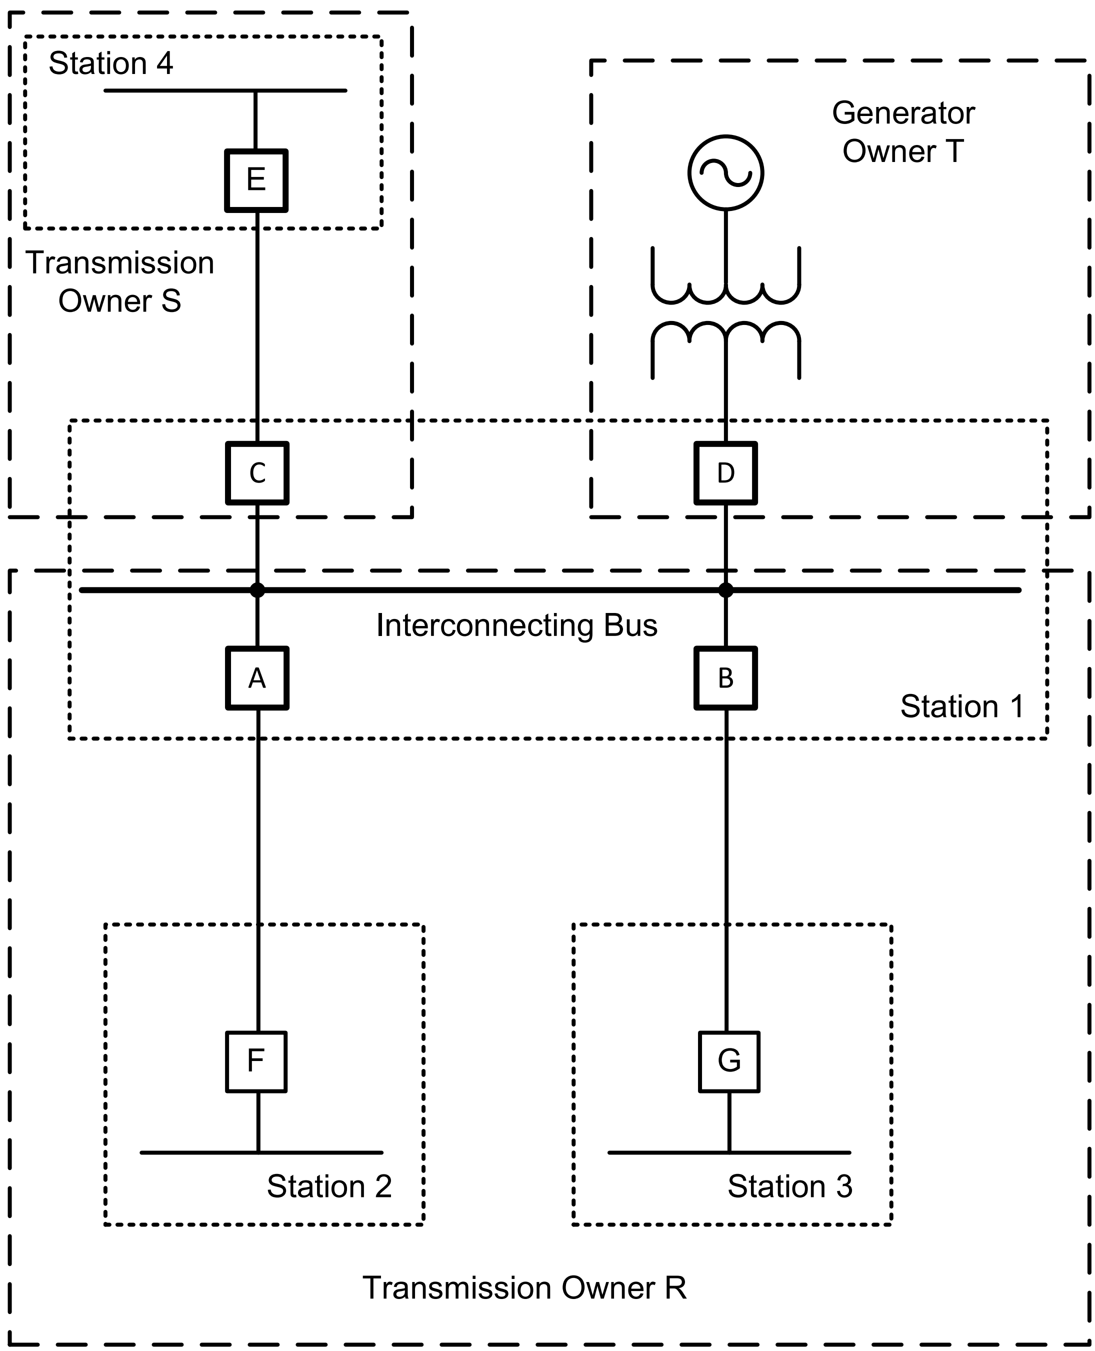
In Figure 4 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.

Note: No specific ~~Protection System Study~~PSCS is required per this standard for this example since the Protection System at the Distribution Provider's substation is not ~~designed to protect~~installed for the purpose of detecting Faults on BES ~~transmission system~~ Elements.

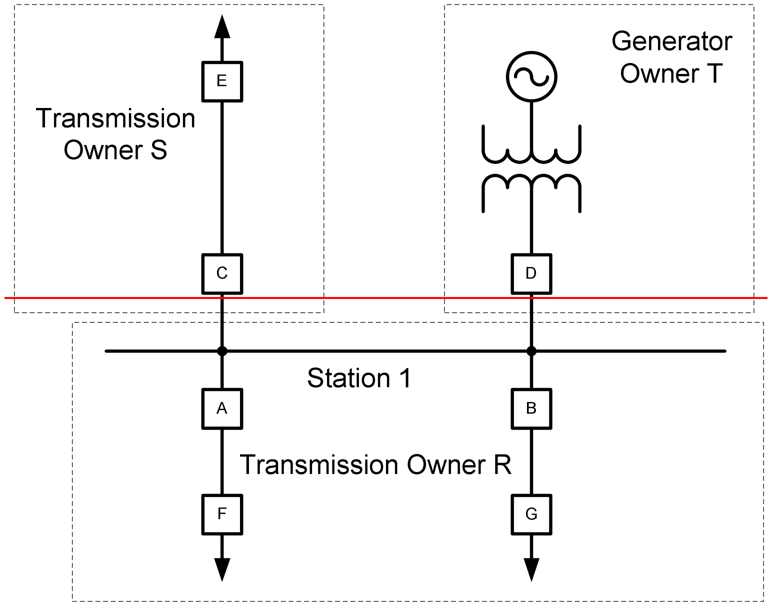
Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.



Station 4
E
Transmission
Owner S
Generator
Owner T
C
D
Interconnecting Bus
A
B
Station 1
F
G
Station 2
Station 3
Transmission Owner R



In Figure 5 above, the Interconnected Element between the Transmission Owners R and S and ~~the Generation~~Generator Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at ~~Transmission~~ Station 1~~, and all~~. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 5:

Owner S is to develop proposed Protection System settings associated with Breakers C and E.

Owner T is to develop proposed Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop proposed Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A~~,~~ and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the ~~Protection Systems associated with~~ generator Protection System~~s~~. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.

~~5.~~6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1, with the stated purpose 'to coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the ~~least number of power system Elements are isolated to clear~~desired sequence during Faults.'~~.~~ This standard incorporates and ~~enhances~~ clarifies the coordination aspects of Requirements ~~R3~~ R2 and ~~R4~~ R3 from PRC-001-~~1~~ 2 (~~now~~ formerly ~~R2~~ R3 and ~~R3~~ R4 of PRC-001-~~2~~1). The SPC SDT is requesting a posting for stakeholder comments ~~under~~ for a 30-day formal comment period with a parallel successive ballot.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period with Parallel Successive Ballot	~~November 2012~~June 2013
Conduct Recirculation Ballot	~~January~~August 2013
BOT Adoption	~~August~~November 2013

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: ~~An~~A BES Element that electrically joins facilities owned by:
a) separate ~~Functional~~Registered Entities, ~~including those Functional Entities that are a part of~~or
b) the same Registered Entity~~.~~ that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for Interconnected Elements, such that ~~the least number of power system Elements are isolated to clear~~Protection System components operate in the desired sequence during Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   ~~**4.2 Facilities:**~~

   4.2 Facilities: For the purpose of the requirements contained herein, the following Protection Systems owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.

   4.2.1 Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and ~~enhanced~~ clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Elements, such that ~~the least number of power system Elements are isolated to clear~~Protection System components operate in the desired sequence during Faults."*

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in ~~the proposed~~ Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPC SDT revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)~~The SPC SDT is incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 in a new standard (as recommended by the SPCTF assessment), and focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1. The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard.~~

~~Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.~~

Other Aspects of ~~c~~Coordination of Protection Systems ~~a~~Addressed by ~~o~~Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency Load shedding programs are addressed ~~by~~in PRC-006-1~~ (Project 2007-01 Underfrequency Load Shedding – pending FERC approval) and generator~~. Generator performance during frequency excursions is being addressed ~~by~~in PRC-024-1 ~~in~~by Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed ~~by~~in PRC-024-1 ~~in~~by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed ~~by~~in PRC-019-1 ~~in~~by Project 2007-09.
- Transmission relay loadability is addressed in PRC-023-~~1 and, pending FERC approval, PRC-023-~~2.
- Generator relay loadability will be addressed in PRC-025-1 by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.
- Protective relay response during power swings will be addressed ~~in~~by Phase 3 of Project 2010-13.3, Relay Loadability.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new Interconnected Elements. The drafting team defines the term "Interconnected Element" as "A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner)."

Part 1.1.1 The drafting team believes 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team believes that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required, e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.

Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations. The drafting team believes that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnected Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s).

Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that provides the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.

~~Rationale for R1:~~

~~Part 1.1 Protection System Studies are necessary to verify coordination of Protection Systems for existing and new Interconnected Element. The drafting team defines the term "Interconnected Element" as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."~~

~~Part 1.1.1 The drafting team believes 48 months is an appropriate period of time for entities to perform the Protection System Studies required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.~~

~~Part 1.1.2 The drafting team believes that 6 months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current deviation at an interconnecting bus, where such conditions may warrant a new Protection System Study, or to technically justify why no such study is required, i.e., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.~~

~~Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.~~

~~Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnected Element(s), all entities need to share the summary of results of a Protection System Study (PSS) and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSS performed in accordance with Requirement R1 to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).~~

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its Interconnected ~~Element on its System~~Elements as follows:

1.1.1 Within ~~48~~60 calendar months after the effective date of this standard, if no ~~Protection System Study~~PSCS for that Interconnected Element exists.

1.1.2 Within ~~six~~12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1~~ or Part 3.3.~~, or within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each ~~Protection System Study~~PSCS, provide to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s~~)~~), a summary of the results of each ~~Protection System Study~~PSCS performed pursuant to ~~this requirement~~Requirement R1, Part 1.1, (including, at a minimum, the ~~protective relay settings~~Protection Systems reviewed, ~~power system Elements to be isolated, contingencies evaluated,~~the associated Fault currents used, any issues identified, and any revisions or actions proposed).

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated ~~Protection System Study~~PSCS, or the summary results of each ~~Protection System Study (either in~~ PSCS (hard copy or electronic file formats) demonstrating ~~that~~ the time frames specified or agreed to in Parts 1.1.1~~. and~~, 1.1.2~~.~~, and 1.1.3 were achieved. Acceptable evidence of a technical justification for not performing a ~~Protection System Study~~PSCS as specified in Parts 1.1.2 and 1.1.3 ~~could be~~may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspects of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary results of each ~~Protection System Study~~PSCS (hard copy or electronic file formats) ~~was~~were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing ~~to~~ the results to the applicable entities when ~~deviations~~changes occur that meet the criteria of Requirement R2 ~~criteria~~. It is important that interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. ~~The drafting team determined that 10% was an appropriate point to provide this information based on the fact that Protection Systems are typically set with margins above 10%.~~Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

~~Part 2.1 Short circuit databases are customarily updated annually, so the~~The drafting team believes ~~24~~60 calendar months provides the entities flexibility to either technically justify why Fault current does not affect the Protection System coordination, or schedule and perform the ~~new~~ activities specified in Requirement R2, Parts 2.1 and 2.2.

The drafting team recognizes the coordination of some types of Protection Systems is unaffected by changes in Fault current and, where technically justified, can be exempted from the short circuit ~~studies and calculate the percent deviation.~~ review.

Part 2.1 The drafting team believes ~~studies associated with changes that would affect~~maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination ~~in less time would be triggered by other requirements in this standard.~~.

Part 2.2 The drafting team is including this ~~formula~~equation to assure a consistent approach is used by each Transmission Owner when calculating the percent ~~deviation~~change in Fault current values.

R2. For each ~~Facility associated with an~~ Interconnected Element on its System, the Transmission Owner shall, once every 60 calendar months, technically justify why Fault current does not affect the Protection System coordination, or: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

~~2.1. At least once every 24 months:~~

~~2.2.~~2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Coordination Study (PSCS) is available per Requirement R1.

~~2.3.~~2.2. Calculate the percent ~~deviation~~change between the Fault current values (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent ~~Protection System Study~~PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.~~1~~.1, using the following equation:

$$\%\ \cancel{Deviation}Change = \cancel{\left|\frac{Iscs - Ipss}{Ipss}\right|}\left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent ~~Protection System Study~~PSCS

2.2.1 Within 30 calendar days after identification ~~where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates~~of a ~~deviation in Fault current~~change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System associated with the Interconnected Element ~~the updated Fault current values (I_{scs}).~~.

M3. Acceptable evidence of technical justification for not performing a short circuit study as specified in Requirement R2, could be documented engineering analyses or assessments that demonstrate why Fault current does not impact any aspects of coordination.

~~M3.~~M4. Acceptable evidence for Requirement R2, ~~Part~~ Parts 2.1 and 2.2~~.1~~ is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and ~~that~~ identifies the percent ~~deviation~~change from the ~~most recent Protection System Study~~ Fault current values used in the most recent PSCS determined by the ~~formula~~equation.

~~M4.~~M5. Acceptable evidence ~~that the updated Fault current values (I_{scs}), along with~~for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) ~~for Requirement R2, Part 2.2 was~~that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the Interconnected Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnected Element. The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, and 1.1.3. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.

~~Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.~~

~~Part 3.1 The reliability objective of this requirement is to enable the process of conducting Protection System Studies by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Part 1.1.~~

~~Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a Protection System Study, as required in Parts 1.1.1, 1.1.2, and 1.1.3. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.~~

~~Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.~~

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnected Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition~~s~~ listed below; either at an existing or new Facility associated with the Interconnected Element; or at other ~~f~~Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

- New installation, replacement with different types, or modification of ~~:~~ protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that ~~change~~alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

~~M5.~~M6. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited~~,~~ to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) ~~in hard copy or electronic file formats~~ as identified in the bulleted list ~~for Requirement R3, Part 3.1~~, was provided to each responsible entity connected to the same Interconnected Element.

~~M6.~~M7. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

~~M7.~~M8. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements affirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.

Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a PSCS and respond. Note: Per Requirement R1, Part 1.2, at a minimum, the summary results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate acceptance with the review results/conclusions; or rejection of or disagreement with the review results/conclusions and offer of suggestions/modifications to resolve any identified coordination issues. The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they accept the proposed changes since no coordination issues were identified.

Part 4.2 The drafting team believes that proposed changes or modifications (including project schedules) to Facilities associated with the Interconnected Element, as described in Requirement R3, Part 3.1, or modifications suggested in Requirement R4, Part 4.1 must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.

~~Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements confirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.~~

~~Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a Protection System Study. If any issues are identified that require changes then respond whether further action is required.~~

~~Part 4.2 The drafting team believes that proposed modifications (including project schedules) to Facility changes associated with the Interconnected Element, as described in Requirement R3, Part 3.1, must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.~~

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a ~~Protection System Study, as described in~~PSCS (per Requirement R1, Part 1.2~~,~~) and respond ~~as~~ to ~~whether further action is required.~~ the other owner(s):

- Accepting the results, or
- Rejecting the results and suggesting modifications to resolve any identified coordination issues.

4.2. Prior to implementing any ~~planned~~proposed change(s) or modifications associated with Requirement R3, Part 3.1~~, confirm the~~ or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element ~~accept any resulting~~have accepted the Protection System(s) changes including the resolution of any identified coordination issues.

~~M8.~~M9. Acceptable evidence for Requirement R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

~~M9.~~M10. Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that ~~confirmation of acceptance was achieved,~~ prior to implementation of any ~~planned~~proposed Protection System(s) changes or modifications, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System ~~at~~associated with an Interconnected ~~Facility~~Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures M1 through ~~M9~~M10, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner ~~and~~or Distribution Provider that owns a Protection System at a Facility associated with an Interconnected Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing Interconnected Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with Interconnected Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the desired sequence for internal and external Faults on the Interconnected Element.

Requirement R1:

This requirement directs the ~~performance of~~applicable entities to perform a Protection System ~~Studies~~Coordination Study (PSCS) for every Interconnected Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current ~~deviations~~changes of 10% or more have occurred. In developing the language to define ~~Protection System Study~~a PSCS, the System Protection Coordination Standard Drafting Team (~~SPC SDT~~SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

~~Protection System Studies~~PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in ~~Protection System Studies~~PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The drafting team believes applicable entities should have a documented ~~Protection System Study~~PSCS for each Interconnected Element to validate the Protection Systems associated with those Interconnected Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that ~~48~~60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Parts 1.1.2 and 1.1.3 further direct that ~~Protection System Studies~~PSCSs must be completed under the following two circumstances:

1. After notification of an identified 10% or greater ~~deviation~~change in Fault current~~,~~ (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new ~~Protection System Study~~PSCS of the Interconnected Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater ~~deviation~~change in Fault current may not necessitate a new ~~Protection System Study~~PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the ~~six~~ 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the ~~24~~ 60-calendar month Fault current review.

2. After proposing or being notified of a change at a Facility associated with the Interconnected Element, entities must perform a new ~~Protection System Study~~PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new ~~Protection System Study~~PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with ~~this requirement~~performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of

conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2. The drafting team believes that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed, when details of changes are provided associated with Requirement R3 Part 3.3.

Requirement R1, Part 1.2 directs the entity performing the ~~Protection System Study~~PSCS to provide a summary of the study results to the affected Interconnected Element owner(s). The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s). (Note: In cases where a single group performs an overall coordination study for a given Interconnected Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) As guidance, the drafting team lists the following inputs and results of a ~~Protection System Study~~PSCS that may be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. ~~Data used to determine Fault currents in performing the study, along with a~~A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing ~~Protection System Studies~~PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated ~~Protection System Study~~PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner either provide a technical justification stating why Fault current does not affect the Protection System coordination of a specific Interconnected Element or perform a periodic review of Fault currents.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
   - Loss of potential condition
   - Some communication assisted tripping
   - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
   - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and ~~includes the calculation of the percent deviation between the~~ under single contingency conditions regardless of Fault current.
   - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

The short circuit study provides the Fault current values used ~~in the~~ to calculate the percent change between the most recent ~~Protection System Study~~PSCS and the present Fault current values indicated by the short circuit study performed pursuant to ~~this requirement~~Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

~~Polling of~~The drafting team ~~membership and various protection engineering committees indicates~~believes that ~~short circuit databases are customarily updated annually. Based on this information, the drafting team believes that requiring a 24-month periodic review of~~60 calendar months is an appropriate interval for technically justifying why Fault currents ~~provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation, as described in Requirement R2, Part 2.1.~~ do not affect the Protection System coordination of a specific Interconnected Element, or for reviewing Fault currents. The drafting team believes studies associated with changes that would affect the coordination in less than ~~24~~60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnected Element when short circuit studies indicate that 10% ~~deviations~~changes in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnected entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the ~~Functional Entity~~functional entity responsible for performing the ~~Fault current~~short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the Interconnected Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its ~~Protection System Studies~~PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the ~~Protection System Study~~PSCS of the Facility associated with the Interconnected Element; e.g., the addition of a large autotransformer bank or generator not directly ~~associated with~~connected to the Interconnected Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a ~~Protection System Study~~PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed-upon coordination when changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

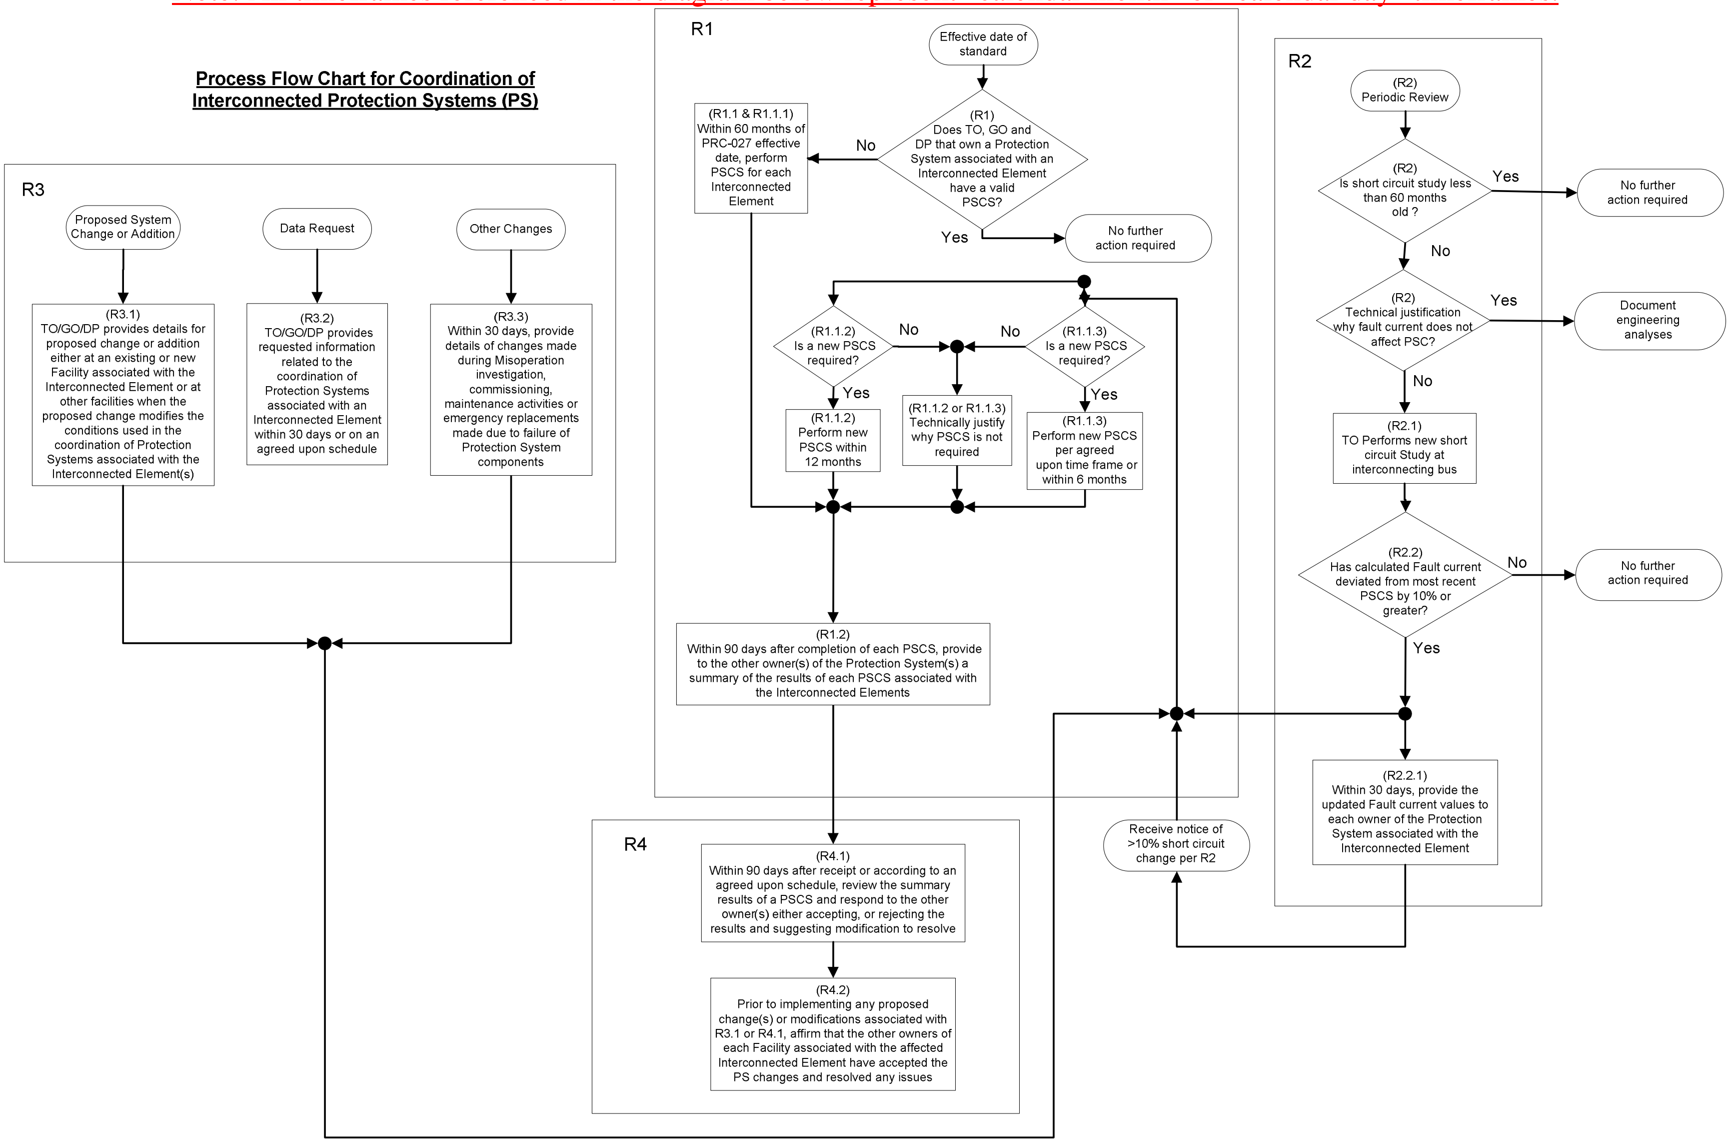
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

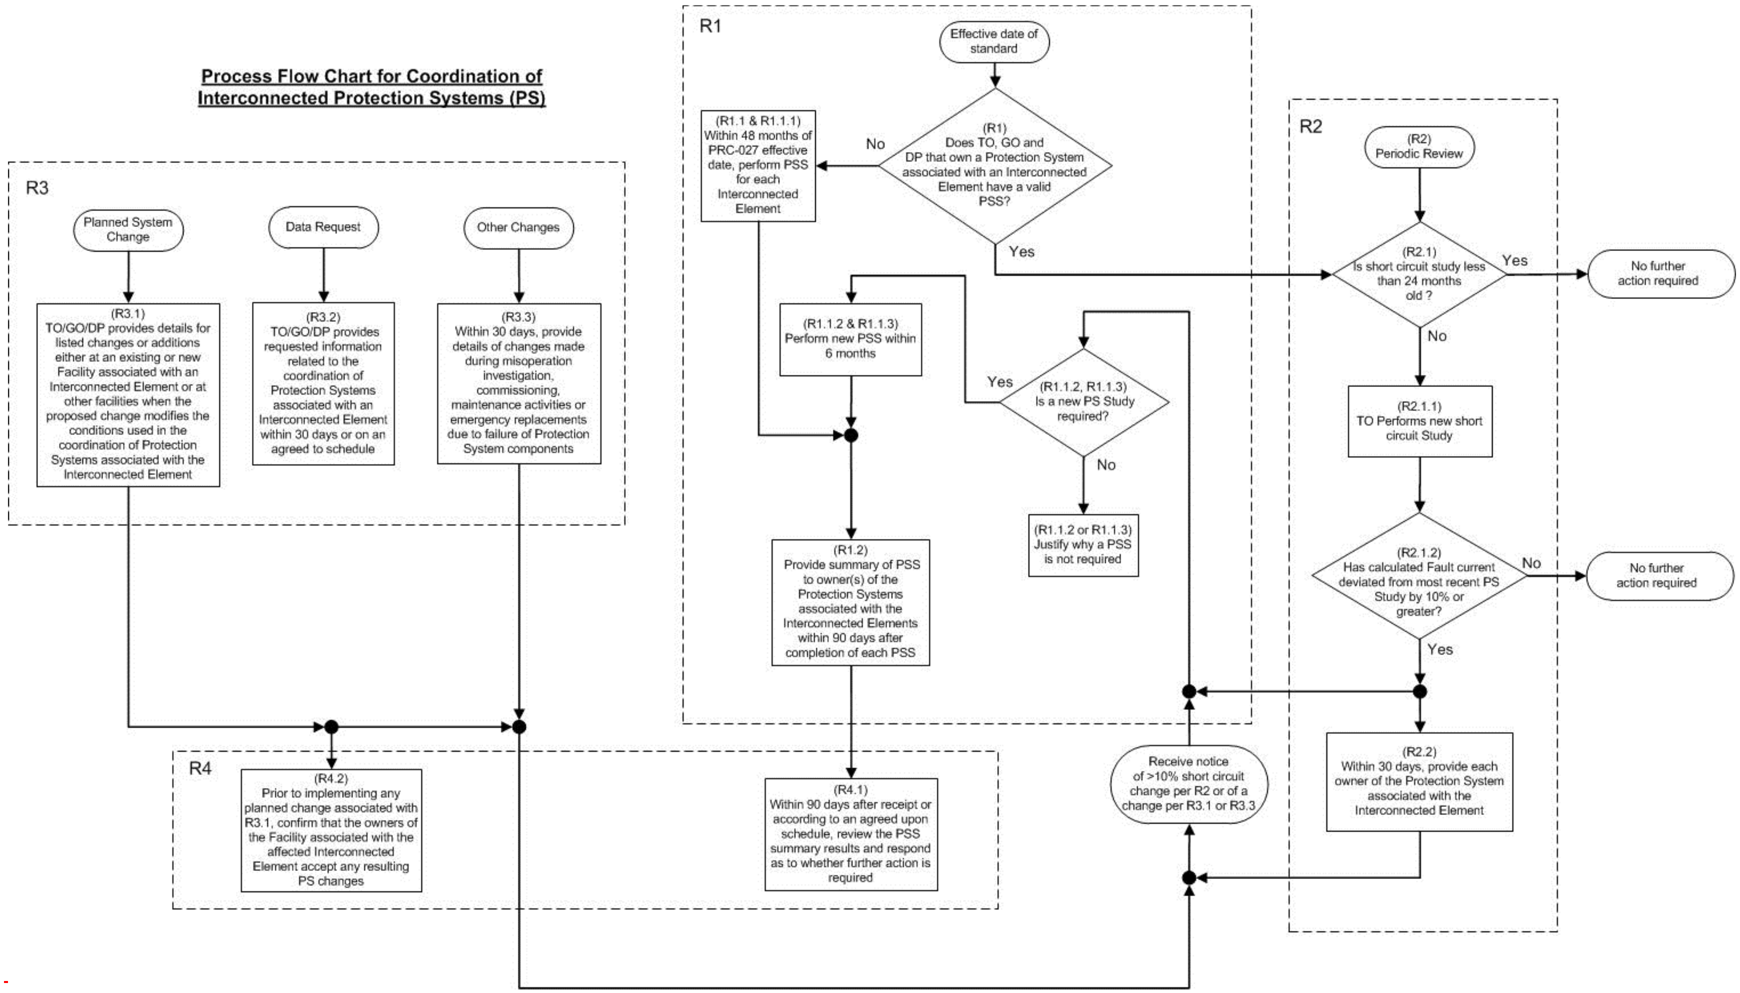
Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a ~~Protection System Study~~PSCS, as described in Requirement R1, Part 1.2; ~~or absent acceptance propose revisions~~and respond as to ~~achieve acceptable results.~~whether they accepting or rejecting the results, and if rejecting, suggesting modifications to resolve any identified coordination issues. The drafting team believes 90 calendar days after receipt of the results of a ~~Protection System Study~~PSCS provides a reasonable time for the owners of Facilities to ~~resolve differences and confirm acceptance that their Protection Systems are coordinated~~review the summary results of a PSCS.

Requirement R4, Part 4.2 directs entities to ~~con~~affirm that ~~planned~~the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes as described in Requirement 3, Part 3.1 ~~are acceptable~~and Requirement 4, Part 4.1 prior to the in-service date of those changes. Any coordination issues identified during the review must be resolved prior to implementing the proposed changes. The purpose of ~~this requirement~~Requirement 4, Part 4.2 is to assure the effects ~~that planned~~the proposed changes have on Protection Systems at a Facility associated with the ~~affected~~ Interconnected Element have been considered by all affected entities.

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:

Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes.





Process Flow Chart for Coordination of Interconnected Protection Systems (PS)
R1
Effective date of standard
(R1) Does TO, GO and DP that own a Protection System associated with an Interconnected Element have a valid PSS?
No
(R1.1 & R1.1.1) Within 48 months of PRC-027 effective date, perform PSS for each Interconnected Element
Yes
(R1.1.2 & R1.1.3) Perform new PSS within 6 months
Yes
(R1.1.2, R1.1.3) Is a new PS Study required?
No
(R1.1.2 or R1.1.3) Justify why a PSS is not required
(R1.2) Provide summary of PSS to owner(s) of the Protection Systems associated with the Interconnected Elements within 90 days after completion of each PSS
R2
(R2) Periodic Review
(R2.1) Is short circuit study less than 24 months old ?
Yes
No further action required
No
(R2.1.1) TO Performs new short circuit Study
(R2.1.2) Has calculated Fault current deviated from most recent PS Study by 10% or greater?
No
No further action required
Yes
(R2.2) Within 30 days, provide each owner of the Protection System associated with the Interconnected Element
Receive notice of >10% short circuit change per R2 or of a change per R3.1 or R3.3
R3
Planned System Change
Data Request
Other Changes
(R3.1) TO/GO/DP provides details for listed changes or additions either at an existing or new Facility associated with an Interconnected Element or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element
(R3.2) TO/GO/DP provides requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 days or on an agreed to schedule
(R3.3) Within 30 days, provide details of changes made during misoperation investigation, commissioning, maintenance activities or emergency replacements due to failure of Protection System components
R4
(R4.2) Prior to implementing any planned change associated with R3.1, confirm that the owners of the Facility associated with the affected Interconnected Element accept any resulting PS changes
(R4.1) Within 90 days after receipt or according to an agreed upon schedule, review the PSS summary results and respond as to whether further action is required

-

Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is ~~below~~provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and provide details of the proposed change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a ~~Protection System Study~~PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the ~~Protection System Study~~PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, ~~confirm agreement that~~respond as to whether any coordination issues were identified, and if any further action is ~~achieved~~required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
- ~~Documentation of the final agreement is required prior to implementation of planned changes.~~
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

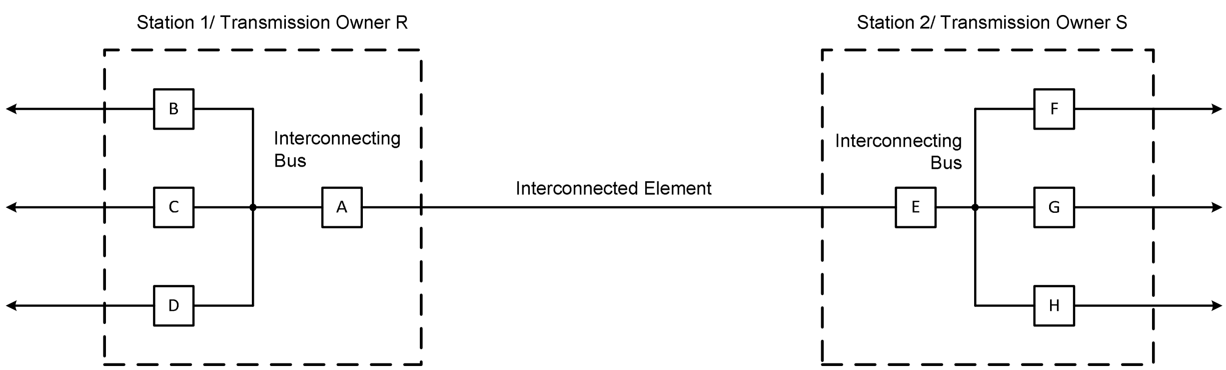
Diagrams

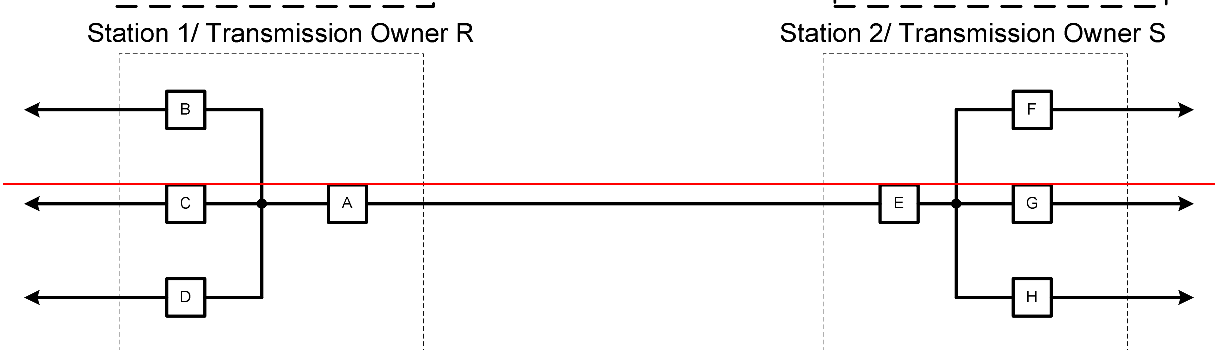
Introduction: The diagrams below are intended to provide guidance ~~related~~, to the ~~purpose of this standard between~~ owners of Facilities associated with the affected Interconnected Element~~.~~, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable Interconnected Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of ~~the~~ changes, the owners must ~~reach agreement on the final settings to achieve~~work together to resolve any coordination ~~of the Protection Systems.~~ issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".

Figure 1

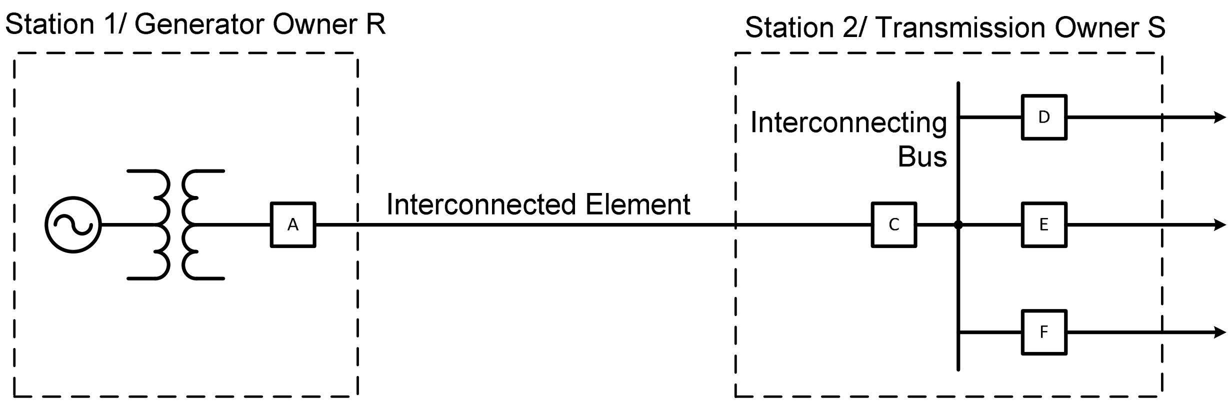


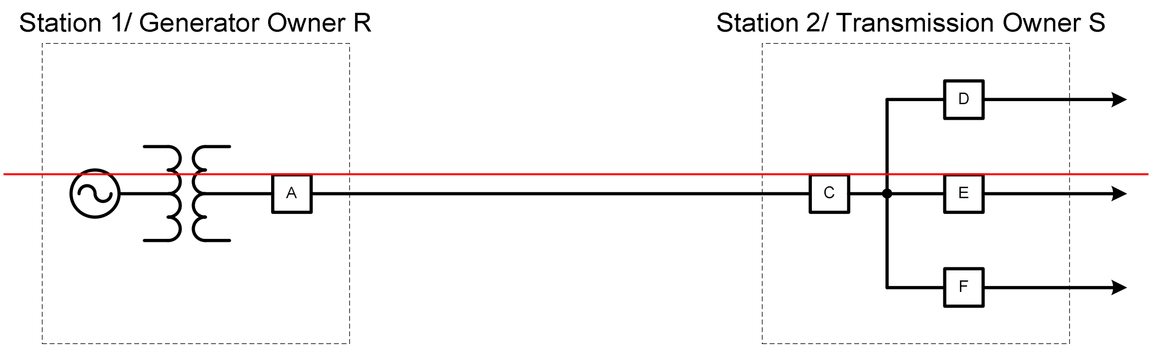


In Figure 1 above, the Interconnected Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. ~~Likewise,~~ Likewise, Owner S is to develop proposed Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2



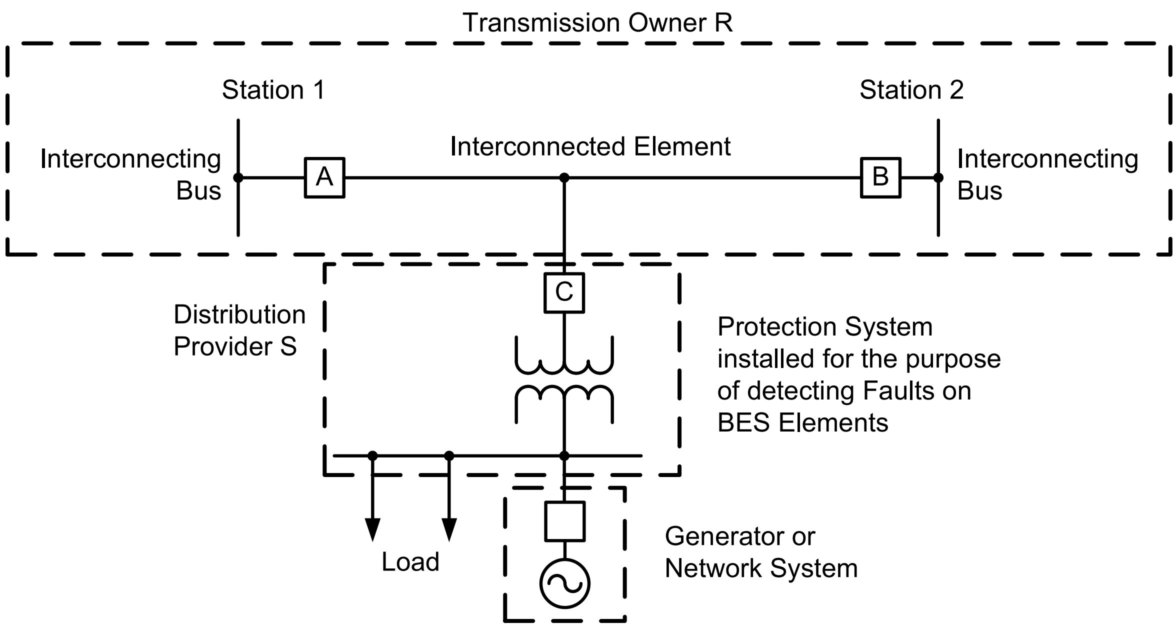


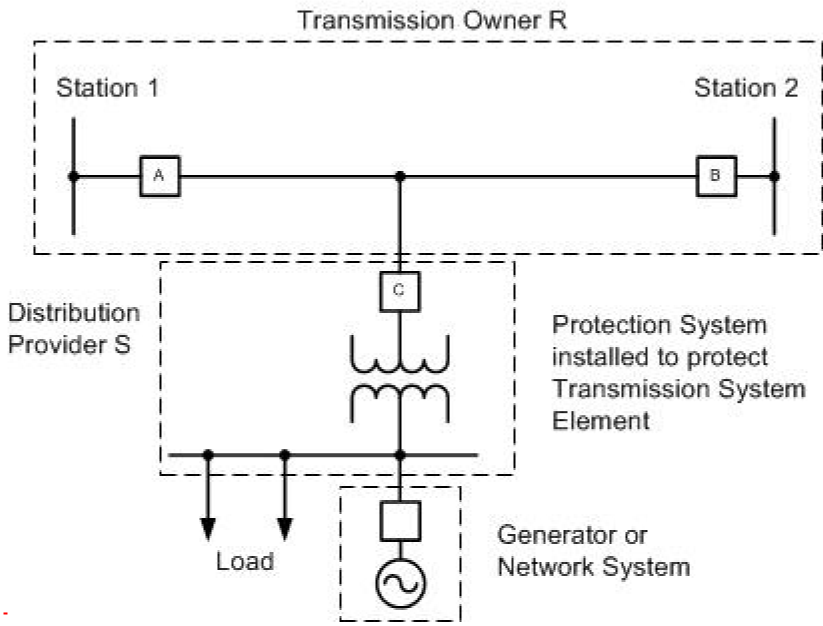
In Figure 2 above, the Interconnected Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, ~~breaker~~Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 2, Owner R is to develop proposed Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. ~~Likewise,~~Likewise, Owner S is to develop proposed Protection System settings associated with Breaker C. Generation Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3





In Figure 3 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between Breaker C and the point of connection to the line between Breakers A and ~~Breaker C~~B.

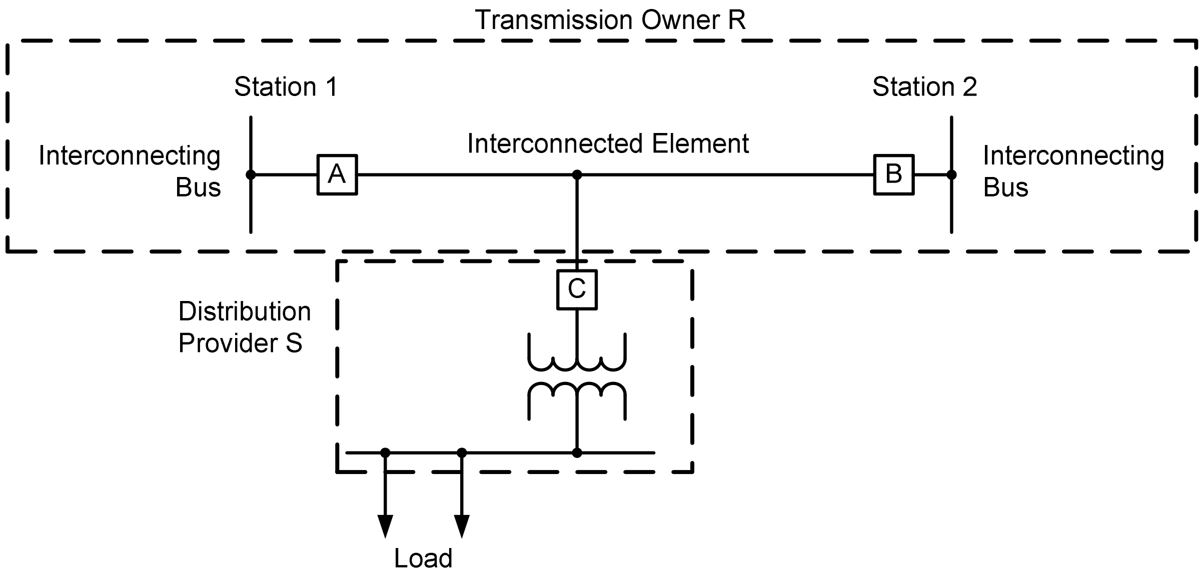
Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop proposed Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

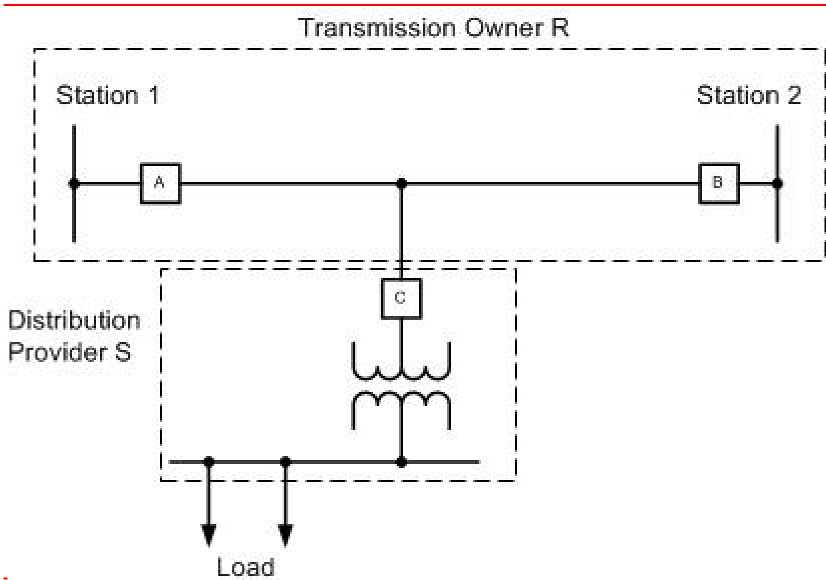
Notes:

~~A Protection System Study~~A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is ~~designed to detect~~installed for the purpose of detecting Faults on ~~the~~ BES ~~Transmission System~~Elements.

~~"~~Protection Systems installed ~~to detect faults on~~ for the purpose of detecting Faults on BES ~~Transmission System" are~~Elements do not ~~inclusive of those~~include relays that, though they may operate for such ~~faults, but~~Faults, are not installed specifically for that purpose ~~(i.e. transformer overcurrent, reverse power, etc.).~~ . As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized ~~and~~(for whatever reason) while the distribution bank remains energized from a source on the low-voltage side ~~of the transformer and~~. In this case, the settings ~~are~~of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although ~~these~~ relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not ~~"~~specifically installed ~~to detect faults on~~for the ~~BES Transmission System."~~purpose of detecting that Fault.

Figure 4





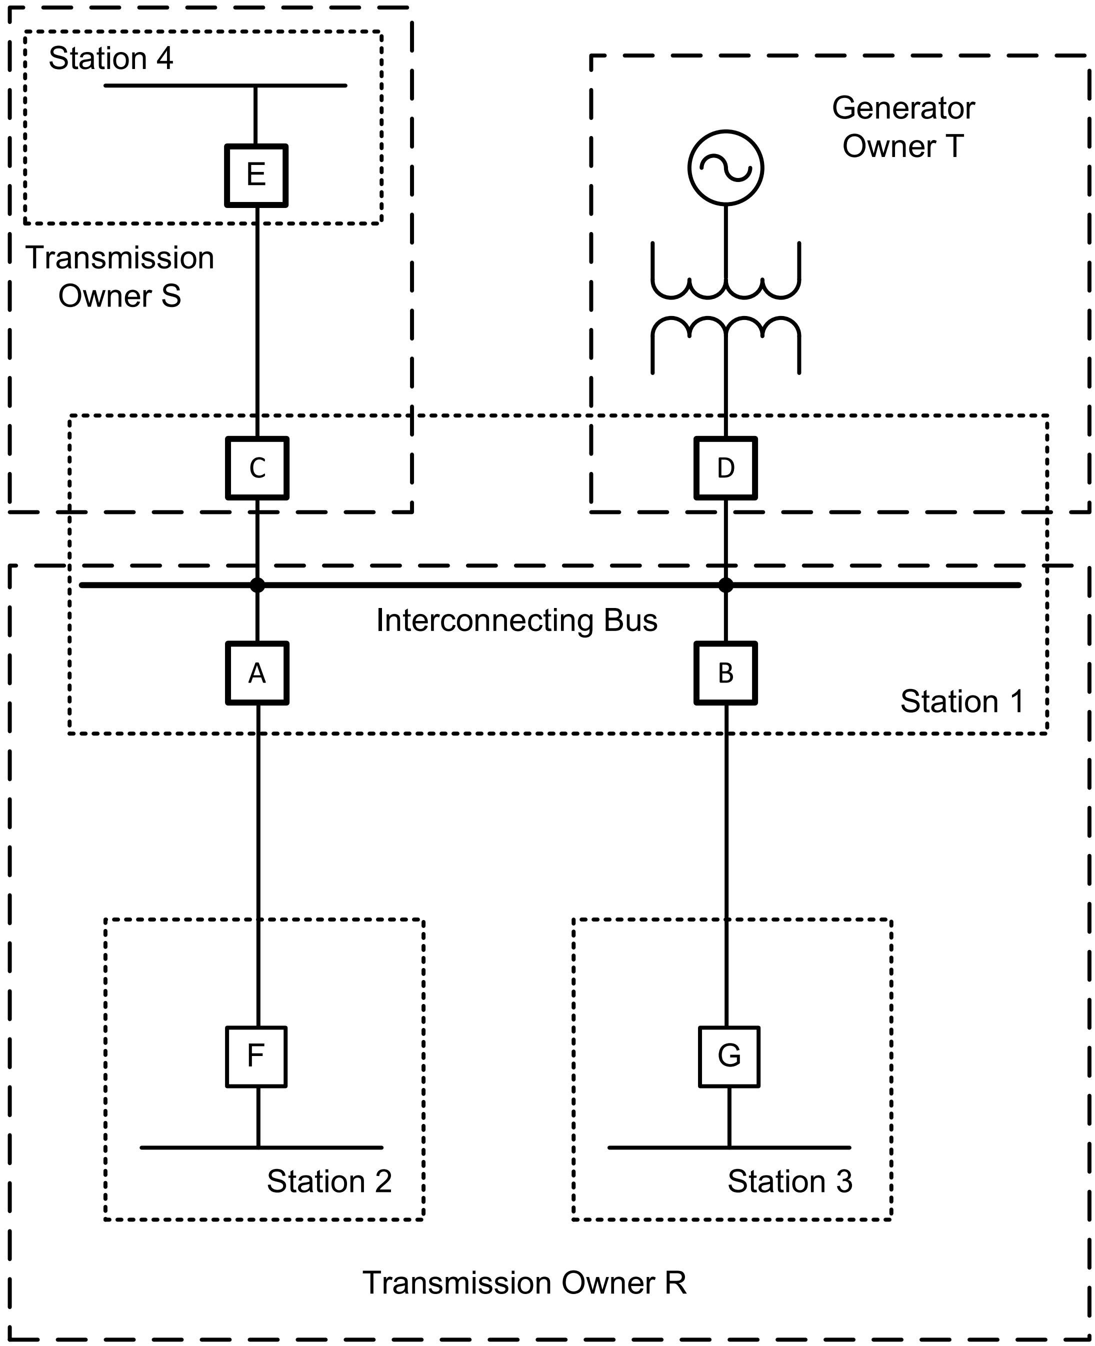
In Figure 4 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.

Note: No specific ~~Protection System Study~~PSCS is required per this standard for this example since the Protection System at the Distribution Provider's substation is not ~~designed to protect~~installed for the purpose of detecting Faults on BES ~~transmission system~~ Elements.

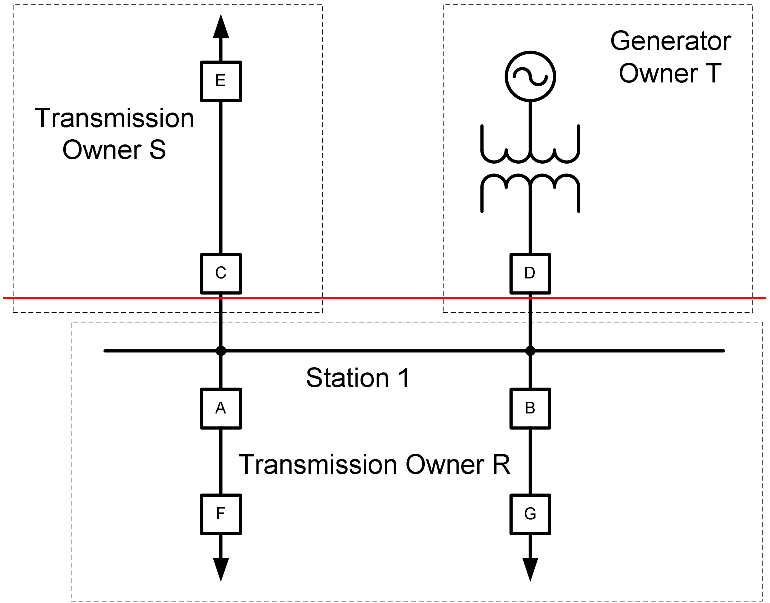
Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.



Station 4
E
Transmission
Owner S
Generator
Owner T
C
D
Interconnecting Bus
A
B
Station 1
F
G
Station 2
Station 3
Transmission Owner R



In Figure 5 above, the Interconnected Element between the Transmission Owners R and S and ~~the Generation~~Generator Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at ~~Transmission~~ Station 1~~, and all~~. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the ~~Protection System Study~~PSCS associated with the Facilities in Figure 5:

Owner S is to develop proposed Protection System settings associated with Breakers C and E.

Owner T is to develop proposed Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop proposed Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A~~,~~ and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the ~~Protection Systems associated with~~ generator Protection System~~s~~. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Unofficial Comment Form

Project 2007-06 System Protection Coordination
3rd Draft of PRC-027-1

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the 3rd draft of the standard PRC-027-1: Protection System Coordination for Performance During Faults. Comments must be submitted by **8 p.m. Eastern July 3, 2013**. If you have questions please contact Al McMeekin or by telephone at 803-530-1963.

http://www.nerc.com/pa/Stand/Pages/Project-2007-06-System-Protection-Coordination.aspx

Background Information:

The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPCSDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPCSDT has also revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)

The SPCSDT has responded to stakeholder comments and incorporated pertinent suggestions into the third draft of PRC-027-1 for stakeholder review and comment. PRC-001-3 is also presented for your review.

Questions

For questions 1 – 7, please provide specific comments related to the individual question. For question 8, please provide general comments not related to questions 1 – 7.

You do not have to answer all questions. Enter All Comments in Simple Text Format. *Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Based on stakeholder comments, the drafting team modified the Purpose of this standard to:

   "To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults."

   Do you agree with this Purpose? If not, please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. The drafting team modified the proposed definition of **Interconnected Element** to read as follows:

   Interconnected Element: A BES Element that electrically joins facilities owned by:
   a) separate Registered Entities, or
   b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

   Do you agree with the revised definition? If not please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

3. In Requirement R1, the drafting team modified the time frame to allow entities 60 months to have a documented Protection System Coordination Study (PSCS) completed for each Interconnected Element if no PSCS exists. Note, the drafting team has allowed inclusion of all previously performed PSCS whose summary of results include, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed.

Do you agree with this revised time frame? If not, please provide specific suggestions for change in the comment area.

☐ Yes

☐ No

Comments:

4. In Requirement R2, the drafting team modified the time frame to 60 months for either conducting a Fault current review or provide a technical justification as to why a Fault current review is not necessary.

   Do you agree with this revision to Requirement R2? If not, please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

5. In Requirement R4, the drafting team has clarified the expectation of what a response to a review of the summary results of a Protection System Coordination Study should include. The options are as follows:

   - Accepting the results, or
   - Rejecting the results and suggesting modifications to resolve any identified coordination issues.

   Do you agree with this revision to Requirement R4? If not, please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. The drafting team revised the Applicability section of PRC-001-2 to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.) Do you agree with this revision to the Applicability? If not, please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. The drafting team provided a measure to accompany Requirement R1 of PRC-001-2. (The language in the measure was modeled after the existing language in the RSAW for PRC-001-2.) Do you agree with this measure? If not, please provide specific suggestions for improvement in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

Implementation Plan

Project 2007-06 System Protection Coordination
PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults
- PRC-001-3 System Protection Coordination

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults	X	X	X			
PRC-001-3: System Protection Coordination				X	X	X

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: A BES Element that electrically joins facilities owned by:
a) separate Registered Entities, or
b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).

Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In*

addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."

And further:

"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

   Note: The drafting team added Measure (M1) to PRC-001-3 related to Requirement R1.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

PRC-001-3 – System Protection Coordination
Same effective date as PRC-027-1.

Effective Date for Definitions

The two proposed definitions (Interconnected Facilities and Protection System Coordination Study) shall become effective at the same time as PRC-027-1.

Retirement:

PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In*

addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."

And further:

"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

   Note: The drafting team added Measure (M1) to PRC-001-3 related to Requirement R1.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~six~~12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

PRC-001-3 – System Protection Coordination
Same effective date as PRC-027-1.

Effective Date for Definitions

The two proposed definitions (Interconnected Facilities and Protection System Coordination Study) shall become effective at the same time as PRC-027-1.

Retirement:

PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors
High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.
In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has four (4) requirements that incorporate and clarify the reliability intent of Requirements R3 and R4 of PRC-001-1. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All four requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnected Element to verify that Protection Systems components operate in the desired sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnected Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each Interconnected Facility to verify that Protection Systems components operate in the desired sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study on an Interconnected Element as required in Requirement R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Part 1.1.2, or technically justified why a study was not required, but was late by less than or equal to 30 calendar days. OR The responsible entity provided the Protection System Coordination Study results in accordance with Requirement R1, Part 1.2, but was late by less than or equal to 10 calendar days.	The responsible entity performed a Protection System Coordination Study on an Interconnected Element as required in Requirement R1, Part 1.1.1, but was late by more than 30 calendar days but less than or equal to 60 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Part 1.1.2, or technically justified why a study was not required, but was late by more than 30 calendar days but less than or equal to 45 calendar days. OR The responsible entity provided the Protection System Coordination Study results in accordance with Requirement R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity performed a Protection System Coordination Study on an Interconnected Element as required in Requirement R1, Part 1.1.1, but was late by more than 60 calendar days but less than or equal to 90 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Part 1.1.2, or technically justified why a study was not required, but was late by more than 45 calendar days but less than or equal to 60 calendar days. OR The responsible entity provided the Protection System Coordination Study results in accordance with Requirement R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days	The responsible entity performed a Protection System Coordination Study on an Interconnected Element as required in Requirement R1, Part 1.1.1, but was late by more than 90 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Part 1.1.2, or technically justified why a study was not required but was late by more than 60 calendar days. OR The responsible entity provided the Protection System Coordination Study results in accordance with Requirement R1, Part 1.2, but was late by more than 30 calendar days. OR

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
			The responsible entity failed to perform a Protection System Coordination Study on an Interconnected Element in accordance with Requirement R1, Parts 1.1.1, 1.1.2, or 1.1.3. OR The responsible entity failed to technically justify why a study was not required in accordance with Requirement R1, Parts 1.1.2 or 1.1.3. OR The responsible entity failed to provide Protection System Coordination Study results in accordance with Requirement R1, Part 1.2.

VSL Justifications – PRC-027-1, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to periodically justify why Fault current does not affect the Protection System coordination; or perform a short circuit study, calculate the percent change in Fault current values used as inputs for updating Protection System Coordination Study(s), and to provide each owner of the Protection System associated with the Interconnected Element of requisite changes in Fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R2 is similar in scope to Requirements R1, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R2 facilitates a periodic review of technical justifications or Fault currents, and notification of owner(s) of the Protection System(s) associated with the Interconnected Element(s). This requirement is similar to Requirement R6 of BAL-005-0.2b in that it also requires the comparison of calculated data and possible notification of other entities; and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to periodically justify why Fault current does not affect Protection System Coordination; or perform a short circuit study, calculate the percent change in Fault current values used as inputs for updating Protection System Coordination Study(s) and to provide each owner of the Protection System associated with the Interconnected Element of requisite deviations in Fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R2 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R2			
Lower	**Moderate**	**High**	**Severe**
For an Interconnected Element on its System, the Transmission Owner technically justified why Fault current does not affect the Protection System coordination, as required in Requirement R2, but was late by less than or equal to 30 calendar days. VSL Justifications – PRC-027-1, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has four (4) requirements that incorporate and ~~enhance~~clarify the reliability intent of Requirements R3 and R4 of PRC-001-1. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as ~~changes to~~requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, ~~and confirming acceptance of~~reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All four requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnected Element to verify that Protection Systems ~~coordinate such that~~components operate in the ~~least number of power system Elements are isolated to clear~~desired sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnected Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each Interconnected Facility to verify that Protection Systems ~~coordinate such that~~components operate in the ~~least number of power system Elements are isolated to clear~~desired sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study on an Interconnected Element ~~per~~as required in Requirement R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to ~~confirm acceptance for proposed changes that modify the~~communicate and cooperate with the ~~conditions used in~~ other owners of the ~~coordination of~~ Protection System(s) to resolve coordination issues associated with ~~the~~an Interconnected Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. ~~Therefore, this Violation Risk Factor level conforms to~~This requirement meets NERC's ~~definition of~~criterion for a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R4 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R4			
Lower	**Moderate**	**High**	**Severe**
The responsible entity ~~confirmed acceptance~~responded in more than 90 calendar days but less than or equal to 100 calendar days following the receipt of the summary results of the Protection System Coordination Study ~~per~~, as required in Requirement R4, Part 4.1~~, but was late by 10 calendar days or less.~~ .	The responsible entity ~~confirmed acceptance~~responded in more than 100 calendar days but less than or equal to 110 calendar days following the receipt of the summary results of the Protection System Coordination Study ~~per~~, as required in Requirement R4, Part 4.1~~, but was late by more than 10 calendar days but less than or equal to 20 calendar days.~~ .	The responsible entity ~~confirmed acceptance~~responded in more than 110 calendar days but less than or equal to 120 calendar days following the receipt of the summary results of the Protection System Coordination Study ~~per~~, as required in Requirement R4, Part 4.1~~, but was late by more than 20 calendar days but less than or equal to 30 calendar days.~~ .	The responsible entity ~~confirmed acceptance~~responded in more than 120 calendar days following the receipt of the summary results of the Protection System Coordination Study ~~per~~, as required in Requirement R4, Part 4.1~~, but was late by more than 30 calendar days~~. OR The responsible entity failed to ~~confirm acceptance of~~review the summary results of the Protection System Coordination Study ~~per~~provided to them in accordance with Requirement R4, Part 4.1. OR The responsible entity failed to ~~confirm acceptance of the planned~~respond to the other owners in accordance with Requirement R4, Part 4.1. OR The responsible entity failed to affirm that the other owner(s) of each Facility associated with the affected Interconnected Element

Proposed VSLs for PRC-027-1, R4			
Lower	**Moderate**	**High**	**Severe**
			accepted the Protection System(s) changes ~~pursuant to R4, Part 4.2~~including the resolution of any identified coordination issues, prior to implementation of those changes, as required in Requirement R4, Part 4.2.

VSL Justifications – PRC-027-1, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Successive Ballot and Non-Binding Poll now open through July 3, 2013

Now Available

A successive ballot of **PRC-027-1** – System Protection Coordination for Performance During Faults and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now being conducted through **8 p.m. Eastern on Wednesday, July 3, 2013**.

Background information for this project can be found on the project page.

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results for **PRC-027-1** will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Standards Development Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Non-binding Poll Results	
Non-binding Poll Name:	Project 2007-06 Non-binding Poll PRC-027-1
Poll Period:	6/24/2013 - 7/3/2013
Total # Opinions:	300
Total Ballot Pool:	389
Summary Results:	77.12% of those who registered to participate provided an opinion or an abstention; 52.48% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results

Segment	Organization	Member	Opinions	Comments
1	Ameren Services	Kirit Shah	Abstain	
1	American Electric Power	Paul B Johnson	Abstain	
1	American Transmission Company, LLC	Andrew Z Pusztai	Abstain	
1	Associated Electric Cooperative, Inc.	John Bussman	Negative	
1	ATCO Electric	Glen Sutton	Negative	
1	Austin Energy	James Armke	Affirmative	
1	Avista Corp.	Scott J Kinney		
1	Balancing Authority of Northern California	Kevin Smith	Negative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Beaches Energy Services	Joseph S Stonecipher		
1	Black Hills Corp	Eric Egge		
1	Bonneville Power Administration	Donald S. Watkins	Negative	
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey	Negative	
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax	Negative	
1	City of Pasadena	Marco A Sustaita	Affirmative	
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Negative

FMPA continues to believe the greater purpose is to ensure faults are cleared within their critical clearing times and that such consideration is greater than operating within the desired sequence. The same comment would apply to the definition of Protection System Coordination Study.
No
The definition poses a problem with the second bullet. It is relatively easy to determine the "boundaries" between separate Registered Entities. It can be difficult to determine the boundaries between where an entity's separate registrations begin and end. Just look at how difficult determining the boundaries of the BES is, and witness the challenges of the GO/TO project where the boundaries between GO and TO are/were not clear. This standard now requires us to also draw the boundary between TO and DP. For example, let's take a step-down

transformer to distribution that is connected to a ring bus or breaker-and-a-half scheme. Typically, the high side relays for the transformer will be connected to the current transformers on the breaker bushings within the bus arrangement, which are part of the BES. Those relays are not only there to protect the transformer (not BES), but, also the bus section within the ring or breaker-and-a-half scheme (which is BES). So, are those relays (e.g., differential, directional overcurrent looking into the transformer) owned by the TO or DP registration? It also seems to FMPA that the reliability objective should not be limited to coordinating relays at just the "boundaries"; so, maybe one way to solve the boundary issue is to ignore it and just require a Registered Entity to coordinate its relays that protect the BES. This would expand the scope of the standard even more than the current PRC-001 to the proposed PRC-027, but, it would meet the reliability objective better. Another way to do it is to coordinate all at > 200 kV following PRC-023, and coordinate at the boundaries between entities (not registrations), at all BES.
No
Five (5) years seems way too long for an initial coordination study. We should pick a period of time that both industry and FERC will likely approve, maybe something like two (2) years. Other comments on R1: FMPA's interpretation of the Applicability combined with the standard is that remote back-up protection is included as it was "installed for the purpose of detecting Faults on Interconnected Elements". This becomes ambiguous for directional, inverse time ground current protection whose reach can vary with ground current, or with such relays and zone distance relays with changes in system configuration. FMPA's interpretation is that the Applicability is to the maximum reach of such relays; is that the intent of the SDT? Bullet 1.2 is ambiguous in its use of the term "owner"; especially in combination with the definition of Interconnected Element that makes the distinction between different registered functions within the same entity. Is the owner the entity, or the registered function? We assume the "owner" is the entity; is that the intent of the SDT?
Yes

It seems like the scope of the standard as stated in the purpose statement can be misunderstood. Later in the proposed standard, the purpose is narrowed: “Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1.” The SDT should consider revising the purpose to reflect the scope of this standard, e,g. “,,,operate in the desired sequence to CLEAR faults.” a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. This is a training requirement and as such, it should be transferred to the appropriate PER standards. The SRC supports the project for removing this requirement and moved into the PER standards..Providing training evidence does not demonstrate that the (operating personnel of) responsible entities are “familiar with” the purpose and limitations of protection system schemes applied in its area. c. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. In response to comment submitted by some commenters, the SDT indicates that it “…recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.” We do not agree with this recommendation and hold the view that adding the issue to the NERC Issue Data Base is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT should propose a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee’s advice/direction for appropriate actions. We do not believe that the SDT or staff has brought this to the Standards Committee’s attention. Note that the Standards Committee is responsible for managing the standards development process and as such, can make an informed decision to either request the SDT to expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel. Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. We urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.]

R4 requires all affected parties to agree to a solution. However the applicable Functional Entities that PRC-027 impacts are limited only to the TO, GO and DP. When designing a protection system scheme to clear faults, a satisfactory solution in the prospective of a TO, GO and DP may have unintended consequences for the Transmission Operator. For example, what if the solution is to leave a significantly loaded transmission line in a potentially single end situation by leaving a ring bus configuration open after clearing a fault? How can the TO, GO and DP ensure their agreed upon solution is manageable for the Transmission Operator? Should there be a notification requirement to the TOP?

•Please provide more examples of interconnected elements, especially for a merchant generator. It’s not clear if the protection system study should address protection systems for just the generator breaker or also the generator step up transformer, unit auxiliary transformer, or the generator itself. Perhaps this information belongs in the Application Guideline.

Yes
Yes

If a Generator Owner does not own a Protection System associated with an Interconnected Element, does the Standard apply? For instance, if the generator breaker opens only for faults on the Generator Owner side of the breaker (i.e., GSU or generator faults). Is it expected most GOs will own Protection Systems associated with an Interconnected Element?

No
The wording is redundant. Coordinating Protection Systems mean operating in the desired sequence during faults. The Purpose should just read "To coordinate Protection Systems for Interconnected Elements".
Yes
Yes
60 months is an adequate and appropriate period which balances the interest of reliability with the economics related to engineering costs.

R4 requires all affected parties agree to a solution. However, the applicable Functional Entities that PRC-027 impacts are limited only to the TO, GO and DP. When designing a protection system scheme to clear faults, a satisfactory solution in the perspective of a TO, GO and DP may have unintended consequences for the Transmission Operator. For example, what if the solution is to leave what in normal operation is a significantly loaded transmission line in a potentially open terminal configuration by leaving a ring bus configuration open after clearing a fault? How can the TO, GO and DP ensure their agreed upon solution is manageable for the Transmission Operator? There should be a notification requirement to the TOP.
Yes
There should be consistency between standards on this point.
No
To specifically address Requirement R1, the Measure should be rewritten to stress that there be familiarity with the protection system schemes applied in its area. Suggest revising the Measure for Requirement R1 to read: Each Transmission Operator, Balancing Authority, and generator Operator shall have evidence that its appropriate personnel were made familiar with protection systems in its area. That can be made easily auditable by having written summaries of the schemes, and have personnel sign offs after reading.
PRC-027-1 in its entirety needs a quality review. Requirement R2 is not written correctly--it does not refer to the entities first. Also, each Requirement has multiple numbered Measures.

The Requirement also states that the functional registration (e.g. GOP) has to demonstrate compliance, not the individual operators. If it is the intent of the Standard that each individual operator of an entity be familiar this should be added. By stating the functional registration as opposed to the individuals, it could be interpreted that as long as any Registered Entity SME is familiar with the purpose and limitations of the protection systems that the entity will be able to demonstrate compliance. Suggested rewording of the Requirement: Each Transmission Operator, Balancing Authority, and Generator Operator responsible for the operation of BES elements shall have its operators be familiar with the purpose and limitations of protection system schemes, either through training or operational experience, applied in its area. There has been a broad variation in how the language of this requirement is applied during audits.

PHI suggests the definition of Interconnection Element be revised as follows: “Interconnection Element: A BES element that electrically joins facilities a) owned by separate Registered Entities, or b) operated by separate Functional Entities (Distribution Provider, Generation Owner, or Transmission Owner) within the same Registered Entity.” Without this change the existing language could be mis-interpreted as requiring a documented Protection System Coordination Study on each and every internal BES transmission line (transmission line to transmission line coordination) within a Registered Entity’s system, just because the Registered Entity has registered as multiple Functional Entities, and despite the fact that all the lines in question are owned and operated by the same Transmission Owner Functional Entity. The intent of the standard is to address coordination of interconnected elements between separate Registered Entities or between separate functional entities within the same Registered Entity.

Yes
No
PHI finds that the revised wording in Section R4 does little to address the root problem associated with mandating mutual agreement. PHI suggests Requirement R4 be removed

entirely or extensively re-written to address the concerns outlined below: Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. It is unreasonable and unfair to hold one party non-compliant due to the failure of another party to reach agreement. Furthermore, in the example provided above, it is a detriment to reliability to delay implementation of the setting change on breaker D just because mutual agreement could not be reached. It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the "Protection System Study" and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing a clear division of responsibilities and assignment of who will be held non-compliant if agreement cannot be reached is unfair to either party.
Yes
Yes
1) The SDT states that "the requirements in the proposed Reliability Standard PRC-027-1 take

into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays". However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of "the appropriate use of time delays in relays" in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS's during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although PHI supports the overall desire to ensure that protective systems are "properly coordinated"; PHI sees little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. The above comment was also submitted with Draft 1 of the standard. In their response the SDT stated that PRC-027 was being developed in response to FERC Order 693. However, Order 693 only directs NERC to address specific deficiencies in PRC-001 surrounding certain measures and levels of non-compliance relating to the notification and response to the detection of failures in relay protection systems. As such, PHI believes PRC-027 goes well beyond what is was directed by FERC, and the stated purpose of the SAR. PHI urges the SDT to revisit FERC Order 693 and revise this standard as appropriate to address only the stated FERC directives. 2) Based on the arguments presented in the above comments, including the lack of historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions, PHI suggests that NERC conduct a Cost Effective Analysis (CEA) to provide information about cost impacts (e.g.,

implementation and ongoing compliance resource requirements) of this draft standard and its relative effectiveness in preventing widespread blackouts, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of this standard. 3) Requirement R2, Parts 2.1.1 and 2.1.2: Remove the term “interconnecting bus” and replace it with the phrase “point of interconnection between the Entities.” The point of interconnection between the entities is more descriptive in that the interconnection point may not be a physical “bus”, but rather the terminals of a line disconnect switch, terminals of a breaker, specific transmission pole, etc. Even though the point of interconnection is often modeled in a short circuit program as a “bus”, the term “interconnecting bus” has no physical meaning. 4) Requirement R3, Part 3.3: A footnote should be added stating that this requirement does not apply to those temporary setting changes that sometimes are applied during commissioning, maintenance, or investigative testing activities to verify performance of individual protective elements, provided the original settings were returned upon the conclusion of the testing activity. For example, in multifunction relays when testing backup time delayed protective elements (i.e., zone distance or time overcurrent elements) it may be necessary to temporarily disable high speed elements (i.e., pilot or zone 1 elements). In response to this comment the SDT responded that it “believes temporary settings changes are addressed in TOP-002, which incorporated Requirements R5 and R6 from PRC-001-1. Temporary settings applied (or changed) to perform maintenance testing of a relay would not have an effect upon overall coordination of the Protection System, as the relay would likely be taken out of service for such testing.” PHI agrees with this conclusion, however, this standard does not specifically exclude these temporary changes from Part 3.3. Therefore an auditor may conclude that they are in scope for this standard. As such, PHI suggests Part 3.3 be qualified with a footnote to specifically exclude these types of temporary settings. 5) Based on the commentary accompanying Figure 3 in the Guidelines and Technical Basis document it appears that a Protective System Coordination Study (PSCS) is required only if there are protective systems installed on breaker C for the purpose of detecting faults on the BES system. Is there a recommended criteria or generation size below which there is no need for a PSCS, or for a dedicated “fault protection system” at Breaker C to detect faults on the Interconnected BES element? For example, suppose all generation downstream of the Distribution Provider’s system is comprised of solar installations with non-islandizing inverters. In these cases, it would be unusual to install fault detection systems “looking into” the BES system at breaker C even though there is generation installed downstream. The non-islanding inverters with 27/59 and 81O/U protection would isolate the generation upon loss of transmission source when Breakers A and B opened. Similarly, if a small synchronous generator was installed on a downstream distribution feeder with sufficient connected load to “swamp” the generator upon the loss of transmission source, protective relays at the generator location, rather than at Breaker C, would operate to remove the generator upon loss of the transmission system source. In both of these examples, even though there may be overcurrent protection, or fuses, installed on the high side of the transformer for transformer faults, there is no dedicated fault protection system installed at breaker C for the purpose of detecting faults on the transmission system, and as such there would be no need for a PSCS. Is this correct?

ComEd believes that the definition should be revised to read “To coordinate time-delayed Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.”
Yes
No
We do not believe that a mandatory PSCS needs to be completed for each interconnected element as stated in Requirement 1. We believe that the design of the Protection System for an interconnected element must first be considered before requiring a PSCS. In cases where high speed protection schemes are redundant, the reliance on time-delayed backup elements would require at least 2 protection system element contingencies. We propose that redundancy should consist of the use of two separate relays and auxiliary relays as per the redundancy test required in the NERC board-approved TPL-001-2 standard. If failure of a single relay or auxiliary relay results in reliance on time delayed back-up protection, we agree that a PSCS should be required, and consequently would agree to the 60 month time frame.
No
This requirement unnecessary burden on the Generation Owner. The fault current seen by Generator Owner’s protective devices depend on the Generation Owners equipment (e.g., the main generator and transformers). So unless those are replaced there should be no requirement on the Generator Owner to review the protection coordination study due to change in fault current at the interconnecting bus which will be due to grid changes. The Transmission Owner will be reviewing those changes and will be coordinating if needed with the Generator Owner. Therefore these requirements should not be applicable to Generation Owner. [Requirement R1 1.1.2 and Requirement R 4 4.1 should also not be applicable to Generator Owner for same reason]. Need to identify which elements of Generator Owner’s protection system are included in this Standard and provide specific criteria for showing coordination with TOs protective devices.
Yes
Yes
Yes
a. For voltage levels at 345Kv and above (EHV), our standard Protection System design utilizes two high-speed pilot schemes, and includes time-delayed backup protection. Due to pilot scheme redundancy, the operation of time-delayed backup elements is an extremely rare event. Our time-delayed backup protection is intended to serve only as a safety net for

extreme events and we do not believe it is cost effective to study time coordination of these elements across our EHV systems. We believe that in cases where high speed protection schemes are redundant, that is designed such that loss of a single relay or auxiliary relay will not result in relying on time-delayed backup relaying to clear faults, the study of back-up element coordination is not necessary and the completion of a PSCS should not be required. b. Additionally, we believe Requirement 1 should state how many protection system failures must be considered for a PSCS. We believe that only one failure is appropriate for the reasons discussed above. c. PRC-001: The proposed Violation Severity Levels for PRC-001-3 R1 are not commensurate with the draft Measure of the Requirement. The current VSL is “High” for failure to be “familiar with the limitations of the protection system schemes applied in its area” and “Severe” for failure to be “familiar with the purpose of protection system schemes applied in its area.” The draft Measure states that the applicable entity “shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel.” The VSLs should be revised to align with the Measure and the “intent” of the Standard and not effectively split out the purpose of Requirement R1 thus requiring specific documentation for a “purpose” and a “limitation”. Exelon suggests the VSLs be revised to the following: Severe: The responsible entity failed to provide evidence that any training evidence exists for basic relaying and any Special Protection Systems within its area. High: The responsible entity failed to provide evidence that all applicable personnel were trained in basic relaying and any Special Protection Systems within its area d. PRC-001: In the Background Section of PRC-027-1 there is a discussion related to PRC-001-1 that was revised as part of Project 2007-03. Specifically, it is stated that in Project 2007-03 SDT retired PRC-001-1 Requirement R2 as because this Requirement addresses data and data requirements that are included in the proposed Reliability Standard TOP-003-2; however, the justification provided in the mapping document associated with Project 2007-03 does not seem to meet the original intent of PRC-001 R2, and does not seem to be a "relocation" of the original requirement (refer to Project 2007-03 Mapping Document Draft 7). PRC-001-1 R2 current revision is as follows: R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. The Background Section of PRC-027-1 further states that the SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new Standard. The current revision to PRC-001-2 that removed Requirement R2 was not fully addressed by Project 2007-3 nor voted on by the Ballot Body and therefore Exelon requests that PRC-001-1 R2 be added back in to PRC-001-3 and Project 2007-06, similar to Requirement R1, until its reliability objective by similarly addressed by either a revision or development of a new Standard.

(1) For clarity, consider re-writing the definition as “A BES Element that electrically joins a Facility owned by: a) a separate Registered Entity, or b) the same Registered Entity that is represented by multiple functional entities (Distribution Provider, Generator Owner, or Transmission Owner).”
Yes
Yes
Yes
Yes
(1) The title of the new PRC-001-3 standard does not seem to be the appropriate title since the standard addresses protection coordination issues, rather than requiring the system operators to be familiar with, and understand the protection system.
Yes
(1) The wordings of the sentence “Examples of Protection Systems where technical justifications may be used include” under heading “Requirement R2 in the “Application Guidelines” are unclear. MH suggests that It read as follows: “Examples of Protection Systems that are not affected by the fault current change include”. Also, under the same section, it’s very confusing as to what relays the following refers to: 4. Reverse power, definite time &/or time overcurrent elements: Designed to coordinate during maximum generation with the transmission system under normal operating conditions and includes the calculation of the percent deviation between the under single contingency conditions regardless of Fault current. Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.). (2) Protection System Coordination Study definition - for clarity, replace the word “that” with the word “which” and insert the word “that” between “demonstrates existing”. Moreover, consider replacing the words “for clearing Faults” with “during Faults” for consistency with the purpose of the Standard. The suggested definition should read “A study which demonstrates that existing or proposed Protection Systems operate in the desired sequence during Faults. This definition should also be changed in the rational for R1 section and Implementation Plan document if it is an accepted change by the SDT. (3) Background - references are made to standards PRC-001, PRC-027, TOP-003, PRC-005, etc. in this section, which in some cases, do

not include the title following the standard number. For consistency, the title should be included, or in the least referred to at the first instance of the standard number in this section. (4) Other Aspects of Coordination of Protection Systems Addressed by Other Projects - replace the period "." at the end of the last paragraph with a colon ":" . Moreover, follow each project number with its title for consistency and clarity. (5) R1.2 - the words "Protection Systems" and 'Currents used" should be written as "Protection System(s)" and "Current(s) used" to maintain consistency with the rest of the paragraph. As a note, consider changing all instances of the words "Protection Systems", "Currents", "owners" and "Interconnected Elements" to "Protection System(s)", "Current(s)", "owner(s)" and "Interconnected Element(s)", to maintain consistency throughout the document. (6) R2.1 - remove the words "Protection System Coordination Study", leaving only the acronym "PSCS", because it has been previously defined in the document. (7) R2.2.1 and M5 - add an "s" or "(s)" to both "Protection System" and "Interconnected Element". (8) M4 - replace "is" with "includes" and "that contains" with "which contain". (9) All measures - for consistency, the phrase "may include, but is not limited to," should be added to each measure. (10) R4.2 - place brackets around the "s" in the following words "modifications" and "issues" for consistency with the rest of the document. Please continue this change throughout the Standard and Technical Guideline document for consistency. (11) 1.2 Evidence Retention - is it necessary to state that "The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit." since this information is already included in the CMEP. (12) R4.2 and M10 - the words "proposed changes and modifications" should be changed to "proposed changes and additions" to mirror the wording in R3.1.
Individual
Michael Falvo
Independent Electricity System Operator
Yes
We agree with the revised purpose statement, but reiterate our previous suggestion to add "settings" after protection system (with the "s" removed") to make it clear that it is the coordination of the settings, not the design of protection systems. The SDT's response to our previous comment indicates that: "…settings' are not the only aspect of Protection Systems that can impact the stated purpose." We are unable to come up with any specific examples of what other parameters or actions associated with the Protection System of an Interconnection Element that would require coordination to ensure "Protection System components operate in the desired sequence during Faults". Please elaborate, or revise the purpose statement accordingly.
Yes
Yes

Yes
Yes
No
We do not have any comment on the revised Applicability Section, but continue to express a serious concern with leaving PRC-001 in its present form. As indicated in our previous comment, we do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. This is a training requirement and as such, it should be transferred to the appropriate PER standards. Providing training evidence does not demonstrate that the (operating personnel of) responsible entities are "familiar with" the purpose and limitations of protection system schemes applied in its area. c. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. In response to our previous comment, the SDT indicates that it "…recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database." We do not agree with this recommendation and hold the view that adding the issue to the NERC Issue Data Base is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT should propose a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee's advice/direction for appropriate actions. We do not believe that the SDT or staff has brought this to the Standards Committee's attention. Note that the Standards Committee is responsible for managing the standards development process and as such, can make an informed decision to either request the SDT to expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel. Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. Once again, we urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.
No
We do not agree with the proposed Measure for the reason as stated under Q6, above.

Yes
Duke Energy agrees with the changes made by the SDT to extend the period to 60 months.
Yes
Duke Energy agrees with the changes made by the SDT to extend the period to 60 months.
Yes
Yes
Duke Energy believes that the Facilities section provides sufficient detail and clarity for this standard.
Yes
In the interest of clarity, Duke Energy feels an example of acceptable evidence for measure 3 of PRC-027-1 R2 would be beneficial. In PRC-027-1, Duke Energy identified a potential gap in Figure 4 of the Application Guidelines. Duke Energy believes that without coordination between the DP and TO, it could lead Transmission Planners and System Protection Engineers to disregard the coordination with protection for the tap line between BES and non-BES equipment. Given the proposed definition of the BES, this scenario could potentially pose a risk to the BES without the proper coordination identified in PRC-027-1.

Will there be an expectation that each entity involved with interconnected elements or facilities be pre-identified in any other documentation other than perhaps in each PSCS?

No
In theory I understand the drafting team stating: "The drafting team believes that any conflict resolution should be handled through normal business practices. The old Measure M9 (new Measure M10) has been modified as follows: Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted. The drafting team believes the requestor cannot be held accountable when the other party does not respond". However, I don’t believe that we can predict or project how an audit or enforcement team will apply or misapply this requirement which is cause for concern. There are utilities that will respond but may not respond in a timely manner. This puts all entities unfairly under scrutiny. Perhaps some form of clarification could be added to the application guidelines or another location for example.
My general impression is this standard could be quite a burden to track data for an audit due to the numerous time lines specified that are between entities. My opinion is this will likely result in a difficult to audit standard. This causes concern if we remain in a zero tolerance compliance environment. Consider changing some of the time lines such as 30 and 90 days to 6 months. My general feeling is we should consider other ways to simplify this standard however suggestions I have made have not made it into the draft standard. I recommend more consideration be given to simplification.

Michelle R D'Antuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration (“ICLP”)agrees that the updated purpose statement is more appropriate for a BES Reliability Standard. The previous version sought to minimize the faulted

elements – which is a desirable goal in most cases, but may not be the highest priority where multiple interconnected entities are concerned. (Otherwise, the ironic result could be that local service is preserved at the expense of the wider-area system.) The intended Protection System design should predominate, as it will account for any such circumstances.
Yes
The addition of the modifier “BES” to describe the applicable Elements is critical in Ingleside’s view. Without it, CEAs may assume that a Fault study is required for an interconnection at any voltage – an issue highlighted in FERC Order 773 concerning the Definition of the BES.
No
ICLP mostly agrees with rationale for R1 that states “The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame <than 60 months>.” We would take that one step further and argue that far more critical coordination occurs in UVLS, UFLS, SPS, and distance relay schemes – and is already covered in other NERC standards. Fault analyses are comparatively basic, and do not require a re-evaluation unless a material change is made in the local grid. This means that a Generator Owner should be able to make a simple confirmation that nothing has changed since the previous time a Fault study was performed – usually during commissioning or a major reconfiguration. If the TO wants a full Fault evaluation due to a change in the local transmission system, they are free to do so under R1.1.2. Requiring every GO to produce the results of a study that took place years in the past serves no reliability purpose.
No
Although ICLP is not a Transmission Owner, we will be impacted if the TO’s assessment shows a material change in Fault current has occurred in an interconnecting element. We believe our TO has every economic and reliability incentive to contact us if a modification threatens the transmission network. It should be sufficient that the TO show that a coordinated assessment takes place when an appropriate trigger condition occurs.
Yes
Yes
ICLP agrees that consistency between NERC standards is helpful. Since our Protection System maintenance program has been developed specifically to address BES relaying, it is a straight forward process to develop the related Operator training.
No
ICLP believes that the measure should identify that front-line operators are the target audience of the training. As a Generator Operator, we employ engineers, process developers, and operators – and not all of these individuals require basic Protection System training. This ambiguity should be resolved while there is focus on PRC-001.
Individual
Don Jones
Texas Reliability Entity

No
We suggest re-wording the second half of the purpose to say ”such that Protection System components operate in the desired sequence to properly isolate Faults”.
No
We have concerns with this proposed definition surrounding the current state of the proposed BES definition changes especially in light of the multiple possible exclusions that may be allowed. In ERCOT, there are numerous large private-use-networks (PUNs) with generation behind the fence that could possibly be excluded under the new BES definition, based solely on how much power they export to the grid. If the new definition of the BES grants exclusions to these PUNs, then the PUN as well as the Transmission Owner that connects to the PUN would not be subject to the requirements of PRC-027. In our opinion, this presents a risk to the BES in that there could possibly be protection systems associated with the PUN interconnection that might need to be coordinated to properly respond to faults on the BES or within the PUN. These protection systems should require some level of coordination between the entities involved.
Yes
Yes
Yes
Yes
Yes
How many buses away from the Interconnect Element does the PSCS need to cover? Figure 5 of the Application Guidelines indicates that only the next adjacent bus is to be included in the PSCS, which implies that the PSCS only covers up to Zone 2. We understand that PRC-027 does not tell any owner how to perform a PSCS or dictate the specific information that is required for a PSCS. It appears from our understanding that the coordination of protective relays beyond the primary zones that affect the interconnected element are the responsibility of the equipment owner, and that it is up to the owner to determine whether these settings are to be shared with other entities for the interconnected element. Please clarify if this understanding is correct.

American Electric Power
Yes

Yes
The term “functional entity” is defined in the NERC Glossary of terms and we believe it should be capitalized in this definition.
Yes
Yes
Yes
No
AEP appreciates the drafting team’s efforts to clearly identify the Protection Systems that are applicable to Requirement R1 but is concerned that the combination of Applicable Facilities in Section 4.2 and Requirement R1 may result in burdensome training requirements for the TOP, BA and GOP that do not provide an increase to BES reliability. In particular, the Applicable Facilities includes Protection Systems installed for the Generator Step-Up transformers, Station Service transformers and the Excitation transformers. Nowhere does the standard limit the scope of this applicability to a subset of the Applicable Functional Entities. As a result, an auditor may interpret the standard to require that the TOP and BA be familiar with this level of generator protection for the units connected to their system.
No
The examples of evidence in Measure M1 appear to be overly simplistic compared to the potential scope of R1.
PRC-001-3: R1 – The term “protection system” should be capitalized to match previous versions of this standard. PRC-027-1: Mapping Document – The verbiage in R1.1 of the mapping document does not match the wording in the proposed standard: “Protection System Study” is used instead of “PSCS”. PRC-027-1: Figure 2 – The phrase “generator Protection Systems” is often used by Generation Owner relay engineers to mean the Protection Systems installed for the purpose of detecting faults on and protecting the physical generator, which is clearly outside of the scope of this standard. Therefore, AEP recommends changing the verbiage associated with this figure to remove the phrase “generator Protection Systems” and replace it with a reference to Generator Owner R’s Protection Systems installed for the purpose of detecting faults on the Interconnected Elements. Suggested wording is shown below: Transmission Owner S is to review the Protection System settings associated with Breaker A *and the Interconnected Element* (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop proposed Protection System settings associated with Breaker C. Generation Owner R is to review the Protection System settings associated with Breaker C *and the Interconnected Element* (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A. PRC-027-1: R3 & Figure 5 – As written, R3 will place undue burden on each TO, GO and DP to maintain a list of all other entities connected to each

interconnecting bus to which they connect. Furthermore, since the elements are typically owned by the TO, burden will be placed on the TO to respond to requests from other TO's, GO's and DP's as they build their list. R3 and its' associated Figure 5 should be revised such that the responsibility lies with the owner of the Interconnected Element to ensure that relevant information is passed along to each entity who connects to the element when any one entity makes a change.

Yes
Yes
Yes
Yes
We agree with Part 4.1 of Requirement 4, but we have comments regarding Part 4.2 and have stated below in Question 8.
Yes
Yes
Although we agree with the proposed change, we have reservations of having a standard with only 1 requirement. Please see our comments on Question #8.
In regard to PRC-027-1: We believe that R3, Part 3.1 is covered in R1, Part 1.2 and propose that R4, part 4.2 be reworded to: 4.2. Prior to implementing any proposed change (s) or modifications associated with Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues In regard to PRC-001-3: The title for PRC-001 "System Protection Coordination" and the purpose statement of this standard is no longer pertinent for the only requirement that remains in the standard - entity familiarity with the purpose and limitations of protection system schemes. This remaining requirement is essentially a training obligation and better suited in a PER standard if deemed necessary for reliability. The drafting team also appears to support this view as discussed in the background statements of the PRC-027-1 standard, however, believes this additional work is outside the scope of its project. However, the PRC-001-3 standard should not be left with a title and purpose statement that will cause industry confusion with PRC-027-1. We suggest that this team adjust PRC-001-3 to include the title "System Protection

Awareness" and a purpose statement of "To ensure entity understanding of system protection schemes applied to their assets." FE believes the continuing need for this requirement (PRC-001-3 R1) needs to be carefully considered. NERC standards PRC-023 and PRC-25 address relay loadability limitations. The original blackout report recommendation that drove this requirement appears to now be more thoroughly addressed by those standards. We encourage the NERC Standards Committee to extend the scope of this drafting team's work through a supplemental SAR to address whether or not PRC-001 can be retired.

ITC
Yes
No
The Applicability section 4.2 defines "facilities" as protection systems with the purpose of detecting BES faults on Interconnected Elements. Therefore, in example Figure 4 the DP does not own "facilities" and the transmission line or tap are not an Interconnected Element. The definition of Interconnected Element should reflect this fact and Figure 4 should be corrected. If the intention is that Figure 4 should be an Interconnected Element so that R2 still applies, then clarification that Interconnected Elements does not require Applicability section 4.2 defined facilities is required. ITC Holdings engineers perform coordination at Interconnected Elements between ITC Holdings subsidiaries ITCTransmission and METC, both registered TOs. The definition should exclude applications such as this, where the only outcome is increased administrative burden to be auditable with no reliability benefit to BES.
Yes
Yes
Yes
Yes
ITC Holding is in agreement with the clarification on which protection systems are applicable to requirement 1. Using the same definition as used in PRC-005-2 promotes consistency across the standards within the same category (PRC).
Yes
ITC Holdings is in agreement to add the measure to the standard to be in-line with the language in the RSAW for PRC-001-2.
We vote to reject Draft 3 of PRC-027-1 primarily due to enormous increase in administrative burden with no appreciable gain in system reliability. We agree with SDT there is reliability benefit to performing these tasks. However, as the SDT members stated at presentations to

RFC Protection Subcommittee and to NATF Workshop, utilities are already doing this work. The SDT’s own rationale states “no evidence there is widespread miscoordination of Protection Systems”. Therefore, the only outcome of this standard is that utilities will greatly increase administrative burden to become auditable. Figure 4 exclusion of PSCS on the Interconnected Element is not found in standard. Figure 4 states the line or tap is the Interconnected Element, therefore TO owns “facilities” and must meet R1-R4. Either definition of Interconnected Element must be revised to exclude Figure 4 example, or Figure 4 must be corrected to show TO is still responsible for R1-R4. Example Figures 1-5 create responsibilities on owners to “propose” and “review for coordination” which are not found in the standard. Either these responsibilities should be removed from Figures or the responsibilities should be added to the standard. The last sentence in Figure 5 specifies the TO will provide GO settings to the other TO. This contradicts R3 which states, “Each TO, GO, and DP shall provide to each TO, GO, and DP…” Again, the Figures are creating responsibilities not found in the standard. The purpose of Applicability section 4.2 Facilities is unclear. Each requirement deals with requirements around the Interconnected Elements. If the purpose of section 4.2 is to try and exclude DP relays which do not purposefuly trip for BES faults, this should be more clearly stated. This exclusion should be moved to Interconnected Element definition and section 4.2 rewritten to target Interconnected Elements. Or section 4.2 should be the corrected Interconnected Element definition, and there will be no need for a new definition in this standard. Example Figure 2 creates different responsibilities for GO than Figure 3 does for DP. Why the difference? Essentially they are the same: both have protection systems which trip for faults on Interconnected Element. Again, the Figures are creating responsibilities not found in the standard.

Public Service Enterprise Group
No
As a Results-Based Standard, “coordinate” should be removed from the Purpose. We suggest that the Purpose should be “To ensure that Protection Systems involving Interconnected Elements operate in the desired sequence during Faults.”
Yes
Yes
No
We agree with that the 60 months is adequate; however, we disagree that a technical justification should be required for relays and schemes that are unaffected by the level of Fault current. See our proposed language changes in 8.a below.
Yes

No
Change section 4.2.1 (capitalized words show changes) as follows: “4.2.1 - Protection Systems that are installed for the purpose of detecting AND ISOLATING Faults on BES Elements (lines, buses, transformers, etc.)”
No
• Requirement R1 requires that “Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area.” This is too broad and vague with respect to which TOP, BA and GOP personnel are in the requirement’s scope. Subject to addressing PSEG’s additional comment of “What is meant by “familiar with” in R1?” in the bullet below, PSEG recommends that the requirement at least be revised to: ”Transmission Operator, Balancing Authority, and Generator Operator personnel shall be familiar with the basic purpose and limitations of protection system schemes applied to the BES equipment and Facilities they control.” • M1 should describe methods other than documented training to meet R1 – see the “but not limited to” language. What is an alternative to documented training? What is meant by “familiar with” in R1? Until “familiar with” is better defined, M1 cannot be written.
PSEG has the following additional comments: a. To avoid make-work reporting that is detrimental to BES reliability, PSEG recommends that the Applicability section remove Protection Systems, Interconnected Elements, and Protection System components that do not require coordination. Therefore, we propose that the 4.2.1 be modified with this additional language after “faulted Element”: “, except for the following Protection Systems, Interconnected Elements, and Protection System components that do not require such coordination: • Protection Systems for the Interconnected Element that are owned by the same functional entity of a single Registered Entity. • An Interconnected Element that is protected by overlapping differential relays only (e.g., a Generator Owner’s GSU that is connected to a Transmission Owner’s bus) • Protection System components for which coordination is unaffected solely due to an increase in Fault current, including: • Transformer differential relays • Line current differential schemes • Generator differential or overall differential, bus differential schemes • Step distance protection schemes • Fault detector settings (these settings are guided directly by PRC-023-X) • Breaker failure settings • Directional Comparison Blocking overcurrent schemes b. “Application Guidelines” comments 1. More clarity on what a pre-standard PSCS needs to contain to meet R1.1. Is an e-mail trail from other owners stating that the settings are acceptable? Do calculations need to be shown? 2. Language on p. 21: “The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” If there is no problem, why is this standard being proposed? 3. Language on p. 22 that lists examples of Protections Systems where technical justification may be used to exclude the need for a PSCS. Although PSEG has suggested limiting the Applicability in its comments in 8.a, it may be simpler if the standard just listed the Protection Systems that require a PSCS – that would only be overcurrent elements based upon Fault current. If that

scheme is not employed, no PSCS is needed.

Thank you for the opportunity to comment. While we are in favor of this version, we seek clarification on one item. Requirement R2 states that the fault values used in determining the 10% change will be measured at the “interconnecting bus”. While reviewing the examples in the application guideline section, two “interconnecting bus” are labeled in Figure 1, 3, and 4. If the coordination concern is related to the interconnecting element, it would seem reasonable that the “interconnecting bus” for Owner S to place faults on to determine the 10% change is that at Station 1/Transmission owner R, looking at figure 1. This would capture the change in fault current seen by the Owner S Protection System on breaker E. Placing faults on the interconnecting bus behind breaker E if I am owner S does not seem appropriate when considering coordination on the interconnecting element.
Group
Bonneville Power Administration
Morgan Senkal
Yes
No
1. In this new term, the use of “interconnected” implies that the element is connected by another element, which is not what is intended. A more appropriate word would be “interconnecting” as this indicates that this is the element that connects other elements. 2. The definition as written does not make sense because there is typically not an element that electrically joins facilities owned by separate registered entities. Instead, where the point of interconnection between separate registered entities is made, one entity will own the element on one side of the point of interconnection and the other entity will own the element on the other side of the point of interconnection. The change of ownership is made at a point, not through a commonly-owned element. Since all elements are owned by one entity or the other, there is no element that electrically joins the elements owned by the two entities and nothing that meets the definition provided for an Interconnected Element. 3. Part B of the definition does not indicate which element is the Interconnected Element in a system where the same registered entity represents multiple functions. Does this allow the entity to choose which element is considered to be the Interconnected Element? For example, if an entity is both a generator owner and transmission owner they will own all elements from the generator to and including the transmission system, with no change of ownership. There is no clear point where the generator function stops and the transmission function begins. Which element will be considered to be the Interconnected Element and required to comply with this standard?
No
BPA believes that the requirement to provide a protection system study for each interconnected element is onerous, and as a result, any amount of time is too short. While beneficial to periodically perform fault studies and review protection system coordination, the creation of a NERC standard to require reviews for Interconnected Elements on a rigid time

frame is likely to be counterproductive for the following reasons: a. There is nothing unique about the Protection Systems for Interconnected Elements compared to other Protection Systems that warrants this special treatment. If this standard is deemed necessary, the only logical consequence is that similar standards must be created for all protection systems. Trying to coordinate Protection Systems to comply with numerous standards will limit flexibility. Diverting resources from addressing Protection System problems to completing compliance documentation makes the system less reliable, not more. b. This standard provides no quality benefit to the Protection System Coordination process. It only increases the documentation burden, which is just as likely to decrease the quality of the review as it is to improve it. c. There are an enormous number of things that entities do to keep the BES reliable. If NERC wishes to regulate and enforce all of these things, it will come at an enormous cost to consumers of electric power. Cost increases are already being experienced due to the present standards. Since there has been no widespread problem with Protection System coordination between entities, this particular issue should not be the subject of a standard. d. Any specified time frame for a Protection System Coordination review will be too long for some situations and too short for others. The Protection System Engineers within the entities are in the best position to determine an appropriate review interval for each element.
No
Please see comments for Question 3.
No
The requirement does not describe what further actions are required or what time limits apply if the suggested modifications are not acceptable to the originating entity.
No
As described in the Facilities Section, the protection systems for which the requirements are applicable are “Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements”. Since most Protection Systems are capable of isolating faulted elements without coordination, nearly all Protection Systems would be exempt from the requirements. While this would be acceptable to us, we don’t think this is what the drafting team intends.
Yes
1. The definition of Protection System Coordination Study is inadequate because it does not address what type of faults must be studied or where on the system the faults need to be applied. 2. R1.1.2 uses the term interconnecting bus. This is not a common term and requires a definition.

Yes
Yes
Yes
Yes
Yes
PacifiCorp would like to highlight a recommendation that was made by the drafting team on page 4 of Draft 3 of PRC-027-1 regarding Requirement R1 of PRC-001-2. The drafting team has recommended via the NERC Issues Database that the future standards drafting team tasked with revising PER-005-1 incorporate the reliability objective of PRC-001-2 Requirement R1 into that revised standard. PacifiCorp is concerned with the potential overlap that could result from the failure to retire Requirement R1 in PRC-001-2 concurrent with the effective date of the new version of PER-005. To avoid the risk of entities having to comply with duplicative requirements under two currently-effective standards, the standards drafting team should include language in PRC-001-2 expressly confirming that compliance with the relevant requirement of the revised version of PER-005 will satisfy Requirement R1 of PRC-001-2 until such requirement is retired. In addition, there have been several proposals in the informal development of PER-005-1 that would expand the scope of applicability to include Generator Operators and Support Personnel. If R1 of PRC-001-2 is to be included in the new version of PER-005-1, the requirements of R1 could apply to additional functional entities. As such, any recommendation to move R1 of PRC-001-2 into the new version of PER-005-1 should be part of the PER-005-1 discussions that are currently taking place. At present, they are not. PacifiCorp would like to encourage more collaboration between drafting teams on the development of new draft standards and would like to thank the System Protection Coordination Standard Drafting Team for highlighting this recommendation.

Yes
Yes
Yes
No
Tri-State believes that the Requirement R1 and Measure M1 need to refer more directly to the Facilities included in the Applicability section. A couple of options are presented below. Option 1: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of the following protection system schemes applied in its area: • Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.) • Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements. • Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability. • Protection Systems installed as a Special Protection System (SPS) for BES reliability. • Protection Systems for generator Facilities that are part of the BES, including: o Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays. o Protection Systems for generator step-up transformers for generators that are part of the BES. o Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES). o Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays. If Option 1 is chosen, then the Facilities section in the Applicability can be removed. Option 2: M1. For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in the purpose and limitations of the Protection System schemes included in the Facilities section of the Applicability that are used within its area was provided to its applicable personnel.
Tri-State is concerned about the timeframes allowed in Requirement R1, associated with Requirement 3, Part 3.1, especially when the proposed change does not affect the conditions used in the coordination of Protection Systems. The way we read Requirement R3, Part 3.1, a planned relay replacement will have to go through the PSCS process or a technical justification would be required even if it does not affect coordination of other Protection Systems. We would propose that Part 3.1 be changed as follows: 3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnected Element if the proposed change requires a change in the coordination of Protection Systems associated with the Interconnected Element(s); or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

Individual
Kayleigh Wilkerson
Lincoln Electric System
In consideration that the rationale for Requirement R1 Part 1.1.1 acknowledges that the drafting team has “no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements”, LES recommends further development of the standard be halted until sufficient technical justification can be provided for the standard’s development. As currently drafted, the drafting team would place excessive documentation requirements on registered entities for activities already being performed as industry best practices. In lieu of turning those best practices into compliance requirements, LES suggests the drafting team leverage existing Reliability Standard PRC-001 as a basis for system protection coordination.

1) The SPC standard drafting team created this result-based standard specifically directed toward Interconnected Facility applications by stating in the current draft that “PRC027-1, with the stated pupose ‘to coordinate Protection Systems for Interconnected Elements….’ . Also in Draft#3 the purpose now places emphasis on “desired operating sequence” versus Element isolation. To align with this purpose, as previously suggested, we recommend that the title of this standard reflect the revised purpose and be renamed “Protection System Coordination for Interconnected Elements”.
Yes
1). The word “facilities” included in the proposed definition, “Interconnected Element: A BES Element that electrically joins facilities owned by…” should be capitalized as it is included in NERC’s Glossary of Terms Used in NERC Reliability Standards. 2). Dominion agrees with SERC PCS comment: “As evident by a note in the rational box for R1 (Page 6 of Redline Version) the drafting team recognizes that vertically integrated entities that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves. To ensure that this intent is retained in the final version of the standard it is suggested that this note or some derivative be placed somewhere in body of the standard such as the definition of Interconnected Element or under the requirements.”
Yes

Yes
Yes
Yes
Yes
Dominion believes the reference to PRC-001-2 is incorrect and should be noted as PRC-001-3 as PRC-001-2, Page 11, cites “Measures and Compliance Elements will be added to a later draft.” Dominion supports the measure accompanying Requirement 1, as included in PRC-001-3. Dominion also notes that the reference to the RSAW for PRC-001-2 is incorrect and should reference the RSAW for PRC-001-1. Dominon was unable to locate a draft of RSAW PRC-001-2 or PRC-001-3 on the Standards Under Development NERC webpage or under any category, on the NERC RSAW page.
1). Under Requirement 2 (Page 8 of Redline Version), studies are referred to as “most recent” and “present” which is confusing and could be considered synonymous. Recommend changing this terminology to replace “most recent” with “previous” study and “present” with “new” study in all places within the standard where they exist. 2). Requirement R3, 3.1 first bullet (Page 10 of Redline Version) is both broad far reaching (new installation, replacement with different types) and specific (modifications to protective relays or protection functions settings, communications CT/PT ratios). 3.1 Clearing targets changes or additions to existing or new Facilities that modify conditions that impact coordination of Protection Systems. Recommend changing bullets to clarify areas of this emphasis to: • Change in Protective Relay Types or Functions • Change in Communication System(s) that interface with Protection System(s) • Change in connected voltage (VT) or current (CT) source ratios • Change to transmission system Element(s) that alters impedance • Change to generator unit (s) that alters impedance • Change to generator step-up transformer (s) that alter in impedance 3). In Application Guidelines – Example Process (Page 30 of Redline Version) the second bullet indicates that a single study can be used whereas in R1 1.1.3 it states that “each” entity shall perform a PSCS. Recommend clarification in this example to reflect Note that is included in Rational for R1 that indicates in cases where a single group performs overall study for the interconnection for both entities. This reference may lead to confusion in the example. 4). Wording is confusing in PRC-027-1 Applicability Section (Page 3 of Redline Version). Suggest combining 4.2 and 4.2.1 into something like “Protection Systems owned by the Functional Entities in 4.1 are applicable if they are installed for the purpose of detecting Faults on Interconnected Elements of the BES and require coordination for isolating those faulted Elements”. 5). There are numerous locations in the standard that note that “Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.” Given the complexities of system configurations, it is not always the case that this scenario (Max Gen and All Facilities In) will be the best case under which to verify proper coordination. Recommend removing this note and require entities to determine the best scenario under which to evaluate coordination.

The presence of this note may create unintended bias. 6). Dominion agrees with SERC PCS comment: “Please change Figures 3 and 4 in the Applications Guidelines section so that “Interconnected Element” is adjacent or points to the line between Breaker C and the point of connection (tap point) on the line between Breakers A and B. It clarifies these examples by having the Figures align with your wording. (The Figures presently imply that the line between Breakers A and B is the “Interconnected Element”.)

In our area, there do not appear to be any issues with lack of protection system coordination and I am unsure if there is really a need for this standard. Their appear to be adequate protection systems standards noted in the "Other Aspects of Coordination of Protection Systems Addressed by Other Projects" section.
No
It is difficult to support the current definition that relies on the BES Element language from the BES definition process that has not been finalized. In our case, there are elements that would not be in scope for Interconnected Element consideration, but if there is no finalization of the BES definition and this standard moves ahead, the heart of this definition would be in flux. More specificity in what equipment we are really talking about here might be helpful in the absense of a settled definition of a BES element.
Yes
Yes
No
Although well-intended, this seems like a difficult thing to document for audit if there are legitimate back and forth over a long period of time.
No
Do not believe that a DP-only entity would typically have Interconnected Elements that would necessitate inclusion, when the purpose is to protect the TO equipment.
Individual
Dale Fredrickson
Wisconsin Electric Power Company
No

Change "in the desired sequence" to "in an acceptable sequence". This better reflects the compromises that may be required by the different entities owning protection systems on an Interconnected Element.
Yes
No
Requirement 3.3 needs to be revised to allow an entity the flexibility to make emergency changes to protection systems or settings that are necessary to correct a reliability problem. The current draft allows such changes only when a failure occurs.
Yes
No
R4 needs revision to better accomodate the entire range of diversities in TO-GO interconnections, especially when agreement cannot be reached between entities, or when agreement cannot be reached in a timeframe required to make critical changes during generating unit outages. R4 also neeeds to include flexibility when the GO is not a vertically integrated utility, and does not have in-house protection engineering resources to respond in the required timeframe. It is unjust to put compliance risk on an entity due to the failure of another entity to reach agreement on settings. In some cases the best that can be expected is for two parties to exchange protection system information and live with a compromise in coordination that allows both to best protect their assets. This may be especially true when generating assets are at stake, and insurance considerations require sensitive protection that may not allow complete coordination.

Yes
Yes
Yes
Yes
PJM supports both standards as drafted. Specific to PRC-001-3 R1, PJM urges the SDT to replace the term ‘familiar’ with language less subjective. There may be a number of interpretations for this term that will result in compliance issues for applicable entities. Suggested revised wording should include language that has a direct tie to the Measure. PJM recommends the following revised requirement for the applicable entities, ‘knowledge of the purpose of and limitations of protection system schemes shall be based on the training programs provided.’

Ameren
Yes
(1) Ameren supports the SERC Protection & Control Subcommittee comments and hereby includes them by reference rather than repeating them all.
Yes
(1) The word “facilities” should be capitalized, since it is included in the NERC Glossary: “Facility - A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)” and “Element - Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.”
Yes
Yes

(1) The "maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus" could either be the total Fault current at that bus, or the Fault current flowing through the Interconnected Element. Our reading of R2, Part 2.2 "used in the most recent PSCS" is that it depends on what the entity used in their study.
Yes
Yes
Yes
(1) The measure was provided for PRC-001-3, not PRC-001-2.
(1) In Application Guidelines for R1, please add “A Protection System Coordination Study includes, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed.” We request adding it just after the definition of a PSCS. This will more clearly align the Application Guidance with R1.2. (2) Under Requirement 2, studies are referred to as “most recent” and “present” which is confusing and could be considered synonymous. We ask the SDT to change this terminology to replace “most recent” with “previous” study and “present” with “new” study in all places within the standard where they exist. (3) Requirement R3, 3.1 first bullet is both broad (new installation, replacement with different types) and specific (modifications to protective relays or protection functions settings, communications, CT/PT ratios). The 3.1 text itself clearly targets changes or additions to existing or new Facilities that modify conditions that impact coordination of Protection Systems. We request the SDT to replace the existing bullet points to clarify areas of this emphasis to these bullet points: “• Change in Protective Relay Types or Functions • Change in Communication System(s) that interface with Protection System(s) • Change in connected voltage (VT) or current (CT) source ratios • Change to transmission system Element(s) that alters impedance • Change to generator unit (s) that alters impedance, or • Change to generator step-up transformer (s) that alter in impedance” (4) We request the SDT to clarify 4.2 by combining 4.2.1 into it, thus removing the separate 4.2.1. Please reword as follows: “These requirements contained herein are applicable to each 4.1 Functional Entity that owns Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.”
Group
Bureau of Reclamation
Erika Doot
Yes
Reclamation appreciates and agrees with the drafting team’s clarification of the Purpose section. Reclamation agrees with the drafting team that it is more important for Protection System components to “operate in the desired sequence during Faults” than to have “the least number of power system Elements” isolated to clear Faults as previously stated in Draft 2 of the Purpose section.

No
Reclamation appreciates the drafting team's clarification of the definition of Interconnected Element to specify that Interconnected Elements must be "BES Elements." However, Reclamation believes that the addition of part b) of the definition is problematic. Reclamation believes that "Interconnected Elements" covered by the standard should only join facilities owned by separate Registered Entities as specified in part a) of the definition. Reclamation is not clear on how an entity would document internal coordination of Protection System Coordination Studies for the TO and GO arms of the same entity. Reclamation notes that the examples provided by the drafting team in the Application Guideline Diagrams appear to describe only Interconnected Elements at the point of demarcation between separate registered entities. At some Reclamation facilities, the same staff members coordinate TO and GO relay settings, so it is not clear how the studies and concurrence required under R1-R4 would be accomplished. Reclamation believes that PRC-023, PRC-025, and other standards will ensure that TO and GO relay settings are appropriate, and that PRC-027 should only address relay setting coordination where facilities join separate Registered Entities. In addition, the Background section of the standard explains that one purpose of the standard is to address the August 14, 2003 blackout report recommendation on the need to "address 'the appropriate use of time delays in relays,' by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination. Consistent with this rationale, Reclamation recommends that the drafting team modify the definition of Interconnected Element to read, "A BES Element that electrically joins facilities owned by separate Registered Entities." Finally, Reclamation notes that the definition of Elements in the NERC Glossary is, "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components." By incorporating the term Element, PRC-027-1 perpetuates the ambiguous definition of Elements by including the term "such as," which creates an open-ended list of possible Elements. Reclamation believes it would be helpful for entities to have a better defined list of possible "Interconnected Elements" so that Entities can ensure compliance.
Yes
Yes
No
Reclamation agrees with this comment but suggests rephrasing R4 to encourage collaboration among registered entities. Reclamation suggests that R4.1 should read "Within 90 calendar days after receipt or according to an agreed upon schedule, review the summary results of a PSCS (per Requirement R1, R1.2) and respond to the other owner(s) by accepting the results or suggesting modifications to resolve any identified coordination." Reclamation does not believe that entities should submit formal rejections of PSCSs merely to satisfy the standard. Reclamation suggests that the phrasing above would better encourage collaborative relay setting coordination.

No
Reclamation requests that the drafting team clarify which Protection Systems “require coordination” for isolating faulted Elements, or remove the phrase “that require coordination” from the definition of Facilities.
Yes
Reclamation thanks the drafting team for assisting Registered Entities with the transition from PRC 001 to PRC-027 by incorporating the RSAW language to ensure continuity of compliance.
1. Reclamation requests that the drafting team clarify what "acceptable evidence" it envisions for PSCSs. For an example, is a PSCS acceptable if the document contains (a) Date of study, (b) Deviation of short-circuit currents, (c) System change, (d) all recipients, etc. We appreciate if you can include an example form/document as acceptable evidence. Reclamation would appreciate if the drafting team added a sample PSCS template that would be considered acceptable evidence. 2. In order to avoid similar vagueness of coordination issues that were problematic under PRC-001, Reclamation would appreciate if the drafting team clarifies what a PSCS should contain (e.g. which relay element(s) is required to coordinate with, how to show it as the evidence, etc.)The PRC-025 documents may provide helpful examples. 3. Regarding R1 & M1, if a PSCS shows no impact on the existing coordination (no setting changes are required), would an entity still have to send neighboring utility(s) the entire PSCS supporting study or would a brief statement of the study results suffice? Reclamation requests that the drafting team clarify the acceptable evidence. 4. Reclamation suggests that R2 should be revised to read, “For each interconnected element on its System, the TO shall, once every 60 calendar moths, technically justify if a fault current has changed more than 10% but does not affect to the Power System coordination, or …” rather than "techincally justify why Fault current does not affect the Protection System coordination." 5. Reclamation requests clarification of the items requiring coordination listed in R3.1. Reclamation believes that the current list implies that any changes in relay equipment or settings would require coordination.

Comments: Since the main purpose of this standard is to assure coordination of BES Interconnected Elements, there should be a provision included to require TOs to provide system fault data to DPs and GOs on a continuous basis so that coordination is performed on BES as well as non-BES elements using the latest data. If complete system fault study files are provided regularly (bi-annually?), projects can be completed using the latest data and not subject to re-evaluation when an update is provided by the TO every 60 months.

Comments: Since the main purpose of this standard is to assure coordination of BES Interconnected Elements, there should be a provision included to require TOs to provide system fault data to DPs and GOs on a continuous basis so that coordination is performed on BES as well as non-BES elements using accurate data. If complete system fault study files are provided regularly (bi-annually?), projects can be completed using the latest data and not subject to re-evaluation when an update is provided by the TO every 60 months. It is critical that fault study data file compatibility exists between the short circuit programs of the different entities.
Yes
None
Yes
None
Yes
None
Comments: Different entities that are highly integrated electrically should be using the same short circuit data. If fault data files could be exchanged regularly (bi-annually?) using compatible file formats, short circuit databases wouldn't drift apart (as would occur after five years) and coordination studies could be performed with more confidence. Many settings could require re-visiting when the once every five year fault current update is received. It should be noted that while the emphasis is on BES Interconnected Elements, many other non-BES Interconnected Elements, such as radial distribution transformers, could be affected resulting in a negative impact on the BES.

Suggest that "the desired sequence" be replaced with "an acceptable sequence" to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in an acceptable sequence during Faults. e.g. the GO and TO may not have the same desires.
Yes
Yes
Yes
Yes

Yes
No
While we agree with the changes made to the applicability section and the measurement section, we believe that it is not necessary to separate "limitations" from "purpose" in the VSL, and recommend that a single Severe VSL be used to cover all of R1 by using the requirement R1 verbiage "…familiar with the purpose and limitations of …". Will compliance be evidenced by training records for individuals, the content of the training, or both? How might the "familiar with limitations" and "familiar with purpose" be separately evaluated in an audit?
(a) The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. (b) Please retain one measure per requirement so that the Measurement numbers match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts. (c) There is no equation found in R2.2. (d) In R3.3, it is not clear when the 30 days starts - is it the 30 days following the change(s)? (e) R3.3 should be limited to Protection Systems associated with Interconnected Elements. (f) 4.2 can hold an entity hostage if the other Interconnected Element owner does not/will not accept/reject the changes.

The expression "the desired sequence" should be replaced with "an acceptable sequence," since the GO and TO may not have the same desires.
Yes
Yes
Yes
No
R4.2 can hold an entity hostage (and possibly non-compliant) if the other Interconnected Element owner does not/will not accept the proposed changes. This requirement is extremely objectionable for entities in deregulated markets, since the “firewall” separating the regulated

and deregulated sides of the business would ordinarily prevent the GO from seeing TO critical infrastructure information. R4.1 speaks of sharing only, “summary results,” but the Application Guidelines calls on p.24 for transmittal of, “power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings.” R4.2 also raises concerns for the situation in which a TO connects to GOs within the same corporate umbrella as well as to GOs that are part of completely separate corporate entities. The TO is legally required to treat all GOs equally, and we would certainly expect this to continue to be the case if PRC-027 is enacted, but suspicions could arise whenever expansion plans of a TO are impeded or overtly vetoed via PRC-027 “reject” decisions by an other-corporate-entity GO and vice-versa. Proposed changes to Interconnection Service Agreements are handled under market rules, and NERC standards should not contain features that might create opportunity for infringing-on or bypassing these rules.
Did you mean PRC-001-3? If so, the response is, “Yes.” We believe however that PRC-001 should be left as-is and PRC-027 should be made an exclusively TO-applicable standard, as explained elsewhere in these comments.
No
a. Did you mean PRC-001-3? b. It is not necessary to separate "limitations" from "purpose" in the VSL, and recommend that a single Severe VSL be used to cover all of R1 by using the requirement R1 verbiage "…familiar with the purpose and limitations of …" PRC-001 moreover should remain as is, with PRC-027 being applicable to GOs under only very limited circumstances, as stated above. c. The word “area” in R1 of PRC-001-3 needs to be defined for compliance to be measured and enforced. The area for GOs should be restricted to the plants they own, if PRC-001 is modified (see other comments).
a. R3.3 should be limited to Protection Systems associated with Interconnected Elements. b. There is no change needed to the present system: -The TOP is provided with detailed information of GO equipment via PRC-001 and MOD-010, and the TO (being informed of these inputs by the TOP) is then at liberty to modify their Protection Systems if needed. - We periodically request data for available fault current at the interconnect point from the TO, for use in our aux system short circuit studies Changes in the T&D system otherwise don’t matter to GOs. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO’s system. The most that could reasonably be asked of independent GOs is to have a valid Interconnection Service Agreement (ISA), since a coordination study is performed by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so detailed evidence could not be asked of the GO. The SDT states on p.21 of PRC-027 that “The drafting team has no evidence there is widespread mis-coordination between Owners of Facilities,” and, “records collected for reliability standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” This appears to indicate that the present system is working and therefore there is no need to go back to existing unit’s coordination studies to make sure they crossed all of the T’s and dotted all of the I’s according to a standard that retroactively

applies requirements that were not in existence at the time of the original coordination studies. c. The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. Please retain one measure per requirement so that the Measurement numbers match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts.

Yes, as long as the standard only requires documentation in cases where there are neighboring owners that need to agree on protection and control. As an owner of multiple functional entities, we believe that the BES would not benefit by an intra-utility documentation process, not when the required due diligence is already performed within our System Protection Engineering group. Our System Protection Engineering group is already responsible for the coordination of all protection, whether generation, transmission, or distribution.
Yes
The modification to a longer time frame is acceptable. However, we do not agree that there is adequate justification for requiring a fault current review every five years. Relay settings that are valid today will remain valid until changes are made at our end of an interconnected element or when another Registered Entity notifies us of change. A technical justification that is valid today will remain valid until changes are made to the BES within our system or a neighboring owner's system.
Yes
Yes
Yes
1) The definition of Protection System Coordination Study should be changed to "A study that documents the intended sequence of operation for clearing faults of an existing or proposed Protection System." The word "demonstrates" implies that live testing should be conducted to prove the sequence of operation. 2) In the Rationale for R1, Part 1.1.2, the following portion should be deleted, "e.g. when a line is protected by dual current differential systems with no backup elements set that are dependent upon fault current." The deleted portion should be

replaced with “Refer to the Application Guidelines for Requirement R2 for examples of protection systems where technical justifications may be used.” 3) Requirement R2 specifies a 10% change in fault current as the trigger for a review of the Protection Coordination. We believe that the only time that a Protection Coordination Study should be required is if the fault current increases by more than 10%. Fault studies are typically conducted with all generation on, but we know that this is not the normal system configuration year round and the system could be operating below the 10% fault current threshold. Unit outages are anticipated and fault detecting elements are set to operate even during outage conditions. Elements that coordinate at higher fault current values will coordinate at reduced values. Our suggested change would not preclude a Registered Entity from initiating a Protection Coordination Study upon the reduction of fault current by 10%.

NSRF’s concern with the proposed definition is related to part B of the definition, on how to prove compliance in case of a vertically- integrated Registered Entity where one department is responsible for performing PSCS and the same Registered Entity is performing multiple functions. Recommend that the measures be updated for both part A and part B or clarity within the RSAW.
No
As currently written, each TO, GO and DP are required to perform a PSCS. This will lead to multiple efforts by each entity. Recommend that GO and DP be removed from this Requirement. Since the TO has access to the hierarchy of systems (Interconnected Elements) they are positioned to request current protection system settings from the GO and DP and then perform a PSCS. They can then request adjustments by the GO and DP in order to assure a more secure system.
Yes
Yes
Yes

Yes
PRC-027-1: The proposed standard contains 30-day and 90-day timing requirements in addition to the 60-month requirement. Please consider revising the 30 calendar day's provision in requirements R2.2.1, R3.2 and R3.3 to 90 calendar days to avoid possible confusion between different timing requirements in the standard. We do not see a basis on why there needs to be different dates. If all dates were 90 days, it would provide consistancy for entities to follow. In consideration that the rationale for Requirement R1 Part 1.1.1 acknowledges that the drafting team has "no evidence there is widespread mis-coordination of Protection Systems associated with Interconnected Elements", LES recommends further development of the standard be halted until sufficient technical justification can be provided for the standard's development. As currently drafted, the drafting team would place excessive documentation requirements on registered entities for activities already being performed as industry best practices. In lieu of turning those best practices into compliance requirements, NSRF suggests the drafting team leverage existing Reliability Standard PRC-001 as a basis for system protection coordination. PRC-001-3: Please consider revising the Purpose of PRC-001-3 to reflect the one remaining requirement. With the updated measure there is an inconsistency between the Purpose, the Requirement, and the Measure. We suggest revising the Purpose to PRC-001, the following: To ensure familiarity with the purpose and limitations of protection systems operated by the entity. Suggest revising Requirement R1 to: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall train its applicable personnel to be familiar with the purpose and limitations of protection systems operated by the entity. The above rewrite now provides a clear and understandable (plus it adds to system reliability) Standard for the applicable entities to follow. The Standard sets a minimum level of training concerning protection systems that entities operate. An entity can always provide training on non-operated protection systems, whereby the entity has determined (based on risk to their system) the scope of training outside the proposed rewrite.

AECI remains unclear as to the intent and effect of PRC-027-1's definition for "Interconnected Element" with respect to clause-b, "the same Registered Entity…" clause. As written, this clause potentially captures all internal BES Elements that electrically joins any internal facilities owned within a Registered Entity that represents multiple functional entity responsibilities. Does clause-b intend to scope additional BES Elements: 1) that electrically join facilities between legally distinct entities within the same Registered Entity (including a JRO) that

represents multiple functional entity responsibilities (Distribution Provider, Generation Owner, or Transmission Owner), or 2) that (even within a JRO) electrically join only functionally distinct facilities within the same Registered Entity that represents different functional entity responsibilities such that internally included Elements join: DP-GO, DP-TO, GO-TO, while internally Excluded Elements join: DP-DP, GO-GO, TO-TO?
Yes
Yes
Yes
Yes
Yes
AECI seeks additional clarify of the SDT's intent as to how base PSCS requirements are to be applied within a JRO, and if R1-R2 serves legitimate reliability function, where R1.1.3, & R3-R4 do not apply to intra-JRO interconnected elements because JROs already internally do these; a JRO would still perform R1.1.3 & R3-R4 for interconnected elements with other registered entities; also clarify that R1 would only require one “master” PSCS for the JRO as opposed to multiple studies for each functional entity within the same JRO.

Our concern with the way the definition is worded relates to how to prove compliance between separate entities as well as entities within a vertically integrated utility. How would a Registered Entity actually show that the proper coordination took place? In some instances it appears that evidence would have to be provided for coordination within the same department of an entity. On the other hand, if separate entities are involved, just what evidence would be required to show adequate coordination? Does this need to be formal documentation indicating all the owners of the interconnecting facility?
Yes
Yes

No
The way the requirement is currently worded, the sending entity could conceivably be found non-compliant if an entity receiving the results does not respond within 90 days. We would suggest incorporating language to clarify that the receiving entity has the obligation to respond within 90 days. This could be accomplished by inserting 'each recipient of the results shall' in the requirement. The requirement would then read "Within 90 calendar days after receipt, or according to an agreed upon schedule, each recipient of the results shall review the summary results of a PSCS…"
Yes
Yes
While we concur with the proposed measure, there does appear to be a mismatch between the requirement and the measure. See our comment in Question 8 below to address this issue.
PRC-027-1 As drafted the standard contains 30-day and 90-day timing requirements in addition to the 60-month requirement. Would the drafting team consider making the 30-day and 90-day requirements the same, for example 90 days? This would make staying abreast of timing issues much simpler. Figure 4, Application Guidelines The Note at the bottom of Figure 4 is misleading in that it states that no PSCS is required under this scenario. However, Transmission Owner R is required to have a PSCS for the Interconnected Element between Breakers A and B. The Distribution Provider S is not required to have a PSCS for Breaker C. PRC-001-3 Purpose The existing purpose does not fit the single requirement that is left in the standard. We would suggest changing the purpose to the following: To ensure familiarity with system protection schemes utilized within an operating entity's area. Requirement R1 Similarly, the requirement does not match the proposed measure. We suggest modifying the requirement to: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall train its applicable personnel to be familiar with the purpose and limitations of protection system schemes applied in its area.

- R1 referring to other requirements with different timelines is very confusing to understand and execute. - R1 (and PRC-027-1 draft 3 in general) also has too many timelines: 90 calendar days, 60 calendar months, 12 calendar months, "agreed upon timeframe", etc. - Requirement R1.1.2 – A 10% change in fault current isn't much in some areas of ATCO Electric's system, perhaps as little as a few hundred amps. This could lead to a burdensome requirement to frequently review the same areas of our system. Ten percent seems fairly restrictive when we typically use safety margins of 40% to 50% in selecting instantaneous overcurrent settings.

No
- R2 referring to other requirements with different timelines is very confusing to understand and execute. - R2 (and PRC-027-1 draft 3 in general) also has too many timelines: 90 calendar days, 60 calendar months, 12 calendar months, "agreed upon timeframe", etc.
Can the drafting team draw all timelines in 4 requirements together in a chart to see how these timelines fit together for an entity?

There still is some concern regarding coordination within a Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). This type of Registered Entity is one organization and the standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one entity. The comments below provide specifics of these concerns. In order to address these concerns it is suggested that the words “separate” and “same” in this definition be capitalized for reference purposes. The definition should be modified as follows: Interconnected Element: A BES Element that electrically joins facilities owned by: a) Separate Registered Entities, or b) the Same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).
No
The revised time frame of 60 months is agreeable, however, requirement 1.2 should not be applicable to any Interconnection Element owners that are part of the “same Registered Entity that represents multiple functional entity responsibilities.” Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the Protection System Coordination Study to provide a copy to “other owners”. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of “Separate Registered Entities and “Same Registered Entities” it is suggested that the wording be modified to incorporate theses terms as follows: R1.2 Within 90 calendar days after the completion of each PSCS, provide to the other Separate Registered Entities that are owner(s) of the Protection System(s) associated with the

Interconnected Element(s), a summary of the results of each PSCS performed pursuant to Requirement R1, Part 1.1, (including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed).
No
The revised time frame of 60 months is agreeable, however, requirement 2.2.1 should not be applicable to any Interconnection Element owners that are part of the “same Registered Entity that represents multiple functional entity responsibilities.” Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the updated Fault current study to provide the updated Fault current values (Iscs) to “each owner” of the Protection System associated with the Interconnected Element. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of “Separate Registered Entities and “Same Registered Entities” it is suggested that the wording be modified to incorporate theses terms as follows: R2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (Iscs) to each Separate Registered Entity that is an owner of the Protection System associated with the Interconnected Element.
No
The response options are agreeable, however, requirement 4 (and any sub-requirements) should not be applicable to any Interconnection Element owners that are part of the “same Registered Entity that represents multiple functional entity responsibilities.” Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the same organization that developed the Protection System Coordination Study to provide a document accepting it or rejecting it. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of “Separate Registered Entities and “Same Registered Entities” it is suggested that the wording be modified to incorporate theses terms as follows: R4. Each Transmission Owner, Generator Owner, and Distribution Provider that is a Separate Registered Entity and each Same Registered Entity (on behalf of its multiple functional entity responsibilities) shall: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a PSCS (per Requirement R1, Part 1.2) and respond to the Registered Entity providing the PSCS: • Accepting the results, or • Rejecting the results and suggesting modifications to resolve any identified coordination issues. 4.2. Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other Separate Registered Entities that are owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the

resolution of any identified coordination issues.
Yes
Yes
Requirement 3 (and any sub-requirements) should not be applicable to any Interconnection Element owners that are part of the “same Registered Entity that represents multiple functional entity responsibilities.” Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the same functionally registered entity that developed the details for proposed changes to provide a documentation of those details to all other functionally registered entities. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of “Separate Registered Entities and “Same Registered Entities” it is suggested that the wording be modified to incorporate theses terms as follows: R3. Each Separate Registered Entity and each Same Registered Entity shall provide to each other Separate Registered Entity connected to the same Interconnected Element: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning] 3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnected Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s). • New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios • Changes to a transmission system Element that alter any sequence or mutual coupling impedance • Changes to generator unit(s) that result in a change in impedance • Changes to the generator step-up transformer(s) that result in a change in impedance 3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule. 3.3. Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

Yes

We feel this is a good compromise to making the applicability the Transmission Planner. In our earlier comments we noted that we feel the drafting team should identify the Transmission Planner to be the entity who performs the studies as this is the function identified for the TP. The drafting team responded by stating they changed the Purpose.
Yes
We would like confirmation that this proposed Standard only requires a study for elements that have been determined to be BES elements. For example, a study would not be required on Elements that connect a radial line serving only load because by definition of BES, there are no BES elements to study.

Comments: The expression "the desired sequence" should be replaced with "an acceptable sequence," since the GO and TO may not have the same desires.
No
Section b) of the definition should be deleted. An “interconnected element” subject to these requirements should not include elements owned/operated by the same registered entity. To minimize the impact of equipment outages under fault conditions, coordination studies are routinely performed by vertically integrated utilities that own and operate facilities that extend from generation plants to distribution pole top transformers. The requirements appear to be intended to insure this same level of coordination is achieved between disparate owner/operators of upstream and downstream facilities. Moreover, as used throughout industry the term interconnected generally refers to electrically contiguous facilities belonging to different operators. After eliminating part b) of the definition, PRC-027 requirements would still apply to vertically integrated registered entities at each point of interconnection with facilities owned/operated by unaffiliated and separately registered entities performing as, e.g., DPs, GO/GOPs, neighboring TOs as appropriate.
No
There is no basis for performing studies every 60-months. Such studies should be performed when necessary based on predetermined criteria set forth in the standard. There is no

evidence of wide spread miscoordination of Protection Systems associated with Interconnected Elements. In fact, none of the recent blackouts resulted from miscoordination of protective settings.
No
See response to question 3 above.
No
90-days is not in all cases the appropriate time period to review such results. The terms and conditions for generator interconnections are regulated by FERC or state PUCs. The proposed reliability standard should clearly state that responsible entities are not obligated to take any actions that are inconsistent with the rights of the parties under any interconnection or similar agreements. Such agreements typically address the procedures for making modifications to a party's facilities that may affect the other party and the required notice and approval rights. The standard should not seek to impose any requirements that are inconsistent with these contractual rights. R4.1 speaks of sharing only, "summary results," but the Application Guidelines on p.24 lists as examples "power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings." We recommend that the above list be preceded with the words "summaries of."
No
Did you mean PRC-001-3? If so, the response is, "Yes."
No
a. Did you mean PRC-001-3? b. The word "area" in R1 of PRC-001-3 needs to be defined for compliance to be measured and enforced. The area for GOs should be restricted to the plants they own, if PRC-001 is modified (see other comments).
a. PRC-027-1, R3.3 should be limited to Protection Systems associated with Interconnected Elements b. There is no clear indication of need to change the present system. The SDT states on p.21 of PRC-027 that "[t]he drafting team has no evidence there is widespread miscoordination between Owners of Facilities," and "records collected for reliability standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations." The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. c. Please retain one measure per requirement so that the Measurement numbers in PRC-027-1 match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts.

SMUD
No
SMUD believes the purpose of this standard should state: “To coordinate Protection Systems for Interconnected Connection to help ensure Protection System components operate as expected for off-nominal conditions. We believe that the coordination is an effort to avoid misoperations a condition that may occur if the purpose statement is not met. We further believe that the coordination should not only cover a Fault condition but other intended operation that the protections scheme would cover, i.e. power swing, out of step tripping/blocking, etc.
No
SMUD believes the Interconnected Element should be defined as those BES elements that electrically join two or more facilities. SMUD disagrees with differentiating ownership as this delineates those requirements based upon ownership causing confusion and an administrative burden for those entities that solely own and coordinate protection components to demonstrate compliance for internal notifications.
No
The revised time frame of 60 months is agreeable, however, requirement 1.2 should not be applicable to any Interconnection Element owners that are one of the same Registered Entity that represents multiple functional entity responsibilities. There are several Registered Entities that have only one person or department within a utility that is responsible for protection system coordination for all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the Protection System Coordination Study to provide a copy to “other owners”. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner.
No
Please see our comments in Question #3; The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner.

David Greene
Yes
Yes
As evident by a note in the rational box for R1 (pg. 6) the drafting team recognizes that vertically integrated entities that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves. To ensure that this intent is retained in the final version of the standard it is suggested that this note or some derivative be placed somewhere in body of the standard such as the definition of Interconnected Element or under the requirements.
Yes
Yes
Yes
Yes
Regarding the applicability to the Generator Operator, the registered function of the Generator Operator could exist as a centralized corporate function as well as a remote function at the generation station. The requirements are probably aimed at the remote function, but if the corporate function embodies an electrical design group that is “familiar” with the protection systems “in their area”, is that sufficient for compliance? The draft includes a description of applicable “Facilities”, but the question still applies.
Yes
The requirement still calls for “familiarity” with the protection systems “in their area”. The extent of “familiarity” comes into question as well as the question of what constitutes “their area”. The newly crafted Measurement attempts to give some detail as to what that means. But if training is the expected means of achieving compliance, why not just require the training? And if training is expected, then the scope of that training should be related to application of a systematic approach to training, not a scope identified by the SDT, or an area arbitrarily selected by the auditors.
Please change Figures 3 and 4 so that “Interconnected Element” is adjacent or points to the line between Breaker C and the point of connection (tap point) on the line between Breakers A and B. It clarifies these examples by having the Figures align with your wording. (The Figures presently imply that the line between Breakers A and B is the “Interconnected Element”.) The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

ReliabilityFirst

No
a. ReliabilityFirst requests clarification on the term “Interconnected Element.” First, is the term “facilities” referring to the NERC Glossary of Terms defined term “Facility”? If so, this term needs to be capitalized. Furthermore, if this is the intent, with a Facility being defined as “a set of electrical equipment that operates as a single Bulk Electric System Element”, there seems to be no need to add the term “BES” to the beginning of the definition. ReliabilityFirst recommends capitalizing the term “facility” and deleting the term “BES” from the definition.
No
a. ReliabilityFirst believes the shift from 48 calendar months to 60 calendar months is an excessive amount of time to allow an entity to perform a Protection System Coordination Study (PSCS). With the effective date of the standard being 12 months beyond the date that it is approved by applicable regulatory authorities, this is essentially giving entities over six years to perform their initial study, for equipment that previously had no study performed. Furthermore, from a reliability perspective, this coordination is most likely already occurring in some capacity, when the interconnection is made, and entities should not require this excessive timeframe to perform the study (i.e., as quoted from the SDT: “…there is no evidence of widespread miscoordination of Protection Systems associated with Interconnected Elements…”). ReliabilityFirst recommends a 24 calendar month implementation timeframe to limit any potential reliability issues as a result of shortcomings in the existing set of Standards.
ReliabilityFirst offers the following comments for consideration: 1) Requirement R1, Part 1.2 - ReliabilityFirst recommends converting the parenthetical last sentence “(including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed)” into four separate and distinct sub-parts. Separating these out will clearly spell out to the applicable entity and compliance auditors the specific items which are required to be provided. Listed below is an example for consideration: 1.2.1 Protection Systems Reviewed 1.2.2 Associated fault currents 1.2.3 Identified issues 1.2.4 Proposed revisions or actions 2) Requirement R2, Part 2.2 - Within both the clean and redline version of the posted draft standard, the equation referenced at the end of Requirement R2, Part 2.2 is inadvertently missing and therefore needs to be added back into the requirement.

CenterPoint Energy
The draft for PRC-027-1 states: “records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” CenterPoint Energy considers the proposed requirements to be too prescriptive for Protection System coordination when it has not been identified as a reliability issue and expects such requirements would provide little, if any, reliability benefits. We believe the majority of existing Interconnected Facilities have time-proven and fault-proven Protection System set points and that newer facilities, including replacement relay panels, are commissioned utilizing appropriate coordination studies that include necessary interaction between interconnected entities. CenterPoint Energy recommends reevaluating the need for this standard with

consideration that this subject area could instead be addressed by continuing to focus on misoperation analysis and through best practices initiatives.

Suggest removing the word ‘components.’ A Protection System operates together. If the SDT elects to retain the word ‘components,’ clarification of the intent of this word in this context is requested.
No
There is some concern about the language in part b of the proposed definition of an Interconnected Element. In some cases, a Registered Entity may have one engineering group that is responsible for all Protection Systems, regardless of registered function. Part b of the proposed definition seems to suggest that documented PSCSs, including coordination activities, could be required by proposed PRC-027-1 even if the same engineering group is responsible for all Protection Systems associated with the Interconnected Element. A distinction should be drawn between a Registered Entity in which one engineering group is responsible for Protection Systems associated with its DP, GO, and TO functions, as applicable, and another Registered Entity in which a different engineering group is responsible for Protection Systems associated with its DP vs. GO vs. TO functions, as applicable.
Yes
Yes
Yes
Should the Flowchart be updated to reflect the course of action if an entity rejects the results and suggests modifications to resolve any identified coordination issues?
No
The level of detail in the Applicability section appears to be inconsistent with the language in M1 “…training in basic relaying…” For this reason, it is recommended not to include the ‘Facilities’ portion.
Yes
Tacoma Power appreciates the efforts of the SDT. This is a difficult process and topic on which to standardize. It would help, especially for the Flowchart, if R1.1.3 could be separated into a revised R1.1.3 “according to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1; or technically justify why such a study is not required” and a new R1.1.4 “within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a

study is not required." In R3.1, the language "or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s)" appears to be very open-ended with respect to the second, third, and fourth bullets under R3.1. In theory, any impedance change within an entity's system could qualify, which brings into question potential overlap between R2 to address incremental changes and R3.1. R3.1 should establish a brighter line for what triggers an entity to begin coordination activities for proposed impedance changes not at an existing or new Facility associated with the Interconnected Element. In other words, at what point is an impedance change considered an incremental change and, therefore, applicable to R2, as opposed to R3.1? In the Flowchart, the arrows are confusing above the decision diamond "(R1.1.3) Is a new PSCS required?" Referring to M2, M5, M7, and M8, is any confirmation of receipt required in order to demonstrate that a responsible entity 'provided' the information? It is recommended that evidence of receipt not be required to demonstrate that an entity 'provided' information applicable to these measurements. Referring to the Application Guidelines, Figure 5 and associated discussion, the introductory paragraph statement "in Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be check for coordination with Generator Owner T" appears to contradict the discussion on page 39 of 40 of the redlined copy of PRC-27-1.

Since there are no guidelines on who "applicable personnel" are, and there are no guidelines on what type of training is required and how often, this measure serves little purpose should be removed. Measures and VSLs are overly complex and will be difficult to effectively track as written.
1) PRC-027-1 R3.2 has a deadline based on the date of receiving a request. There should more

details regarding what constitutes receiving a request. If informal channels are used, there may be disagreement about whether the 30 day deadline was met. The complexity of this standard becomes all the more evident when looking at ways to implement and track all the measures. For many of the measures, the only practical way to capture time frames is to tie communications with an interconnected entity to a task within an established schedule. Communications with interconnected entities will likely need to become more limited and formal to become more trackable. Bringing tractability to emails and other communications for evidence will be a significant issue, with the need to capture communications of out-side resources performing studies as well as the use of secure email requiring tedious offloading or screen captures of communications from secure servers. It would be recommended that acceptable evidence demonstrating the time frames should allow for documented processes along with activity schedules providing start and completion dates. More detailed evidence should be signed and verified studies, which indicate that validated models and remote settings have been utilized in the analysis. Here are our specific recommendations by requirement and measure: a) Requirement R1- R1.1.3- It would be recommended to be consistent with the time frame as specified in 1.1.2 and change the specified calendar months to read “or within 12 calendar months of being notified of a change as described in Requirement R3, Part 3.3.” M1, M2 - Acceptable evidence demonstrating time frames should allow for documented processes along with activity schedules providing start and completion dates. (VSL) Violation Security Levels- Each security level should provide consistent time frames to avoid confusion in tracking. b) Requirement R2 – R2.2- Allowance should be made to allow for tracking of fault level trends at the bus based on a 10% change in fault level for the year of the coordination study. M5 - Acceptable evidence demonstrating time frames should allow for documented processes along with activity schedules providing start and completion dates. (VSL) Violation Security Levels- Each security level should provide consistent time frames to avoid confusion in tracking. c) Requirement R3 – M7 – A data request should indicate that it is being made per requirement R3 of PRC-027 to be measured under M7. M6, M7, M8- Acceptable evidence demonstrating time frames should allow for documented processes along with activity schedules providing start and completion dates. d) Requirement R4— R4- Study submittals should be required to stipulate that the study is being submitted per requirement R4 of PRC-027 to be measured under M9. M9, M10- Acceptable evidence demonstrating that the time frames have been met should allow for documented processes along with activity schedules providing start and completion dates. 2) 4.2.1 Applicability: For Generator Owners, many elements that are covered under the PRC-019, PRC-024 and PRC-025 (and future Phase 3 Loadability Standards) also fall under the Facilities Section of this draft of PRC-027-1, as the functions exist for the sole purpose of allowing coordination for faults to clear external to the generator. The elements covered by other standards should be excluded from applicability, in order to avoid a double jeopardy situation. Instead, we recommend that a list of applicable elements be identified. Typical functions are identified below. We believe these to be the only functions applicable to the standard as far as a GO is concerned. - Ground Time Overcurrent Relay – (Directional Towards the System) (51G) - Neutral Time Overcurrent Relay – (Directional Towards the System) (51N) - Ground Directional Time Overcurrent Relay – Directional Toward Transmission System (67G) - Negative Phase Sequence Overcurrent (46) In addition, please

consider adding a list of excluded elements, such as these: - Phase Distance (21) (Covered under PRC-025) - Volts/Hz (24) (Covered under PRC-024) - Undervoltage (27) (Covered under PRC-024) - Reverse Power (32) (Not applicable to standards as it is protection for the generator) - Loss of Field (40) (Covered under PRC-019) - Inadvertent Energization (50/27) (Not applicable to standards as it is protection for the generator) - Breaker Failure (50BF) (Not applicable to standards as it is protection for the generator) - Phase Time Overcurrent Relay (51) (Covered under PRC-025) - Phase Time Overcurrent Relay – Voltage-Restrained (51V-R) (Covered under PRC-025) - Phase Time Overcurrent Relay – Voltage Controlled (51V-C) (Covered under PRC-025) - Overvoltage (59) (Covered under PRC-024) - Field Overvoltage (59E) (Covered under PRC-019) - Stator Ground (59GN/27TH/64S) (Not applicable to standards as it is protection for the generator) - Field Ground (64F) (Not applicable to standards as it is protection for the generator) - Phase Directional Time Overcurrent Relay – Directional Toward Transmission System (67) (Covered under PRC-025) - Field Overcurrent (76E) (Covered under PRC-019) - Out of Step (78) (Covered under Future Phase 3 Loadability Standards) - Frequency (81) (Covered under PRC-024) - Differential (87) (Not applicable to standards as it is protection for the unit) Alternatively, perhaps a table listing excluded elements could be added to the back of the standard, and referenced in the 4.2.1 Applicability section. Here is an example of what 4.2.1 might look like: “4.2.1 Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements with the exclusion of the elements listed in table XXX. “ 3) Regarding R2 M3 - Our technical justification to exempt the above excluded elements is: a) duplication in applicability to other standards, and b) the type of fault. Mandating technical justification beyond these two points puts an unnecessary burden on industry resources.

Illinois Municipal Electric Agency (IMEA)supports comments under Question 8 submitted by the SERC EC Protection and Control Subcommittee. Also,IMEA requests that Figure 3 be modified or a separate figure be included to clarify guidelines for DP systems that include only non-BES generation. IMEA also requests that Applicability Section 4.2.1 be revised to prevent inconsistency with the FERC-approved interpretation of transmission Protection System as specified in PRC-005-1b. Very specific attention/consideration needs to be given to avoiding unnecessary expansion of applicability to facilities owned by small Distribution Providers; i.e., unnecesarry expansion of scope to protective devices owned by a DP that have no potential adverse impact on the BES. Both FERC and NERC have stated the need to minimize impacts on small entity resources.
Individual
Bret Galbraith
Seminole Electric Cooperative Inc.
(1) In proposed PRC-027-1 R2, Seminole believes that the Reliability Coordinator (RC) should have the responsibility of performing any studies or analyses and the distribution of those studies/analyses required under R2 instead of the Transmission Owner (TO). In peninsular Florida, the RC has access to the data needed for the analyses and having a single entity perform the analyses and distribution will assure uniformity across the region. (2) In proposed PRC-027-1 R2-2.2.1., Seminole believes the 10% threshold for fault current is too low, as this percent change occurs daily. Seminole recommends the 10% threshold value be increased to 20% for fault current. (3) In proposed PRC-027-1 R2, is the 10% change in fault current study

based on the individual TO's system contribution as an island at the interconnection bus, or does it include all other interconnection that border the TO's system that could provide fault current, i.e., how many buses out from the TO's other interconnections does the study require for determining available fault current? (4) In proposed PRC-027-1 R2, Seminole believes that the requirements and guidelines for the Protection System Coordination Study (PSCS) need to be more specific and give additional detailed methodology. (5) In proposed PRC-027-1 R3-3.1, it should be noted that current and voltage ratio changes do not necessarily indicate a change in the protection system if the protective relay set points are adjusted accordingly. Therefore, R3-3.1 should be revised to reflect that certain ratio changes do not require notification.

Consideration of Comments

Project 2007-06 System Protection Coordination
PRC-027-1

The Project 2007-06 Drafting Team thanks all commenters who submitted comments on the PRC-027-1 standard for System Protection Coordination. The standard was posted for a 30-day formal comment period from June 4, 2013 through July 3, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 67 sets of responses, including comments from approximately 196 different people from approximately 130 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Summary Consideration of all Comments Received

PRC-027-1

Definitions:

Interconnecting Element:

Based on comments, the drafting team made two minor changes to the previous term "Interconnected Element". First, the term was changed to "Interconnecting Element", and secondly the words "owned by" were moved to the beginning of both parts (a) and (b). The new definition is:

"Interconnecting Element"

A Bulk Electric System (BES) Element that electrically joins Facilities:

a) owned by separate Registered Entities, or

b) owned by the same Registered Entity that represents multiple functional entity responsibilities

(Transmission Owner, Generator Owner, or Distribution Provider)

Protection System Coordination Study:

Based on comments, the drafting team made two minor changes to the definition of "Protection System Coordination Study". First, "that demonstrates" was replaced with "documenting that," and secondly the word "desired" was replaced with "intended." The new definition is:

"Protection System Coordination Study"

A study documenting that existing or proposed Protection Systems operate in the intended sequence for clearing Faults.

Purpose:

Commenters suggested several minor modifications to the Purpose statement. Based on discussions related to these suggestions, the drafting team revised the Purpose to read:

"To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults."

Applicability:

To emphasize the fact that a subset of Applicability section 4.1.3 "Distribution Provider" would be applicable to this standard, the drafting team added the parenthetical phrase "(that own Protection Systems identified in the Facilities section 4.2 below)"

Based on comments, the drafting team removed section 4.2.1 from section 4.2 Facilities for clarity. It now states:

Protection Systems:

a) installed for the purpose of detecting Faults on Interconnecting Elements, and

b) that require coordination for isolating those faulted Elements

Background:

General revisions were made to provide clarity and remove duplicitous information.

Based on feedback from NERC legal staff, the "Other Aspects of Coordination of Protection Systems Addressed by Other Projects" section was moved from the Background section to the Roadmap section.

Requirements and Rationale boxes:

Based on the change to the term "Interconnecting Element" and some clarifying language suggested by stakeholders, minor revisions were made to each requirement and the corresponding Rationale boxes. Also based on stakeholder comments, an additional requirement (R5) was added for clarity.

Requirement R1:

Based on stakeholder comments, the drafting team separated Requirement R1.1, Part 1.1.3 because of the referenced requirements and the associated time frames. Requirement R1.1, Part 1.1.3 now references only Requirement R3, Part 3.1; and reads:

"According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or technically justify why such a study is not required."

New Requirement R1.1, Part 1.1.4 now references only Requirement R3, Part 3.3; and reads:

"Within six calendar months of being notified of a change as described in Requirement R3, Part 3.3, or technically justify why such a study is not required."

Requirement R2:

The drafting team removed the provision that the Transmission Owner could provide a technical justification for not conducting the 60 month Fault current review because of the reliability benefit associated with providing updated Fault current information to the other Protection System owners for model validation and ultimately proper coordination.

Requirement R3:

Based on stakeholder comments, the drafting team inserted the word "permanent" and made minor clarifying edits to Requirement R3, Part 3.3; it now reads:

"Within 30 calendar days of making the change, details of permanent changes made to Protection Systems associated with the Interconnecting Element during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."

Requirement R4:

Based on stakeholder comments, the drafting team separated Requirement R4 into two requirements. The modified Requirement R4 mandates that owners, who receive either a summary of the results of a Protection System Coordination Study (PSCS) or a technical justification, review and respond to the sender, acknowledging the review and noting whether or not any coordination issues were identified. Requirement R4 retains the “90 calendar days” or “agreed-upon schedule” time frames for performing the reviews.

Requirement R5:

The new Requirement R5 mandates that any identified coordination issues be addressed prior to the implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element.

Measures:

Measure M3 was eliminated because the option of providing a technical justification for not performing a short circuit study was removed.

The other measures were renumbered and/or modified to be consistent with the revised requirements.

Evidence Retention:

The drafting team modified the language for consistency.

VSLs:

The drafting team modified the VSLs for consistency with the revised requirements.

Guidelines and Technical Basis:

Complementary changes were made to the Guidelines and Technical Basis corresponding to all changes to the standard.

The drafting team updated the process flow chart to align with the revised requirements and made minor edits to the Example Process.

In the introductory section for the Diagrams, the drafting team included an additional note for clarity.

Based on comments, the Figures and associated descriptions were modified to provide more clarity.

The drafting team revised the description associated with Figure 4 to clarify that it depicts an example of a configuration that is not applicable to this standard because the Distribution Provider does not have a Protection System installed for the purpose of detecting Faults on BES Elements.

Unresolved Minority Views:

A few commenters continue to suggest that there is no need for this standard because there is no evidence that suggests there is a lack of Protection System coordination. The drafting team responded that the standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.

Some commenters disagree with part "b" in the proposed definition of Interconnecting Element that reads: A BES Element that electrically joins Facilities owned by the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner) because of compliance concerns, primarily for vertically integrated utilities. However, the drafting team contends part "b" is necessary because in some vertically integrated utilities, coordination related to different functional entities may not be performed by the same protection group. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."

Some commenters disagree with the various time frames associated the requirements. The drafting team responded that the specified time frames are relevant and appropriate for each of the requirements, and also reminded the commenters that the process flow chart in the Guidelines and Technical Basis section of the standard illustrates the relationship between the requirements.

A few commenters continue to suggest that Generator Owners (GO) should be excluded from performing a Protection System Coordination Study (PSCS) after being notified by the Transmission Owner of a 10% or greater change in Fault current at an interconnecting bus. The drafting team responded that a GO could provide a technical justification explaining why changes in bus Fault current do not affect its coordination rather than performing a Protection System Coordination Study (PSCS), and that a previous technical justification could be reused provided it is still valid.

A few commenters continue to disagree with the 10% deviation trigger in Requirement R2. The threshold of 10% was selected based on the experience of drafting team members, discussions with members of various regional protection and control committees, and the recognition that there are margins of error in models and in protection system accuracies. The drafting team contends that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. No change was made to the standard.

A few commenters continue to suggest that mutual agreement on Protection System settings between owners will sometimes not be achieved and have compliance concerns associated this fact. The drafting team revised Requirement R4 replacing the language that specified either "accepting" or "rejecting" the summary results of a PSCS with confirming that the summary of results or the technical justification were reviewed and whether or not any identified coordination issues were noted. Requirement R5 mandates that any identified coordination issues must be addressed prior to implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element.

PRC-001-3

The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027 in June of 2013 for comment and ballot. As part of the Draft 3 posting, the SPCSDT recommended retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults. In preparing the initial posting package for Draft 4 of PRC-027-1, the SPCSDT noted that the retirement of the remaining Requirement R1 would be coordinated through the Project 2010-01 Training project. After NERC staff review, it was determined that the retirement of PRC-001-2 Requirement R1 was outside the scope of the SAR of either project. Because Requirement R1 of PRC-001-2 will not be retired in either current project, a modified version of PRC-001-3 reflecting the retirement of Requirements R2 and R3 is currently posted for stakeholder review. The modified Reliability Standard also reflects updates to the “Effective Dates” as well as Section “D. Compliance” to reflect current ERO language. Requirement R1 will remain unchanged. NERC standards staff is currently reviewing how to address the recommendations of the Independent Experts Review Panel to consolidate training requirements, including R1 of PRC-001-2, and industry concerns with Requirement R1. The ballot of PRC-001-3 is associated with the approval of PRC-027-1 and the implementation plan for this project.

Effective Date:

Updated to reflect current ERO language

Requirement R1:

Unchanged

Requirement R2:

Retired

Requirement R3:

Retired

Measure M1:

Eliminated

Compliance Enforcement Authority:

Updated to reflect current ERO language

Evidence Retention:

Updated to reflect current ERO language

VSLs:

Eliminated VSLs for Requirements R2 and R3

Index to Questions, Comments, and Responses

1. Based on stakeholder comments, the drafting team modified the Purpose of this standard to: "To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults." Do you agree with this Purpose? If not, please provide specific suggestions for improvement in the comment area. 20

2. The drafting team modified the proposed definition of Interconnected Element to read as follows: Interconnected Element: A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that repesents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). Do you agree with the revised definition? If not please provide specific suggestions for improvement in the comment area. 31

3. In Requirement R1, the drafting team modified the time frame to allow entities 60 months to have a documented Protection System Coordination Study (PSCS) completed for each Interconnected Element if no PSCS exists. Note, the drafting team has allowed inclusion of all previously performed PSCS whose summary of results include, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. Do you agree with this revised time frame? If not, please provide specific suggestions for change in the comment area. 49

4. In Requirement R2, the drafting team modified the time frame to 60 months for either conducting a Fault current review or provide a technical justification as to why a Fault current review is not necessary. Do you agree with this revision to Requirement 2? If not, please provide specific suggestions for improvement in the comment area. 59

5. In Requirement R4, the drafting team has clarified the expectation of what a response to a review of the summary results of a Protection System Coordination Study should include. The options are as follows: • Accepting the results, or • Rejecting the results and suggesting modifications to resolve any identified coordination issues. Do you agree with this revision to Requirement R4? If not, please provide specific suggestions for improvement in the comment area. 67

6. The drafting team revised the Applicability section of PRC-001-2 to clarify which Protection Systems are applicable to Requirement R1. (The "Facilities" portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.) Do you agree with this revision to the Applicability? If not, please provide specific suggestions for improvement in the comment area. 80

7. The drafting team provided a measure to accompany Requirement R1 of PRC-001-2. (The language in the measure was modeled after the existing language in the RSAW for PRC-001-2.) Do you agree with this measure? If not, please provide specific suggestions for improvement in the comment area. 89

8. If you have any other comments that you haven't already provided in response to the above questions, please provide them here. 98

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **Based on stakeholder comments, the drafting team modified the Purpose of this standard to: “To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.” Do you agree with this Purpose? If not, please provide specific suggestions for improvement in the comment area.**

Summary Consideration:

Several commenters suggested changes to the Purpose statement. Among them were: change “desired” to “acceptable”, remove the words “coordinate” and “components”, change “coordinate” to “ensure”, add “to clear faults” to the end of the statement, and add “time delayed” before Protection Systems. Based on discussions related to these suggestions, the drafting team revised the Purpose as follows: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.”

One commenter suggested changing the title of the standard to “Protection System Coordination for Interconnected Elements”. The drafting team did not make the suggested change. The drafting team contends that the title of the standard should remain “Protection System Coordination for Performance During Faults.” The Purpose and Applicability effectively limit the scope of the standard.

Several commenters referenced PRC-001 rather than the Purpose statement of PRC-027. The drafting team referred them to the response for questions #6 and #7 regarding PRC-001.

Organization	Yes or No	Question 1 Comment
Public Service Enterprise Group	No	As a Results-Based Standard, ?coordinate? should be removed from the Purpose. We suggest that the Purpose should be ?To ensure that Protection Systems involving Interconnected Elements operate in the desired sequence during Faults.?
Response: Thank you for your comment. The drafting team contends that “coordinate” is a necessary part of the Purpose for this Results-Based Standard. The last clause of the Purpose (“such that Protection System components operate in the desired sequence during Faults”) is meant to help define “coordinate” when applied to Protection Systems for Interconnecting Elements. Based on overall stakeholder comments, the Purpose statement was modified to: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System		

Organization	Yes or No	Question 1 Comment
components operate in the intended sequence during Faults.”		
Wisconsin Electric Power Company	No	Change "in the desired sequence" to "in an acceptable sequence". This better reflects the compromises that may be required by the different entities owning protection systems on an Interconnected Element.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.”		
Exelon and its Affiliates	No	ComEd believes that the definition should be revised to read ?To coordinate time-delayed Protection Systems for Interconnected Elements, such that Protection System components operate in the desired sequence during Faults.?
Response: Thank you for your comment. Coordination includes consideration of more than time-delayed elements, e.g. relay reaches and sensitivities of relay pickups. Based on overall stakeholder comments, the Purpose statement was modified to: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.”		
DTE Electric	No	Comments: Since the main purpose of this standard is to assure coordination of BES Interconnected Elements, there should be a provision included to require TOs to provide system fault data to DPs and GOs on a continuous basis so that coordination is performed on BES as well as non-BES elements using the latest data. If complete system fault study files are provided regularly (bi-annually?), projects can be completed using the latest data and not subject to re-evaluation when an update is provided by the TO every 60 months.
Response: Thank you for your comment. The drafting team does not agree that more frequent exchanges should be required by the standard. It is noted that each interconnected owner has the ability to request information at any time as part of Requirement R3, Part 3.2. The standard does not prohibit an owner from performing more frequent reviews.		

Organization	Yes or No	Question 1 Comment
LG&E and KU Services	No	Comments: The expression "the desired sequence" should be replaced with "an acceptable sequence," since the GO and TO may not have the same desires.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the <u>intended</u> sequence during Faults.”		
Florida Municipal Power	No	FMPA continues to believe the greater purpose is to ensure faults are cleared within their critical clearing times and that such consideration is greater than operating within the desired sequence. The same comment would apply to the definition of Protection System Coordination Study.
Response: Thank you for your comment. The drafting team contends the initial Protection System design and settings take into account the critical clearing times; and that operating within the intended sequence, as stated in both the Purpose and the definition of Protection System Coordination Study, ensures that Faults are cleared within their critical clearing times.		
Flathead Electric Cooperative, Inc.	No	In our area, there do not appear to be any issues with lack of protection system coordination and I am unsure if there is really a need for this standard. Their appear to be adequate protection systems standards noted in the "Other Aspects of Coordination of Protection Systems Addressed by Other Projects" section.
Response: Thank you for your comment. The standard is necessary to codify the roles and responsibilities of the interconnected owners to achieve coordination of Protection Systems that affect the reliability of the BES.		
ISO RTO Council Standards Review Committee	No	It seems like the scope of the standard as stated in the purpose statement can be misunderstood. Later in the proposed standard, the purpose is narrowed:?Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1.?The SDT should consider revising the purpose to reflect the scope of this standard, e,g. ?,,,operate in the desired sequence to CLEAR faults.?

Organization	Yes or No	Question 1 Comment
		PRC-001 issues; a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. This is a training requirement and as such, it should be transferred to the appropriate PER standards. The SRC supports the project for removing this requirement and moved into the PER standards..Providing training evidence does not demonstrate that the (operating personnel of) responsible entities are ?familiar with? the purpose and limitations of protection system schemes applied in its area. c. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. In response to comment submitted by some commenters, the SDT indicates that it ??recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.? We do not agree with this recommendation and hold the view that adding the issue to the NERC Issue Data Base is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT should propose a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee?s advice/direction for appropriate actions. We do not believe that the SDT or staff has brought this to the Standards Committee?s attention. Note that the Standards Committee is responsible for managing the standards development process and as such, can make an informed decision to either request the SDT to

Organization	Yes or No	Question 1 Comment
		expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel. Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. We urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.]

Response: Thank you for your comments.

a) The drafting team contends the Purpose statement is clear. The title of the standard "Protection System Coordination for Performance During Faults" explains the scope of the standard. Consequently, the inclusion of "to clear faults" in the Purpose is unnecessary.

b and c) PRC-001 issues:

In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.

Organization	Yes or No	Question 1 Comment
SMUD	No	SMUD believes the purpose of this standard should state: ?To coordinate Protection Systems for Interconnected Connection to help ensure Protection

Organization	Yes or No	Question 1 Comment
		System components operate as expected for off-nominal conditions. We believe that the coordination is an effort to avoid misoperations a condition that may occur if the purpose statement is not met. We further believe that the coordination should not only cover a Fault condition but other intended operation that the protections scheme would cover, i.e. power swing, out of step tripping/blocking, etc.
Response: Thank you for your comment. The purpose of this standard is not to ensure Protection System components operate as expected for all off-nominal conditions. Protection System performance during Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. As stated in the Background section of this standard, Protection System responses to power swings, out of step tripping/blocking, etc. are being addressed in other NERC projects.		
City of Tacoma	No	Suggest removing the word ?components.? A Protection System operates together. If the SDT elects to retain the word ?components,? clarification of the intent of this word in this context is requested.
Response: Thank you for your comment. The NERC Glossary of Terms lists five types of Protection System components which must operate together to achieve the intended sequence during Faults. The word “components” was used in the Purpose because protective relays and their settings are not the only aspects of Protection Systems that can impact coordination.		
Southern Company	No	Suggest that "the desired sequence" be replaced with "an acceptable sequence" to read: To coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in an acceptable sequence during Faults. e.g. the GO and TO may not have the same desires.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.”		

Organization	Yes or No	Question 1 Comment
NextEra Energy	No	The end of the sentence should read: . . . . desired sequence and time during Faults.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: "To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults." The drafting team contends that intended sequence includes timing; therefore, adding "and time" to the Purpose would be redundant.		
Essential Power, LLC	No	The expression "the desired sequence" should be replaced with "an acceptable sequence," since the GO and TO may not have the same desires.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: "To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults."		
Northeast Power Coordinating Council	No	The wording is redundant. Coordinating Protection Systems mean operating in the desired sequence during faults. The Purpose should just read ?To coordinate Protection Systems for Interconnected Elements?.
Response: Thank you for your comment. The title of the standard "Protection System Coordination for Performance During Faults" explains the scope of the standard. The last clause of the Purpose "such that Protection System components operate in the intended sequence during Faults" supports the standard's title.		
Texas Reliability Entity	No	We suggest re-wording the second half of the purpose to say ?such that Protection System components operate in the desired sequence to properly isolate Faults?.
Response: Thank you for your comment. Based on overall stakeholder comments, the Purpose statement was modified to: "To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults." The drafting team contends operating in the intended sequence during Faults includes the idea of properly isolating Faults.		

Organization	Yes or No	Question 1 Comment
Ameren	Yes	(1) Ameren supports the SERC Protection & Control Subcommittee comments and hereby includes them by reference rather than repeating them all.
Response: Thank you for your comment. Please see the response to the (SERC RRO) comments submitted by the SERC Protection & Control Subcommittee.		
Dominion	Yes	1) The SPC standard drafting team created this result-based standard specifically directed toward Interconnected Facility applications by stating in the current draft that ?PRC027-1, with the stated pupose ?to coordinate Protection Systems for Interconnected Elements?.? . Also in Draft#3 the purpose now places emphasis on ?desired operating sequence? versus Element isolation. To align with this purpose, as previously suggested, we recommend that the title of this standard reflect the revised purpose and be renamed ?Protection System Coordination for Interconnected Elements?.
Response: Thank you for your comment. The drafting team contends the Purpose statement is clear. The title of the standard "Protection System Coordination for Performance During Faults" explains the scope of the standard. The Purpose statement supports the standard's title.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration (?ICLP?)agrees that the updated purpose statement is more appropriate for a BES Reliability Standard. The previous version sought to minimize the faulted elements ? which is a desirable goal in most cases, but may not be the highest priority where multiple interconnected entities are concerned. (Otherwise, the ironic result could be that local service is preserved at the expense of the wider-area system.) The intended Protection System design should predominate, as it will account for any such circumstances.
Response: Thank you for your support.		
Bureau of Reclamation	Yes	Reclamation appreciates and agrees with the drafting team?s clarification of the Purpose section. Reclamation agrees with the drafting team that it is more

Organization	Yes or No	Question 1 Comment
		important for Protection System components to ?operate in the desired sequence during Faults? than to have ?the least number of power system Elements? isolated to clear Faults as previously stated in Draft 2 of the Purpose section.
Response: Thank you for your support.		
Independent Electricity System Operator	Yes	We agree with the revised purpose statement, but reiterate our previous suggestion to add ?settings? after protection system (with the ?s? removed?) to make it clear that it is the coordination of the settings, not the design of protection systems. The SDT?s response to our previous comment indicates that: ??settings? are not the only aspect of Protection Systems that can impact the stated purpose.? We are unable to come up with any specific examples of what other parameters or actions associated with the Protection System of an Interconnection Element that would require coordination to ensure ?Protection System components operate in the desired sequence during Faults?. Please elaborate, or revise the purpose statement accordingly.
Response: Thank you for your comment. The coordination of settings is important to achieving the Purpose of the standard. However, the coordination of settings is not the only aspect of Protection Systems that can impact the ability to achieve the Purpose "to operate in the intended sequence during Faults." Notification of replacement with different types of protective relays, modification of protective relays, changes in communication systems, current transformer ratios and voltage transformer ratios are examples of Protection System information required to achieve coordination.		
Cooper Compliance Corp	Yes	We feel this is a good compromise to making the applicability the Transmission Planner. In our earlier comments we noted that we feel the drafting team should identify the Transmission Planner to be the entity who performs the studies as this is the function identified for the TP. The drafting team responded by stating they changed the Purpose.
Response: Thank you for your support.

2. **The drafting team modified the proposed definition of Interconnected Element to read as follows: Interconnecting Element: A BES Element that electrically joins facilities owned by: a) separate Registered Entities, or b) the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). Do you agree with the revised definition? If not please provide specific suggestions for improvement in the comment area.**

Summary Consideration:

Based on comments, the drafting team made two minor changes to the previous term "Interconnected Element". First, the term was changed to "Interconnecting Element", and secondly the words "owned by" were moved to the beginning of both parts (a) and (b).

The new definition is:

Interconnecting Element:
A Bulk Electric System (BES) Element that electrically joins Facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities
(Transmission Owner, Generator Owner, or Distribution Provider).

Numerous commenters had concerns regarding part "b" of the definition of Interconnecting Element. The drafting team wants to clarify that the intent of this standard is to promote the coordination of Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults. The drafting team is not trying to be prescriptive how the coordination process is achieved regardless of the organizational structure of the applicable Registered Entity. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."

Organization	Yes or No	Question 2 Comment
Nebraska Public Power District	No	Will there be an expectation that each entity involved with interconnected elements or facilities be pre-identified in any other documentation other than perhaps in each PSCS?

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. There is no requirement for pre-identification; however, it would be a reasonable expectation that an applicable entity would identify the Interconnecting Elements on its system.		
Dynegy	No	?Please provide more examples of interconnected elements, especially for a merchant generator. It?s not clear if the protection system study should address protection systems for just the generator breaker or also the generator step up transformer, unit auxiliary transformer, or the generator itself. Perhaps this information belongs in the Application Guideline.
Response: Thank you for your comment. Please see Figures #2 and #5 in the standard for examples of generator interconnections. Note that Figure #2 covers the large majority of generator interconnections. The Protection Systems included in the Applicability section of this standard are: Protection Systems: a) installed for the purpose of detecting Faults on Interconnecting Elements, and; b) that require coordination for isolating those faulted Elements.		
Bonneville Power Administration	No	1. In this new term, the use of ?interconnected? implies that the element is connected by another element, which is not what is intended. A more appropriate word would be ?interconnecting? as this indicates that this is the element that connects other elements. 2. The definition as written does not make sense because there is typically not an element that electrically joins facilities owned by separate registered entities. Instead, where the point of interconnection between separate registered entities is made, one entity will own the element on one side of the point of interconnection and the other entity will own the element on the other side of the point of interconnection. The change of ownership is made at a point, not through a commonly-owned element. Since all elements are owned by one entity or the other, there is no element that electrically joins the elements owned by the two entities and nothing that meets the definition provided for an Interconnected Element.3. Part B of the definition does not indicate which element is the Interconnected

Organization	Yes or No	Question 2 Comment
		Element in a system where the same registered entity represents multiple functions. Does this allow the entity to choose which element is considered to be the Interconnected Element? For example, if an entity is both a generator owner and transmission owner they will own all elements from the generator to and including the transmission system, with no change of ownership. There is no clear point where the generator function stops and the transmission function begins. Which element will be considered to be the Interconnected Element and required to comply with this standard?
Response: Thank you for your comment. 1. The drafting team agrees and accepts your suggestion; the term is now "Interconnecting Element" 2. The Interconnecting Element is the Bulk Electric System (BES) Element being protected by the Protection Systems requiring coordination. Please reference the figures in the Guidelines and Technical Basis section of the standard for various examples of Interconnecting Elements.		
ReliabilityFirst	No	ReliabilityFirst requests clarification on the term ?Interconnected Element.? First, is the term ?facilities? referring to the NERC Glossary of Terms defined term ?Facility?? If so, this term needs to be capitalized. Furthermore, if this is the intent, with a Facility being defined as ?a set of electrical equipment that operates as a single Bulk Electric System Element?, there seems to be no need to add the term ?BES? to the beginning of the definition. a. ReliabilityFirst recommends capitalizing the term ?facility? and b. deleting the term ?BES? from the definition.
Response: Thank you for your comment. a. The drafting team agrees and accepts your suggestion of capitalizing "Facility". b. The drafting team contends the inclusion of BES in the definition is appropriate for emphasis.		
Associated Electric Cooperative,	No	AECI remains unclear as to the intent and effect of PRC-027-1?s definition for

Organization	Yes or No	Question 2 Comment
Inc.		?Interconnected Element? with respect to clause-b, ?the same Registered Entity?? clause. As written, this clause potentially captures all internal BES Elements that electrically joins any internal facilities owned within a Registered Entity that represents multiple functional entity responsibilities. Does clause-b intend to scope additional BES Elements: 1) that electrically join facilities between legally distinct entities within the same Registered Entity (including a JRO) that represents multiple functional entity responsibilities (Distribution Provider, Generation Owner, or Transmission Owner), or 2) that (even within a JRO) electrically join only functionally distinct facilities within the same Registered Entity that represents different functional entity responsibilities such that internally included Elements join: DP-GO, DP-TO, GO-TO, while internally Excluded Elements join: DP-DP, GO-GO, TO-TO?
Response: Thank you for your comment. The intent of part “b” in the definition of Interconnecting Element is to address the situation you cite in item 2.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. See the response to Florida Municipal Power Agency.		
Flathead Electric Cooperative, Inc.	No	It is difficult to support the current definition that relies on the BES Element language from the BES definition process that has not been finalized. In our case, there are elements that would not be in scope for Interconnected Element consideration, but if there is no finalization of the BES definition and this standard moves ahead, the heart of this definition would be in flux. More specificity in what equipment we are really talking about here might be helpful in the absense of a settled definition of a BES element.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. Regardless of how the "BES" is finally defined, the applicability of this standard will not be affected.		
JEA	No	Most of the standard (R1.2, R2.2.1, R3 & R4) should not be applicable to a Registered Entity that represents multiple functional entity where the same system protection group has responsibility for the protection of their entire control area.
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
Madison Gas and Electric Company	No	NSRF?s concern with the proposed definition is related to part B of the definition, on how to prove compliance in case of a vertically- integrated Registered Entity where one department is responsible for performing PSCS and the same Registered Entity is performing multiple functions. Recommend that the measures be updated for both part A and part B or clarity within the RSAW.
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." The drafting team reviewed the measures and disagrees that they require updating. Measures provide examples of evidence that can be used to demonstrate compliance.		
Southwest Power Pool	No	Our concern with the way the definition is worded relates to how to prove compliance between separate entities as well as entities within a vertically integrated utility. How would a Registered Entity actually show that the proper coordination took place? In some instances it appears that evidence would have to be provided for coordination within the same department of an entity. On the other

Organization	Yes or No	Question 2 Comment
		hand, if separate entities are involved, just what evidence would be required to show adequate coordination? Does this need to be formal documentation indicating all the owners of the interconnecting facility?
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." Measures provide examples of evidence that can be used to demonstrate compliance.		
Pepco Holdings	No	PHI suggests the definition of Interconnection Element be revised as follows:?Interconnection Element: A BES element that electrically joins facilities a) owned by separate Registered Entities, or b) operated by separate Functional Entities (Distribution Provider, Generation Owner, or Transmission Owner) within the same Registered Entity.? Without this change the existing language could be mis-interpreted as requiring a documented Protection System Coordination Study on each and every internal BES transmission line (transmission line to transmission line coordination) within a Registered Entity?s system, just because the Registered Entity has registered as multiple Functional Entities, and despite the fact that all the lines in question are owned and operated by the same Transmission Owner Functional Entity. The intent of the standard is to address coordination of interconnected elements between separate Registered Entities or between separate functional entities within the same Registered Entity.
Response: Thank you for your comment. Based on stakeholder comments, the drafting team modified the definition to read: Interconnecting Element: A Bulk Electric System (BES) Element that electrically joins Facilities:		

Organization	Yes or No	Question 2 Comment
a) owned by separate Registered Entities, or b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider). The drafting team intends for this standard to address coordination of Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements, and that require coordination for isolating those faulted Elements - between separate Registered Entities or between separate functional entities within the same Registered Entity.		
Bureau of Reclamation	No	1. Reclamation appreciates the drafting team?s clarification of the definition of Interconnected Element to specify that Interconnected Elements must be ?BES Elements.? However, Reclamation believes that the addition of part b) of the definition is problematic. Reclamation believes that ?Interconnected Elements? covered by the standard should only join facilities owned by separate Registered Entities as specified in part a) of the definition. Reclamation is not clear on how an entity would document internal coordination of Protection System Coordination Studies for the TO and GO arms of the same entity. Reclamation notes that the examples provided by the drafting team in the Application Guideline Diagrams appear to describe only Interconnected Elements at the point of demarcation between separate registered entities. At some Reclamation facilities, the same staff members coordinate TO and GO relay settings, so it is not clear how the studies and concurrence required under R1-R4 would be accomplished. Reclamation believes that PRC-023, PRC-025, and other standards will ensure that TO and GO relay settings are appropriate, and that PRC-027 should only address relay setting coordination where facilities join separate Registered Entities. In addition, the Background section of the standard explains that one purpose of the standard is to address the August 14, 2003 blackout report recommendation on the need to ?address ?the appropriate use of time delays in relays,? by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve

Organization	Yes or No	Question 2 Comment
		coordination. Consistent with this rationale, Reclamation recommends that the drafting team modify the definition of Interconnected Element to read, ?A BES Element that electrically joins facilities owned by separate Registered Entities.? 2. Finally, Reclamation notes that the definition of Elements in the NERC Glossary is, ?Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.? By incorporating the term Element, PRC-027-1 perpetuates the ambiguous definition of Elements by including the term ?such as,? which creates an open-ended list of possible Elements. Reclamation believes it would be helpful for entities to have a better defined list of possible ?Interconnected Elements? so that Entities can ensure compliance.
Response: Thank you for your comment. 1. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." 2. The drafting team contends the use of the NERC Glossary of Terms "Element" is appropriate within the context of the term "Interconnecting Element". Please reference the figures in the Guidelines and Technical Basis section of the standard for various examples of Interconnecting Elements.		
LG&E and KU Services	No	Section b) of the definition should be deleted. An ?interconnected element? subject to these requirements should not include elements owned/operated by the same registered entity. To minimize the impact of equipment outages under fault conditions, coordination studies are routinely performed by vertically integrated utilities that own and operate facilities that extend from generation plants to distribution pole top transformers. The requirements appear to be intended to insure this same level of coordination is achieved between disparate

Organization	Yes or No	Question 2 Comment
		owner/operators of upstream and downstream facilities. Moreover, as used throughout industry the term interconnected generally refers to electrically contiguous facilities belonging to different operators. After eliminating part b) of the definition, PRC-027 requirements would still apply to vertically integrated registered entities at each point of interconnection with facilities owned/operated by unaffiliated and separately registered entities performing as, e.g., DPs, GO/GOPs, neighboring TOs as appropriate.
Response: Thank you for your comment. The drafting team contends part "b" is necessary because in some vertically integrated utilities, coordination related to different functional entities may not be performed by the same protection group. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
SMUD	No	SMUD believes the Interconnected Element should be defined as those BES elements that electrically join two or more facilities. SMUD disagrees with differentiating ownership as this delineates those requirements based upon ownership causing confusion and an administrative burden for those entities that solely own and coordinate protection components to demonstrate compliance for internal notifications.
Response: Thank you for your comment. The drafting team disagrees with your suggested change to the definition. The drafting team intends for this standard to address coordination of Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements, and that require coordination for isolating those faulted Elements - between separate Registered Entities or between separate functional entities within the same Registered Entity.		
ITC	No	1. The Applicability section 4.2 defines ?facilities? as protection systems with the purpose of detecting BES faults on Interconnected Elements. Therefore, in example Figure 4 the DP does not own ?facilities? and the transmission line or tap are not an

Organization	Yes or No	Question 2 Comment
		Interconnected Element. The definition of Interconnected Element should reflect this fact and Figure 4 should be corrected. If the intention is that Figure 4 should be an Interconnected Element so that R2 still applies, then clarification that Interconnected Elements does not require Applicability section 4.2 defined facilities is required. 2. ITC Holdings engineers perform coordination at Interconnected Elements between ITC Holdings subsidiaries ITCTransmission and METC, both registered TOs. The definition should exclude applications such as this, where the only outcome is increased administrative burden to be auditable with no reliability benefit to BES.
Response: Thank you for your comment. 1. The drafting team revised Figures 3 and 4 in the Guidelines and Technical Basis section of the standard and the associated texts for clarity. 2. The drafting team disagrees with your premise. The drafting team intends for this standard to address coordination of Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements, and that require coordination for isolating those faulted Elements - between separate Registered Entities or between separate functional entities within the same Registered Entity. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
Florida Municipal Power	No	1. The definition poses a problem with the second bullet. It is relatively easy to determine the "boundaries" between separate Registered Entities. It can be difficult to determine the boundaries between where an entity's separate registrations begin and end. Just look at how difficult determining the boundaries of the BES is, and witness the challenges of the GO/TO project where the boundaries between GO and TO are/were not clear. This standard now requires us to also draw the boundary between TO and DP. For example, let's take a step-down transformer to distribution that is connected to a ring bus or breaker-and-a-half scheme. Typically, the high side relays for the

Organization	Yes or No	Question 2 Comment
		transformer will be connected to the current transformers on the breaker bushings within the bus arrangement, which are part of the BES. Those relays are not only there to protect the transformer (not BES), but, also the bus section within the ring or breaker-and-a-half scheme (which is BES). So, are those relays (e.g., differential, directional overcurrent looking into the transformer) owned by the TO or DP registration? 2. It also seems to FMPA that the reliability objective should not be limited to coordinating relays at just the "boundaries"; so, maybe one way to solve the boundary issue is to ignore it and just require a Registered Entity to coordinate its relays that protect the BES. This would expand the scope of the standard even more than the current PRC-001 to the proposed PRC-027, but, it would meet the reliability objective better. Another way to do it is to coordinate all at > 200 kV following PRC-023, and coordinate at the boundaries between entities (not registrations), at all BES.
Response: Thank you for your comment. 1. In the example you cite, if the Distribution Provider has Protection Systems that meet the Applicability; then they are subject to this standard. 2. The drafting team disagrees with both of your suggestions regarding the scope of the standard. The drafting team is not permitted to expand the scope of the SAR for this project. This standard is only applicable to Protection Systems on Interconnecting Elements as stated in the Applicability.		
City of Tacoma	No	There is some concern about the language in part b of the proposed definition of an Interconnected Element. In some cases, a Registered Entity may have one engineering group that is responsible for all Protection Systems, regardless of registered function. Part b of the proposed definition seems to suggest that documented PSCSs, including coordination activities, could be required by proposed PRC-027-1 even if the same engineering group is responsible for all Protection Systems associated with the Interconnected Element. A distinction should be drawn between a Registered Entity in which one engineering group is responsible for

Organization	Yes or No	Question 2 Comment
		Protection Systems associated with its DP, GO, and TO functions, as applicable, and another Registered Entity in which a different engineering group is responsible for Protection Systems associated with its DP vs. GO vs. TO functions, as applicable.
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
Clark Public Utilities	No	There still is some concern regarding coordination within a Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner). This type of Registered Entity is one organization and the standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one entity. The comments below provide specifics of these concerns. In order to address these concerns it is suggested that the words ?separate? and ?same? in this definition be capitalized for reference purposes. The definition should be modified as follows:Interconnected Element: A BES Element that electrically joins facilities owned by:a) Separate Registered Entities, orb) the Same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." The drafting team sees no benefit in capitalizing the terms "separate" and "same", and declines to make the suggested change.		

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comment</th></tr>
<tr><td>Texas Reliability Entity</td><td>No</td><td>We have concerns with this proposed definition surrounding the current state of the proposed BES definition changes especially in light of the multiple possible exclusions that may be allowed. In ERCOT, there are numerous large private-use-networks (PUNs) with generation behind the fence that could possibly be excluded under the new BES definition, based solely on how much power they export to the grid. If the new definition of the BES grants exclusions to these PUNs, then the PUN as well as the Transmission Owner that connects to the PUN would not be subject to the requirements of PRC-027. In our opinion, this presents a risk to the BES in that there could possibly be protection systems associated with the PUN interconnection that might need to be coordinated to properly respond to faults on the BES or within the PUN. These protection systems should require some level of coordination between the entities involved.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.
Regardless of how the “BES” is finally defined, the applicability of this standard will not be affected.</td></tr>
<tr><td>Manitoba Hydro</td><td>Yes</td><td>(1) For clarity, consider re-writing the definition as ?A BES Element that electrically joins a Facility owned by:
a) a separate Registered Entity, or
b) the same Registered Entity that is represented by multiple functional entities (Distribution Provider, Generator Owner, or Transmission Owner).?</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.
The drafting team disagrees with the suggested change; however, based on stakeholder comments, the definition was modified to read:
Interconnecting Element: A Bulk Electric System (BES) Element that electrically joins Facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider).</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
Ameren	Yes	(1) The word ?facilities? should be capitalized, since it is included in the NERC Glossary: ? Facility - A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)? and ? Element - Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.?
Response: Thank you for your comment. The drafting team agrees and made the suggested change.		
Dominion	Yes	1). The word ?facilities? included in the proposed definition, ?Interconnected Element: A BES Element that electrically joins facilities owned by?? should be capitalized as it is included in NERC?s Glossary of Terms Used in NERC Reliability Standards. 2). Dominion agrees with SERC PCS comment: ?As evident by a note in the rational box for R1 (Page 6 of Redline Version) the drafting team recognizes that vertically integrated entities that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves. To ensure that this intent is retained in the final version of the standard it is suggested that this note or some derivative be placed somewhere in body of the standard such as the definition of Interconnected Element or under the requirements.?
Response: Thank you for your comment.		

Organization	Yes or No	Question 2 Comment
1. The drafting team agrees and made the suggested change. 2. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
SERC RRO	Yes	As evident by a note in the rational box for R1 (pg. 6) the drafting team recognizes that vertically integrated entities that have the same personnel performing the review of protection systems for the function of the TO and GO could be unnecessarily burdened if the definition were misconstrued to the point of requiring these personnel to display evidence of comparing studies with themselves. To ensure that this intent is retained in the final version of the standard it is suggested that this note or some derivative be placed somewhere in body of the standard such as the definition of Interconnected Element or under the requirements.
Response: Thank you for your comment. The Rationale boxes will be moved but will remain in the final version of the standard; therefore, the drafting team did not insert it elsewhere in the body of the standard.		
DTE Electric	Yes	None
Ingleside Cogeneration LP	Yes	The addition of the modifier ?BES? to describe the applicable Elements is critical in Ingleside?s view. Without it, CEAs may assume that a Fault study is required for an interconnection at any voltage ? an issue highlighted in FERC Order 773 concerning the Definition of the BES.
Response: Thank you for your comment.		
American Electric Power	Yes	The term ?functional entity? is defined in the NERC Glossary of terms and we believe it should be capitalized in this definition.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. The term "functional entity" is not in the NERC Glossary of Terms and should not be capitalized.		
Cooper Compliance Corp	Yes	We would like confirmation that this proposed Standard only requires a study for elements that have been determined to be BES elements. For example, a study would not be required on Elements that connect a radial line serving only load because by definition of BES, there are no BES elements to study.
Response: Thank you for your support. The drafting team agrees with your premise; however, if the radial line is included in the BES and has Protection Systems included in the Applicability of this standard, then the standard would be applicable.		
Kansas City Power and Light	Yes	Yes, as long as the standard only requires documentation in cases where there are neighboring owners that need to agree on protection and control. As an owner of multiple functional entities, we believe that the BES would not benefit by an intra-utility documentation process, not when the required due diligence is already performed within our System Protection Engineering group. Our System Protection Engineering group is already responsible for the coordination of all protection, whether generation, transmission, or distribution.
Response: Thank you for your support. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."

3. **In Requirement R1, the drafting team modified the time frame to allow entities 60 months to have a documented Protection System Coordination Study (PSCS) completed for each Interconnected Element if no PSCS exists. Note, the drafting team has allowed inclusion of all previously performed PSCS whose summary of results include, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. Do you agree with this revised time frame? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration:

Approximately 70% of commenters agreed with the revised time frame of 60 months to produce a documented Protection System Coordination Study (PSCS) for each Interconnected Element, if none exists. A few commenters thought that 60 months was either too long or too short. The drafting explained that the change to 60 months was made based on the reasonable arguments presented by the majority of stakeholders.

One commenter suggested there were too many time frames in general in the requirements. The drafting team responded that the specific time frames are appropriate and relevant for the reliability-related tasks in each of the requirements.

There were numerous comments unrelated to this question that were addressed but are not included in this summary.

Organization	Yes or No	Question 3 Comment
ATCO Electric	No	- R1 referring to other requirements with different timelines is very confusing to understand and execute. - R1 (and PRC-027-1 draft 3 in general) also has too many timelines: 90 calendar days, 60 calendar months, 12 calendar months, "agreed upon timefram

Response: Thank you for your comment.

The drafting team contends the specific time frames are appropriate and relevant for the reliability-related tasks in each of the requirements. The process flow chart is included in the Guidelines and Technical Basis section of the standard shows the relationship between the requirements.

Organization	Yes or No	Question 3 Comment
ReliabilityFirst	No	a. ReliabilityFirst believes the shift from 48 calendar months to 60 calendar months is an excessive amount of time to allow an entity to perform a Protection System Coordination Study (PSCS). With the effective date of the standard being 12 months beyond the date that it is approved by applicable regulatory authorities, this is essentially giving entities over six years to perform their initial study, for equipment that previously had no study performed. Furthermore, from a reliability perspective, this coordination is most likely already occurring in some capacity, when the interconnection is made, and entities should not require this excessive timeframe to perform the study (i.e., as quoted from the SDT: ??there is no evidence of widespread miscoordination of Protection Systems associated with Interconnected Elements??). ReliabilityFirst recommends a 24 calendar month implementation timeframe to limit any potential reliability issues as a result of shortcomings in the existing set of Standards.
Response: Thank you for your comment. The time frame was revised to 60 months based on the reasonable arguments presented by the majority of stakeholders.		
Madison Gas and Electric Company	No	As currently written, each TO, GO and DP are required to perform a PSCS. This will lead to multiple efforts by each entity. Recommend that GO and DP be removed from this Requirement. Since the TO has access to the hierarchy of systems (Interconnected Elements) they are positioned to request current protection system settings from the GO and DP and then perform a PSCS. They can then request adjustments by the GO and DP in order to assure a more secure system.
Response: Thank you for your comment. The drafting team contends that it is the Protection System owner's responsibility to ensure that a Protection System Coordination Study is performed.		
Bonneville Power Administration	No	BPA believes that the requirement to provide a protection system study for each interconnected element is onerous, and as a result, any amount of time is too short. While beneficial to periodically perform fault studies and review protection system

Organization	Yes or No	Question 3 Comment
		coordination, the creation of a NERC standard to require reviews for Interconnected Elements on a rigid time frame is likely to be counterproductive for the following reasons: a. There is nothing unique about the Protection Systems for Interconnected Elements compared to other Protection Systems that warrants this special treatment. If this standard is deemed necessary, the only logical consequence is that similar standards must be created for all protection systems. Trying to coordinate Protection Systems to comply with numerous standards will limit flexibility. Diverting resources from addressing Protection System problems to completing compliance documentation makes the system less reliable, not more. b. This standard provides no quality benefit to the Protection System Coordination process. It only increases the documentation burden, which is just as likely to decrease the quality of the review as it is to improve it. c. There are an enormous number of things that entities do to keep the BES reliable. If NERC wishes to regulate and enforce all of these things, it will come at an enormous cost to consumers of electric power. Cost increases are already being experienced due to the present standards. Since there has been no widespread problem with Protection System coordination between entities, this particular issue should not be the subject of a standard. d. Any specified time frame for a Protection System Coordination review will be too long for some situations and too short for others. The Protection System Engineers within the entities are in the best position to determine an appropriate review interval for each element.
Response: Thank you for your comment. a, b, c, d. The standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.		
Florida Municipal Power	No	1. Five (5) years seems way too long for an initial coordination study. We

Organization	Yes or No	Question 3 Comment
		should pick a period of time that both industry and FERC will likely approve, maybe something like two (2) years. 2. Other comments on R1:FMPA's interpretation of the Applicability combined with the standard is that remote back-up protection is included as it was "installed for the purpose of detecting Faults on Interconnected Elements". This becomes ambiguous for directional, inverse time ground current protection whose reach can vary with ground current, or with such relays and zone distance relays with changes in system configuration. FMPA's interpretation is that the Applicability is to the maximum reach of such relays; is that the intent of the SDT? 3. Bullet 1.2 is ambiguous in its use of the term "owner"; especially in combination with the definition of Interconnected Element that makes the distinction between different registered functions within the same entity. Is the owner the entity, or the registered function? We assume the "owner" is the entity; is that the intent of the SDT?

Response: Thank you for your comment.

1. The time frame was revised to 60 months based on the reasonable arguments presented by the majority of stakeholders.
2. The standard is applicable to: Protection Systems: a) installed for the purpose of detecting Faults on Interconnecting Elements, and; b) that require coordination for isolating those faulted Elements.
3. The "owner" is the functional entity that owns the Protection System.

Organization	Yes or No	Question 3 Comment
Ingleside Cogeneration LP	No	ICLP mostly agrees with rationale for R1 that states ?The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame <than 60 months>.? We would take that one step further and argue that far more critical coordination occurs in UVLS, UFLS, SPS, and distance relay schemes ? and is already covered in other NERC standards. Fault analyses are comparatively basic, and do not require a re-evaluation unless a material change is made in the local grid. This means that a

Organization	Yes or No	Question 3 Comment
		Generator Owner should be able to make a simple confirmation that nothing has changed since the previous time a Fault study was performed ? usually during commissioning or a major reconfiguration. If the TO wants a full Fault evaluation due to a change in the local transmission system, they are free to do so under R1.1.2. Requiring every GO to produce the results of a study that took place years in the past serves no reliability purpose.
Response: Thank you for your comment. The drafting team contends there is a reliability benefit in ensuring that all existing Protection Systems on Interconnecting Elements have been reviewed; and that it is the owner's responsibility to ensure a study has been performed. Requirement R1, Part 1.2 describes the minimum that a summary of the results of a Protection System Coordination Study performed pursuant to Requirement R1, Part 1.1 must include. The Generator Operator must provide the summary results to the other owner(s) within 90 days to satisfy the intent of the requirement.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. See the response to Florida Municipal Power Agency.		
Wisconsin Electric Power Company	No	Requirement 3.3 needs to be revised to allow an entity the flexibility to make emergency changes to protection systems or settings that are necessary to correct a reliability problem. The current draft allows such changes only when a failure occurs.
Response: Thank you for your comment. Requirement R3 mandates the provision of information to other owners after changes to Protection Systems associated with the Interconnecting Element have occurred. The requirement is not precluding any maintenance work. Requirement R3, Part 3.3 specifies that the entity must provide information regarding whatever maintenance was done within 30 calendar days of completing the maintenance.		

Organization	Yes or No	Question 3 Comment
SMUD	No	The revised time frame of 60 months is agreeable, however, requirement 1.2 should not be applicable to any Interconnection Element owners that are one of the same Registered Entity that represents multiple functional entity responsibilities. There are several Registered Entities that have only one person or department within a utility that is responsible for protection system coordination for all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the Protection System Coordination Study to provide a copy to ?other owners?. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner.
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: “In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities.”		
Clark Public Utilities	No	1. The revised time frame of 60 months is agreeable, however, requirement 1.2 should not be applicable to any Interconnection Element owners that are part of the ?same Registered Entity that represents multiple functional entity responsibilities.? Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the Protection System Coordination Study to provide a copy to ?other owners?. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. 2. Since the definition of Interconnection Elements incorporates the concept of

Organization	Yes or No	Question 3 Comment
		?Separate Registered Entities and ?Same Registered Entities? it is suggested that the wording be modified to incorporate theses terms as follows:R1.2 Within 90 calendar days after the completion of each PSCS, provide to the other Separate Registered Entities that are owner(s) of the Protection System(s) associated with the Interconnected Element(s), a summary of the results of each PSCS performed pursuant to Requirement R1, Part 1.1, (including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed).
Response: Thank you for your comment. 1. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." 2. The drafting team disagrees with your suggested changes to Requirement R1, Part 1.2.		
LG&E and KU Services	No	There is no basis for performing studies every 60-months. Such studies should be performed when necessary based on predetermined criteria set forth in the standard. There is no evidence of wide spread miscoordination of Protection Systems associated with Interconnected Elements. In fact, none of the recent blackouts resulted from miscoordination of protective settings.
Response: Thank you for your comment. Requirement R1 does not mandate that a PSCS be performed every 60 months. The requirement states the conditions that require a PSCS be performed.		
Exelon and its Affiliates	No	We do not believe that a mandatory PSCS needs to be completed for each interconnected element as stated in Requirement 1. We believe that the design of the Protection System for an interconnected element must first be considered before requiring a PSCS. In cases where high speed protection schemes are redundant, the reliance on time-delayed backup elements would require at least 2

Organization	Yes or No	Question 3 Comment
		protection system element contingencies. We propose that redundancy should consist of the use of two separate relays and auxiliary relays as per the redundancy test required in the NERC board-approved TPL-001-2 standard. If failure of a single relay or auxiliary relay results in reliance on time delayed back-up protection, we agree that a PSCS should be required, and consequently would agree to the 60 month time frame.
Response: Thank you for your comment. The application of redundant Protection Systems does not preclude the necessity of ensuring that your Protection Systems are coordinated.		
Northeast Power Coordinating Council	Yes	60 months is an adequate and appropriate period which balances the interest of reliability with the economics related to engineering costs.
Response: Thank you for your support.		
Duke Energy	Yes	Duke Energy agrees with the changes made by the SDT to extend the period to 60 months.
Response: Thank you for your support.		
DTE Electric	Yes	None
Response: Thank you for your support.

4. **In Requirement R2, the drafting team modified the time frame to 60 months for either conducting a Fault current review or provide a technical justification as to why a Fault current review is not necessary. Do you agree with this revision to Requirement R2? If not, please provide specific suggestions for improvement in the comment area.**

Summary Consideration:

No specific changes to the timeframe in Requirement R2 were made based on comments. , however, overall discussion within the drafting team related to comments received did result in the removal of the provision that the Transmission Owner could provide a technical justification for not conducting the 60 month Fault current review specified in Requirement R2.

A few commenters suggested that a provision should be included to require Transmission Owners to provide system fault data to Distribution Providers and Generator Owners on a continuous basis. The drafting team does not agree that more frequent exchanges are required because each interconnected owner has the ability to request information at any time (Requirement R3 Part 3.2).

A few commenters continue to suggest that Generator Owners (GO) should be excluded from performing a Protection System Coordination Study (PSCS) after being notified by the Transmission Owner of a 10% or greater change in Fault current at an interconnecting bus. The drafting team responded that a GO could provide a technical justification explaining why changes in bus Fault current do not affect its coordination rather than performing a Protection System Coordination Study (PSCS), and that a previous technical justification could be reused provided it is still valid.

Several commenters suggested that Requirement R2 should not apply to Registered Entities that represent multiple functional entity responsibilities. The drafting team responded that for the case where one registered entity representing multiple functional entities with the same protection group performing all the coordination, the drafting team included the following note: “In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS would be sufficient for use by all entities.

Organization	Yes or No	Question 4 Comment
ATCO Electric	No	- R2 referring to other requirements with different timelines is very confusing to

Organization	Yes or No	Question 4 Comment
		understand and execute. - R2 (and PRC-027-1 draft 3 in general) also has too many timelines: 90 calendar days, 60 calendar months, 12 calendar months, "agreed upon timefram
Response: Thank you for your comment. A process flowchart is included in the Guidelines and Technical Basis section of the standard to show the relationship between the requirements. The drafting team contends the specific time frames are appropriate and relevant for the reliability-related tasks in each of the requirements.		
Ingleside Cogeneration LP	No	Although ICLP is not a Transmission Owner, we will be impacted if the TO?s assessment shows a material change in Fault current has occurred in an interconnecting element. We believe our TO has every economic and reliability incentive to contact us if a modification threatens the transmission network. It should be sufficient that the TO show that a coordinated assessment takes place when an appropriate trigger condition occurs.
Response: Thank you for your comment. The intent of Requirement R2 is for the Transmission Owner to inform the other owner(s) of a change in Fault currents of 10% or more. The drafting team contends a 10% change in Fault current is an appropriate trigger. Note that the standard (Requirement R1, Part 1.1.2) allows an entity (a Generator Owner in your case) to provide a technical justification explaining why changes in bus Fault current do not affect its coordination rather than performing a Protection System Coordination Study (PSCS). A Generator Owner is allowed to reuse its previous technical justification provided it is still valid to justify why a new PSCS is not required.		
DTE Electric	No	Comments: Since the main purpose of this standard is to assure coordination of BES Interconnected Elements, there should be a provision included to require TOs to provide system fault data to DPs and GOs on a continuous basis so that coordination is performed on BES as well as non-BES elements using accurate data. If complete system fault study files are provided regularly (bi-annually?), projects can be completed using the latest data and not subject to re-evaluation when an update is provided by the TO every 60 months. It is critical that fault study data file compatibility exists between the short circuit programs of the different entities.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. The drafting team does not agree that more frequent exchanges need be mandated through a requirement because each interconnected owner has the ability to request information at any time as part of Requirement R3 Part 3.2. This standard does not prevent an owner from performing more frequent reviews.		
Bonneville Power Administration	No	Please see comments for Question 3.
Response: Thank you for your comment. Please see the response for Question #3.		
SMUD	No	Please see our comments in Question #3; The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner.
Response: Thank you for your comment. Please see the response for Question #3.		
LG&E and KU Services	No	See response to question 3 above.
Response: Thank you for your comment. Please see the response for Question #3.		
Clark Public Utilities	No	1. The revised time frame of 60 months is agreeable, however, requirement 2.2.1 should not be applicable to any Interconnection Element owners that are part of the ?same Registered Entity that represents multiple functional entity responsibilities.? Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the organization that developed the updated Fault current study to provide the updated Fault current values (Iscs) to ?each owner? of the Protection System

Organization	Yes or No	Question 4 Comment
		associated with the Interconnected Element. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. 2. Since the definition of Interconnection Elements incorporates the concept of ?Separate Registered Entities and ?Same Registered Entities? it is suggested that the wording be modified to incorporate theses terms as follows:R2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (Iscs) to each Separate Registered Entity that is an owner of the Protection System associated with the Interconnected Element.
Response: Thank you for your comment. 1. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." 2. The drafting team disagrees with your suggested changes to Requirement R1, Part 1.2.		
Exelon and its Affiliates	No	This requirement unnecessary burden on the Generation Owner. The fault current seen by Generator Owner?s protective devices depend on the Generation Owners equipment (e.g., the main generator and transformers). So unless those are replaced there should be no requirement on the Generator Owner to review the protection coordination study due to change in fault current at the interconnecting bus which will be due to grid changes. The Transmission Owner will be reviewing those changes and will be coordinating if needed with the Generator Owner. Therefore these requirements should not be applicable to Generation Owner. [Requirement R1 1.1.2 and Requirement R 4 4.1 should also not be applicable to Generator Owner for same reason].Need to identify which elements of Generator Owner?s protection system are included in this Standard and provide specific criteria

Organization	Yes or No	Question 4 Comment
		for showing coordination with TOs protective devices.
Response: Thank you for your comment. Requirement R2 is only applicable to Transmission Owners. Note that the standard (Requirement R1, Part 1.1.2) allows an entity (a Generator Owner in your case) to provide a technical justification explaining why changes in bus Fault current do not affect its coordination rather than performing a Protection System Coordination Study (PSCS). A Generator Owner is allowed to reuse its previous technical justification provided it is still valid to justify why a new PSCS is not required.		
Public Service Enterprise Group	No	We agree with that the 60 months is adequate; however, we disagree that a technical justification should be required for relays and schemes that are unaffected by the level of Fault current. See our proposed language changes in 8.a below.
Response: Thank you for your comment. If you meet the qualifications regarding the Applicability section of the standard: e.g., you are one of the owners listed in the Functional Entities section 4.1 and you own Facilities as described in the Facilities section 4.2 of the standard, the standard is applicable to you. The drafting team contends an initial technical justification is required to demonstrate that the Protection Systems are not impacted by changes in Fault current. A Generator Owner is allowed to reuse its previous technical justification provided it is still valid to justify why a new PSCS is not required (as in Requirement R1, Part 1.1.2).		
Ameren	Yes	(1) The "maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus" could either be the total Fault current at that bus, or the Fault current flowing through the Interconnected Element. Our reading of R2, Part 2.2 "used in the most recent PSCS" is that it depends on what the entity used in their study.
Response: Thank you for your comment. The drafting team intends for the "…maximum available Fault current values…at its interconnecting bus(s)…" to be determined.		
Northeast Power Coordinating Council	Yes	60 months is an adequate and appropriate period which balances the interest of reliability with the economics related to engineering costs.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your support.		
Duke Energy	Yes	Duke Energy agrees with the changes made by the SDT to extend the period to 60 months.
Response: Thank you for your support.

Response: Thank you for your comment. Please refer to the responses for SRC comments.		
Kansas City Power and Light		The modification to a longer time frame is acceptable. However, we do not agree that there is adequate justification for requiring a fault current review every five years. Relay settings that are valid today will remain valid until changes are made at our end of an interconnected element or when another Registered Entity notifies us of change. A technical justification that is valid today will remain valid until changes are made to the BES within our system or a neighboring owner?s system.
Response: Thank you for your comment. The drafting team contends that a Fault current review and notification should remain in the standard. Upon notification, the other owner has the option to review and use a previously developed technical justification provided it is still valid to justify why a new PSCS is not required (Requirement R1, Part 1.1.2).		

5. **In Requirement R4, the drafting team has clarified the expectation of what a response to a review of the summary results of a Protection System Coordination Study should include. The options are as follows: • Accepting the results, or • Rejecting the results and suggesting modifications to resolve any identified coordination issues. Do you agree with this revision to Requirement R4? If not, please provide specific suggestions for improvement in the comment area.**

Summary Consideration:

Approximately 70% of the respondents supported the changes made to Requirement R4, but expressed a desire for additional clarity. However, a few commenters continue to suggest that mutual agreement on Protection System settings between owners will sometimes not be achieved and have compliance concerns associated this fact. Consequently, the drafting team separated Requirement R4 into Requirements R4 and R5. The modified Requirement R4 provides a variety of alternative responses for replying to the other owners after receiving a Protection System Coordination Study (PSCS), or a summary of the results of a PSCS, or a technical justification. The drafting team replaced the language that specified either "accepting" or "rejecting" the summary of the results of a PSCS with confirming that the summary of results or the technical justification were reviewed and whether or not any identified coordination issues were noted. Requirement R4 retains the "90 calendar days" or "agreed-upon schedule" time frames for performing the reviews. The new Requirement R5 mandates that any identified coordination issues be addressed prior to the implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element.

A few commenters had concerns of possible conflicts between the draft standard and contractual rights associated with existing terms and conditions of generator interconnection agreements. The drafting team responded that they agree that contractual rights must be adhered to, including notice and approval rights, and they do not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the Generator Owner to ensure the Protection Systems covered by this standard are properly coordinated. The drafting team contends that the standard as drafted does not preclude those contracts, but does address instances where a contract may not address modifications. The phrase "according to an agreed upon schedule" in Requirement R4 provides an avenue to follow the terms of the contract.

Two commenters were concerned that a coordination solution between the owners (Transmission Owner(s), Generator Owner(s) and Distribution Provider(s)) could potentially result in unintended consequences for the Transmission Operator(s) (TOPs) so they suggested a notification requirement for the TOP. The drafting team contends the coordination and cooperation among entities as codified in the TOP group of Reliability Standards address notifications of situations potentially posing risk to the reliability of the BES.

A commenter was concerned about the ability to reach agreement when critical replacements are made during unit outages. The response indicated that the drafting team contends the exchange of Protection System information is critical to the reliability of the BES; therefore, the details of any planned changes need to follow the Requirement 3 criteria. Requirement R3, Part 3.3 requires notifications of emergency replacements such as critical changes made during generation outages within 30 calendar days of making the change. Note that the requirement allows agreed upon time frames which could be significantly shorter than the 30 days noted in the standard.

Organization	Yes or No	Question 5 Comment
Nebraska Public Power District	No	In theory I understand the drafting team stating: "The drafting team believes that any conflict resolution should be handled through normal business practices. The old Measure M9 (new Measure M10) has been modified as follows: Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that, prior to implementation of any proposed Protection System(s) changes, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted. The drafting team believes the requestor cannot be held accountable when the other party does not respond". However, I don?t believe that we can predict or project how an audit or enforcement team will apply or misapply this requirement which is cause for concern. There are utilities that will respond but may not respond in a timely manner. This puts all entities unfairly under scrutiny. Perhaps some form of clarification could be added to the application guidelines or another location for example.
Response: Thank you for your comment. The goal of the drafting team is to write clear, concise requirements that leave no room for interpretation by anyone including auditors. In this vein, the drafting team split Requirement R4 into two separate requirements in an effort to improve clarity. The entity not responding in a timely manner pursuant to Requirement R4 would be in violation.		
LG&E and KU Services	No	90-days is not in all cases the appropriate time period to review such results. The terms and conditions for generator interconnections are regulated by FERC or state PUCs. The proposed reliability standard should clearly state that responsible entities

Organization	Yes or No	Question 5 Comment
		are not obligated to take any actions that are inconsistent with the rights of the parties under any interconnection or similar agreements. Such agreements typically address the procedures for making modifications to a party?s facilities that may affect the other party and the required notice and approval rights. The standard should not seek to impose any requirements that are inconsistent with these contractual rights. R4.1 speaks of sharing only, ?summary results,? but the Application Guidelines on p.24 lists as examples ?power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings.? We recommend that the above list be preceded with the words ?summaries of.?
Response: Thank you for your comment. The drafting team agrees that contractual rights must be adhered to, including notice and approval rights. The drafting team contends that the standard as written does not preclude those contracts, but instead address instances where a contract may not address modifications. The phrase “according to an agreed upon schedule” in Requirement R4 provides an avenue to follow the terms of the contract. The drafting team agrees that a “summary” of the PSCS is appropriate. The Guidelines and Technical Basis section of the standard includes a broader listing of documentation that could be provided but may not lend itself to a “summary”. This information should be conveyed as convenient and agreed upon by both the sender and the recipient.		
Flathead Electric Cooperative, Inc.	No	Although well-intended, this seems like a difficult thing to document for audit if there are legitimate back and forth over a long period of time.
Response: Thank you for your comment. As you suggest, there may be instances where substantial back and forth comments could occur; in those cases the parties would retain the correspondence demonstrating that a response acknowledging that “coordination was achieved” was received.		
Florida Municipal Power	No	Bullet 1.2 is ambiguous in its use of the term ?owner?; especially in combination with the definition of Interconnected Element that makes the distinction between different registered functions within the same entity. Is the owner the entity, or the registered function? We assume the ?owner? is the entity; is that the intent of the SDT?

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. The "owner" is the functional entity that owns the Protection System.		
Pepco Holdings	No	PHI finds that the revised wording in Section R4 does little to address the root problem associated with mandating mutual agreement. PHI suggests Requirement R4 be removed entirely or extensively re-written to address the concerns outlined below: Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? This is the

Organization	Yes or No	Question 5 Comment
		problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. It is unreasonable and unfair to hold one party non-compliant due to the failure of another party to reach agreement. Furthermore, in the example provided above, it is a detriment to reliability to delay implementation of the setting change on breaker D just because mutual agreement could not be reached. It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the ?Protection System Study? and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing a clear division of responsibilities and assignment of who will be held non-compliant if agreement cannot be reached is unfair to either party.
Response: Thank you for your comment. The drafting team acknowledges that entities may have differing protection philosophies. Based on yours and other stakeholder comments, the drafting team separated Requirement R4 into two Requirements, R4 and R5. The new Requirement R5 states that any identified coordination issues must be addressed prior to the implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element. The drafting team contends that any conflict resolution should be handled through normal business practices.		
Wisconsin Electric Power Company	No	R4 needs revision to better accomodate the entire range of diversities in TO-GO interconnections, especially when agreement cannot be reached between entities, or when agreement cannot be reached in a timeframe required to make critical changes during generating unit outages. R4 also neeeds to include flexibility when the GO is not a vertically integrated utility, and does not have in-house protection engineering resources to respond in the required timeframe. It is unjust to put

Organization	Yes or No	Question 5 Comment
		compliance risk on an entity due to the failure of another entity to reach agreement on settings. In some cases the best that can be expected is for two parties to exchange protection system information and live with a compromise in coordination that allows both to best protect their assets. This may be especially true when generating assets are at stake, and insurance considerations require sensitive protection that may not allow complete coordination.
Response: Thank you for your comment. The drafting team acknowledges that entities may have differing protection philosophies. The drafting team contends the exchange of Protection System information is critical to the reliability of the BES; therefore, the details of any planned changes need to follow the Requirement 3 criteria. In the case you cite of critical changes made during generation outages, Requirement R3, Part 3.3 allows notifications of emergency replacements be made. Note that the requirement allows agreed upon time frames which could be significantly shorter than the 30 days noted in the standard. Based on yours and other stakeholder comments, the drafting team separated Requirement R4 into two Requirements, R4 and R5.		
Northeast Power Coordinating Council	No	R4 requires all affected parties agree to a solution. However, the applicable Functional Entities that PRC-027 impacts are limited only to the TO, GO and DP. When designing a protection system scheme to clear faults, a satisfactory solution in the perspective of a TO, GO and DP may have unintended consequences for the Transmission Operator. For example, what if the solution is to leave what in normal operation is a significantly loaded transmission line in a potentially open terminal configuration by leaving a ring bus configuration open after clearing a fault? How can the TO, GO and DP ensure their agreed upon solution is manageable for the Transmission Operator? There should be a notification requirement to the TOP.
Response: Thank you for your comment. The situation you describe is not a satisfactory solution and would not be in keeping with "good utility practice." The drafting team contends the coordination and cooperation among entities as codified in the TOP group of Reliability Standards address notifications of situations potentially posing risk to the reliability of the BES.		
ISO RTO Council Standards	No	R4 requires all affected parties to agree to a solution. However the applicable

Organization	Yes or No	Question 5 Comment
Review Committee		Functional Entities that PRC-027 impacts are limited only to the TO, GO and DP. When designing a protection system scheme to clear faults, a satisfactory solution in the prospective of a TO, GO and DP may have unintended consequences for the Transmission Operator. For example, what if the solution is to leave a significantly loaded transmission line in a potentially single end situation by leaving a ring bus configuration open after clearing a fault? How can the TO, GO and DP ensure their agreed upon solution is manageable for the Transmission Operator? Should there be a notification requirement to the TOP?
Response: Thank you for your comment. The situation you describe is not a satisfactory solution and would not be in keeping with “good utility practice.” The drafting team contends the coordination and cooperation among entities as codified in the TOP group of Reliability Standards address notifications of situations potentially posing risk to the reliability of the BES.		
Essential Power, LLC	No	R4.2 can hold an entity hostage (and possibly non-compliant) if the other Interconnected Element owner does not/will not accept the proposed changes. This requirement is extremely objectionable for entities in deregulated markets, since the ?firewall? separating the regulated and deregulated sides of the business would ordinarily prevent the GO from seeing TO critical infrastructure information. R4.1 speaks of sharing only, ?summary results,? but the Application Guidelines calls on p.24 for transmittal of, ?power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings.? R4.2 also raises concerns for the situation in which a TO connects to GOs within the same corporate umbrella as well as to GOs that are part of completely separate corporate entities. The TO is legally required to treat all GOs equally, and we would certainly expect this to continue to be the case if PRC-027 is enacted, but suspicions could arise whenever expansion plans of a TO are impeded or overtly vetoed via PRC-027 ?reject? decisions by an other-corporate-entity GO and vice-versa. Proposed changes to Interconnection Service Agreements are handled under market rules, and NERC standards should not contain features that might create opportunity for infringing-

Organization	Yes or No	Question 5 Comment
		on or bypassing these rules.
Response: Thank you for your comment. The drafting team acknowledges that entities may have differing protection philosophies. The drafting team contends the exchange of Protection System information is critical to the reliability of the BES. Based on yours and other stakeholder comments, the drafting team separated Requirement R4 into two Requirements, R4 and R5. The drafting team does not believe that the Transmission Owner is restricted in providing the Protection System data necessary for the Generator Owner to ensure the Protection Systems covered by this standard are properly coordinated. The drafting team agrees that a "summary" of the PSCS is appropriate. The Guidelines and Technical Basis section of the standard includes a broader listing of documentation that could be provided but may not lend itself to a "summary". This information should be conveyed as convenient and agreed upon by both the sender and the recipient. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities." The drafting team agrees that contractual rights must be adhered to, including notice and approval rights. The drafting team contends that the standard as written does not preclude those contracts, but instead address instances where a contract may not address modifications. The phrase "according to an agreed upon schedule" in Requirement R4 provides an avenue to follow the terms of the contract.		
Bureau of Reclamation	No	Reclamation agrees with this comment but suggests rephrasing R4 to encourage collaboration among registered entities. Reclamation suggests that R4.1 should read ?Within 90 calendar days after receipt or according to an agreed upon schedule, review the summary results of a PSCS (per Requirement R1, R1.2) and respond to the other owner(s) by accepting the results or suggesting modifications to resolve any identified coordination.? Reclamation does not believe that entities should submit formal rejections of PSCSs merely to satisfy the standard. Reclamation suggests that the phrasing above would better encourage collaborative relay setting coordination.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. The drafting team acknowledges that entities may have differing protection philosophies. The drafting team contends the exchange of Protection System information is critical to the reliability of the BES. Based on yours and other stakeholder comments, the drafting team separated Requirement R4 into two Requirements, R4 and R5.		
Bonneville Power Administration	No	The requirement does not describe what further actions are required or what time limits apply if the suggested modifications are not acceptable to the originating entity.
Response: Thank you for your comment. The drafting team acknowledges that entities may have differing protection philosophies. The drafting team contends the exchange of Protection System information is critical to the reliability of the BES. The drafting team contends that any conflict resolution should be handled through normal business practices.		
Clark Public Utilities	No	The response options are agreeable, however, requirement 4 (and any sub-requirements) should not be applicable to any Interconnection Element owners that are part of the ?same Registered Entity that represents multiple functional entity responsibilities.? Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the same organization that developed the Protection System Coordination Study to provide a document accepting it or rejecting it. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of ?Separate Registered Entities and ?Same Registered Entities? it is suggested that the wording be modified to incorporate theses terms as follows:R4. Each Transmission Owner, Generator Owner, and Distribution Provider that is a Separate Registered Entity and each Same Registered Entity (on behalf of its multiple functional entity responsibilities) shall: [Violation

Organization	Yes or No	Question 5 Comment
		Risk Factor: Medium] [Time Horizon: Operations Planning]4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a PSCS (per Requirement R1, Part 1.2) and respond to the Registered Entity providing the PSCS:? Accepting the results, or? Rejecting the results and suggesting modifications to resolve any identified coordination issues.4.2. Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other Separate Registered Entities that are owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.
Response: Thank you for your comment. For the case where one registered entity represents multiple functional entities and the same protection group performs all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities."		
Southwest Power Pool	No	The way the requirement is currently worded, the sending entity could conceivably be found non-compliant if an entity receiving the results does not respond within 90 days. We would suggest incorporating language to clarify that the receiving entity has the obligation to respond within 90 days. This could be accomplished by inserting ?each recipient of the results shall? in the requirement. The requirement would then read ?Within 90 calendar days after receipt, or according to an agreed upon schedule, each recipient of the results shall review the summary results of a PSCS??
Response: Thank you for your comment. The goal of the drafting team is to write clear, concise requirements that leave no room for interpretation by anyone including auditors. In this vein, the drafting team split Requirement R4 into two separate requirements in an effort to improve clarity. The entity not responding in a timely manner pursuant to Requirement R4 would be in violation.

6. The drafting team revised the Applicability section of PRC-001-2 to clarify which Protection Systems are applicable to Requirement R1. (The "Facilities" portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.) Do you agree with this revision to the Applicability? If not, please provide specific suggestions for improvement in the comment area.

Summary Consideration:

In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.

Organization	Yes or No	Question 6 Comment
American Electric Power	No	AEP appreciates the drafting team?s efforts to clearly identify the Protection Systems that are applicable to Requirement R1 but is concerned that the combination of Applicable Facilities in Section 4.2 and Requirement R1 may result in burdensome training requirements for the TOP, BA and GOP that do not provide an increase to BES reliability. In particular, the Applicable Facilities includes Protection Systems installed for the Generator Step-Up transformers, Station Service transformers and

Organization	Yes or No	Question 6 Comment
		the Excitation transformers. Nowhere does the standard limit the scope of this applicability to a subset of the Applicable Functional Entities. As a result, an auditor may interpret the standard to require that the TOP and BA be familiar with this level of generator protection for the units connected to their system.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Bonneville Power Administration	No	As described in the Facilities Section, the protection systems for which the requirements are applicable are ?Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements?. Since most Protection Systems are capable of isolating faulted elements without coordination, nearly all Protection Systems would be exempt from the requirements. While this would be acceptable to us, we don?t think this is what the drafting team intends.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Public Service Enterprise Group	No	Change section 4.2.1 (capitalized words show changes) as follows: ?4.2.1 - Protection Systems that are installed for the purpose of detecting AND ISOLATING Faults on BES Elements (lines, buses, transformers, etc.)?
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
LG&E and KU Services	No	Did you mean PRC-001-3? If so, the response is, ?Yes.?
Response: Thank you for your comment. The drafting team did mean PRC-001-3. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		

Organization	Yes or No	Question 6 Comment
Flathead Electric Cooperative, Inc.	No	Do not believe that a DP-only entity would typically have Interconnected Elements that would necessitate inclusion, when the purpose is to protect the TO equipment.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Bureau of Reclamation	No	Reclamation requests that the drafting team clarify which Protection Systems ?require coordination? for isolating faulted Elements, or remove the phrase ?that require coordination? from the definition of Facilities.
Response: Thank you for your comment. Your comment is apparently referencing the Facilities section of PRC-027-1 and does not pertain to this question.		
City of Tacoma	No	The level of detail in the Applicability section appears to be inconsistent with the language in M1 ??training in basic relaying?? For this reason, it is recommended not to include the ?Facilities? portion.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Independent Electricity System Operator	No	We do not have any comment on the revised Applicability Section, but continue to express a serious concern with leaving PRC-001 in its present form. As indicated in our previous comment, we do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. This is a training requirement and as such, it should be transferred to the appropriate PER standards. Providing training evidence does not demonstrate that the (operating personnel of) responsible entities are ?familiar with? the purpose and limitations of

Organization	Yes or No	Question 6 Comment
		protection system schemes applied in its area. c. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. In response to our previous comment, the SDT indicates that it ??recommended that Requirement R1 remain in PRC-001-3 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. This issue has been added to the NERC Issues Database.? We do not agree with this recommendation and hold the view that adding the issue to the NERC Issue Data Base is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT should propose a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee?s advice/direction for appropriate actions. We do not believe that the SDT or staff has brought this to the Standards Committee?s attention. Note that the Standards Committee is responsible for managing the standards development process and as such, can make an informed decision to either request the SDT to expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel. Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. Once again, we urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.

Response: Thank you for your comment.

Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.

Organization	Yes or No	Question 6 Comment
Manitoba Hydro	Yes	(1) The title of the new PRC-001-3 standard does not seem to be the appropriate title since the standard addresses protection coordination issues, rather than requiring the system operators to be familiar with, and understand the protection system.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Duke Energy	Yes	Duke Energy believes that the Facilities section provides sufficient detail and clarity for this standard.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Ingleside Cogeneration LP	Yes	ICLP agrees that consistency between NERC standards is helpful. Since our Protection System maintenance program has been developed specifically to address BES relaying, it is a straight forward process to develop the related Operator training.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
ITC	Yes	ITC Holding is in agreement with the clarification on which protection systems are applicable to requirement 1. Using the same definition as used in PRC-005-2 promotes consistency across the standards within the same category (PRC).
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
DTE Electric	Yes	None
PacifiCorp	Yes	PacifiCorp would like to highlight a recommendation that was made by the drafting team on page 4 of Draft 3 of PRC-027-1 regarding Requirement R1 of PRC-001-2. The

Organization	Yes or No	Question 6 Comment
		drafting team has recommended via the NERC Issues Database that the future standards drafting team tasked with revising PER-005-1 incorporate the reliability objective of PRC-001-2 Requirement R1 into that revised standard. PacifiCorp is concerned with the potential overlap that could result from the failure to retire Requirement R1 in PRC-001-2 concurrent with the effective date of the new version of PER-005. To avoid the risk of entities having to comply with duplicative requirements under two currently-effective standards, the standards drafting team should include language in PRC-001-2 expressly confirming that compliance with the relevant requirement of the revised version of PER-005 will satisfy Requirement R1 of PRC-001-2 until such requirement is retired. In addition, there have been several proposals in the informal development of PER-005-1 that would expand the scope of applicability to include Generator Operators and Support Personnel. If R1 of PRC-001-2 is to be included in the new version of PER-005-1, the requirements of R1 could apply to additional functional entities. As such, any recommendation to move R1 of PRC-001-2 into the new version of PER-005-1 should be part of the PER-005-1 discussions that are currently taking place. At present, they are not. PacifiCorp would like to encourage more collaboration between drafting teams on the development of new draft standards and would like to thank the System Protection Coordination Standard Drafting Team for highlighting this recommendation.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
SERC RRO	Yes	Regarding the applicability to the Generator Operator, the registered function of the Generator Operator could exist as a centralized corporate function as well as a remote function at the generation station. The requirements are probably aimed at the remote function, but if the corporate function embodies an electrical design group that is ?familiar? with the protection systems ?in their area?, is that sufficient for compliance? The draft includes a description of applicable ?Facilities?, but the question still applies.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 6 above.		
Northeast Power Coordinating Council	Yes	There should be consistency between standards on this point.

Response: Thank you for your comment. Please refer to the responses for SRC comments.		

7. **The drafting team provided a measure to accompany Requirement R1 of PRC-001-2. (The language in the measure was modeled after the existing language in the RSAW for PRC-001-2.) Do you agree with this measure? If not, please provide specific suggestions for improvement in the comment area.**

Summary Consideration:

In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.

Organization	Yes or No	Question 7 Comment
Public Service Enterprise Group	No	? Requirement R1 requires that ?Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area.? This is too broad and vague with respect to which TOP, BA and GOP personnel are in the requirement?s scope. Subject to addressing PSEG?s additional comment of ?What is meant by ?familiar with? in R1?? in the bullet below, PSEG recommends that the requirement at least be revised to: ?Transmission Operator, Balancing Authority, and Generator Operator

Organization	Yes or No	Question 7 Comment
		personnel shall be familiar with the basic purpose and limitations of protection system schemes applied to the BES equipment and Facilities they control.?? M1 should describe methods other than documented training to meet R1 ? see the ?but not limited to? language. What is an alternative to documented training? What is meant by ?familiar with? in R1? Until ?familiar with? is better defined, M1 cannot be written.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Essential Power, LLC	No	a. Did you mean PRC-001-3? b. It is not necessary to separate "limitations" from "purpose" in the VSL, and recommend that a single Severe VSL be used to cover all of R1 by using the requirement R1 verbiage "?familiar with the purpose and limitations of ?" PRC-001 moreover should remain as is, with PRC-027 being applicable to GOs under only very limited circumstances, as stated above. c. The word ?area? in R1 of PRC-001-3 needs to be defined for compliance to be measured and enforced. The area for GOs should be restricted to the plants they own, if PRC-001 is modified (see other comments).
Response: Thank you for your comment. The drafting team did mean PRC-001-3. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
LG&E and KU Services	No	a. Did you mean PRC-001-3? b. The word ?area? in R1 of PRC-001-3 needs to be defined for compliance to be measured and enforced. The area for GOs should be restricted to the plants they own, if PRC-001 is modified (see other comments).
Response: Thank you for your comment.		

Organization	Yes or No	Question 7 Comment
The drafting team did mean PRC-001-3. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Ingleside Cogeneration LP	No	ICLP believes that the measure should identify that front-line operators are the target audience of the training. As a Generator Operator, we employ engineers, process developers, and operators ? and not all of these individuals require basic Protection System training. This ambiguity should be resolved while there is focus on PRC-001.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Xcel Energy	No	Since there are no guidelines on who ?applicable personnel? are, and there are no guidelines on what type of training is required and how often, this measure serves little purpose should be removed. Measures and VSLs are overly complex and will be difficult to effectively track as written.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
American Electric Power	No	The examples of evidence in Measure M1 appear to be overly simplistic compared to the potential scope of R1.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Northeast Power Coordinating Council	No	To specifically address Requirement R1, the Measure should be rewritten to stress that there be familiarity with the protection system schemes applied in its area. Suggest revising the Measure for Requirement R1 to read: Each Transmission Operator, Balancing Authority, and generator Operator shall have evidence that its appropriate personnel were made familiar with protection systems

Organization	Yes or No	Question 7 Comment
		in its area. That can be made easily auditable by having written summaries of the schemes, and have personnel sign offs after reading.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Tri-State G &T	No	Tri-State believes that the Requirement R1 and Measure M1 need to refer more directly to the Facilities included in the Applicability section. A couple of options are presented below. Option 1: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of the following protection system schemes applied in its area: • Protection Systems that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.) • Protection Systems used for underfrequency load-shedding systems installed per ERO underfrequency load-shedding requirements. • Protection Systems used for undervoltage load-shedding systems installed to prevent system voltage collapse or voltage instability for BES reliability. • Protection Systems installed as a Special Protection System (SPS) for BES reliability. • Protection Systems for generator Facilities that are part of the BES, including: o Protection Systems that act to trip the generator either directly or via lockout or auxiliary tripping relays. o Protection Systems for generator step-up transformers for generators that

Organization	Yes or No	Question 7 Comment
		are part of the BES. o Protection Systems for transformers connecting aggregated generation, where the aggregated generation is part of the BES (e.g., transformers connecting facilities such as wind-farms to the BES). o Protection Systems for station service or excitation transformers connected to the generator bus of generators which are part of the BES, that act to trip the generator either directly or via lockout or tripping auxiliary relays. If Option 1 is chosen, then the Facilities section in the Applicability can be removed. Option 2: M1. For Requirement 1, each Transmission Operator, Balancing Authority, and Generator Operator shall have evidence that may include, but is not limited to, documentation indicating that training in the purpose and limitations of the Protection System schemes included in the Facilities section of the Applicability that are used within its area was provided to its applicable personnel.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Independent Electricity System Operator	No	We do not agree with the proposed Measure for the reason as stated under Q6, above.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Southern Company	No	While we agree with the changes made to the applicability section and the measurement section, we believe that it is not necessary to separate "limitations" from "purpose" in the VSL, and recommend that a single Severe VSL be used to cover all of R1 by using the requirement R1 verbiage "?familiar with the purpose and limitations of ?". Will compliance be evidenced by training records for individuals,

Organization	Yes or No	Question 7 Comment
		the content of the training, or both? How might the "familiar with limitations" and "familiar with purpose" be separately evaluated in an audit?
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
SERC RRO	Yes	The requirement still calls for ?familiarity? with the protection systems ?in their area?. The extent of ?familiarity? comes into question as well as the question of what constitutes ?their area?. The newly crafted Measurement attempts to give some detail as to what that means. But if training is the expected means of achieving compliance, why not just require the training? And if training is expected, then the scope of that training should be related to application of a systematic approach to training, not a scope identified by the SDT, or an area arbitrarily selected by the auditors.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Ameren	Yes	(1) The measure was provided for PRC-001-3, not PRC-001-2.
Response: Thank you for your support. The drafting team did mean PRC-001-3. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
FirstEnergy Corp	Yes	Although we agree with the proposed change, we have reservations of having a standard with only 1 requirement. Please see our comments on Question #8.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Dominion	Yes	Dominion believes the reference to PRC-001-2 is incorrect and should be noted as PRC-001-3 as PRC-001-2, Page 11, cites ?Measures and Compliance Elements will be

Organization	Yes or No	Question 7 Comment
		added to a later draft.? Dominion supports the measure accompanying Requirement 1, as included in PRC-001-3. Dominion also notes that the reference to the RSAW for PRC-001-2 is incorrect and should reference the RSAW for PRC-001-1.Dominon was unable to locate a draft of RSAW PRC-001-2 or PRC-001-3 on the Standards Under Development NERC webpage or under any category, on the NERC RSAW page.
Response: Thank you for your support. The drafting team did mean PRC-001-3. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
ITC	Yes	ITC Holdings is in agreement to add the measure to the standard to be in-line with the language in the RSAW for PRC-001-2.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
DTE Electric	Yes	None
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Bureau of Reclamation	Yes	Reclamation thanks the drafting team for assisting Registered Entities with the transition from PRC 001 to PRC-027 by incorporating the RSAW language to ensure continuity of compliance.
Response: Thank you for your comment. Please see the statement related to the future of PRC-001 in the Summary Consideration for Question 7 above.		
Southwest Power Pool	Yes	While we concur with the proposed measure, there does appear to be a mismatch between the requirement and the measure. See our comment in Question 8 below

8. **If you have any other comments that you haven't already provided in response to the above questions, please provide them here.**

Summary Consideration:

There were numerous comments similar to those found in earlier questions. The drafting team responded to each of those comments below but they are not included in this summary for brevity.

Various commenters suggested minor revisions to the standard that were accepted by the drafting team, they include:

- Updated the Background section
- Modified Requirement 4 and separated it into two Requirements, R4 and R5 for clarity
- Modified the Figures and associated descriptions in the Guidelines and Technical Basis section to provide more clarity
- Changed the word "demonstrates" to "documents" in the definition of the PSCS
- Removed section 4.2.1 from the Facilities section of the Applicability
- Inserted the word "permanent" and the phrase "associated with the Interconnecting Element" in Requirement R3, Part 3.3
- Changed the word "modification" to "addition" in the new Requirement R5 (old Requirement R4, Part 4.2)

Some commenters believed the standard should not apply to separate functional entities within the same registered entity. The response explained that the drafting team does not agree because there are cases where the Transmission Owner and Generator Owner are part of the same Registered Entity but separate technical groups are involved in performing the required Protection System Coordination Studies. For the case where one registered entity representing multiple functional entities with the same protection group doing all the coordination, the drafting team included the following note: "In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS would be sufficient for use by all entities."

A few commenters continue to disagree with the 10% deviation trigger in Requirement R2. The threshold of 10% was selected based on the experience of drafting team members, discussions with members of various regional protection and control committees, and the recognition that there are margins of error in models and in protection system accuracies. The drafting team contends that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. No change was made to the standard.

Organization	Question 8 Comment
LG&E and KU Services	a. PRC-027-1, R3.3 should be limited to Protection Systems associated with Interconnected Elements b. There is no clear indication of need to change the present system. The SDT states on p.21 of PRC-027 that ?[t]he drafting team has no evidence there is widespread miscoordination between Owners of Facilities,? and ?records collected for reliability standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.? The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. c. Please retain one measure per requirement so that the Measurement numbers in PRC-027-1 match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts.
Response: Thank you for your comment. a. The drafting team made the suggested change to Requirement R3, Part R3.3. b. The drafting team discussed your suggestions and determined they are not feasible. c. The drafting team's method for writing and numbering the measures as well as the one you describe are both permissible. The drafting team prefers the method they have chosen.	
Seminole Electric Cooperative Inc.	(1) In proposed PRC-027-1 R2, Seminole believes that the Reliability Coordinator (RC) should have the responsibility of performing any studies or analyses and the distribution of those studies/analyses required under R2 instead of the Transmission Owner (TO). In peninsular Florida, the RC has access to the data needed for the analyses and having a single entity perform the analyses and distribution will assure uniformity across the region.

Organization	Question 8 Comment
	(2) In proposed PRC-027-1 R2-2.2.1., Seminole believes the 10% threshold for fault current is too low, as this percent change occurs daily. Seminole recommends the 10% threshold value be increased to 20% for fault current. (3) In proposed PRC-027-1 R2, is the 10% change in fault current study based on the individual TO?s system contribution as an island at the interconnection bus, or does it include all other interconnection that border the TO?s system that could provide fault current, i.e., how many buses out from the TO?s other interconnections does the study require for determining available fault current? (4) In proposed PRC-027-1 R2, Seminole believes that the requirements and guidelines for the Protection System Coordination Study (PSCS) need to be more specific and give additional detailed methodology. (5) In proposed PRC-027-1 R3-3.1, it should be noted that current and voltage ratio changes do not necessarily indicate a change in the protection system if the protective relay set points are adjusted accordingly. Therefore, R3-3.1 should be revised to reflect that certain ratio changes do not require notification.

Response: Thank you for your comment.

(1) The Functional Model assigns real-time operating responsibilities to the Reliability Coordinator, and Requirement R2 in PRC-027-1 is in the planning horizon. The drafting team assigned the responsibility of performing the short circuit studies in Requirement R2 to the Transmission Owner (TO) because the TO has all the data required to run the studies.

(2) The threshold of 10% was selected based on the collective experience of drafting team members, discussions with members of various regional protection and control committees, and the recognition that there are margins of error in models and in Protection System accuracies. As stated in the Guidelines and Technical Basis section of the standard, the short circuit studies performed for this function typically assume maximum generation and all Facilities in service. The drafting team contends that this value will not change daily. No change was made to the standard.

(3) The 10% change is based on the total Fault current available at the interconnecting bus.

(4) The drafting team contends the Guidelines and Technical Basis section of the standard provide sufficient guidance on the methodology of the PSCS and intentionally allowed flexibility for the entities to comply with the standard. No change was

Organization	Question 8 Comment
made to the standard. (5) The drafting team contends that any transformer ratio change that modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s) needs to be provided to the other entities associated with the Interconnecting Element(s). No change was made to the standard.	
Manitoba Hydro	(1) The wordings of the sentence ?Examples of Protection Systems where technical justifications may be used include? under heading ?Requirement R2 in the ?Application Guidelines? are unclear. MH suggests that It read as follows: ?Examples of Protection Systems that are not affected by the fault current change include?.Also, under the same section, it?s very confusing as to what relays the following refers to:4. Reverse power, definite time &/or time overcurrent elements: Designed to coordinate during maximum generation with the transmission system under normal operating conditions and includes the calculation of the percent deviation between the under single contingency conditions regardless of Fault current. Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.). (2) Protection System Coordination Study definition - for clarity, replace the word ?that? with the word ?which? and insert the word ?that? between ?demonstrates existing?. Moreover, consider replacing the words ?for clearing Faults? with ?during Faults? for consistency with the purpose of the Standard. The suggested definition should read ?A study which demonstrates that existing or proposed Protection Systems operate in the desired sequence during Faults. This definition should also be changed in the rational for R1 section and Implementation Plan document if it is an accepted change by the SDT. (3) Background - references are made to standards PRC-001, PRC-027, TOP-003, PRC-005, etc. in this section, which in some cases, do not include the title following the standard number. For consistency, the title should be included, or in the least referred to at the first instance of the standard number in this section. (4) Other Aspects of Coordination of Protection Systems Addressed by Other Projects -

Organization	Question 8 Comment
	replace the period ?.? at the end of the last paragraph with a colon ?:? .Moreover, follow each project number with its title for consistency and clarity. (5) R1.2 - the words ?Protection Systems? and ?Currents used? should be written as ?Protection System(s)? and ?Current(s) used? to maintain consistency with the rest of the paragraph.As a note, consider changing all instances of the words ?Protection Systems?, ?Currents?, ?owners? and ?Interconnected Elements? to ?Protection System(s)?, ?Current(s)?, ?owner(s)? and ?Interconnected Element(s)?, to maintain consistency throughout the document. (6) R2.1 - remove the words ?Protection System Coordination Study?, leaving only the acronym ?PSCS?, because it has been previously defined in the document. (7) R2.2.1 and M5 - add an ?s? or ?(s)? to both ?Protection System? and ?Interconnected Element?. (8) M4 - replace ?is? with ?includes? and ?that contains? with ?which contain?. (9) All measures - for consistency, the phrase ?may include, but is not limited to,? should be added to each measure. (10) R4.2 - place brackets around the ?s? in the following words ?modifications? and ?issues? for consistency with the rest of the document. Please continue this change throughout the Standard and Technical Guideline document for consistency. (11) 1.2 Evidence Retention - is it necessary to state that ?The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.? since this information is already included in the CMEP. (12) R4.2 and M10 - the words ?proposed changes and modifications? should be changed to ?proposed changes and additions? to mirror the wording in R3.1.

Organization	Question 8 Comment
Response: Thank you for your comment. (1) The drafting team contends the wording is clear and is not confusing. The conditions described in each of the bullets apply to any of the relays listed. No change was made to the standard. (2) The drafting contends the proposed definition is both technically and grammatically correct. No change was made to the standard. (3) The drafting team contends the standard number is sufficient to adequately reference the standards in the Background section. No change was made to the standard. (4) The drafting team made the suggested changes. (5) The drafting team made the suggested changes to Requirement R1, Part 1.2. (6) The drafting team made the suggested changes. (7) The drafting team made the suggested changes. (8) The drafting team contends that Measure M4 is accurate and grammatically correct as proposed. No change was made to the standard. (9) The drafting team included “may include, but is not limited to” only in instances where it believed the phrase was appropriate. No change was made to the standard. (10) The drafting team moved the content of Requirement 4, Part 4.2 to Requirement 5, and made your suggested changes. (11) This is “boiler plate” language used in the “Evidence Retention” section of all Reliability Standards. (12) The drafting team moved the content of Requirement 4, Part 4.2 to Requirement 5, and made your suggested changes.	
Ameren	(1) In Application Guidelines for R1, please add ?A Protection System Coordination Study includes, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed.? We request adding it just after the definition of a PSCS. This will more clearly align the Application Guidance with R1.2. (2) Under Requirement 2, studies are referred to as ?most recent? and ?present? which

Organization	Question 8 Comment
	is confusing and could be considered synonymous. We ask the SDT to change this terminology to replace ?most recent? with ?previous? study and ?present? with ?new? study in all places within the standard where they exist. (3) Requirement R3, 3.1 first bullet is both broad (new installation, replacement with different types) and specific (modifications to protective relays or protection functions settings, communications, CT/PT ratios). The 3.1 text itself clearly targets changes or additions to existing or new Facilities that modify conditions that impact coordination of Protection Systems. We request the SDT to replace the existing bullet points to clarify areas of this emphasis to these bullet points:?? Change in Protective Relay Types or Functions? Change in Communication System(s) that interface with Protection System(s)? Change in connected voltage (VT) or current (CT) source ratios? Change to transmission system Element(s) that alters impedance? Change to generator unit (s) that alters impedance, or? Change to generator step-up transformer (s) that alter in impedance? (4) We request the SDT to clarify 4.2 by combining 4.2.1 into it, thus removing the separate 4.2.1. Please reword as follows: ?These requirements contained herein are applicable to each 4.1 Functional Entity that owns Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.?

Response: Thank you for your comment.

(1) The Guidelines and Technical Basis section of the standard for Requirement R1, Part 1.2 indicates what minimum information must be included in the PSCS, and provides more detail rather than simply reiterating the language in the standard. No change was made to the standard.

(2) The drafting team used “present” to qualify the short circuit study and “most recent” to qualify the Protection System Coordination Study. These are two different studies. Only when the differential between the resulting values in the two types of studies exceeds 10% does a new Protection System Coordination Study need to be performed. No change was made to the standard.

(3) The first bullet contains changes made to the Protection System(s) component types, whereas the other bulleted items refer to

Organization	Question 8 Comment
different types of changes that could change the impedance in the system. No change was made to the standard. (4) Based on yours and other stakeholder comments, the drafting team revised the Applicability section to remove 4.2.1.	
Southern Company	(a) The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. (b) Please retain one measure per requirement so that the Measurement numbers match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts. (c) There is no equation found in R2.2. (d) In R3.3, it is not clear when the 30 days starts - is it the 30 days following the change(s)? (e) R3.3 should be limited to Protection Systems associated with Interconnected Elements. (f) 4.2 can hold an entity hostage if the other Interconnected Element owner does not/will not accept/reject the changes.
Response: Thank you for your comment. (a) In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another	

Organization	Question 8 Comment
	body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1. (b) The drafting team's method for writing and numbering the measures as well as the one you describe are both permissible. The drafting team prefers the method they have chosen. (c) The equation was initially missing in the posted version due to formatting errors that occurred during the posting process. The corrected standard was posted on the NERC web site on June 21, 2013. (d) The drafting team modified the language for clarity. Yes, within 30-days of making the change is correct. (e) The drafting team made the suggested change to Requirement R3, Part R3.3. (f) The drafting team acknowledges that entities may have differing protection philosophies. Based on yours and other stakeholder comments, the drafting team separated Requirement R4 into two Requirements, R4 and R5. The new Requirement R5 states that any identified coordination issues must be addressed prior to the implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element. The drafting team contends that any conflict resolution should be handled through normal business practices.
Pepco Holdings	1) The SDT states that ?the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays?. However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of ?the appropriate use of time delays in relays? in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was

Organization	Question 8 Comment
	not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS?s during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although PHI supports the overall desire to ensure that protective systems are ?properly coordinated?; PHI sees little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. The above comment was also submitted with Draft 1 of the standard. In their response the SDT stated that PRC-027 was being developed in response to FERC Order 693. However, Order 693 only directs NERC to address specific deficiencies in PRC-001 surrounding certain measures and levels of non-compliance relating to the notification and response to the detection of failures in relay protection systems. As such, PHI believes PRC-027 goes well beyond what is was directed by FERC, and the stated purpose of the SAR. PHI urges the SDT to revisit FERC Order 693 and revise this

Organization	Question 8 Comment
	standard as appropriate to address only the stated FERC directives. 2) Based on the arguments presented in the above comments, including the lack of historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions, PHI suggests that NERC conduct a Cost Effective Analysis (CEA) to provide information about cost impacts (e.g., implementation and ongoing compliance resource requirements) of this draft standard and its relative effectiveness in preventing widespread blackouts, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of this standard. 3) Requirement R2, Parts 2.1.1 and 2.1.2: Remove the term ?interconnecting bus? and replace it with the phrase ?point of interconnection between the Entities.? The point of interconnection between the entities is more descriptive in that the interconnection point may not be a physical ?bus?, but rather the terminals of a line disconnect switch, terminals of a breaker, specific transmission pole, etc. Even though the point of interconnection is often modeled in a short circuit program as a ?bus?, the term ?interconnecting bus? has no physical meaning. 4) Requirement R3, Part 3.3: A footnote should be added stating that this requirement does not apply to those temporary setting changes that sometimes are applied during commissioning, maintenance, or investigative testing activities to verify performance of individual protective elements, provided the original settings were returned upon the conclusion of the testing activity. For example, in multifunction relays when testing backup time delayed protective elements (i.e., zone distance or time overcurrent elements) it may be necessary to temporarily disable high speed elements (i.e., pilot or zone 1 elements). In response to this comment the SDT responded that it ?believes temporary settings changes are addressed in TOP-002, which incorporated Requirements R5 and R6 from PRC-001-1. Temporary settings applied (or changed) to perform maintenance testing of a relay would not have an effect upon overall coordination of the Protection System, as the relay would likely be taken out of service for such testing.? PHI agrees with this conclusion, however, this standard does not specifically exclude these

Organization	Question 8 Comment
	temporary changes from Part 3.3. Therefore an auditor may conclude that they are in scope for this standard. As such, PHI suggests Part 3.3 be qualified with a footnote to specifically exclude these types of temporary settings. 5) Based on the commentary accompanying Figure 3 in the Guidelines and Technical Basis document it appears that a Protective System Coordination Study (PSCS) is required only if there are protective systems installed on breaker C for the purpose of detecting faults on the BES system. Is there a recommended criteria or generation size below which there is no need for a PSCS, or for a dedicated ?fault protection system? at Breaker C to detect faults on the Interconnected BES element? For example, suppose all generation downstream of the Distribution Provider?s system is comprised of solar installations with non-islandizing inverters. In these cases, it would be unusual to install fault detection systems ?looking into? the BES system at breaker C even though there is generation installed downstream. The non-islanding inverters with 27/59 and 81O/U protection would isolate the generation upon loss of transmission source when Breakers A and B opened. Similarly, if a small synchronous generator was installed on a downstream distribution feeder with sufficient connected load to ?swamp? the generator upon the loss of transmission source, protective relays at the generator location, rather than at Breaker C, would operate to remove the generator upon loss of the transmission system source. In both of these examples, even though there may be overcurrent protection, or fuses, installed on the high side of the transformer for transformer faults, there is no dedicated fault protection system installed at breaker C for the purpose of detecting faults on the transmission system, and as such there would be no need for a PSCS. Is this correct?

Response: Thank you for your comment.

1) The reference to Recommendation 21C has been removed from the standard.

2) The drafting team forwarded your recommendation to NERC staff.

3) The drafting team contends that the figures in the Guidelines and Technical Basis section of the standard clearly illustrate the "interconnecting bus."

Organization	Question 8 Comment
4) The drafting team added the word "permanent" to Requirement R3, Part 3.3 to address your comment. 5) The drafting team intended Figure 3 to be interpreted as you suggest.	
Xcel Energy	1) PRC-027-1 R3.2 has a deadline based on the date of receiving a request. There should more details regarding what constitutes receiving a request. If informal channels are used, there may be disagreement about whether the 30 day deadline was met.The complexity of this standard becomes all the more evident when looking at ways to implement and track all the measures. For many of the measures, the only practical way to capture time frames is to tie communications with an interconnected entity to a task within an established schedule. Communications with interconnected entities will likely need to become more limited and formal to become more trackable. Bringing tractability to emails and other communications for evidence will be a significant issue, with the need to capture communications of out-side resources performing studies as well as the use of secure email requiring tedious offloading or screen captures of communications from secure servers. It would be recommended that acceptable evidence demonstrating the time frames should allow for documented processes along with activity schedules providing start and completion dates. More detailed evidence should be signed and verified studies, which indicate that validated models and remote settings have been utilized in the analysis. Here are our specific recommendations by requirement and measure: a) Requirement R1- R1.1.3- It would be recommended to be consistent with the time frame as specified in 1.1.2 and change the specified calendar months to read ?or within 12 calendar months of being notified of a change as described in Requirement R3, Part 3.3.? M1, M2 - Acceptable evidence demonstrating time frames should allow for documented processes along with activity schedules providing start and completion dates. (VSL) Violation Security Levels- Each security level should provide consistent time frames to avoid confusion in tracking. b) Requirement R2 ?R2.2- Allowance should be made to allow for tracking of fault level trends at the bus based on a 10% change in fault level for the year of the coordination study. M5 - Acceptable evidence demonstrating time frames should allow for

Organization	Question 8 Comment
	documented processes along with activity schedules providing start and completion dates.(VSL) Violation Security Levels- Each security level should provide consistent time frames to avoid confusion in tracking. c) Requirement R3 ?M7 ? A data request should indicate that it is being made per requirement R3 of PRC-027 to be measured under M7. M6, M7, M8- Acceptable evidence demonstrating time frames should allow for documented processes along with activity schedules providing start and completion dates. d) Requirement R4?R4- Study submittals should be required to stipulate that the study is being submitted per requirement R4 of PRC-027 to be measured under M9. M9, M10-Acceptable evidence demonstrating that the time frames have been met should allow for documented processes along with activity schedules providing start and completion dates. 2) 4.2.1 Applicability: For Generator Owners, many elements that are covered under the PRC-019, PRC-024 and PRC-025 (and future Phase 3 Loadability Standards) also fall under the Facilities Section of this draft of PRC-027-1, as the functions exist for the sole purpose of allowing coordination for faults to clear external to the generator. The elements covered by other standards should be excluded from applicability, in order to avoid a double jeopardy situation.Instead, we recommend that a list of applicable elements be identified. Typical functions are identified below. We believe these to be the only functions applicable to the standard as far as a GO is concerned.- Ground Time Overcurrent Relay ? (Directional Towards the System) (51G) - Neutral Time Overcurrent Relay ? (Directional Towards the System) (51N) - Ground Directional Time Overcurrent Relay ? Directional Toward Transmission System (67G) - Negative Phase Sequence Overcurrent (46) In addition, please consider adding a list of excluded elements, such as these:- Phase Distance (21) (Covered under PRC-025) - Volts/Hz (24) (Covered under PRC-024) - Undervoltage (27) (Covered under PRC-024) - Reverse Power (32) (Not applicable to standards as it is protection for the generator) - Loss of Field (40) (Covered under PRC-019) - Inadvertent Energization (50/27) (Not applicable to standards as it is protection for the generator) - Breaker Failure (50BF) (Not applicable to standards as it is protection for

Organization	Question 8 Comment
	the generator) - Phase Time Overcurrent Relay (51) (Covered under PRC-025) - Phase Time Overcurrent Relay ? Voltage-Restrained (51V-R) (Covered under PRC-025) - Phase Time Overcurrent Relay ? Voltage Controlled (51V-C) (Covered under PRC-025) - Overvoltage (59) (Covered under PRC-024) - Field Overvoltage (59E) (Covered under PRC-019) - Stator Ground (59GN/27TH/64S) (Not applicable to standards as it is protection for the generator) - Field Ground (64F) (Not applicable to standards as it is protection for the generator) - Phase Directional Time Overcurrent Relay ? Directional Toward Transmission System (67) (Covered under PRC-025) - Field Overcurrent (76E) (Covered under PRC-019) - Out of Step (78) (Covered under Future Phase 3 Loadability Standards) - Frequency (81) (Covered under PRC-024) - Differential (87) (Not applicable to standards as it is protection for the unit) Alternatively, perhaps a table listing excluded elements could be added to the back of the standard, and referenced in the 4.2.1 Applicability section. Here is an example of what 4.2.1 might look like: ?4.2.1 Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements with the exclusion of the elements listed in table XXX. ? 3) Regarding R2 M3 - Our technical justification to exempt the above excluded elements is: a) duplication in applicability to other standards, and b) the type of fault. Mandating technical justification beyond these two points puts an unnecessary burden on industry resources.

Response: Thank you for your comment.

1) Measures support requirements by providing examples of evidence that can be used to demonstrate compliance; they are not mandatory or enforceable. For some requirements, only one type of evidence may be acceptable but for many requirements, a range of evidence could be acceptable and a phrase such as “evidence that may include, but is not limited to…” is used in the measure.

<table>
<tr><th>Organization</th><th>Question 8 Comment</th></tr>
<tr><td colspan="2">a) While most changes associated with Requirement 3, Part 3.3 may not impact Protection System coordination; the drafting team contends these changes need to be communicated. If a new PSCS is required, then the six month window (Requirement R1, part 1.1.4) is more appropriate than a twelve month window because a Protection System change has been made - not just a modeled change in Fault current. The drafting team contends the evidence suggested in the measure is appropriate and necessary to show that the PSCS has been completed. The drafting team contends that the varying time frames for the different parts of Requirement R1 are appropriate based on the different actions and the associated time frames of those actions. No change was made to the standard.

b) The change in Fault current is based on the cumulative change in Fault current since the last PSCS because Fault currents can gradually change based on system modifications that are unrelated to interconnections. Those Fault currents could be significantly different from the most recent PSCS even though an annual change may never reach the 10% threshold. The drafting team contends the evidence suggested in the measure is appropriate and necessary to show that the PSCS has been completed. The drafting team contends that the varying timeframes for the different parts of Requirement R1 are appropriate based on the different required action time frames in the different parts. No change was made to the standard.

c and d) The drafting team believes that the format of the data request is best left to the requesting entity and that the evidence suggested in the measure is appropriate and necessary to show that the PSCS has been completed. No change was made to the standard.

2) In reference to the Standards noted (PRC-019,024,025), the drafting team does not believe there is conflict. The noted standards (PRC-019,024,025) provide guidance for the setting of certain control and protection functions related primarily to generator capabilities, not for the coordination of Protection Systems with other owners for performance during Faults. The drafting team did not include a list of protection functions included or excluded; however such guidance can be found in the NERC Technical Reference Document written titled “Power Plant and Transmission System Protection Coordination” written by the System Protection and Control Subcommittee. Specific to one example that was noted: Back-up Distance (21) - although other standards may provide guidance on the setting of this function from a loadability perspective, the drafting team contends that it is important to coordinate this setting with other owners to ensure the setting (both reach and time) does not cause the generator to trip for normally cleared Transmission System Faults.

3) Please see the response immediately above.</td></tr>
<tr><td>Kansas City Power and Light</td><td>1) The definition of Protection System Coordination Study should be changed to ?A study that documents the intended sequence of operation for clearing faults of an existing or</td></tr>
</table>

Organization	Question 8 Comment
	proposed Protection System.? The word ?demonstrates? implies that live testing should be conducted to prove the sequence of operation. 2) In the Rationale for R1, Part 1.1.2, the following portion should be deleted, ?e.g. when a line is protected by dual current differential systems with no backup elements set that are dependent upon fault current.? The deleted portion should be replaced with ?Refer to the Application Guidelines for Requirement R2 for examples of protection systems where technical justifications may be used.? 3) Requirement R2 specifies a 10% change in fault current as the trigger for a review of the Protection Coordination. We believe that the only time that a Protection Coordination Study should be required is if the fault current increases by more than 10%. Fault studies are typically conducted with all generation on, but we know that this is not the normal system configuration year round and the system could be operating below the 10% fault current threshold. Unit outages are anticipated and fault detecting elements are set to operate even during outage conditions. Elements that coordinate at higher fault current values will coordinate at reduced values. Our suggested change would not preclude a Registered Entity from initiating a Protection Coordination Study upon the reduction of fault current by 10%.
Response: Thank you for your comment. 1) The drafting team accepted your suggestion and changed and the word "demonstrates" to "documenting" in the definition. 2) The drafting team incorporated your suggested change. 3) The Guidelines and Technical Basis section of the standard indicate that the short circuit studies performed for this function typically assume maximum generation and all Facilities in service. The drafting team contends that if changes are made to the Transmission system that result in lower Fault currents for those conditions that reach the trigger threshold, then a new PSCS is required. No change was made to the standard.	
Dominion	1). Under Requirement 2 (Page 8 of Redline Version), studies are referred to as ?most recent? and ?present? which is confusing and could be considered synonymous. Recommend changing this terminology to replace ?most recent? with ?previous? study

Organization	Question 8 Comment
	and ?present? with ?new? study in all places within the standard where they exist. 2). Requirement R3, 3.1 first bullet (Page 10 of Redline Version) is both broad far reaching (new installation, replacement with different types) and specific (modifications to protective relays or protection functions settings, communications CT/PT ratios). 3.1 Clearing targets changes or additions to existing or new Facilities that modify conditions that impact coordination of Protection Systems. Recommend changing bullets to clarify areas of this emphasis to:? Change in Protective Relay Types or Functions? Change in Communication System(s) that interface with Protection System(s)? Change in connected voltage (VT) or current (CT) source ratios? Change to transmission system Element(s) that alters impedance? Change to generator unit (s) that alters impedance? Change to generator step-up transformer (s) that alter in impedance 3). In Application Guidelines ? Example Process (Page 30 of Redline Version) the second bullet indicates that a single study can be used whereas in R1 1.1.3 it states that ?each? entity shall perform a PSCS. Recommend clarification in this example to reflect Note that is included in Rational for R1 that indicates in cases where a single group performs overall study for the interconnection for both entities. This reference may lead to confusion in the example. 4). Wording is confusing in PRC-027-1 Applicability Section (Page 3 of Redline Version). Suggest combining 4.2 and 4.2.1 into something like ?Protection Systems owned by the Functional Entities in 4.1 are applicable if they are installed for the purpose of detecting Faults on Interconnected Elements of the BES and require coordination for isolating those faulted Elements?. 5). There are numerous locations in the standard that note that ?Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.? Given the complexities of system configurations, it is not always the case that this scenario (Max Gen and All Facilities In) will be the best case under which to verify proper coordination. Recommend removing this note and require entities to determine the best scenario under which to evaluate coordination. The presence of this

Organization	Question 8 Comment
	note may create unintended bias. 6). Dominion agrees with SERC PCS comment: ?Please change Figures 3 and 4 in the Applications Guidelines section so that ?Interconnected Element? is adjacent or points to the line between Breaker C and the point of connection (tap point) on the line between Breakers A and B. It clarifies these examples by having the Figures align with your wording. (The Figures presently imply that the line between Breakers A and B is the ?Interconnected Element?.)
Response: Thank you for your comment. 1) The drafting team used “present” to qualify the short circuit study and “most recent” to qualify the Protection System Coordination Study. These are two different studies. Only when the differential between the resulting values in the two types of studies exceeds 10% does a new Protection System Coordination Study need to be performed. No change was made to the standard. 2) The first bullet contains changes made to the Protection System(s) component types, whereas the other bulleted items refer to different types of changes that could change the impedance in the system. No change was made to the standard. 3) The drafting team believes that the Note in the rationale box for Requirement R1 and the second bullet in the Example Process are worded adequately and sufficiently to avoid any confusion about what is required. No change was made to the standard. 4) Based on yours and other stakeholder comments, the drafting team revised the Applicability section to remove 4.2.1. 5) The drafting team recognizes that engineering judgment will be used by entities when modeling the system for the PSCS. Since at least two entities will be performing or reviewing the PSCS, the drafting team believes that an appropriate system configuration will be used. There is no way to measure whether entities have determined “the best scenario under which to evaluate coordination.” No change made to the standard. 6) The drafting team revised Figures 3 and 4 to indicate that the tap line is the Interconnecting Element.	
Bureau of Reclamation	1. Reclamation requests that the drafting team clarify what "acceptable evidence" it envisions for PSCSs. For an example, is a PSCS acceptable if the document contains (a) Date of study,

Organization	Question 8 Comment
	(b) Deviation of short-circuit currents, (c) System change, (d) all recipients, etc. We appreciate if you can include an example form/document as acceptable evidence. Reclamation would appreciate if the drafting team added a sample PSCS template that would be considered acceptable evidence. 2. In order to avoid similar vagueness of coordination issues that were problematic under PRC-001, Reclamation would appreciate if the drafting team clarifies what a PSCS should contain (e.g. which relay element(s) is required to coordinate with, how to show it as the evidence, etc.)The PRC-025 documents may provide helpful examples. 3. Regarding R1 & M1, if a PSCS shows no impact on the existing coordination (no setting changes are required), would an entity still have to send neighboring utility(s) the entire PSCS supporting study or would a brief statement of the study results suffice? Reclamation requests that the drafting team clarify the acceptable evidence. 4. Reclamation suggests that R2 should be revised to read, ?For each interconnected element on its System, the TO shall, once every 60 calendar moths, technically justify if a fault current has changed more than 10% but does not affect to the Power System coordination, or ?? rather than "techincally justify why Fault current does not affect the Protection System coordination." 5. Reclamation requests clarification of the items requiring coordination listed in R3.1. Reclamation believes that the current list implies that any changes in relay equipment or settings would require coordination.

Response: Thank you for your comment.

1. The drafting team does not believe it should prescribe the entire content (inputs or results) of the PSCS. The minimum elements of a PSCS summary are listed in Requirement R1, Part 1.2 and additional information is provided in the Guidelines and Technical Basis section of the standard in the section for Requirement R1. No change was made to the standard.

Organization	Question 8 Comment
2. The drafting team does not believe it should prescribe the entire content (inputs or results) of the PSCS. The minimum elements of a PSCS summary are listed in Requirement R1, Part 1.2 and additional information is provided in the Guidelines and Technical Basis section of the standard in the section for Requirement R1. No change was made to the standard. 3. Requirement R1, Part 1.2 only requires that a summary of the PSCS be provided to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s), regardless of whether there was impact on the existing coordination. No change was made to the standard. 4. The drafting team revised Requirement R2 to eliminate the use of a technical justification. 5. Your interpretation of Requirement R3, Part 3.1 is correct. Please reference the Guidelines and Technical Basis section of the standard in the section for Requirement R3 for more information.	
Bonneville Power Administration	1. The definition of Protection System Coordination Study is inadequate because it does not address what type of faults must be studied or where on the system the faults need to be applied. 2. R1.1.2 uses the term interconnecting bus. This is not a common term and requires a definition.
Response: Thank you for your comment. 1. The drafting team believes that the definition, as written is adequate. The NERC Glossary of terms "Fault" is used to include all types and locations of Faults. 2. The drafting team believes that the figures in the Guidelines and Technical Basis section of the standard clearly illustrate the "interconnecting bus."	
Exelon and its Affiliates	a. For voltage levels at 345Kv and above (EHV), our standard Protection System design utilizes two high-speed pilot schemes, and includes time-delayed backup protection. Due to pilot scheme redundancy, the operation of time-delayed backup elements is an extremely rare event. Our time-delayed backup protection is intended to serve only as a safety net for extreme events and we do not believe it is cost effective to study time coordination of these elements across our EHV systems. We believe that in cases where high speed protection schemes are redundant, that is designed such that loss of a single

Organization	Question 8 Comment
	relay or auxiliary relay will not result in relying on time-delayed backup relaying to clear faults, the study of back-up element coordination is not necessary and the completion of a PSCS should not be required. b. Additionally, we believe Requirement 1 should state how many protection system failures must be considered for a PSCS. We believe that only one failure is appropriate for the reasons discussed above. c. PRC-001: The proposed Violation Severity Levels for PRC-001-3 R1 are not commensurate with the draft Measure of the Requirement. The current VSL is ?High? for failure to be ?familiar with the limitations of the protection system schemes applied in its area? and ?Severe? for failure to be ?familiar with the purpose of protection system schemes applied in its area.? The draft Measure states that the applicable entity ?shall have evidence that may include, but is not limited to, documentation indicating that training in basic relaying and any Special Protection Systems within its area was provided to its applicable personnel.?The VSLs should be revised to align with the Measure and the ?intent? of the Standard and not effectively split out the purpose of Requirement R1 thus requiring specific documentation for a ?purpose? and a ?limitation?. Exelon suggests the VSLs be revised to the following: Severe: The responsible entity failed to provide evidence that any training evidence exists for basic relaying and any Special Protection Systems within its area. High: The responsible entity failed to provide evidence that all applicable personnel were trained in basic relaying and any Special Protection Systems within its area d. PRC-001: In the Background Section of PRC-027-1 there is a discussion related to PRC-001-1 that was revised as part of Project 2007-03. Specifically, it is stated that in Project 2007-03 SDT retired PRC-001-1 Requirement R2 as because this Requirement addresses data and data requirements that are included in the proposed Reliability Standard TOP-003-2; however, the justification provided in the mapping document associated with Project 2007-03 does not seem to meet the original intent of PRC-001 R2, and does not seem to be a "relocation" of the original requirement (refer to Project 2007-03 Mapping

Organization	Question 8 Comment
	Document Draft 7). PRC-001-1 R2 current revision is as follows:R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. The Background Section of PRC-027-1 further states that the SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new Standard. The current revision to PRC-001-2 that removed Requirement R2 was not fully addressed by Project 2007-3 nor voted on by the Ballot Body and therefore Exelon requests that PRC-001-1 R2 be added back in to PRC-001-3 and Project 2007-06, similar to Requirement R1, until its reliability objective by similarly addressed by either a revision or development of a new Standard.

Response: Thank you for your comment.

a. The drafting team contends that the initial PSCS required in Requirement R1, Part 1.1 must be completed to ensure that present coordination exists. If, during that PSCS, the entity can confirm that the coordination is not affected by changes in Fault current, then the entity can apply that technical justification to Requirement R1, Parts 1.1.2 or 1.1.4. The application of redundant Protection Systems does not preclude the necessity of ensuring that your Protection Systems are coordinated.

b. The drafting team does not believe that it should prescribe the details of performing PSCS and leaves that to the engineering judgment of the entities performing the PSCS. No change was made to the standard.

c. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1.

Organization	Question 8 Comment
	However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1. d. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Essential Power, LLC	a. R3.3 should be limited to Protection Systems associated with Interconnected Elements. b. There is no change needed to the present system:-The TOP is provided with detailed information of GO equipment via PRC-001 and MOD-010, and the TO (being informed of

Organization	Question 8 Comment
	these inputs by the TOP) is then at liberty to modify their Protection Systems if needed. - We periodically request data for available fault current at the interconnect point from the TO, for use in our aux system short circuit studiesChanges in the T&D system otherwise don?t matter to GOs. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO?s system. The most that could reasonably be asked of independent GOs is to have a valid Interconnection Service Agreement (ISA), since a coordination study is performed by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so detailed evidence could not be asked of the GO.The SDT states on p.21 of PRC-027 that ?The drafting team has no evidence there is widespread mis-coordination between Owners of Facilities,? and, ?records collected for reliability standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.? This appears to indicate that the present system is working and therefore there is no need to go back to existing unit?s coordination studies to make sure they crossed all of the T?s and dotted all of the I?s according to a standard that retroactively applies requirements that were not in existence at the time of the original coordination studies. c. The purpose statement for PRC-001-3 needs to be changed to match the content of the sole requirement. If this one requirement is to be absorbed by PER-005, consider keeping the purpose and moving the content of PRC-027 back into PRC-001. Please retain one measure per requirement so that the Measurement numbers match the base requirement number. The evidence required for each sub part of each base requirement can be described in the same section as the other sub parts.

Response: Thank you for your comment.

a. The drafting team made the suggested change to Requirement R3, Part R3.3.

b. The standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of

Organization	Question 8 Comment
Protection Systems that affect the reliability of the BES. c. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.	
Associated Electric Cooperative, Inc.	AECI seeks additional clarify of the SDT's intent as to how base PSCS requirements are to be applied within a JRO, and if R1-R2 serves legitimate reliability function, where R1.1.3, & R3-R4 do not apply to intra-JRO interconnected elements because JROs already internally do these; a JRO would still perform R1.1.3 & R3-R4 for interconnected elements with other registered entities; also clarify that R1 would only require one ?master? PSCS for the JRO as opposed to multiple studies for each functional entity within the same JRO.
Response: Thank you for your comment. The Joint Registration Organization (JRO) is responsible for coordinating all of the Protection Systems associated with Interconnecting Elements between the JRO and its neighboring entities (external to the JRO), and between the applicable internal JRO registrations (e.g., Transmission Owner, Generator Owner).	

Organization	Question 8 Comment
ATCO Electric	Can the drafting team draw all timelines in 4 requirements together in a chart to see how these timelines fit together for an entity?
Response: Thank you for your comment. Please reference the Process Flow Chart in the Guidelines and Technical Basis section of the standard as it is a representation of the process, including the relationships between requirements and timeframes.	
DTE Electric	Comments: Different entities that are highly integrated electrically should be using the same short circuit data. If fault data files could be exchanged regularly (bi-annually?) using compatible file formats, short circuit databases wouldn't drift apart (as would occur after five years) and coordination studies could be performed with more confidence. Many settings could require re-visiting when the once every five year fault current update is received. It should be noted that while the emphasis is on BES Interconnected Elements, many other non-BES Interconnected Elements, such as radial distribution transformers, could be affected resulting in a negative impact on the BES.
Response: Thank you for your comment. The drafting team agrees with your comments and believes PRC-027-1 addresses your concerns. While Requirement 2 provides for the 60-month periodic review of Fault currents, Requirement 3 mandates the details of any proposed change(s) or addition(s) at an existing or new Facility associated with the Interconnecting Element (that would modify the conditions used in the coordination of Protection Systems associated with the Interconnecting Element) be provided to the other owner(s) of the Protection Systems associated with Interconnecting Element(s). The drafting team believes the exchanges of information outlined in these requirements will better enable entities to keep short circuit databases aligned. This standard addresses only BES Facilities; however, the established processes could be used for non-BES Facilities as well.	
Texas Reliability Entity	How many buses away from the Interconnect Element does the PSCS need to cover? Figure 5 of the Application Guidelines indicates that only the next adjacent bus is to be included in the PSCS, which implies that the PSCS only covers up to Zone 2. We understand that PRC-027 does not tell any owner how to perform a PSCS or dictate the specific information that is required for a PSCS. It appears from our understanding that the coordination of protective relays beyond the primary zones that affect the

Organization	Question 8 Comment
	interconnected element are the responsibility of the equipment owner, and that it is up to the owner to determine whether these settings are to be shared with other entities for the interconnected element. Please clarify if this understanding is correct.
Response: Thank you for your comment. Your understanding of the equipment owner responsibilities for performing a PSCS in accordance with the draft standard is correct.	
Dynegy	If a Generator Owner does not own a Protection System associated with an Interconnected Element, does the Standard apply? For instance, if the generator breaker opens only for faults on the Generator Owner side of the breaker (i.e., GSU or generator faults). Is it expected most GOs will own Protection Systems associated with an Interconnected Element?
Response: Thank you for your comment. Per the Applicability section, the standard only applies to the Protection Systems owned by a Transmission Owner, Generator Owner, or Distribution Provider that are "installed for the purpose of detecting Faults on Interconnecting Elements of the BES and that require coordination for isolating those faulted Elements". The drafting team does expect that most Generator Owners will own applicable Protection Systems.	
Illinois Municipal Electric Agency	1. Illinois Municipal Electric Agency (IMEA)supports comments under Question 8 submitted by the SERC EC Protection and Control Subcommittee. 2. Also, IMEA requests that Figure 3 be modified or a separate figure be included to clarify guidelines for DP systems that include only non-BES generation. 3. IMEA also requests that Applicability Section 4.2.1 be revised to prevent inconsistency with the FERC-approved interpretation of transmission Protection System as specified in PRC-005-1b. Very specific attention/consideration needs to be given to avoiding unnecessary expansion of applicability to facilities owned by small Distribution Providers; i.e., unnecesarry expansion of scope to protective devices owned by a DP that have no potential adverse impact on the BES. Both FERC and NERC have stated the need to minimize impacts on small entity

Organization	Question 8 Comment
	resources.

Response: Thank you for your comment.

1. Please see the response to the (SERC RRO) comments submitted by the SERC Protection & Control Subcommittee.
2. If a Distribution Provider's system includes only non-BES generation, and the associated Protection Systems are not installed for the purpose of detecting Faults on Interconnecting Elements of the BES, this standard would not apply to coordination of those Protection Systems. Whether or not the generator in Figure 3 is BES or not does not determine the Distribution Provider's applicability to this standard; the determinant is whether or not the associated Protection Systems are installed for the purpose of detecting Faults on Interconnecting Elements of the BES.
3. The term "transmission Protection System", to which the interpretation you reference applies, is not used in the Applicability section or anywhere else in PRC-027-1. Therefore, the draft standard contains no inconsistencies with the FERC-approved interpretation, which was issued to clarify the use of the term in Reliability Standards PRC-005-1b and PRC-004-2a. Per the Applicability section of PRC-027-1, the standard only applies to the Protection Systems owned by a Transmission Owner, Generator Owner, or Distribution Provider that are "…installed for the purpose of detecting Faults on Interconnecting Elements of the BES and that require coordination for isolating those faulted Elements."

Organization	Question 8 Comment
Lincoln Electric System	In consideration that the rationale for Requirement R1 Part 1.1.1 acknowledges that the drafting team has ?no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements?, LES recommends further development of the standard be halted until sufficient technical justification can be provided for the standard?s development. As currently drafted, the drafting team would place excessive documentation requirements on registered entities for activities already being performed as industry best practices. In lieu of turning those best practices into compliance requirements, LES suggests the drafting team leverage existing Reliability Standard PRC-001 as a basis for system protection coordination.

Response: Thank you for your comment.

PRC-027-1 is replacing the requirements of PRC-001 that are associated with actual coordination of Protection Systems necessary for proper performance during faults. In doing so, the drafting team is leveraging PRC-001 as a basis for system protection coordination as well as following the recommendations of the NERC System Protection and Control Task Force (now the System Protection and

Organization	Question 8 Comment
Control Subcommittee – SPCS) in its 2007 *Assessment of Standard PRC-001-0 – System Protection Coordination*, and addressing observations from the Commission in FERC Order 693. The Project 2007-06 – System Protection Coordination drafting team has taken this course after consultation with both NERC and FERC staffs. The drafting team contends that this standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.	
FirstEnergy Corp	In regard to PRC-027-1: 1. We believe that R3, Part 3.1 is covered in R1, Part 1.2 2. …and propose that R4, part 4.2 be reworded to: 4.2. Prior to implementing any proposed change (s) or modifications associated with Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues In regard to PRC-001-3: 3. The title for PRC-001 "System Protection Coordination" and the purpose statement of this standard is no longer pertinent for the only requirement that remains in the standard - entity familiarity with the purpose and limitations of protection system schemes. This remaining requirement is essentially a training obligation and better suited in a PER standard if deemed necessary for reliability. The drafting team also appears to support this view as discussed in the background statements of the PRC-027-1 standard, however, believes this additional work is outside the scope of its project. However, the PRC-001-3 standard should not be left with a title and purpose statement that will cause industry confusion with PRC-027-1. We suggest that this team adjust PRC-001-3 to include the title ?System Protection Awareness? and a purpose statement of ?To ensure entity understanding of system protection schemes applied to their assets.?FE believes the continuing need for this requirement (PRC-001-3 R1) needs to be carefully considered. NERC standards PRC-023 and PRC-25 address relay loadability limitations. The original blackout report recommendation that

Organization	Question 8 Comment
	drove this requirement appears to now be more thoroughly addressed by those standards. We encourage the NERC Standards Committee to extend the scope of this drafting team?s work through a supplemental SAR to address whether or not PRC-001 can be retired.

Response: Thank you for your comment.

1. Requirement R3, Part 3.1 stipulates that Transmission Owners, Generator Owners, and Distribution Providers with applicable Protection Systems must provide information regarding proposed system changes or additions that may affect the other owner(s) associated with an Interconnecting Element. The objective of this requirement is to enable the process of conducting Protection System Coordination Studies (PSCS). Whereas Requirement R1, Part 1.2, requires Transmission Owners, Generator Owners, and Distribution Providers with applicable Protection Systems to provide a summary of the results of the PSCS after the study has been completed (within 90 calendar days). Therefore, these two requirements are not synonymous.
2. For clarity, the drafting team removed Requirement R4, Part 4.2 and created new Requirement R5, which states: "Each Transmission Owner, Generator Owner, and Distribution Provider that received a response per Requirement R4, shall address any identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element."
3. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal

Organization	Question 8 Comment
of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.	
Duke Energy	1. In the interest of clarity, Duke Energy feels an example of acceptable evidence for measure 3 of PRC-027-1 R2 would be beneficial. 2. In PRC-027-1, Duke Energy identified a potential gap in Figure 4 of the Application Guidelines. Duke Energy believes that without coordination between the DP and TO, it could lead Transmission Planners and System Protection Engineers to disregard the coordination with protection for the tap line between BES and non-BES equipment. Given the proposed definition of the BES, this scenario could potentially pose a risk to the BES without the proper coordination identified in PRC-027-1.
Response: Thank you for your comment. 1. The drafting team removed the option of performing a technical justification from Requirement R2 and consequently removed the associated Measure M3. 2. Because there are no Protection Systems at Breaker C that protect for Faults on BES Elements, the subject Protection Systems are not applicable under this standard. The drafting team understands the commenter's point; however, this standard only applies to Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements.	
Nebraska Public Power District	My general impression is this standard could be quite a burden to track data for an audit due to the numerous time lines specified that are between entities. My opinion is this will likely result in a difficult to audit standard. This causes concern if we remain in a zero tolerance compliance environment. Consider changing some of the time lines such as 30 and 90 days to 6 months. My general feeling is we should consider other ways to simplify this standard however suggestions I have made have not made it into the draft standard. I recommend more consideration be given to simplification.
Response: Thank you for your comment. A process flowchart is included in the Guidelines and Technical Basis section of the standard to show the relationship between the	

Organization	Question 8 Comment
requirements. The drafting team contends the specific time frames are appropriate and relevant for the reliability-related tasks in each of the requirements. The Rationale boxes for each requirement provide the drafting team's reasoning for the different time frames.	
PJM Interconnection	PJM supports both standards as drafted. Specific to PRC-001-3 R1, PJM urges the SDT to replace the term ?familiar? with language less subjective. There may be a number of interpretations for this term that will result in compliance issues for applicable entities. Suggested revised wording should include language that has a direct tie to the Measure. PJM recommends the following revised requirement for the applicable entities, ?knowledge of the purpose of and limitations of protection system schemes shall be based on the training programs provided.?
Response: Thank you for your comment. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.	
SERC RRO	Please change Figures 3 and 4 so that ?Interconnected Element? is adjacent or points to

Organization	Question 8 Comment
	the line between Breaker C and the point of connection (tap point) on the line between Breakers A and B. It clarifies these examples by having the Figures align with your wording. (The Figures presently imply that the line between Breakers A and B is the ?Interconnected Element?.)The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: Thank you for your comment. The drafting team revised Figures 3 and 4 to indicate the tap line is the Interconnecting Element.	
American Electric Power	1. PRC-001-3: R1 ? The term ?protection system? should be capitalized to match previous versions of this standard. 2. PRC-027-1: Mapping Document ? The verbiage in R1.1 of the mapping document does not match the wording in the proposed standard: ?Protection System Study? is used instead of ?PSCS?. 3. PRC-027-1: Figure 2 ? The phrase ?generator Protection Systems? is often used by Generation Owner relay engineers to mean the Protection Systems installed for the purpose of detecting faults on and protecting the physical generator, which is clearly outside of the scope of this standard. Therefore, AEP recommends changing the verbiage associated with this figure to remove the phrase ?generator Protection Systems? and replace it with a reference to Generator Owner R?s Protection Systems installed for the purpose of detecting faults on the Interconnected Elements. Suggested wording is shown below: Transmission Owner S is to review the Protection System settings associated with Breaker A *and the Interconnected Element* (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop proposed Protection System settings associated with Breaker C. Generation Owner R is to review the Protection System settings associated with

Organization	Question 8 Comment
	Breaker C *and the Interconnected Element* (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A. 4. PRC-027-1: R3 & Figure 5 ? As written, R3 will place undue burden on each TO, GO and DP to maintain a list of all other entities connected to each interconnecting bus to which they connect. Furthermore, since the elements are typically owned by the TO, burden will be placed on the TO to respond to requests from other TO?s, GO?s and DP?s as they build their list. R3 and its? associated Figure 5 should be revised such that the responsibility lies with the owner of the Interconnected Element to ensure that relevant information is passed along to each entity who connects to the element when any one entity makes a change.

Response: Thank you for your comment.

1. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC’s Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the “Effective Date” and “Compliance” sections of the standard is included with this fourth posting of PRC-027-1.

Organization	Question 8 Comment
2. The drafting team made the suggested revision to the mapping document. 3. The drafting team sees no benefit in making the suggested change and believes your issue is addressed by the Applicability section of the standard which specifies the Facilities included in this standard. 4. The drafting team contends that entities making changes or additions to Protection Systems associated with an Interconnecting Element must communicate the proposed changes to the other interconnected owner. As noted in Figure 5, it may be necessary for that other interconnected owner to forward the provided information to the other owners.	
Northeast Power Coordinating Council	1. PRC-027-1 in its entirety needs a quality review. Requirement R2 is not written correctly--it does not refer to the entities first. Also, each Requirement has multiple numbered Measures. 2. The Requirement also states that the functional registration (e.g. GOP) has to demonstrate compliance, not the individual operators. If it is the intent of the Standard that each individual operator of an entity be familiar this should be added. By stating the functional registration as opposed to the individuals, it could be interpreted that as long as any Registered Entity SME is familiar with the purpose and limitations of the protection systems that the entity will be able to demonstrate compliance. Suggested rewording of the Requirement: Each Transmission Operator, Balancing Authority, and Generator Operator responsible for the operation of BES elements shall have its operators be familiar with the purpose and limitations of protection system schemes, either through training or operational experience, applied in its area. There has been a broad variation in how the language of this requirement is applied during audits.
Response: Thank you for your comments. 1. PRC-027-1 has been through numerous quality reviews and meets NERC's guidelines for standards development. 2. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the	

Organization	Question 8 Comment
	reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.
Madison Gas and Electric Company	1. PRC-027-1:The proposed standard contains 30-day and 90-day timing requirements in addition to the 60-month requirement. Please consider revising the 30 calendar day?s provision in requirements R2.2.1, R3.2 and R3.3 to 90 calendar days to avoid possible confusion between different timing requirements in the standard. We do not see a basis on why there needs to be different dates. If all dates were 90 days, it would provide consistancy for entities to follow. 2. In consideration that the rationale for Requirement R1 Part 1.1.1 acknowledges that the drafting team has ?no evidence there is widespread mis-coordination of Protection Systems associated with Interconnected Elements?, LES recommends further development of the standard be halted until sufficient technical justification can be provided for the standard?s development. 3. As currently drafted, the drafting team would place excessive documentation requirements on registered entities for activities already being performed as industry best practices. In lieu of turning those best practices into compliance requirements, NSRF suggests the drafting team leverage existing Reliability Standard PRC-001 as a basis for system protection coordination.

Organization	Question 8 Comment
	4. PRC-001-3: Please consider revising the Purpose of PRC-001-3 to reflect the one remaining requirement. With the updated measure there is an inconsistency between the Purpose, the Requirement, and the Measure. We suggest revising the Purpose to PRC-001, the following: To ensure familiarity with the purpose and limitations of protection systems operated by the entity. Suggest revising Requirement R1 to: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall train its applicable personnel to be familiar with the purpose and limitations of protection systems operated by the entity. The above rewrite now provides a clear and understandable (plus it adds to system reliability) Standard for the applicable entities to follow. The Standard sets a minimum level of training concerning protection systems that entities operate. An entity can always provide training on non-operated protection systems, whereby the entity has determined (based on risk to their system) the scope of training outside the proposed rewrite.

Response: Thank you for your comment.

1. A process flowchart is included in the Guidelines and Technical Basis section of the standard to show the relationship between the requirements. The drafting team contends the specified time frames are relevant and appropriate for each of the requirements. The Rationale boxes for each requirement provide the drafting team's reasoning for the different time frames.
2. The drafting team contends that the draft standard provides a reliability benefit of ensuring that all existing, modified, or new Protection Systems on Interconnecting Elements are coordinated for proper performance during Faults. The drafting team contends that this standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.
3. PRC-027-1 is replacing the requirements of PRC-001 that are associated with actual coordination of Protection Systems necessary for proper performance during faults. In doing so, the drafting team is leveraging PRC-001 as a basis for system protection coordination as well as following the recommendations of the NERC System Protection and Control Task Force (now the System

Organization	Question 8 Comment
	Protection and Control Subcommittee – SPCS) in its 2007 *Assessment of Standard PRC-001-0 – System Protection Coordination*, and addressing observations from the Commission in FERC Order 693. The Project 2007-06 – System Protection Coordination drafting team has taken this course after consultation with both NERC and FERC staffs. 4. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.
Southwest Power Pool	1. PRC-027-1 As drafted the standard contains 30-day and 90-day timing requirements in addition to the 60-month requirement. Would the drafting team consider making the 30-day and 90-day requirements the same, for example 90 days? This would make staying abreast of timing issues much simpler. 2. Figure 4, Application Guidelines The Note at the bottom of Figure 4 is misleading in that it states that no PSCS is required under this scenario. However, Transmission Owner R is required to have a PSCS for the Interconnected Element between Breakers A and B. The Distribution Provider S is not required to have a PSCS for Breaker C.

Organization	Question 8 Comment
	3. PRC-001-3: Purpose The existing purpose does not fit the single requirement that is left in the standard. We would suggest changing the purpose to the following: To ensure familiarity with system protection schemes utilized within an operating entity?s area. Requirement R1Similarly, the requirement does not match the proposed measure. We suggest modifying the requirement to: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall train its applicable personnel to be familiar with the purpose and limitations of protection system schemes applied in its area.

Response: Thank you for your comment.

1. A process flowchart is included in the Guidelines and Technical Basis section of the standard to show the relationship between the requirements. The drafting team contends the specific time frames are appropriate and relevant for the reliability-related tasks in each of the requirements. The Rationale boxes for each requirement provide the drafting team's reasoning for the different time frames.
2. The drafting team revised Figure 4 to provide additional clarity that the Distribution Provider S depicted does not own a Protection System installed for the purpose of detecting Faults on the Interconnecting Element and is therefore excluded from this standard.
3. In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults –leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's

Organization	Question 8 Comment
	Reliability Standards be consolidated. Because Requirement R1 of PRC-001-2 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the “Effective Date” and “Compliance” sections of the standard is included with this fourth posting of PRC-027-1.
Public Service Enterprise Group	PSEG has the following additional comments: a. To avoid make-work reporting that is detrimental to BES reliability, PSEG recommends that the Applicability section remove Protection Systems, Interconnected Elements, and Protection System components that do not require coordination. Therefore, we propose that the 4.2.1 be modified with this additional language after ?faulted Element?: ?, except for the following Protection Systems, Interconnected Elements, and Protection System components that do not require such coordination:? Protection Systems for the Interconnected Element that are owned by the same functional entity of a single Registered Entity.? An Interconnected Element that is protected by overlapping differential relays only (e.g., a Generator Owner?s GSU that is connected to a Transmission Owner?s bus)? Protection System components for which coordination is unaffected solely due to an increase in Fault current, including:? Transformer differential relays? Line current differential schemes? Generator differential or overall differential, bus differential schemes? Step distance protection schemes? Fault detector settings (these settings are guided directly by PRC-023-X)? Breaker failure settings? Directional Comparison Blocking overcurrent schemes b. ?Application Guidelines? Comments More clarity on what a pre-standard PSCS needs to contain to meet R1.1. Is an e-mail trail from other owners stating that the settings are acceptable? Do calculations need to be shown? c. Language on p. 21: ?The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements

Organization	Question 8 Comment
	that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.? If there is no problem, why is this standard being proposed? d. Language on p. 22 that lists examples of Protections Systems where technical justification may be used to exclude the need for a PSCS. Although PSEG has suggested limiting the Applicability in its comments in 8.a, it may be simpler if the standard just listed the Protection Systems that require a PSCS ? that would only be overcurrent elements based upon Fault current. If that scheme is not employed, no PSCS is needed.

Response: Thank you for your comment.

a. The drafting team declines to list the exclusions you suggest, but has revised the Applicability section for clarity as follows:

   4.2 Facilities:

   Protection Systems: a) installed for the purpose of detecting Faults on Interconnecting Elements, and; b) that require coordination for isolating those faulted Elements.

b. The parenthetical phrase in Requirement R1, Part 1.2 provides the clarity you request. "…a summary of the results of each PSCS performed pursuant to Requirement R1, Part 1.1, (including, at a minimum, the Protection System(s) reviewed, the associated Fault current(s) used, any issues identified, and any revisions or actions proposed), …."

c. The drafting team contends that the draft standard provides a reliability benefit of ensuring that all existing, modified, or new Protection Systems on Interconnecting Elements are coordinated for proper performance during Faults. The drafting team contends that this standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.

d. The drafting team declines to list the inclusions you suggest, but has revised the Applicability section for clarity as follows:

   4.2 Facilities:

   Protection Systems: a) installed for the purpose of detecting Faults on Interconnecting Elements, and; b) that require coordination for isolating those faulted Elements.

Organization	Question 8 Comment
ReliabilityFirst	ReliabilityFirst offers the following comments for consideration: 1) Requirement R1, Part 1.2 - ReliabilityFirst recommends converting the parenthetical last sentence ?(including, at a minimum, the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed)? into four separate and distinct sub-parts. Separating these out will clearly spell out to the applicable entity and compliance auditors the specific items which are required to be provided. Listed below is an example for consideration: 1.2.1 Protection Systems Reviewed 1.2.2 Associated fault currents 1.2.3 Identified issues 1.2.4 Proposed revisions or actions 2) Requirement R2, Part 2.2 - Within both the clean and redline version of the posted draft standard, the equation referenced at the end of Requirement R2, Part 2.2 is inadvertently missing and therefore needs to be added back into the requirement.
Response: Thank you for your comment. 1. The drafting team removed the parenthetical from the requirement. 2. The equation was inadvertently removed during the conversion process required for posting. A new version with the equation was made available on the NERC web site on June 21, 2013.	
Clark Public Utilities	Requirement 3 (and any sub-requirements) should not be applicable to any Interconnection Element owners that are part of the ?same Registered Entity that represents multiple functional entity responsibilities.? Often times there is only one person or department within a utility that is responsible for protection system coordination of all protection systems (distribution facilities, generator facilities, and transmission facilities). The requirement as written would require the same functionally registered entity that developed the details for proposed changes to provide a

Organization	Question 8 Comment
	documentation of those details to all other functionally registered entities. The standard should allow for the treatment of all of the registered functions within a Registered Entity that represents multiple functional entity responsibilities collectively as one owner. Since the definition of Interconnection Elements incorporates the concept of ?Separate Registered Entities and ?Same Registered Entities? it is suggested that the wording be modified to incorporate theses terms as follows: R3. Each Separate Registered Entity and each Same Registered Entity shall provide to each other Separate Registered Entity connected to the same Interconnected Element: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning] 3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnected Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).? New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios? Changes to a transmission system Element that alter any sequence or mutual coupling impedance? Changes to generator unit(s) that result in a change in impedance? Changes to the generator step-up transformer(s) that result in a change in impedance 3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule. 3.3. Within 30 calendar days, details of changes made to Protection

Organization	Question 8 Comment
	Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

Response: Thank you for your comment.

The drafting team does not agree because there are cases where the Transmission Owner and Generator Owner are part of the same Registered Entity but separate technical groups are involved in performing the required Protection System Coordination Studies. For the case where one registered entity representing multiple functional entities with the same protection group doing all the coordination, the drafting team included the following note: “In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS would be sufficient for use by all entities.”

Organization	Question 8 Comment
City of Tacoma	Tacoma Power appreciates the efforts of the SDT. This is a difficult process and topic on which to standardize. 1. It would help, especially for the Flowchart, if R1.1.3 could be separated into a revised R1.1.3 ?according to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1; or technically justify why such a study is not required? and a new R1.1.4 ?within six calendar months of being notified of a change as described in Requirement R3, Part 3.3; or technically justify why such a study is not required.? 2. In R3.1, the language ?or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s)? appears to be very open-ended with respect to the second, third, and fourth bullets under R3.1. In theory, any impedance change within an entity?s system could qualify, which brings into question potential overlap between R2 to address incremental changes and R3.1. R3.1 should establish a brighter line for what triggers an entity to begin coordination activities for proposed impedance changes not at an existing or new Facility associated with the Interconnected Element. In other words, at what point is an impedance change considered an incremental change and, therefore, applicable to R2, as

Organization	Question 8 Comment
	opposed to R3.1? 3. In the Flowchart, the arrows are confusing above the decision diamond ?(R1.1.3) Is a new PSCS required?? 4. Referring to M2, M5, M7, and M8, is any confirmation of receipt required in order to demonstrate that a responsible entity ?provided? the information? It is recommended that evidence of receipt not be required to demonstrate that an entity ?provided? information applicable to these measurements. 5. Referring to the Application Guidelines, Figure 5 and associated discussion, the introductory paragraph statement ?in Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be check for coordination with Generator Owner T? appears to contradict the discussion on page 39 of 40 of the redlined copy of PRC-27-1.

Response: Thank you for your comment.

1. The drafting team made the suggested change.
2. Requirement R2 addresses periodically performing Fault current studies, using an entity's short circuit model to maintain awareness of Fault current changes (not incremental impedance changes) that could affect proper performance of Protection Systems. Requirement R3 addresses communication of physical changes or additions, such as those that alter impedance values, so entities can keep their Protection System databases and short-circuit models up-to-date for the performance of accurate Protection System Coordination Studies.
3. The drafting team revised the flowchart to provide clarity.
4. The requirements mandate that entities provide information. The measures complement the requirements in suggesting evidence that is appropriate or acceptable to satisfy compliance with the requirement. The measures state that acceptable evidence is documentation demonstrating that the information was provided within the specified timeframe. No confirmation of receipt is required as evidence.
5. Although Transmission Owner S has no Protection Systems located at Station 1, Owner S does have other Protection Systems that require coordination with the Generator Owner; therefore, the language is not contradictory.

Organization	Question 8 Comment
Idaho Power Co.	Thank you for the opportunity to comment. While we are in favor of this version, we seek clarification on one item. Requirement R2 states that the fault values used in determining the 10% change will be measured at the ?interconnecting bus?. While reviewing the examples in the application guideline section, two ?interconnecting bus? are labeled in Figure 1, 3, and 4. If the coordination concern is related to the interconnecting element, it would seem reasonable that the ?interconnecting bus? for Owner S to place faults on to determine the 10% change is that at Station 1/Transmission owner R, looking at figure 1. This would capture the change in fault current seen by the Owner S Protection System on breaker E. Placing faults on the interconnecting bus behind breaker E if I am owner S does not seem appropriate when considering coordination on the interconnecting element.
Response: Thank you for your comment. In reference to Figure 1, the intent is for each Transmission Owner to check for changes in Fault current at its own interconnecting bus; if either owner identifies a 10% change, it would notify the other owner pursuant to Requirement R2, Part 2.2.1.	
CenterPoint Energy	The draft for PRC-027-1 states: ?records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.? CenterPoint Energy considers the proposed requirements to be too prescriptive for Protection System coordination when it has not been identified as a reliability issue and expects such requirements would provide little, if any, reliability benefits. We believe the majority of existing Interconnected Facilities have time-proven and fault-proven Protection System set points and that newer facilities, including replacement relay panels, are commissioned utilizing appropriate coordination studies that include necessary interaction between interconnected entities. CenterPoint Energy recommends reevaluating the need for this standard with consideration that this subject area could instead be addressed by continuing to focus on misoperation analysis and through best practices initiatives.
Response: Thank you for your comment.	

Organization	Question 8 Comment
The drafting team contends that the draft standard provides a reliability benefit of ensuring that all existing, modified, or new Protection Systems on Interconnecting Elements are coordinated for proper performance during Faults. Further, it should be noted that existing standard PRC-001-1 currently requires coordination of protection systems for new facilities and those associated with changes to existing facilities. PRC-027-1 clarifies the intent of the requirements of PRC-001 related to coordination and correcting the applicability to the equipment owners. The drafting team contends that this standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.	
California ISO	The ISO feels that a requirement should be added for the TO, GO or DP to notify their TOP and PC when a new or revised Remedial Action Scheme or Special Protection System is implemented.
Response: Thank you for your comment. The drafting team believes this is outside the scope of PRC-027-1. A NERC project to revise the PRC standards regarding SPSs is included in the most recent Reliability Standards Development Plan.	
SMUD	The timing provided in R3.1 is contains no specification that correlate to the timing requirements of the other R3 subrequirements .
Response: Thank you for your comment. The drafting team believes that specifying a single time frame for Requirement R3, Part 3.1 is not appropriate for the wide variety of conditions that will need to be evaluated.	
Tri-State G &T	Tri-State is concerned about the timeframes allowed in Requirement R1, associated with Requirement 3, Part 3.1, especially when the proposed change does not affect the conditions used in the coordination of Protection Systems. The way we read Requirement R3, Part 3.1, a planned relay replacement will have to go through the PSCS process or a technical justification would be required even if it does not affect coordination of other Protection Systems. We would propose that Part 3.1 be changed as follows: 3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnected Element if the proposed

Organization	Question 8 Comment
	change requires a change in the coordination of Protection Systems associated with the Interconnected Element(s); or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).
Response: Thank you for your comment. The drafting team contends changes associated with the bulleted list in Requirement R3, Part 3.1 must be communicated to the other owners associated with an Interconnecting Element so each owner can: verify the changes do not affect their Protection Systems; and, keep their Protection System databases and models up-to-date.	
ITC	1. We vote to reject Draft 3 of PRC-027-1 primarily due to enormous increase in administrative burden with no appreciable gain in system reliability. We agree with SDT there is reliability benefit to performing these tasks. However, as the SDT members stated at presentations to RFC Protection Subcommittee and to NATF Workshop, utilities are already doing this work. The SDT?s own rationale states ?no evidence there is widespread miscoordination of Protection Systems?. Therefore, the only outcome of this standard is that utilities will greatly increase administrative burden to become auditable. 2. Figure 4 exclusion of PSCS on the Interconnected Element is not found in standard. Figure 4 states the line or tap is the Interconnected Element, therefore TO owns ?facilities? and must meet R1-R4. Either definition of Interconnected Element must be revised to exclude Figure 4 example, or Figure 4 must be corrected to show TO is still responsible for R1-R4. 3. Example Figures 1-5 create responsibilities on owners to ?propose? and ?review for coordination? which are not found in the standard. Either these responsibilities should be removed from Figures or the responsibilities should be added to the standard. 4. The last sentence in Figure 5 specifies the TO will provide GO settings to the other TO. This contradicts R3 which states, ?Each TO, GO, and DP shall provide to each

Organization	Question 8 Comment
	TO, GO, and DP?? Again, the Figures are creating responsibilities not found in the standard. 5. The purpose of Applicability section 4.2 Facilities is unclear. Each requirement deals with requirements around the Interconnected Elements. If the purpose of section 4.2 is to try and exclude DP relays which do not purposefuly trip for BES faults, this should be more clearly stated. This exclusion should be moved to Interconnected Element definition and section 4.2 rewritten to target Interconnected Elements. Or section 4.2 should be the corrected Interconnected Element definition, and there will be no need for a new definition in this standard. 6. Example Figure 2 creates different responsibilities for GO than Figure 3 does for DP. Why the difference? Essentially they are the same: both have protection systems which trip for faults on Interconnected Element. Again, the Figures are creating responsibilities not found in the standard.

Response: Thank you for your comment.

1. The drafting team contends that the draft standard provides a reliability benefit of ensuring that all existing, modified, or new Protection Systems on Interconnecting Elements are coordinated for proper performance during Faults. The drafting team contends that this standard is necessary to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES.
2. The drafting team modified Figure 4 to address your concern.
3. The Figures included in the standard are designed to provide examples of how to apply the requirements of PRC-027-1. Requirements associated with the proposal and review of Protection System design and settings can be found in Requirements R3 and R4, respectively. However, the drafting team modified the language in the figures to address your concern.
4. The drafting team believes the responsibilities described in the example you cite are consistent with the requirements of the standard. In the example (Transmission Owner R) will have settings provided from Generator Owner R, through its obligation under Requirement R3, and will in turn be required by Requirement R3, to provide these settings to Transmission Owner T so a

Organization	Question 8 Comment
	PSCS can be performed. 5. The drafting team revised the Applicability section to remove 4.2.1. 6. Figure 2 represents a BES generator connected to a BES transmission station where the Generator Owner has Protection Systems associated with breaker A that operate for Faults on the Interconnecting Element. The drafting team believes the responsibilities outlined in Figure 2 for the equipment owners are consistent with the requirements of PRC-027-1. Figure 3 represents a generator (or network system) that is not connected to, or part of, the BES. However, in this figure, the Distribution Provider S does have a Protection System at the facility that is "…installed for the purpose of detecting Faults on Interconnecting Elements of the BES" (which trips breaker C) and, therefore, coordination of that Protection System is required by PRC-027-1. The drafting team believes the responsibilities outlined in Figure 3 for the equipment owners are consistent with the requirements of PRC-027-1.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.
7. Draft 3 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from June 4 – July 3, 2013.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1,with the stated purpose ‘to coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.’ This standard incorporates and clarifies the coordination aspects of Requirements R2 and R3 from PRC-001-2 (formerly R3 and R4 of PRC-001-1). The SPCSDT is requesting a posting for stakeholder comments for a 45-day formal comment period and ballot.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Ballot	September - November 2013
Final Ballot	December 2013
BOT Adoption	February 2014

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnecting Element: A BES Element that electrically joins Facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider).

Protection System Coordination Study: A study that documents existing or proposed Protection Systems operate in the intended sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider (that own Protection Systems identified in the Facilities section 4.2 below)

4.2 **Facilities:**

Protection Systems:

a) installed for the purpose of detecting Faults on Interconnecting Elements, and

b) that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPCSDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults."*

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPCSDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPCSDT posted Draft 3 of PRC-027 in June, 2013 for comment and ballot. As part of that posting, the drafting team proposed revisions to PRC-001-2. The revisions were being proposed as an interim step to provide clarity to PRC-001 until it is retired. However, since this last posting, the informal initiative for revising PER-005-1 has transitioned to a formal project, Project 2010-01 Training. The proposed revisions to PER-005-1 address the reliability objective of PRC-001-2, Requirement 1. Proposed Reliability Standard PRC-027-1 incorporates the aspects of coordination in Requirements R2 and R3 of PRC-001-2. Consequently, NERC staff and the SPCSDT are recommending the retirement of PRC-001-2. As such the drafting team is no longer considering changes to PRC-001-2. The disposition of all three PRC-001-2 requirements is outlined in the Mapping Document associated with this project and is posted for stakeholder review. The retirement of PRC-001-2, Requirement R1 is contingent upon the successful ballot and approval of PER-005-2 by the applicable regulatory authorities. The retirement of PRC-001-2, Requirements R2 and R3 are predicated upon the successful ballot and approval of PRC-027-1 by the applicable regulatory authorities.

Other Aspects of Coordination of Protection Systems Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects:

- Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1 by Project 2007-09, Generator Verification.

- Transmission relay loadability is addressed in PRC-023-2.
- Generator relay loadability is addressed in PRC-025-1 by Project 2010-13.2, Phase 2 of Relay Loadability: Generation.
- Protective relay response during power swings will be addressed by Project 2010-13.3, Phase 3 of Relay Loadability: Stable Power Swings.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and are addressed in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new Interconnecting Elements. The drafting team defines the term "Interconnecting Element" as "A BES Element that electrically joins Facilities: a) owned by separate Registered Entities, or b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner)."

Part 1.1.1 The drafting team believes 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnecting Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team believes that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required. Refer to the Application Guidelines for Requirement R1 for examples of Protection Systems where technical justifications may be used.

Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, Part 3.1, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.1.4 The drafting team believes that entities must perform the studies required when notified of changes identified in Requirement R3, Part 3.3, or to technically justify why no such study is needed. The drafting team believes that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnecting Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s).

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its Interconnecting Elements as follows:

1.1.1 Within 60 calendar months after the effective date of this standard, if no PSCS for that Interconnecting Element exists.

1.1.2 Within 12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or technically justify why such a study is not required.

1.1.4 Within six calendar months of being notified of a change as described in Requirement R3, Part 3.3, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each PSCS or the technical justification pursuant to Requirement R1, Part 1.1, provide to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s): a summary of the results of each PSCS performed, including, at a minimum, the Protection Systems reviewed, the associated Fault current(s) used, any issues identified, and any revisions or actions proposed; or the technical justification.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4 is a dated PSCS, or the summary of the results of each PSCS (hard copy or electronic file formats) demonstrating the time frames specified or agreed to in Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4 were achieved. Acceptable evidence of a technical justification for not performing a PSCS as specified in Parts 1.1.2, 1.1.3, and 1.1.4 may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspect of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary of the results of each PSCS or the technical justification (hard copy or electronic file formats) were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnecting Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing the results to the applicable entities when changes occur that meet the criteria of Requirement R2. It is important that interconnecting Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes 60 calendar months provides the entities flexibility to schedule and perform the activities specified in Requirement R2, Parts 2.1 and 2.2.

Part 2.1 The drafting team believes maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination.

Part 2.2 The drafting team is including this equation to assure a consistent approach is used by each Transmission Owner when calculating the percent change in Fault current values.

Part 2.2.1 The drafting team believes the 30-calendar day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the Interconnecting Element. The drafting team determined that a change in Fault current of 10% indicates an appropriate point at which to provide this information, based on the fact that Protection Systems are typically set with margins above 10%.

R2. For each Interconnecting Element on its System, the Transmission Owner shall, once every 60 calendar months: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at its interconnecting bus(s) where a PSCS is available pursuant to Requirement R1.

2.2. Calculate the percent change between the Fault current values (single line to ground and 3-phase for its interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\,Change = \left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent PSCS

2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System(s) associated with the Interconnecting Element(s).

M3. Acceptable evidence for Requirement R2, Parts 2.1 and 2.2 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and identifies the percent change from the Fault current values used in the most recent PSCS determined by the equation.

M4. Acceptable evidence for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the Interconnecting Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnecting Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnecting Element(s). The drafting team believes that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnecting Element. The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnecting Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s).

- New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnecting Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days of making the change, details of permanent changes made to Protection Systems associated with the Interconnecting Element during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

M5. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) as identified in the bulleted list, was provided to each responsible entity connected to the same Interconnecting Element.

M6. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

M7. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the permanent changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnecting Elements confirm that the Protection System(s) applied were reviewed and a response was provided to the other owner(s). The review assures that the owners of Protection Systems associated with the affected Interconnecting Element are aware of the changes and have responded with comments if necessary.

The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnecting Elements to review the summary results of a PSCS or the technical justification and respond. Note: Pursuant to Requirement R1, Part 1.2, at a minimum, the summary of the results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate the results of the PSCS or the technical justification were reviewed and, if applicable, any identified issues.

Note: The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they can confirm that there were no identified coordination issues.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that received a summary of the results of a PSCS or a technical justification explaining why a PSCS is not required (pursuant to Requirement R1, Part 1.2) shall, within 90 calendar days after receipt or according to an agreed upon schedule, review the summary of the results or the technical justification, and respond to the other owner(s) either: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

- Confirming that the summary of the results was reviewed and no coordination issues were identified, or
- Confirming that the summary of the results was reviewed and any identified coordination issue(s) were noted, or

- Confirming that a technical justification was reviewed and no issue(s) were identified, or
- Confirming that a technical justification was reviewed and any identified issue(s) were noted

M8. Acceptable evidence for Requirement R4 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

Rationale for R5: This requirement ensures owner(s) of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (i.e., the in-service date of the Protection System(s)).

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that received a response pursuant to Requirement R4 shall address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

M9. Acceptable evidence for Requirement R5 is dated documentation (hardcopy or electronic file formats) demonstrating that a response pursuant to Requirement R4 was received and that any identified coordination issues were addressed prior to implementation of any proposed Protection System(s) changes or additions.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System associated with an Interconnecting Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, R4, and R5, and Measures M1 through M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider that owns a Protection System at a Facility associated with an Interconnecting Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing Interconnecting Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with Interconnecting Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the intended sequence for internal and external Faults on the Interconnecting Element.

Requirement R1:

This requirement directs the applicable entities to perform a Protection System Coordination Study (PSCS) for every Interconnecting Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current changes of 10% or more have occurred. In developing the language to define a PSCS, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study that documents existing or proposed Protection Systems operate in the intended sequence for clearing Faults."

PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

Part 1.1.1:

The drafting team believes applicable entities should have a documented PSCS for each Interconnecting Element to validate the Protection Systems associated with those Interconnecting Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that 60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnecting Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Part 1.1.2:

After notification of an identified 10% or greater change in Fault current (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new PSCS of the Interconnecting Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater change in Fault current may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 60-calendar month Fault current review.

Part 1.1.3:

After proposing or being notified of a change at a Facility associated with the Interconnecting Element, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R5.

Part 1.1.4:

After being notified of a change at a Facility associated with the Interconnecting Element associated with Requirement R3, Part 3.3, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
    - Loss of potential condition
    - Some communication assisted tripping
    - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
    - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.
    - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

Requirement R1, Part 1.2 directs the entity performing the PSCS to provide a summary of the study results or a technical justification to the affected Interconnecting Element owner(s). The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s). (Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) The following inputs and results of a PSCS must be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner perform a periodic review of Fault currents.

The short circuit study provides the Fault current values used to calculate the percent change between the most recent PSCS and the present Fault current values indicated by the short circuit study performed pursuant to Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes that 60 calendar months is an appropriate interval for reviewing Fault currents. The drafting team believes studies associated with changes that would affect the coordination in less than 60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnecting Element when short circuit studies indicate that 10% changes in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnecting entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the Interconnecting Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the PSCS of the Facility associated with the Interconnecting Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the Interconnecting Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Requirement R3, Part 3.3 includes a provision for providing details associated with changes to the previously agreed-upon coordination when permanent changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

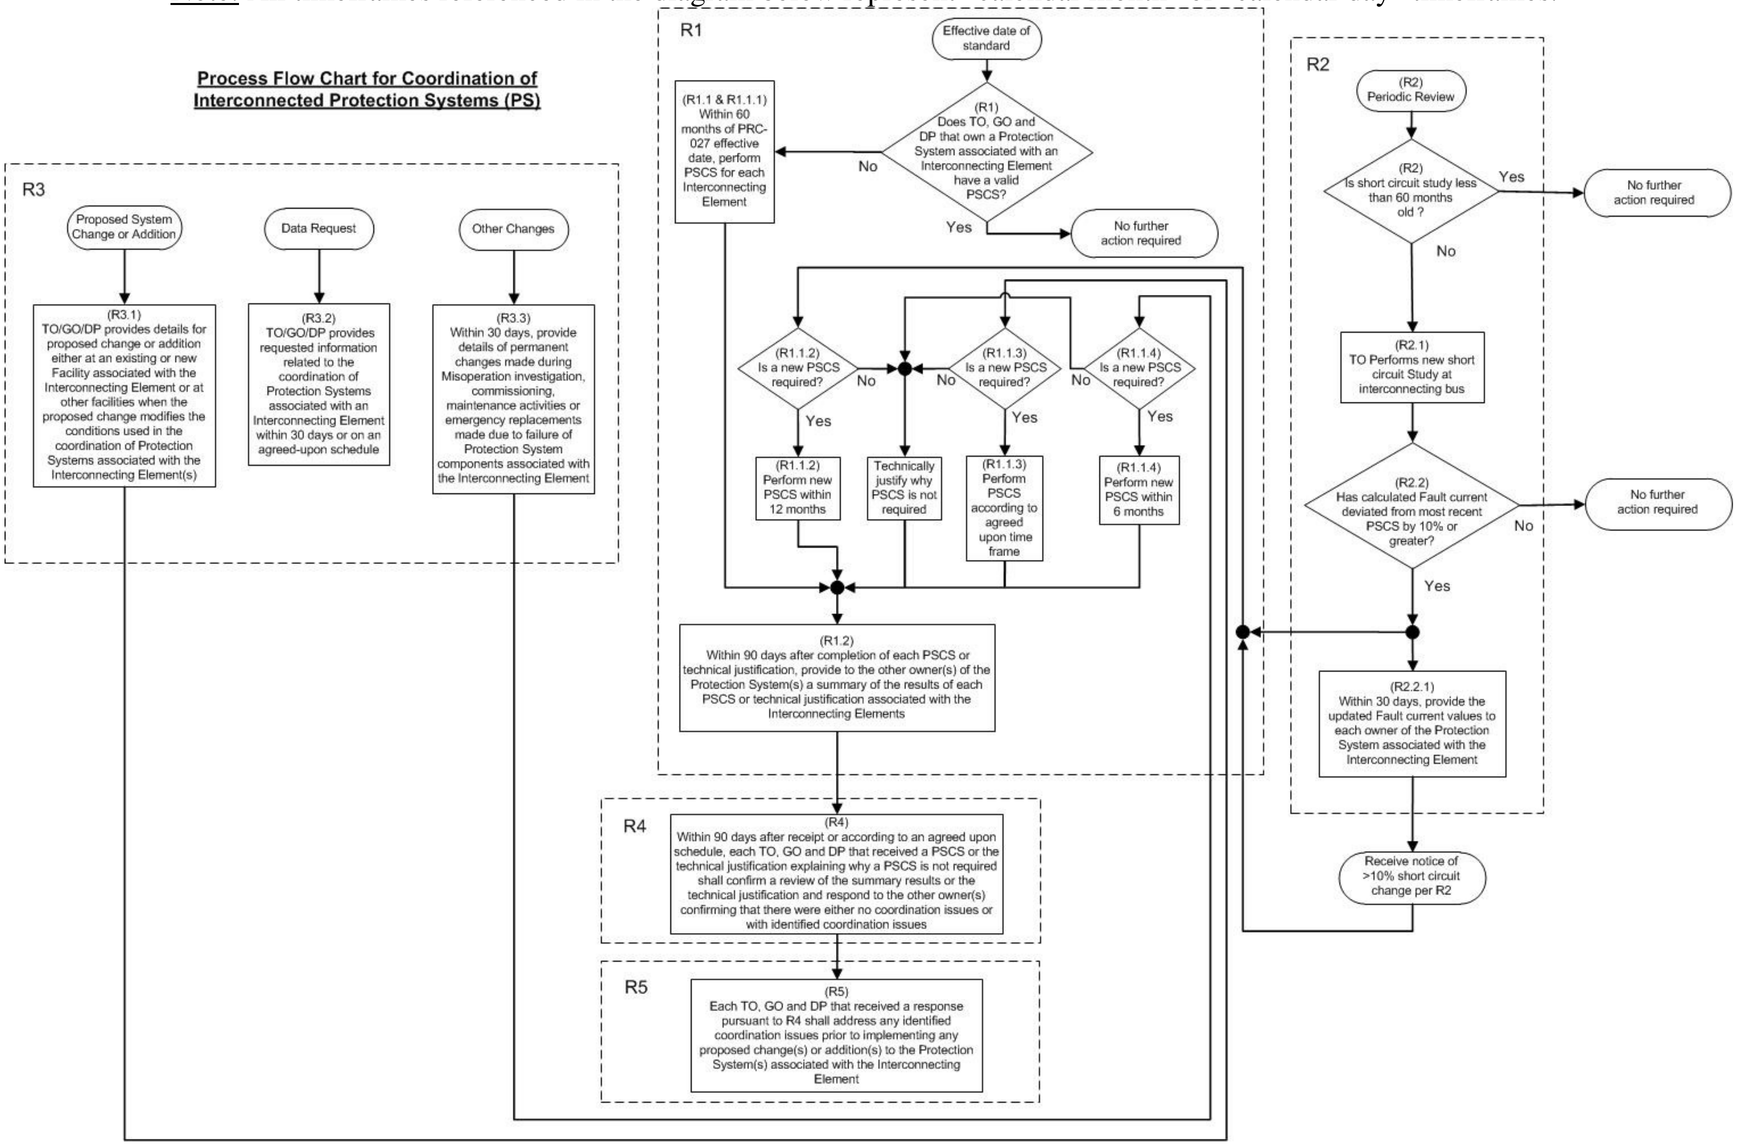
Requirement R4:

Requirement R4directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS or the technical justification, as described in Requirement R1, Part 1.2; and respond that they have reviewed and identified any issues. The drafting team believes 90 calendar days after receipt provides a reasonable time for the owners of Facilities to review.

Requirement R5:

The reliability objective of this requirement is to bring the process of Protection System coordination full circle by ensuring owners of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (in-service date).

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:
Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes.



Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the interconnecting entity (Entity B) and provide details of the change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, respond as to whether any coordination issues were identified, and if any further action is required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

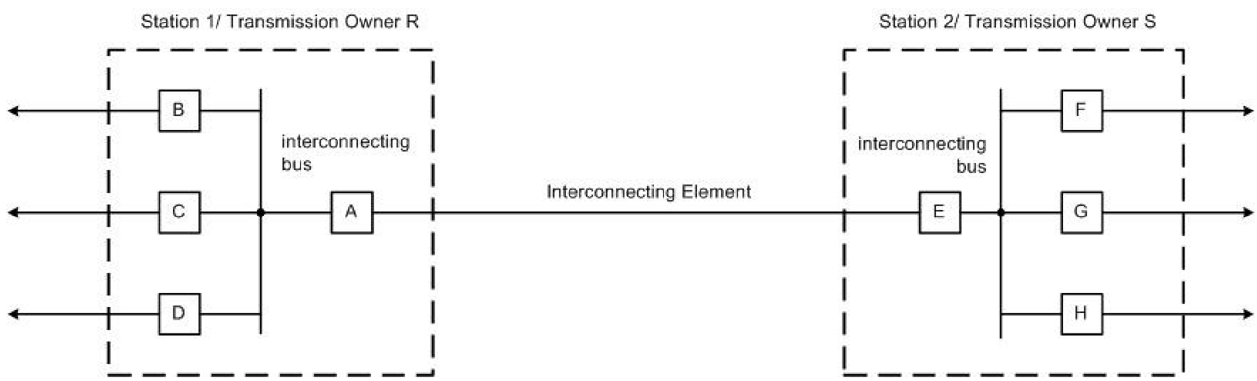
Diagrams

Introduction: The diagrams below are intended to provide guidance, to the owners of Facilities associated with the affected Interconnecting Element, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable Interconnecting Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of changes, the owners must work together to resolve any coordination issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".
3. In the Figures below, the locations of the interconnecting bus(s) referenced in Requirement 2 are indicated.

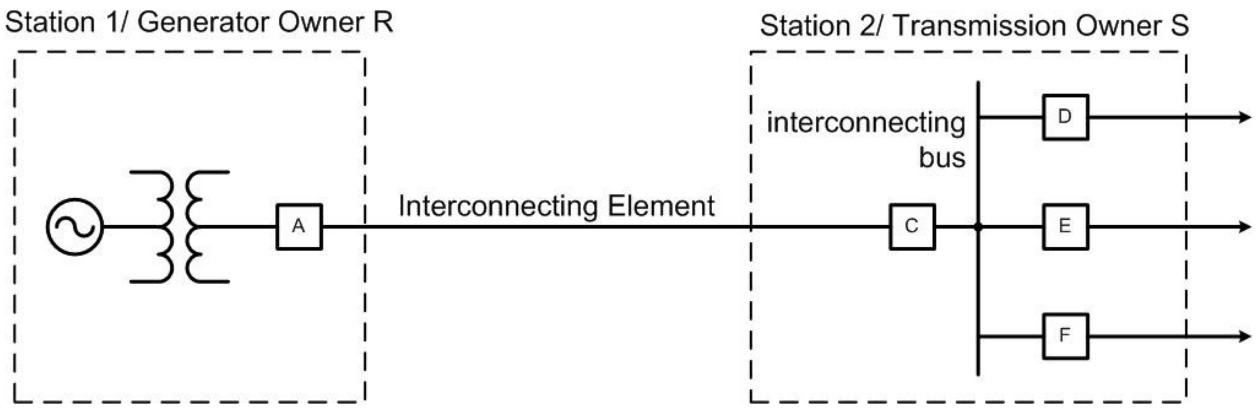
Figure 1



In Figure 1 above, the Interconnecting Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner S is to develop Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2

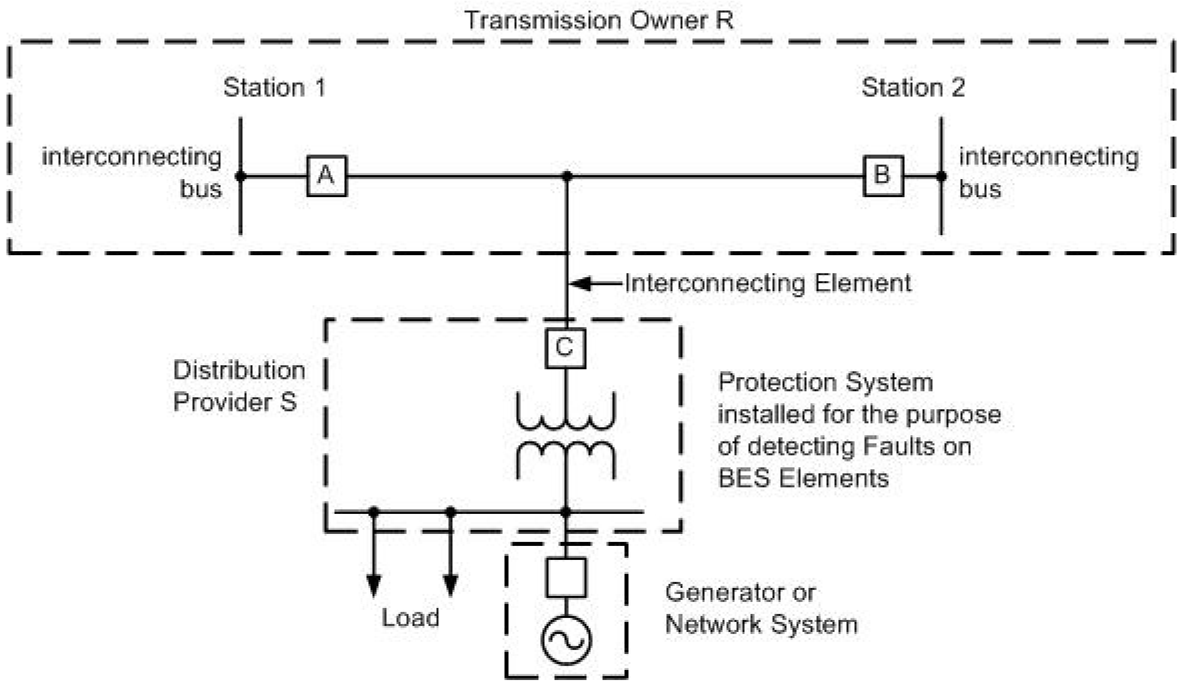


In Figure 2 above, the Interconnecting Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 2, Owner R is to develop Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop Protection System settings associated with Breaker C. Generator Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

<u>Figure 3</u>



In Figure 3 above, the Interconnecting Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between the Distribution Provider's Breaker C and the point of connection to the line between the Transmission Owner's Breakers A and B. Therefore, the applicable Protection Systems per this standard are those at Breakers A, B and C.

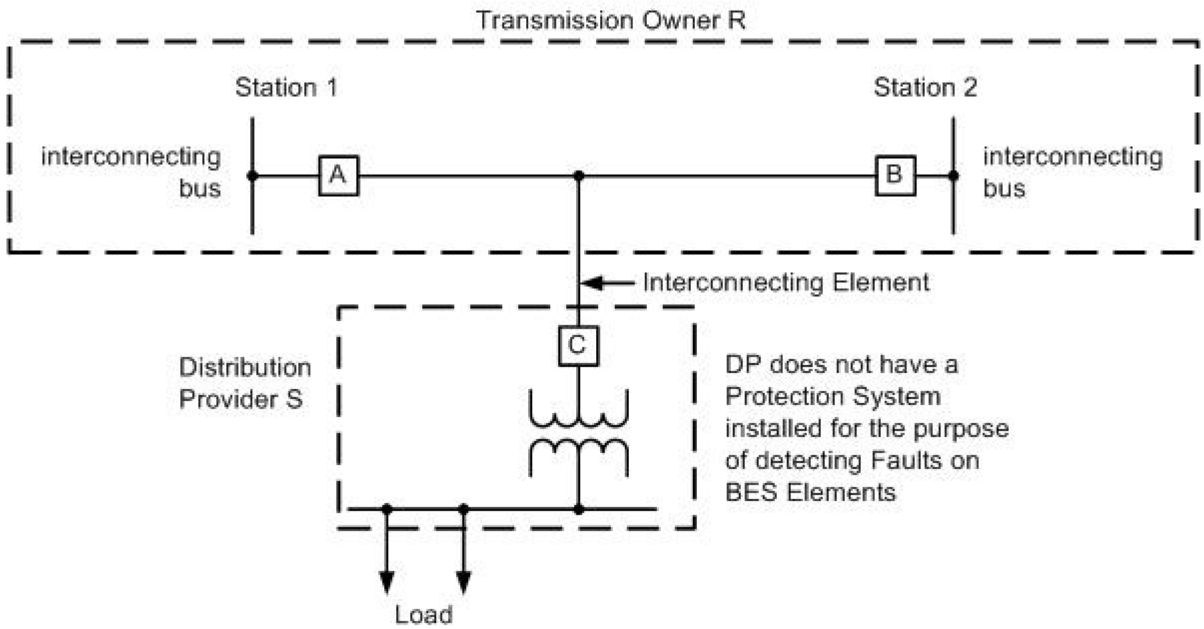
Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is installed for the purpose of detecting Faults on BES Elements.

Protection Systems installed for the purpose of detecting Faults on BES Elements do not include relays that, though they may operate for such Faults, are not installed specifically for that purpose. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized (for whatever reason) while the distribution bank remains energized from a source on the low-voltage side. In this case, the settings of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not specifically installed for the purpose of detecting that Fault.

Figure 4



The configuration above is an example excluded from this standard because the Distribution Provider S does not own Protection Systems installed for the purpose of detecting Faults on BES Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.

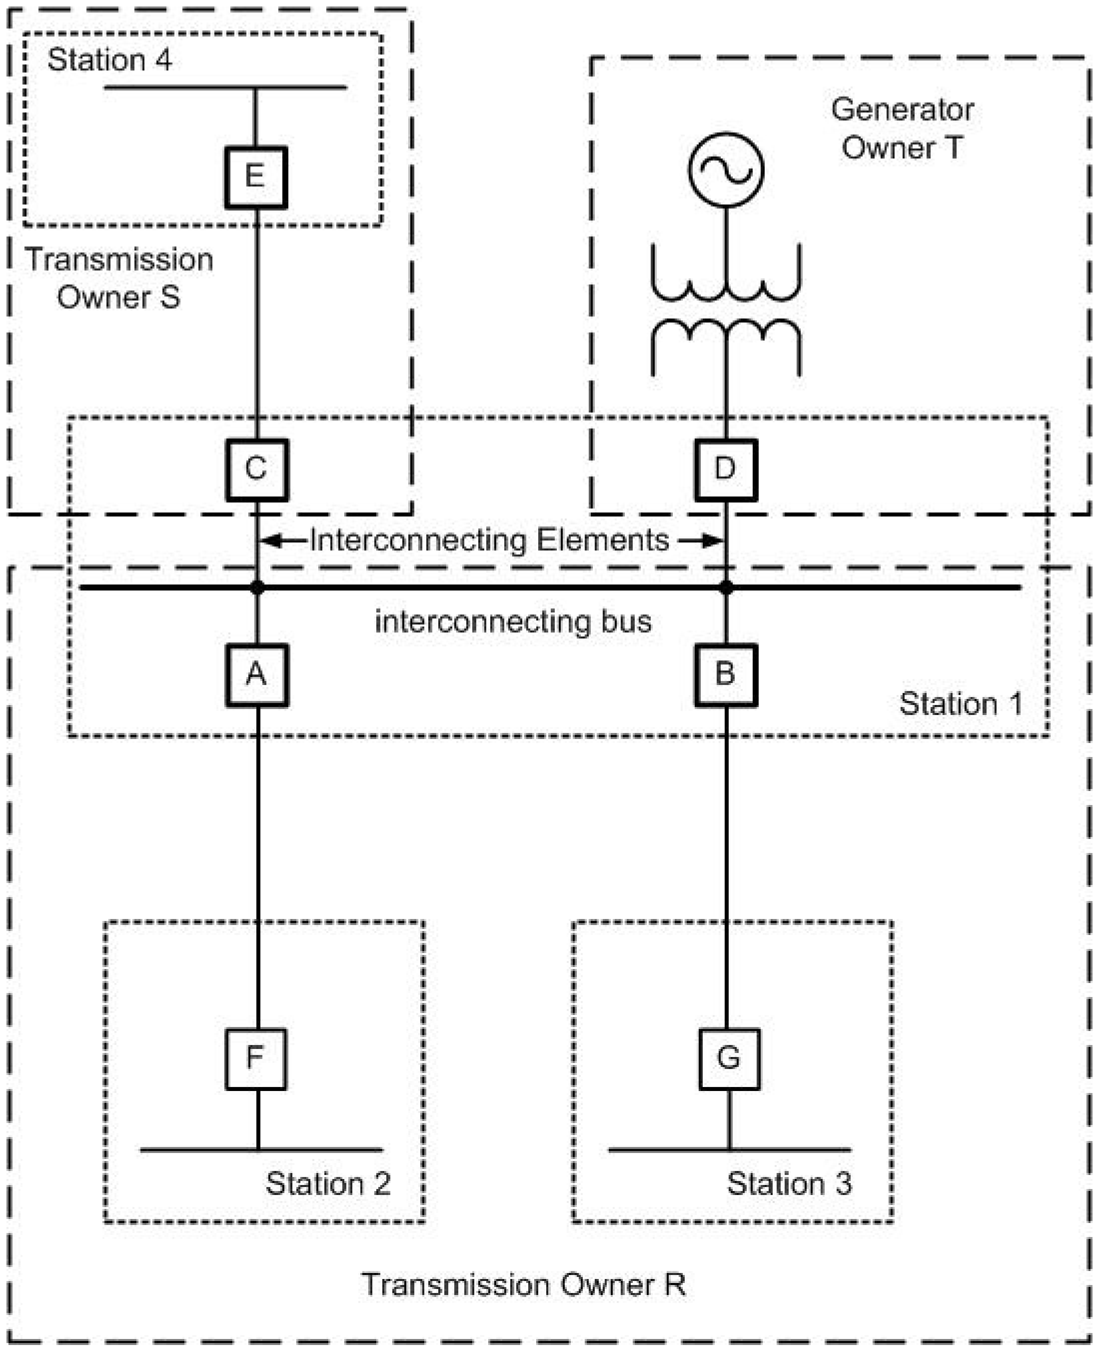


Figure 5 above illustrates the Interconnecting Elements between the Transmission Owners R and S and Generator Owner T. In this example, Transmission Owner S and Generator Owner T are not directly interconnecting to each other at Station 1. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 5:

Owner S is to develop Protection System settings associated with Breakers C and E.

Owner T is to develop Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the generator Protection System. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.
7. Draft 3 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from June 4 – July 3, 2013.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC~~-~~SDT) created a new results-based standard, PRC-027-1,with the stated purpose 'to coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults.' This standard incorporates and clarifies the coordination aspects of Requirements R2 and R3 from PRC-001-2 (formerly R3 and R4 of PRC-001-1). The SPC SDT is requesting a posting for stakeholder comments for a ~~30~~45-day formal comment period ~~with a parallel successive~~and ballot.

Anticipated Actions	Anticipated Date
~~30~~45-day Formal Comment Period with ~~Parallel Successive~~ Ballot	~~June~~September - November 2013
~~Conduct Recirculation~~Final Ballot	~~August~~December 2013
BOT Adoption	~~November 2013~~February 2014

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~shall become effective on the first day of the first calendar quarter that is 12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.~~

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

~~Interconnected~~Interconnecting Element: A BES Element that electrically joins ~~facilities~~ Facilities:
a) owned by~~:~~
~~a)~~ separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (~~Distribution Provider~~Transmission Owner, Generator Owner, or ~~Transmission Owner~~Distribution Provider).

Protection System Coordination Study: A study that ~~demonstrates~~documents existing or proposed Protection Systems operate in the ~~desired~~intended sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: **Protection System Coordination for Performance During Faults**

2. Number: PRC-027-1

3. Purpose: To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults.

4. Applicability:

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider (that own Protection Systems identified in the Facilities section 4.2 below)

4.2 **Facilities:** ~~For the purpose of the requirements contained herein, the following~~

Protection Systems ~~owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.~~:

a) ~~**4.2.1** Protection Systems~~ installed for the purpose of detecting Faults on ~~Interconnected~~Interconnecting Elements ~~of the BES~~, and

~~a)~~b) that require coordination for isolating those faulted Elements

5. Background:

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC-SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC-SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC-SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults."*

~~Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21-C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.~~

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC~~-~~SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

~~The SPC SDT revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)~~

The SPCSDT posted Draft 3 of PRC-027 in June, 2013 for comment and ballot. As part of that posting, the drafting team proposed revisions to PRC-001-2. The revisions were being proposed as an interim step to provide clarity to PRC-001 until it is retired. However, since this last posting, the informal initiative for revising PER-005-1 has transitioned to a formal project, Project 2010-01 Training. The proposed revisions to PER-005-1 address the reliability objective of PRC-001-2, Requirement 1. Proposed Reliability Standard PRC-027-1 incorporates the aspects of coordination in Requirements R2 and R3 of PRC-001-2.

Consequently, NERC staff and the SPCSDT are recommending the retirement of PRC-001-2. As such the drafting team is no longer considering changes to PRC-001-2. The disposition of all three PRC-001-2 requirements is outlined in the Mapping Document associated with this project and is posted for stakeholder review. The retirement of PRC-001-2, Requirement R1 is contingent upon the successful ballot and approval of PER-005-2 by the applicable regulatory authorities. The retirement of PRC-001-2, Requirements R2 and R3 are predicated upon the successful ballot and approval of PRC-027-1 by the applicable regulatory authorities.

Other Aspects of Coordination of Protection Systems Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects~~.~~:

- Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is ~~being~~ addressed in PRC-019-1 by Project 2007-09, Generator Verification.
- Transmission relay loadability is addressed in PRC-023-2.
- Generator relay loadability is ~~will be~~ addressed in PRC-025-1 by Project 2010-13.2, Phase 2 of Relay Loadability: Generation~~, in Project 2010-13.2~~.
- Protective relay response during power swings will be addressed by ~~Phase 3 of~~ Project 2010-13.3, Phase 3 of Relay Loadability: Stable Power Swings.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and ~~will be improved~~are addressed in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new ~~Interconnected~~Interconnecting Elements. The drafting team defines the term "~~Interconnected~~Interconnecting Element" as "A BES Element that electrically joins ~~facilities~~ Facilities: a) owned by~~: a)~~ separate Registered Entities, or b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner)."

Part 1.1.1 The drafting team believes 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with ~~Interconnected~~Interconnecting Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team believes that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required~~, e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current~~. Refer to the Application Guidelines for Requirement R1 for examples of Protection Systems where technical justifications may be used.

Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, Part 3.1, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies ~~associated with Requirement R3, Part 3.1~~ is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.1.4 The drafting team believes that entities must perform the studies required when notified of changes identified in Requirement R3, Part 3.3, or to technically justify why no such study is needed. The drafting team believes that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with ~~Interconnected~~Interconnecting Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s).

Note: In cases where a single group performs an overall coordination study for a given ~~Interconnected~~Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS ~~would be~~is sufficient for use by ~~both Registered Entities~~all entities.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its ~~Interconnected~~Interconnecting Elements as follows:

1.1.1 Within 60 calendar months after the effective date of this standard, if no PSCS for that ~~Interconnected~~Interconnecting Element exists.

1.1.2 Within 12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or ~~within~~technically justify why such a study is not required.

~~1.1.3~~1.1.4 Within six calendar months of being notified of a change as described in Requirement R3, Part 3.3~~;~~, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each PSCS~~,~~ or the technical justification pursuant to Requirement R1, Part 1.1, provide to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s~~),~~): a summary of the results of each PSCS performed~~ pursuant to Requirement R1, Part 1.1, (~~, including, at a minimum, the Protection Systems reviewed, the associated Fault ~~currents~~current(s) used, any issues identified, and any revisions or actions proposed~~).~~; or the technical justification.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1,~~, and~~ 1.1.2, 1.1.3, and 1.1.~~3~~4 is a dated PSCS, or the summary of the results of each PSCS (hard copy or electronic file formats) demonstrating the time frames specified or agreed to in Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.~~3~~4 were achieved. Acceptable evidence of a technical justification for not performing a PSCS as specified in Parts 1.1.2, 1.1.3, and 1.1.~~3~~4 -may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any ~~aspects~~aspect of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary of the results of each PSCS or the technical justification (hard copy or electronic file formats) were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing the results to the applicable entities when changes occur that meet the criteria of Requirement R2. It is important that ~~interconnected~~interconnecting Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes 60 calendar months provides the entities flexibility to ~~either technically justify why Fault current does not affect the Protection System coordination, or~~ schedule and perform the activities specified in Requirement R2, Parts 2.1 and 2.2.

~~The drafting team recognizes the coordination of some types of Protection Systems is unaffected by changes in Fault current and, where technically justified, can be exempted from the short circuit review.~~

Part 2.1 The drafting team believes maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination.

Part 2.2 The drafting team is including this equation to assure a consistent approach is used by each Transmission Owner when calculating the percent change in Fault current values.

Part 2.2.1 The drafting team believes the 30-calendar day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element. The drafting team determined that a change in Fault current of 10% indicates an appropriate point at which to provide this information, based on the fact that Protection Systems are typically set with margins above 10%.

R2. For each ~~Interconnected~~Interconnecting Element on its System, the Transmission Owner shall, once every 60 calendar months~~, technically justify why Fault current does not affect the Protection System coordination, or~~: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at ~~the~~its interconnecting bus(s) where a ~~Protection System Coordination Study (~~PSCS~~)~~ is available ~~per~~ pursuant to Requirement R1.

2.2. Calculate the percent change between the Fault current values (single line to ground and 3-phase for ~~the~~its interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\ Change = \left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent PSCS

2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element~~.~~(s).

~~**M3.** Acceptable evidence of technical justification for not performing a short circuit study as specified in Requirement R2, could be documented engineering analyses or assessments that demonstrate why Fault current does not impact any aspects of coordination.~~

~~M4.~~M3. Acceptable evidence for Requirement R2, Parts 2.1 and 2.2 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and identifies the percent change from the Fault current values used in the most recent PSCS determined by the equation.

~~M5.~~M4. Acceptable evidence for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the ~~Interconnected~~Interconnecting Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each ~~Interconnected~~Interconnecting Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with ~~Interconnected~~Interconnecting Element(s). The drafting team believes that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the ~~Interconnected~~Interconnecting Element. The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.~~3~~4. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same ~~Interconnected~~Interconnecting Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the ~~Interconnected~~Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the ~~Interconnected~~Interconnecting Element(s).

- New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance

- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an ~~Interconnected~~Interconnecting Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days of making the change, details of permanent changes made to Protection Systems associated with the Interconnecting Element during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

~~M6.~~M5. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) as identified in the bulleted list, was provided to each responsible entity connected to the same ~~Interconnected~~Interconnecting Element.

~~M7.~~M6. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

~~M8.~~M7. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the permanent changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with ~~Interconnected~~ Interconnecting Elements ~~affirm~~confirm that the Protection System(s) applied ~~are acceptable per~~were reviewed and a response was provided to the ~~conditions identified in Parts 4.1 and 4.2~~other owner(s). The review assures that the owners of Protection Systems associated with the affected Interconnecting Element are aware of the changes and have responded with comments if necessary.

~~Part 4.1~~ The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with ~~Interconnected~~Interconnecting Elements to review the summary results of a PSCS or the technical justification and respond. Note: ~~Per~~Pursuant to Requirement R1, Part 1.2, at a minimum, the summary of the results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate ~~acceptance with~~ the ~~review~~ results~~/conclusions; or rejection~~ of ~~or disagreement with~~ the ~~review results/conclusions~~PSCS or the technical justification were reviewed and ~~offer of suggestions/modifications to resolve~~, if applicable, any identified ~~coordination~~ issues.

Note: The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they ~~accept the proposed changes since~~ can confirm that there were no identified coordination issues ~~were identified~~.

~~Part 4.2 The drafting team believes that proposed changes or modifications (including project schedules) to Facilities associated with the Interconnected Element, as described in Requirement R3, Part 3.1, or modifications suggested in Requirement R4, Part 4.1 must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.~~Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

~~R4.~~ Each Transmission Owner, Generator Owner, and Distribution Provider that received a summary of the results of a PSCS or a technical justification explaining why a PSCS is not required (pursuant to Requirement R1, Part 1.2) shall~~: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]~~

~~R5.~~R4. ~~Within~~, within 90 calendar days after receipt~~,~~ or according to an agreed upon schedule, review the summary of the results ~~of a PSCS (per Requirement R1, Part 1.2)~~or the technical justification, and respond to the other owner(s~~):~~) either: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

- ~~Accepting~~Confirming that the ~~results, or~~
- ~~Rejecting~~summary of the results was reviewed and ~~suggesting modifications to resolve any identified~~no ~~coordinati~~coordination issues were identified, ~~on issues.~~
- ~~Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1~~ or ~~Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.~~
- Confirming that the summary of the results was reviewed and any identified coordination issue(s) were noted, or
- Confirming that a technical justification was reviewed and no issue(s) were identified, or
- Confirming that a technical justification was reviewed and any identified issue(s) were noted

~~M9.~~M8. Acceptable evidence for Requirement R4~~, Part 4.1~~ is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

Rationale for R5: This requirement ensures owner(s) of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (i.e., the in-service date of the Protection System(s)).

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that received a response pursuant to Requirement R4 shall address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

~~M10.~~M9. Acceptable evidence for Requirement ~~R4, Part 4.2~~R5 is dated documentation (hardcopy or electronic file formats) demonstrating that~~,~~ a response pursuant to Requirement R4 was received and that any identified coordination issues were addressed prior to implementation of any proposed Protection System(s) changes or ~~modifications, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted~~additions.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System associated with an ~~Interconnected~~Interconnecting Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, R4, and ~~R4~~R5, and Measures M1 through ~~M10~~M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider that owns a Protection System at a Facility associated with an ~~Interconnected~~Interconnecting Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing ~~Interconnected~~Interconnecting Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with ~~Interconnected~~Interconnecting Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the ~~desired~~intended sequence for internal and external Faults on the ~~Interconnected~~Interconnecting Element.

Requirement R1:

This requirement directs the applicable entities to perform a Protection System Coordination Study (PSCS) for every ~~Interconnected~~Interconnecting Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current changes of 10% or more have occurred. In developing the language to define a PSCS, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study that ~~demonstrates~~documents existing or proposed Protection Systems operate in the ~~desired~~intended sequence for clearing Faults."

PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and

sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

Part 1.1.1:

The drafting team believes applicable entities should have a documented PSCS for each ~~Interconnected~~Interconnecting Element to validate the Protection Systems associated with those ~~Interconnected~~Interconnecting Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that 60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with ~~Interconnected~~Interconnecting Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

~~Parts 1.1.2 and 1.1.3 further direct that PSCSs must be completed under the following two circumstances:~~

Part 1.1.2:

After notification of an identified 10% or greater change in Fault current (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new PSCS of the ~~Interconnected~~Interconnecting Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater change in Fault current may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 60-calendar month Fault current review.

Part 1.1.3:

After proposing or being notified of a change at a Facility associated with the ~~Interconnected~~Interconnecting Element, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement ~~R4,~~ R5.

Part 1.1.4~~.2.~~:

After being notified of a change at a Facility associated with the Interconnecting Element associated with Requirement R3, Part 3.3, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed~~, when details of changes are provided associated with Requirement R3 Part 3.3~~.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
   - Loss of potential condition
   - Some communication assisted tripping
   - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
   - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.
   - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

Requirement R1, Part 1.2 directs the entity performing the PSCS to provide a summary of the study results or a technical justification to the affected ~~Interconnected~~Interconnecting Element owner(s).~~-~~ The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s). (Note: In cases where a single group performs an overall coordination study for a given ~~Interconnected~~Interconnecting Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) ~~As guidance, the drafting team lists the~~The following inputs and results of a PSCS ~~that may~~must be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner ~~either provide a technical justification stating why Fault current does not affect the Protection System coordination of a specific Interconnected Element or~~ perform a periodic review of Fault currents.

~~**Examples of Protection Systems where technical justifications may be used include:**~~

~~5. Differential elements~~

~~6. Distance elements where infeed is not used in determining reach for the protection scheme.~~

~~7. Supervised overcurrent elements enabled by:~~

- ~~Loss of potential condition~~
- ~~Some communication assisted tripping~~
- ~~Switch-Onto-Fault (SOTF)~~

~~8. Reverse power, definite time &/or time overcurrent elements:~~

- ~~Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.~~

- ~~Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).~~

The short circuit study provides the Fault current values used to calculate the percent change between the most recent PSCS and the present Fault current values indicated by the short circuit study performed pursuant to Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team believes that 60 calendar months is an appropriate interval for ~~technically justifying why Fault currents do not affect the Protection System coordination of a specific Interconnected Element, or for~~ reviewing Fault currents. The drafting team believes studies associated with changes that would affect the coordination in less than 60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the ~~Interconnected~~Interconnecting Element when short circuit studies indicate that 10% changes in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the ~~interconnected~~interconnecting entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the ~~Interconnected~~Interconnecting Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the PSCS of the Facility associated with the ~~Interconnected~~Interconnecting Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the ~~Interconnected~~Interconnecting Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule~~ and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2~~.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

~~Additionally, this requirement~~Requirement R3, Part 3.3 includes a provision for providing details associated with changes to the previously agreed-upon coordination when permanent changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

Requirement R4directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS or the technical justification, as described in Requirement R1, Part 1.2; and respond that they have reviewed and identified any issues. The drafting team believes 90 calendar days after receipt provides a reasonable time for the owners of Facilities to review.

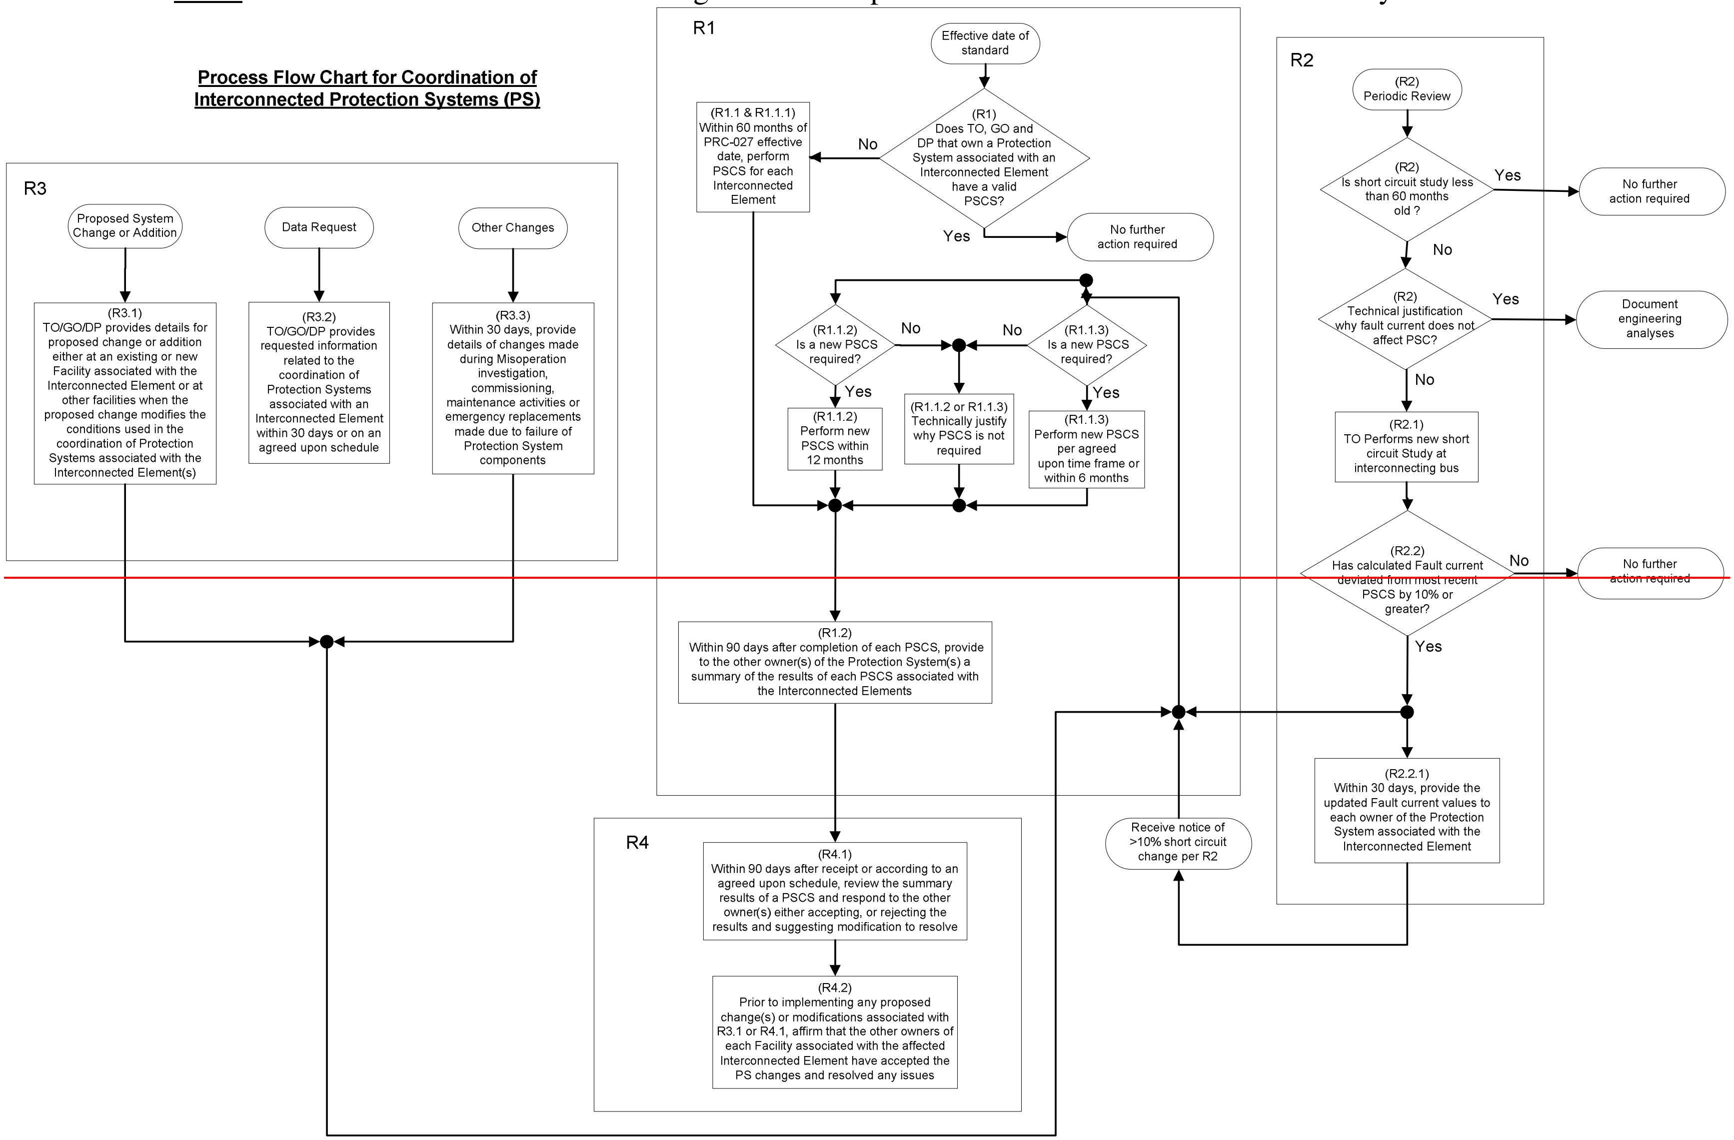
Requirement R5:

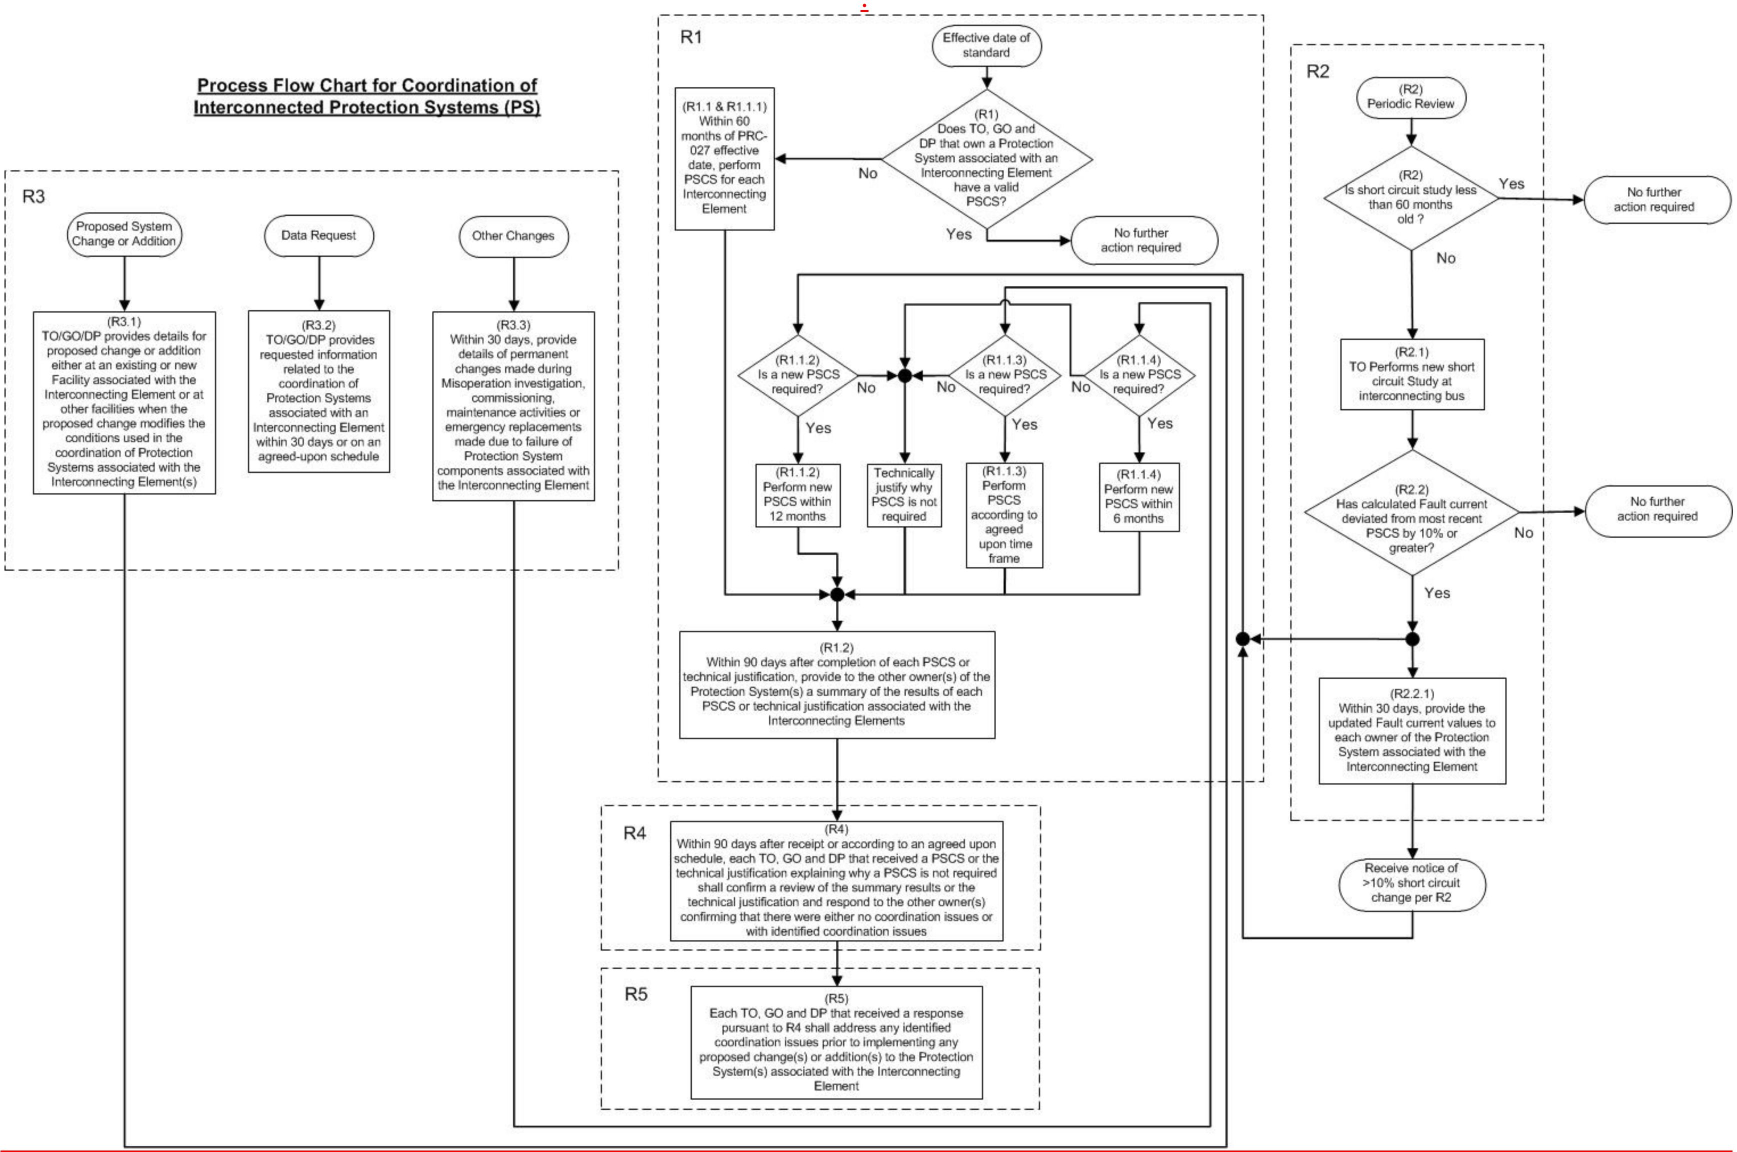
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by ~~gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.~~ensuring owners of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (in-service date).

~~Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS, as described in Requirement R1, Part 1.2; and respond as to whether they accepting or rejecting the results, and if rejecting, suggesting modifications to resolve any identified coordination issues. The drafting team believes 90 calendar days after receipt of the results of a PSCS provides a reasonable time for the owners of Facilities to review the summary results of a PSCS.~~

~~Requirement R4, Part 4.2 directs entities to affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes as described in Requirement 3, Part 3.1 and Requirement 4, Part 4.1 prior to the in-service date of those changes. Any coordination issues identified during the review must be resolved prior to implementing the proposed changes. The purpose of Requirement 4, Part 4.2 is to assure the effects the proposed changes have on Protection Systems at a Facility associated with the Interconnected Element have been considered by all affected entities.~~

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:
Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes~~.~~





Process Flow Chart for Coordination of Interconnected Protection Systems (PS)
R1
Effective date of standard
(R1) Does TO, GO and DP that own a Protection System associated with an Interconnecting Element have a valid PSCS?
No
Yes
(R1.1 & R1.1.1) Within 60 months of PRC-027 effective date, perform PSCS for each Interconnecting Element
No further action required
(R1.1.2) Is a new PSCS required?
(R1.1.3) Is a new PSCS required?
(R1.1.4) Is a new PSCS required?
No
Yes
(R1.1.2) Perform new PSCS within 12 months
Technically justify why PSCS is not required
(R1.1.3) Perform PSCS according to agreed upon time frame
(R1.1.4) Perform new PSCS within 6 months
(R1.2) Within 90 days after completion of each PSCS or technical justification, provide to the other owner(s) of the Protection System(s) a summary of the results of each PSCS or technical justification associated with the Interconnecting Elements
R2
(R2) Periodic Review
(R2) Is short circuit study less than 60 months old ?
Yes
No
No further action required
(R2.1) TO Performs new short circuit Study at interconnecting bus
(R2.2) Has calculated Fault current deviated from most recent PSCS by 10% or greater?
No further action required
(R2.2.1) Within 30 days, provide the updated Fault current values to each owner of the Protection System associated with the Interconnecting Element
Receive notice of >10% short circuit change per R2
R3
Proposed System Change or Addition
Data Request
Other Changes
(R3.1) TO/GO/DP provides details for proposed change or addition either at an existing or new Facility associated with the Interconnecting Element or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s)
(R3.2) TO/GO/DP provides requested information related to the coordination of Protection Systems associated with an Interconnecting Element within 30 days or on an agreed-upon schedule
(R3.3) Within 30 days, provide details of permanent changes made during Misoperation investigation, commissioning, maintenance activities or emergency replacements made due to failure of Protection System components associated with the Interconnecting Element
R4
(R4) Within 90 days after receipt or according to an agreed upon schedule, each TO, GO and DP that received a PSCS or the technical justification explaining why a PSCS is not required shall confirm a review of the summary results or the technical justification and respond to the other owner(s) confirming that there were either no coordination issues or with identified coordination issues
R5
(R5) Each TO, GO and DP that received a response pursuant to R4 shall address any identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element

Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the ~~interconnected~~interconnecting entity (Entity B) and provide details of the ~~proposed~~ change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, respond as to whether any coordination issues were identified, and if any further action is required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

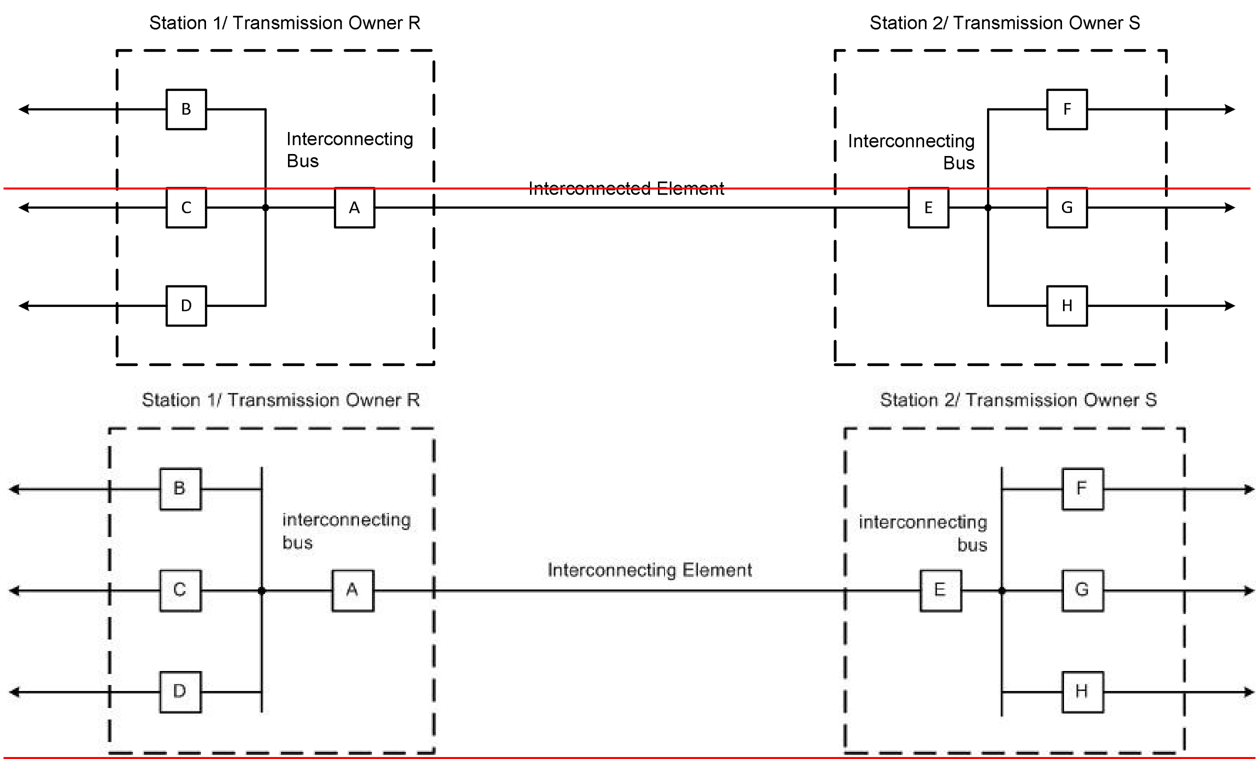
Diagrams

Introduction: The diagrams below are intended to provide guidance, to the owners of Facilities associated with the affected ~~Interconnected~~Interconnecting Element, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable ~~Interconnected~~Interconnecting Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of changes, the owners must work together to resolve any coordination issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".
3. In the Figures below, the locations of the interconnecting bus(s) referenced in Requirement 2 are indicated.

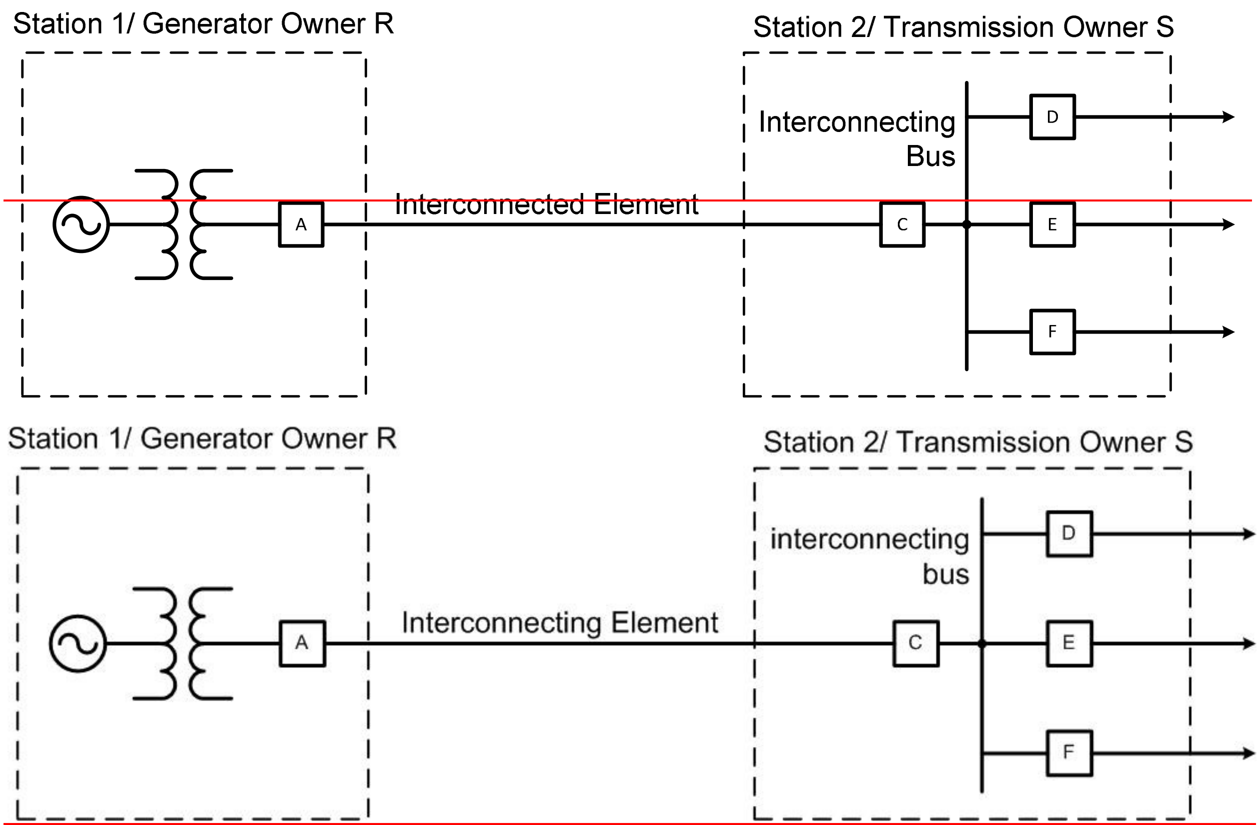
Figure 1



In Figure 1 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner S is to develop ~~proposed~~ Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2

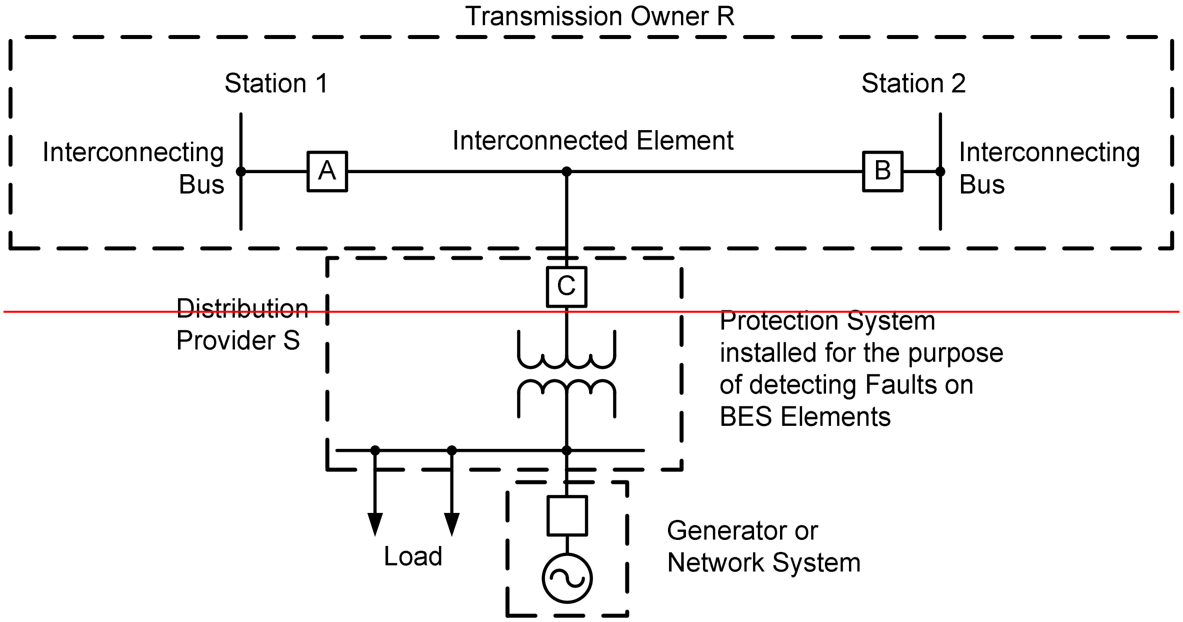


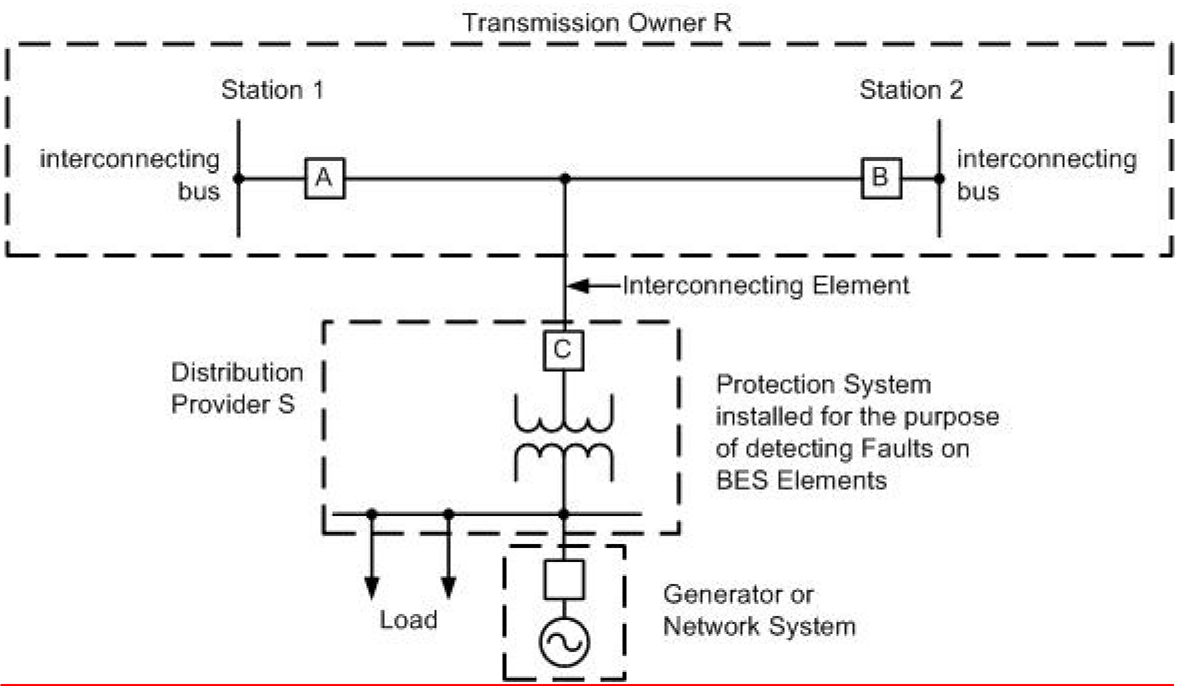
In Figure 2 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 2, Owner R is to develop ~~proposed~~ Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop ~~proposed~~ Protection System settings associated with Breaker C. ~~Generation~~ Generator Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3





In Figure 3 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between the Distribution Provider's Breaker C and the point of connection to the line between the Transmission Owner's Breakers A and B. Therefore, the applicable Protection Systems per this standard are those at Breakers A, B and C.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop ~~proposed~~ Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with

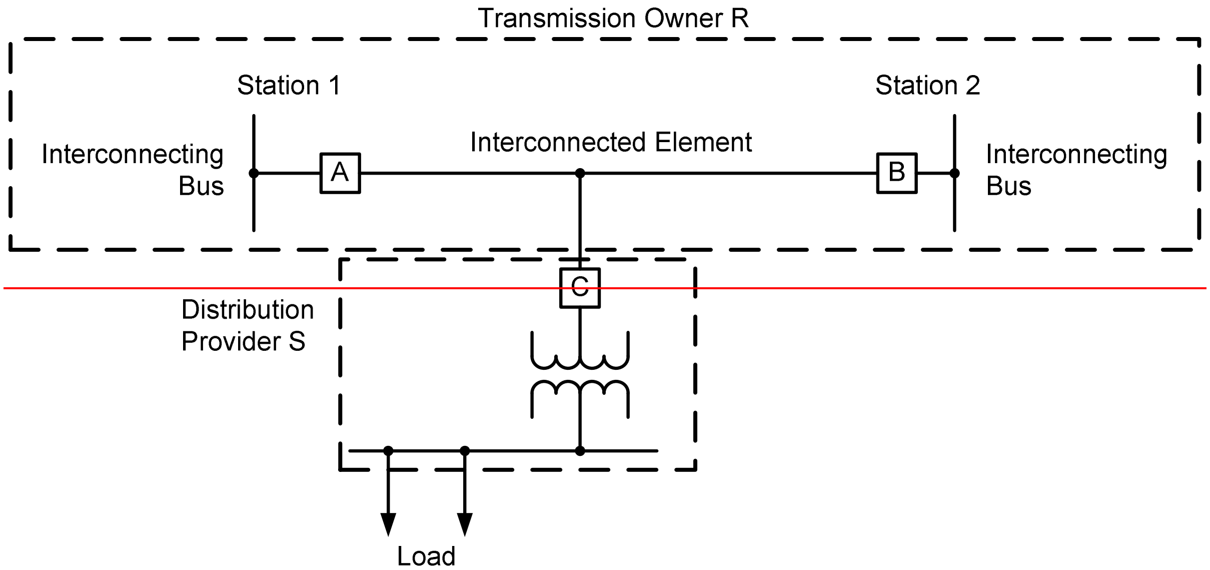
Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

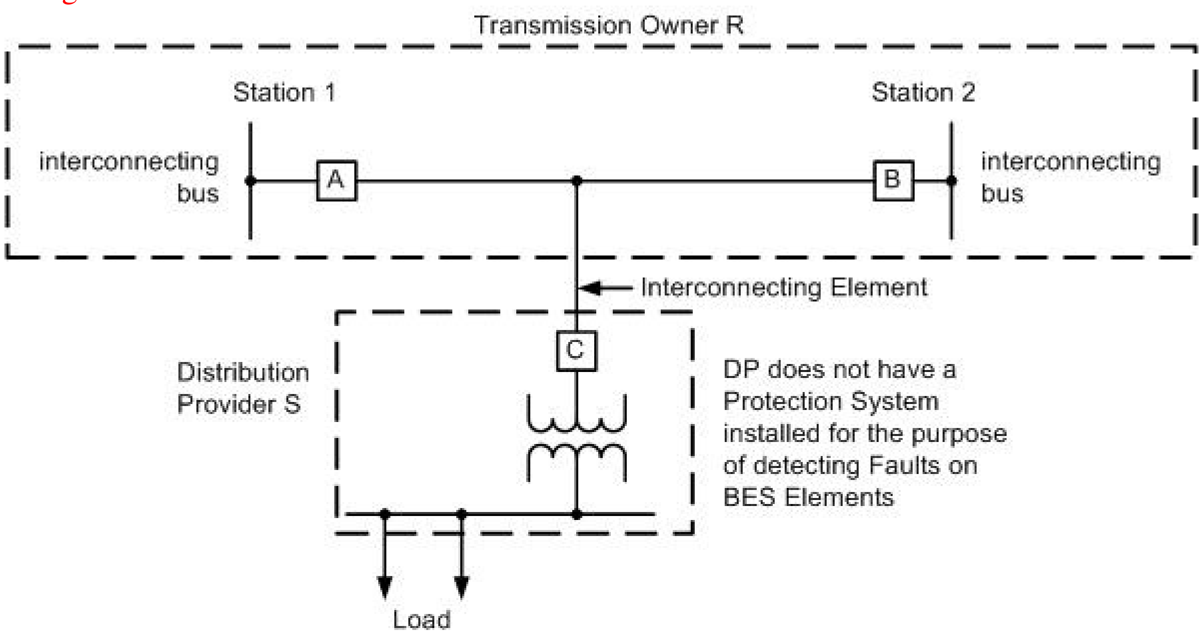
A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is installed for the purpose of detecting Faults on BES Elements.

Protection Systems installed for the purpose of detecting Faults on BES Elements do not include relays that, though they may operate for such Faults, are not installed specifically for that purpose. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized (for whatever reason) while the distribution bank remains energized from a source on the low-voltage side. In this case, the settings of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not specifically installed for the purpose of detecting that Fault.

Figure 4



~~In Figure 4~~



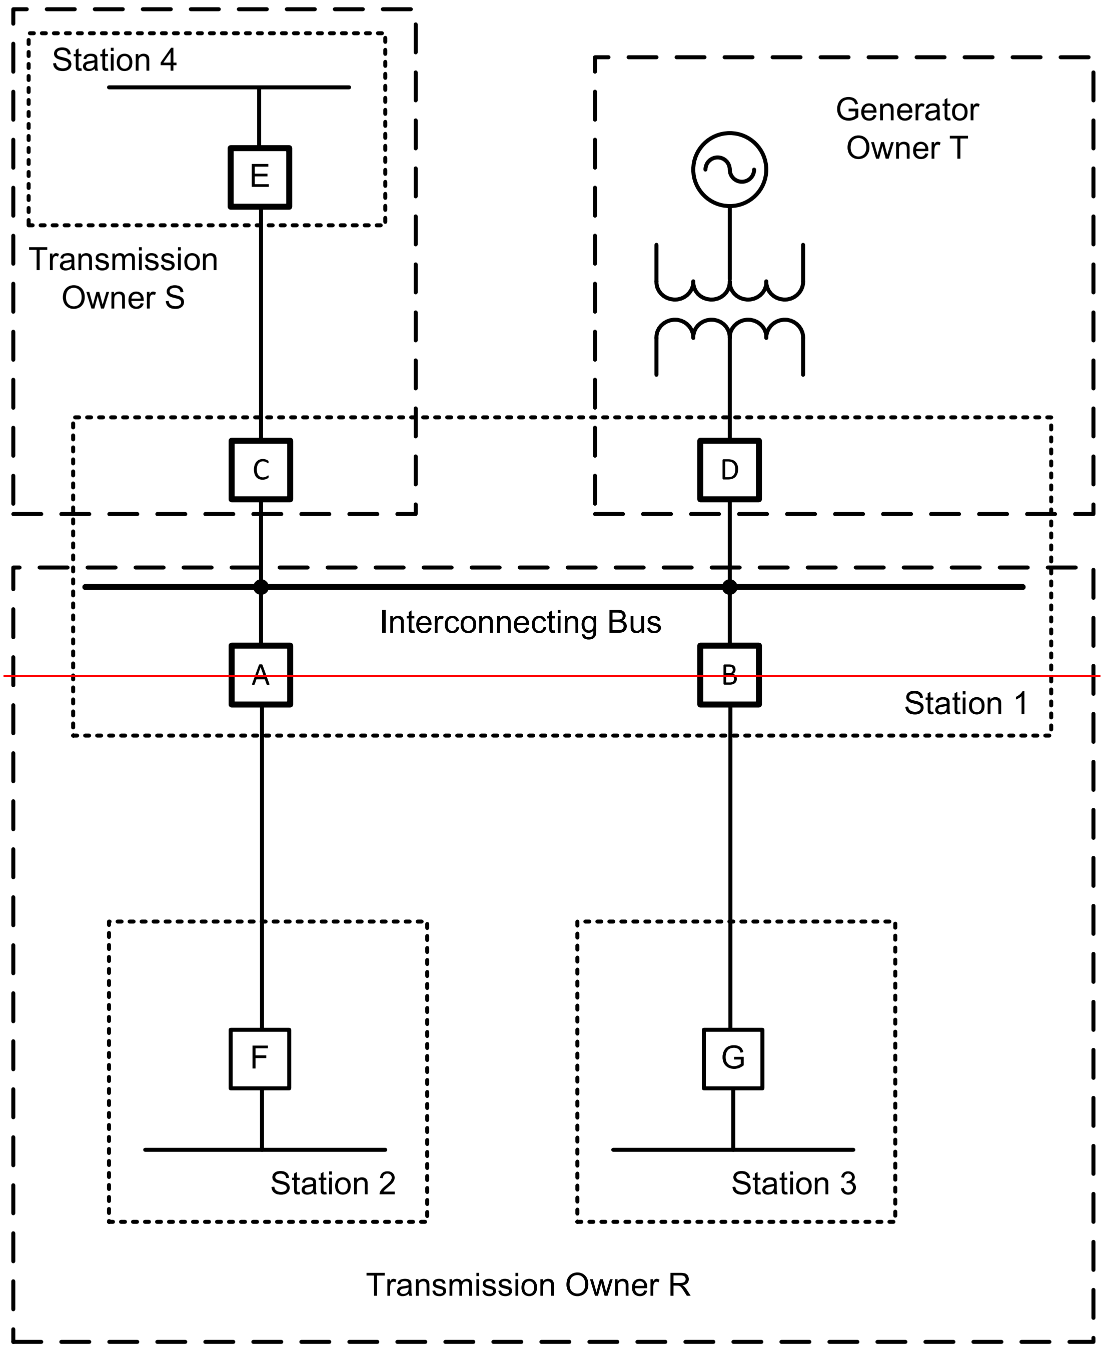
The configuration above~~, the Interconnected Element between the Transmission Owner and~~ is an example excluded from this standard because the Distribution Provider ~~is the transmission line or tap between the line and Breaker C.~~

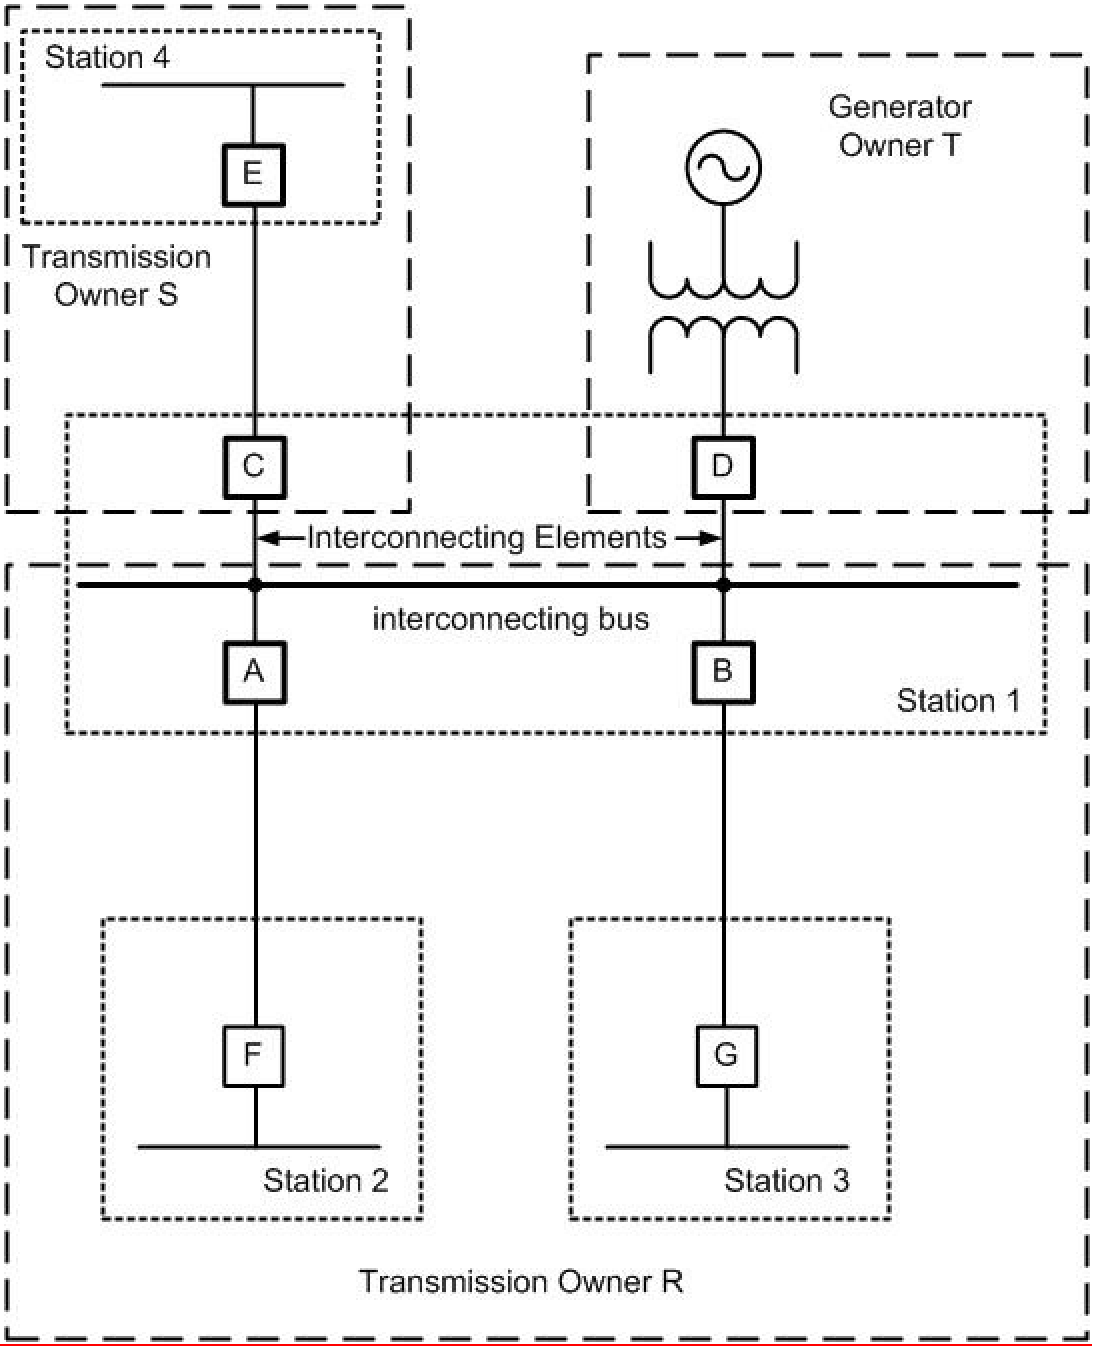
~~**Note:** No specific PSCS is required per this standard for this example since the~~S does not own Protection ~~System at the Distribution Provider's substation is not~~Systems installed for the purpose of detecting Faults on BES Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.





~~In~~ Figure 5 above~~,~~ illustrates the ~~Interconnected Element~~Interconnecting Elements between the Transmission Owners R and S and Generator Owner T~~ is the common Transmission bus.~~. In this example, Transmission Owner S and Generator Owner T are not directly ~~interconnected~~interconnecting to each other at Station 1. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 5:

Owner S is to develop ~~proposed~~ Protection System settings associated with Breakers C and E.

Owner T is to develop ~~proposed~~ Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop ~~proposed~~ Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the generator Protection System. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Implementation Plan

Project 2007-06 System Protection Coordination PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults

Retirements Requested

- PRC-001-2 System Protection Coordination, Requirements R2 and R3

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults	X	X	X			

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnecting Element: A BES Element that electrically joins facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider)

Protection System Coordination Study: A study that documents existing or proposed Protection Systems operate in the intended sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 until PER-005-2 — Operations Personnel Training is approved by the applicable regulatory authorities.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for Definitions

The two proposed definitions (Interconnecting Facilities and Protection System Coordination Study) shall become effective at the same time as PRC-027-1.

Implementation Plan

Project 2007-06 System Protection Coordination
PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults

Retirements Requested

- PRC-001-2 System Protection Coordination, Requirements R2 and R3
- ~~PRC-001-3 System Protection Coordination~~

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults ~~PRC-001-3: System Protection Coordination~~	X	X	X	~~X~~	~~X~~	~~X~~

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

~~Interconnected~~ Interconnecting Element: A BES Element that electrically joins facilities ~~owned by~~:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity ~~r~~responsibilities
(Transmission Owner, Generator Owner, or Distribution Provider~~Distribution Provider, Generator Owner, or Transmission Owner~~)~~.~~

Protection System Coordination Study: A study that documents~~demonstrates~~ existing or proposed Protection Systems operate in the intended ~~desired~~ sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 until PER-005-2 — Operations Personnel Training is approved by the applicable regulatory authorities~~of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard~~.

~~Note: The drafting team added Measure (M1) to PRC-001-3 related to Requirement R1.~~

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date~~.

~~PRC-001-3 – System Protection Coordination~~

~~Same effective date as PRC-027-1.~~

Effective Date for Definitions

The two proposed definitions (~~Interconnected~~ Interconnecting Facilities and Protection System Coordination Study) shall become effective at the same time as PRC-027-1.

~~Retirement:~~

~~PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.~~

Project 2007-06 System Protection Coordination
4th Draft of PRC-027-1

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the 4th draft of the standard PRC-027-1: Protection System Coordination for Performance During Faults. Comments must be submitted by **8 p.m. Eastern November 1, 2013**. If you have questions please contact Al McMeekin or by telephone at 803-530-1963.

http://www.nerc.com/pa/Stand/Pages/Project-2007-06-System-Protection-Coordination.aspx

Background Information:
The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPCSDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

The SPCSDT posted Draft 3 of PRC-027 in June, 2013 for comment and ballot. As part of that posting, the drafting team proposed revisions to PRC-001-2. The revisions were being proposed as an interim step to provide clarity to PRC-001 until it is retired. However, since this last posting, the informal initiative for revising PER-005-1 has transitioned to a formal project, Project 2010-01 Training. The proposed revisions to PER-005-1 address the reliability objective of PRC-001-2, Requirement 1. Proposed Reliability Standard PRC-027-1 incorporates the aspects of coordination in Requirements R2 and R3 of PRC-001-2. Consequently, NERC staff and the SPCSDT are recommending the retirement of PRC-001-2. As such the drafting team is no longer considering changes to PRC-001-2. The disposition of all three PRC-001-2 requirements is outlined in the Mapping Document associated with this project and is posted for stakeholder review. The retirement of PRC-001-2, Requirement R1 is contingent upon the successful ballot and approval of PER-005-2 by the applicable regulatory authorities. The retirement of PRC-001-2, Requirements R2 and R3 are predicated upon the successful ballot and approval of PRC-027-1 by the applicable regulatory authorities.

Based on comments received from industry stakeholders the drafting team made the following modifications to the draft standard:

- Changed the word ‘desired’ to ‘intended’ in the Purpose
- Changed the term ‘Interconnected Element’ to ‘Interconnecting Element’ throughout the standard
- Removed the technical justification for not conducting the Fault current review specified in Requirement R2
- Modified Requirement 4 and split it into two Requirements, R4 and R5 for clarity
- The Process Flow Chart was updated to reflect changes made to the standard
- The Figures and associated descriptions were modified to provide more clarity

The SPCSDT has responded to stakeholder comments and incorporated pertinent suggestions into the fourth draft of PRC-027-1 for stakeholder review and comment.

Questions

Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Please provide any issues you have with this draft of PRC-027-1 along with a proposed solution.

		or addition(s) to the Protection System(s) associated with the Interconnecting Element.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors
High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has five (5) requirements that incorporate and clarify the reliability intent of Requirements R2 and R3 of PRC-001-2. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All five requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnecting Element to verify that Protection Systems components operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3, R4 and R5, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnecting Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each Interconnecting Element to verify that Protection Systems components operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 does not co-mingle reliability objectives.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study on an Interconnecting Element as required in Requirement R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Parts 1.1.2, 1.1.3, and 1.1.4 or technically justified why a study was not required, but was late by less than or equal to 30 calendar days. OR The responsible entity provided a summary of the results of each Protection System Coordination Study or a technical justification in accordance with Requirement R1, Part 1.2, but was late by less than or equal to	The responsible entity performed a Protection System Coordination Study on an Interconnecting Element as required in Requirement R1, Part 1.1.1, but was late by more than 30 calendar days but less than or equal to 60 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Parts 1.1.2, 1.1.3, and 1.1.4 or technically justified why a study was not required but was late by more than 60 calendar days. OR The responsible entity provided a summary of the results of each Protection System Coordination Study or a technical justification in accordance with Requirement R1, Part 1.2, but was late by more than 30 calendar days.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
10 calendar days.	days.	days.	OR The responsible entity failed to perform a Protection System Coordination Study on an Interconnected Element in accordance with Requirement R1, Parts 1.1.1, 1.1.2, 1.1.3, or 1.1.4. OR The responsible entity failed to technically justify why a study was not required in accordance with Requirement R1, Parts 1.1.2, 1.1.3, or 1.1.4. OR The responsible entity failed to provide a summary of the results of each Protection System Coordination Study or a technical justification in accordance with Requirement R1, Part 1.2.

VSL Justifications – PRC-027-1, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to periodically perform a short circuit study to calculate the percent change in Fault current values used as inputs for updating Protection System Coordination Study(s), and to provide the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s) updated Fault current values, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R2 is similar in scope to Requirements R1, R3, R4 and R5 as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R2 facilitates a periodic review of Fault currents, and notification of owner(s) of the Protection System(s) associated with the Interconnecting Element(s). This requirement is similar to Requirement R6 of BAL-005-0.2b in that it also requires the comparison of calculated data and possible notification of other entities; and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to periodically perform a short circuit study to calculate the percent change in Fault current values used as inputs for updating Protection System Coordination Study(s), and to provide the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s) updated Fault current values, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R2 does not co-mingle reliability objectives.

Proposed VSLs for PRC-027-1, R2			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner performed a short circuit study, as required in Requirement R2, Part 2.1, but was late by less than or equal to 30 calendar days.	The Transmission Owner performed a short circuit study as required in Requirement R2, Part 2.1, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The Transmission Owner performed a short circuit study as required in Requirement R2, Part 2.1, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The Transmission Owner performed a short circuit study as required in Requirement R2, Part 2.1, but was late by more than 90 calendar days. OR The Transmission Owner failed to perform a short circuit study, as required in Requirement R2, Part 2.1. OR The Transmission Owner failed to calculate the percent change between the Fault currents, according to the equation designated in Requirement R2, Part 2.2.
OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnecting Element, the changes in Fault currents, as required in Requirement R2, Part 2.2.1, but was late by less than or equal to 10 calendar days.	OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnecting Element, the changes in Fault currents, as required in Requirement R2, Part 2.2.1, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnecting Element, the changes in Fault currents, as required in Requirement R2, Part 2.2.1, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnecting Element, the changes in Fault currents, as required in Requirement R2, Part 2.2.1, but was late by more than 30 calendar days. OR The Transmission Owner failed to provide the owner(s) of the Facility associated with the Interconnected Element, the updated Fault current values, as required in Requirement R2, Part 2.2.1.

VRF Justifications – PRC-027-1, R5	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R5 is similar in scope to Requirements R1, R2, R3 and R4 as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R5 mandates responsible entities address any identified coordination issue(s) prior to implementation. This requirement is similar to Requirement R3 of PRC-023-2 in that it also requires agreement be obtained, and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R5 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R5			
Lower	**Moderate**	**High**	**Severe**
			The responsible entity failed to address any identified coordination issue(s), prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) in accordance with Requirement R5.

VSL Justifications – PRC-027-1, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines for a Severe VSL—This is a binary or "pass-fail" requirement. The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The single proposed VSL is a binary VSL (pass-fail). The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has ~~four (4~~five (5) requirements that incorporate and clarify the reliability intent of Requirements R2 and R3 of PRC-001-2. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All ~~four~~five requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnect~~ed~~ing Element to verify that Protection Systems components operate in the ~~desired~~intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3, R4 and ~~R4~~R5, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnect~~ed~~ing Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each ~~Interconnected Facility~~Interconnecting Element to verify that Protection Systems components operate in the ~~desired~~intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 ~~addresses a single objective and has a single VRF.~~does not co-mingle reliability objectives.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study on an Interconnect~~ed~~ing Element as required in Requirement R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. 			~~including the resolution of any identified coordination issues, prior to implementation of those changes, as required in Requirement R4, Part 4.2~~.

VSL Justifications – PRC-027-1, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R5	
Proposed VRF	Medium
NERC VRF Discussion	Failure to address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R5 is similar in scope to Requirements R1, R2, R3 and R4 as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R5 mandates responsible entities address any identified coordination issue(s) prior to implementation. This requirement is similar to Requirement R3 of PRC-023-2 in that it also requires agreement be obtained, and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R5 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R5			
Lower	Moderate	High	Severe
			The responsible entity failed to address any identified coordination issue(s), prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s) in accordance with Requirement R5.

VSL Justifications – PRC-027-1, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines for a Severe VSL—This is a binary or "pass-fail" requirement. The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The single proposed VSL is a binary VSL (pass-fail). The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Comment Period Closed

PRC-027-1 – Protection System Coordination for Performance During Faults had initially been posted for a 45-day formal comment period on September 18, 2013 with a ballot scheduled for the last ten days of the comment period.

After NERC staff review and discussion with the chairs of Project 2007-06 System Protection Coordination and Project 2010-01 Training, it was determined that the disposition of PRC-001-2 Requirement R1 was outside the scope of the SAR of either project. Therefore, NERC staff has decided to initiate informal development on a new draft SAR that will take a holistic approach to training by combining various training requirements located throughout the set of NERC Reliability Standards (including PRC-001-2 Requirement R1) into a new PER standard. The posting of PRC-027-1 will be removed from comment and ballot and the associated documents will be modified to reflect this direction. The System Protection Coordination Standard Drafting Team expects to repost the documents next week for a 45-day comment period with a ballot period open the last ten days of the posting.

Background information for this project can be found on the project page.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.
7. Draft 3 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from June 4 – July 3, 2013.
8. Draft 4 of PRC-027-1 was posted for a 45-day formal comment and ballot from September 18 – November 1, 2013. Note: Posting and ballot postponed as of September 27, 2013.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.” This standard incorporates and clarifies the coordination aspects of Requirements R2 and R3 from PRC-001-2. The SPCSDT is soliciting stakeholder feedback on draft 4 of PRC-027-1 during a 45-day formal comment period with parallel ballot.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Ballot	November - December 2013
Final Ballot	March 2014
BOT Adoption	May 2014

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1:

Interconnecting Element
A Bulk Electric System (BES) Element that electrically joins Facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider)

Protection System Coordination Study
A study documenting that existing or proposed Protection Systems operate in the intended sequence for clearing Faults.

Other Aspects of Coordination of Protection Systems Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects:

• Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.

• Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.

- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1 by Project 2007-09.
- Transmission relay loadability is addressed in PRC-023-2.
- Generator relay loadability is addressed in PRC-025-1 by Project 2010-13.2, Phase 2 of Relay Loadability: Generation.
- Protective relay response during power swings will be addressed by Project 2010-13.3, Phase 3 of Relay Loadability: Stable Power Swings.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and are addressed in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPCSDT contends that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider (that own Protection Systems identified in the Facilities section 4.2 below)

4.2 Facilities:

Protection Systems:

a) installed for the purpose of detecting Faults on Interconnecting Elements, and

b) that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPCSDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults."*

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPCSDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

Proposed Reliability Standard PRC-027-1 incorporates the aspects of coordination found in Requirements R2 and R3 of PRC-001-2. With the reliability intent of these two legacy requirements being addressed in PRC-027-1, it is necessary to retire them from PRC-001-2.

B. Requirements and Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new Interconnecting Elements. The drafting team defines the term “Interconnecting Element” as “A BES Element that electrically joins Facilities: a) owned by separate Registered Entities, or b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner).”

Part 1.1.1 The drafting team contends 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnecting Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team contends that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required. Refer to the Application Guidelines for Requirement R1 for examples of Protection Systems where technical justifications may be used.

Part 1.1.3 The drafting team contends that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, Part 3.1, or to technically justify why no such study is needed. The drafting team contends the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project’s scope and schedule. Specifying a time frame for performing studies is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.1.4 The drafting team contends that entities must perform the studies required when notified of changes identified in Requirement R3, Part 3.3, or to technically justify why no such study is needed. The drafting team contends that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team contends to properly ensure coordination of Protection Systems associated with Interconnecting Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team contends that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s).

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its Interconnecting Elements as follows:

1.1.1 Within 60 calendar months after the effective date of this standard, if no PSCS for that Interconnecting Element exists.

1.1.2 Within 12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or technically justify why such a study is not required.

1.1.4 Within six calendar months of being notified of a change as described in Requirement R3, Part 3.3, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each PSCS or the technical justification pursuant to Requirement R1, Part 1.1, provide to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s): a summary of the results of each PSCS performed, including, at a minimum, the Protection Systems reviewed, the associated Fault current(s) used, any issues identified, and any revisions or actions proposed; or the technical justification.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4 is a dated PSCS, or the summary of the results of each PSCS (hard copy or electronic file formats) demonstrating the time frames specified or agreed to in Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4 were achieved. Acceptable evidence of a technical justification for not performing a PSCS as specified in Parts 1.1.2, 1.1.3, and 1.1.4 may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspect of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary of the results of each PSCS or the technical justification (hard copy or electronic file formats) were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnecting Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing the results to the applicable entities when changes occur that meet the criteria of Requirement R2. It is important that interconnecting Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team contends 60 calendar months provides the entities flexibility to schedule and perform the activities specified in Requirement R2, Parts 2.1 and 2.2.

Part 2.1 The drafting team contends maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination.

Part 2.2 The drafting team is including this equation to assure a consistent approach is used by each Transmission Owner when calculating the percent change in Fault current values.

Part 2.2.1 The drafting team contends the 30-calendar day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the Interconnecting Element. The drafting team determined that a change in Fault current of 10% indicates an appropriate point at which to provide this information, based on the fact that Protection Systems are typically set with margins above 10%.

R2. For each Interconnecting Element on its System, the Transmission Owner shall, once every 60 calendar months: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at its interconnecting bus(s) where a PSCS is available pursuant to Requirement R1.

2.2. Calculate the percent change between the Fault current values (single line to ground and 3-phase for its interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\,Change = \left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent PSCS

2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System(s) associated with the Interconnecting Element(s).

M3. Acceptable evidence for Requirement R2, Parts 2.1 and 2.2 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and identifies the percent change from the Fault current values used in the most recent PSCS determined by the equation.

M4. Acceptable evidence for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the Interconnecting Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnecting Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnecting Element(s). The drafting team contends that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the Interconnecting Element. The drafting team contends that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.4. The drafting team contends 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team contends 30 calendar days is sufficient time to provide the information.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnecting Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s).

- New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnecting Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days of making the change, details of permanent changes made to Protection Systems associated with the Interconnecting Element during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

M5. Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) as identified in the bulleted list, was provided to each responsible entity connected to the same Interconnecting Element.

M6. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

M7. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the permanent changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnecting Elements confirm that the Protection System(s) applied were reviewed and a response was provided to the other owner(s). The review assures that the owners of Protection Systems associated with the affected Interconnecting Element are aware of the changes and have responded with comments if necessary.

The drafting team contends 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnecting Elements to review the summary results of a PSCS or the technical justification and respond. Note: Pursuant to Requirement R1, Part 1.2, at a minimum, the summary of the results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate the results of the PSCS or the technical justification were reviewed and, if applicable, any identified issues.

Note: The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they can confirm that there were no identified coordination issues.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 is sufficient for use by all entities.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that received a summary of the results of a PSCS or a technical justification explaining why a PSCS is not required (pursuant to Requirement R1, Part 1.2) shall, within 90 calendar days after receipt or according to an agreed upon schedule, review the summary of the results or the technical justification, and respond to the other owner(s) either: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

- Confirming that the summary of the results was reviewed and no coordination issues were identified, or
- Confirming that the summary of the results was reviewed and any identified coordination issue(s) were noted, or

- Confirming that a technical justification was reviewed and no issue(s) were identified, or
- Confirming that a technical justification was reviewed and any identified issue(s) were noted

M8. Acceptable evidence for Requirement R4 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

Rationale for R5: This requirement obligates owner(s) of Protection System(s) associated with Interconnecting Elements to communicate and address any identified coordination issues prior to implementing the proposed Protection System(s) change(s) or addition(s); i.e., the in-service date of the Protection System(s).

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that received a response pursuant to Requirement R4 shall address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

M9. Acceptable evidence for Requirement R5 is dated documentation (hardcopy or electronic file formats) demonstrating that a response pursuant to Requirement R4 was received and that any identified coordination issues were addressed prior to implementation of any proposed Protection System(s) changes or additions.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System associated with an Interconnecting Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, R4, and R5, and Measures M1 through M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider that owns a Protection System at a Facility associated with an Interconnecting Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing Interconnecting Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with Interconnecting Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the intended sequence for internal and external Faults on the Interconnecting Element.

Requirement R1:

This requirement directs the applicable entities to perform a Protection System Coordination Study (PSCS) for every Interconnecting Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current changes of 10% or more have occurred. In developing the language to define a PSCS, the System Protection Coordination Standard Drafting Team (SPCSDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study documenting that existing or proposed Protection Systems operate in the intended sequence for clearing Faults."

PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

Part 1.1.1:

The drafting team contends applicable entities should have a documented PSCS for each Interconnecting Element to validate the Protection Systems associated with those Interconnecting Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team contends that 60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnecting Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Part 1.1.2:

After notification of an identified 10% or greater change in Fault current (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new PSCS of the Interconnecting Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater change in Fault current may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team contends the 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 60-calendar month Fault current review.

Part 1.1.3:

After proposing or being notified of a change at a Facility associated with the Interconnecting Element, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team contends the timeframe associated with performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R5.

Part 1.1.4:

After being notified of a change at a Facility associated with the Interconnecting Element associated with Requirement R3, Part 3.3, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team contends that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
    - Loss of potential condition
    - Some communication assisted tripping
    - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
    - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.
    - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

Requirement R1, Part 1.2 directs the entity performing the PSCS to provide a summary of the study results or a technical justification to the affected Interconnecting Element owner(s). The drafting team contends that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS it performed to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s). (Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) The following inputs and results of a PSCS must be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated PSCS may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner perform a periodic review of Fault currents.

The short circuit study provides the Fault current values used to calculate the percent change between the most recent PSCS and the present Fault current values indicated by the short circuit study performed pursuant to Requirement R2, Part 2.1. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team contends that 60 calendar months is an appropriate interval for reviewing Fault currents. The drafting team contends studies associated with changes that would affect the coordination in less than 60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnecting Element when short circuit studies indicate that 10% changes in Fault current have occurred at the interconnecting bus(s). The drafting team contends the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnecting entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the short circuit studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the Interconnecting Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the PSCS of the Facility associated with the Interconnecting Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the Interconnecting Element. The drafting team contends that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team contends 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Requirement R3, Part 3.3 includes a provision for providing details associated with changes to the previously agreed-upon coordination when permanent changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the drafting team contends 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

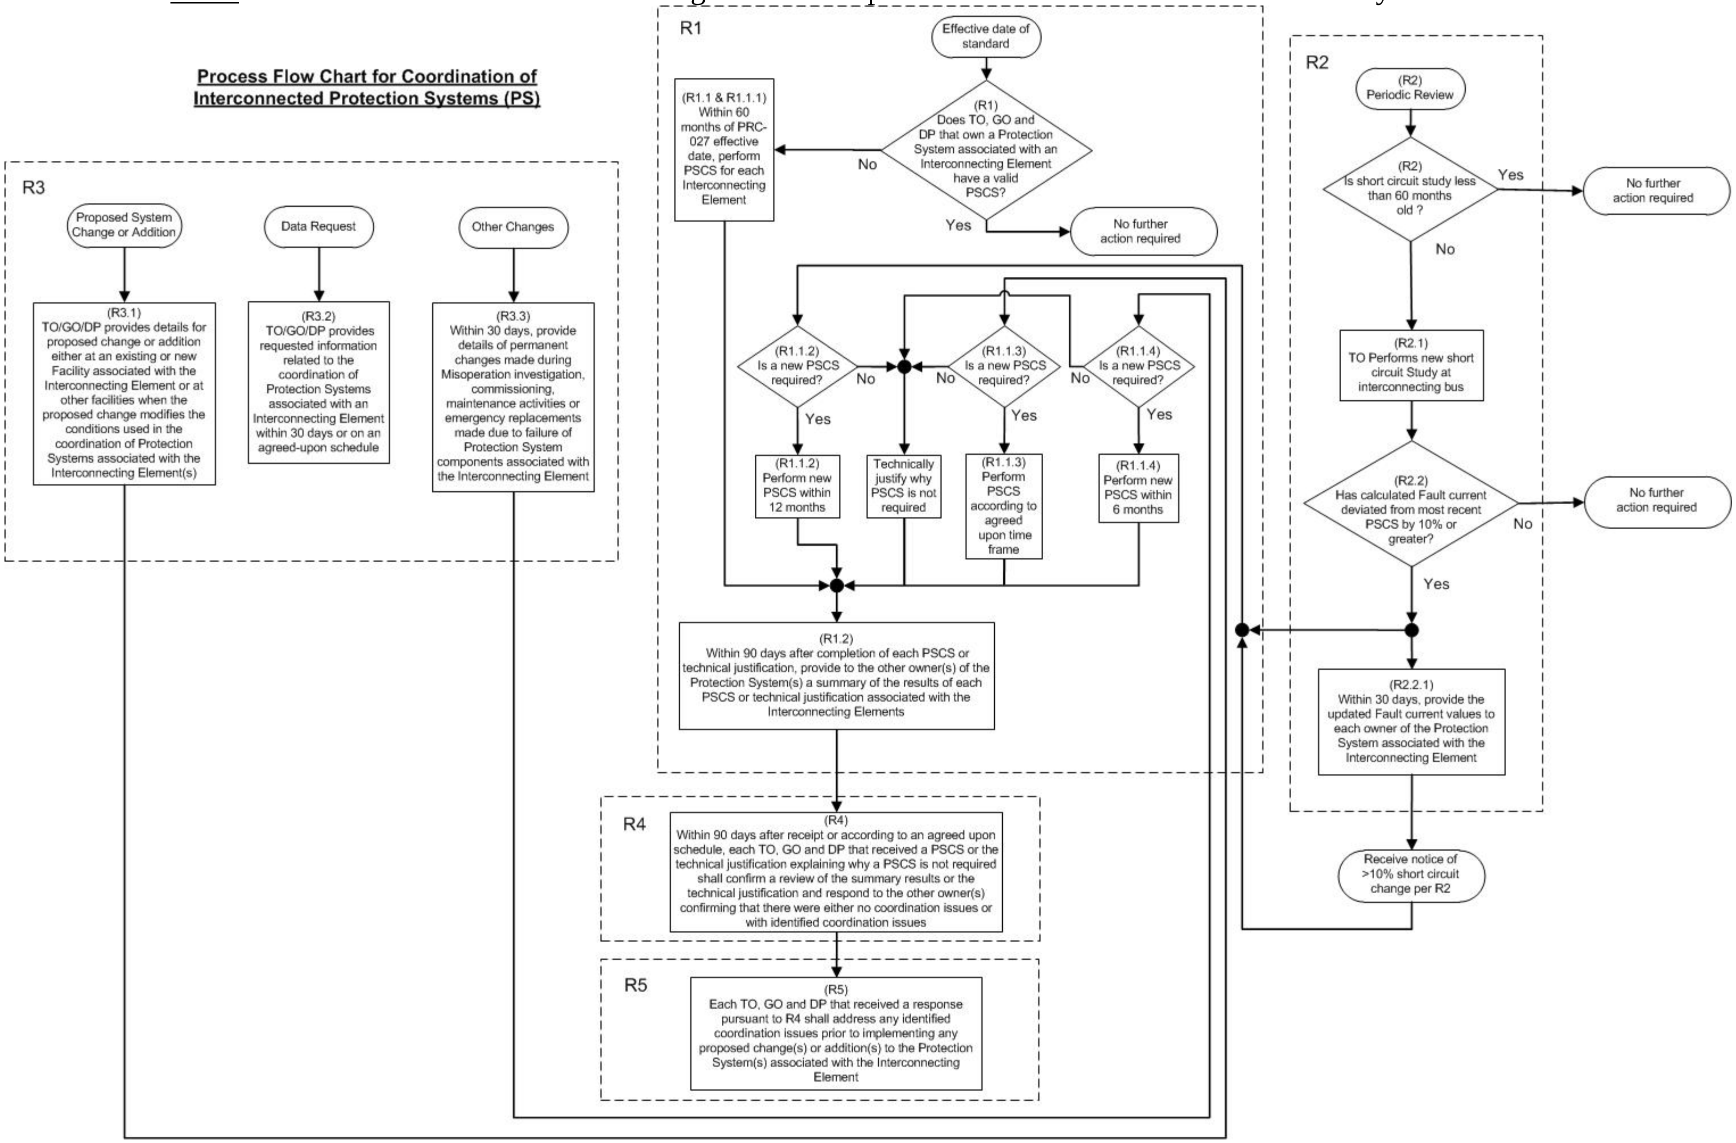
Requirement R4:

Requirement R4directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS or the technical justification, as described in Requirement R1, Part 1.2; and respond that they have reviewed and identified any issues. The drafting team contends 90 calendar days after receipt provides a reasonable time for the owners of Facilities to review.

Requirement R5:

The reliability objective of this requirement is to bring the process of Protection System coordination full circle by ensuring owners of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (in-service date).

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:
Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes.



Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the interconnecting entity (Entity B) and provide details of the change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, respond as to whether any coordination issues were identified, and if any further action is required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

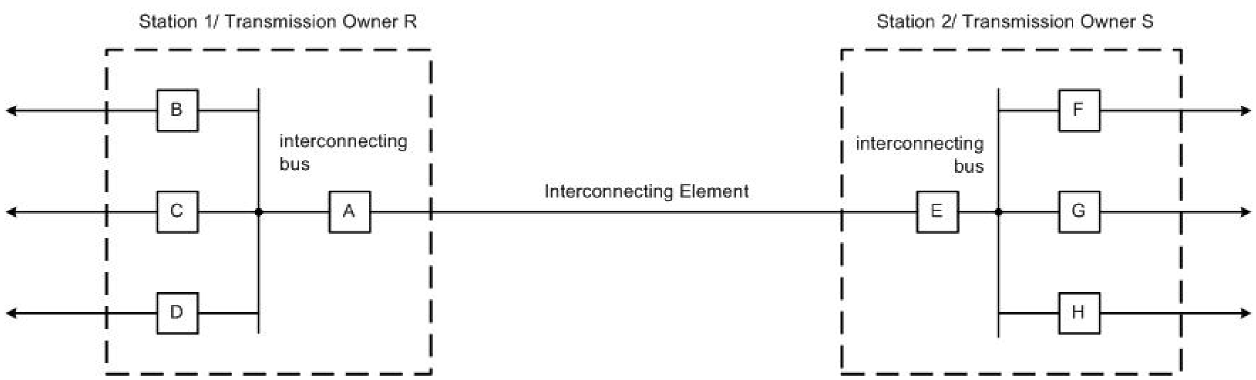
Diagrams

Introduction: The diagrams below are intended to provide guidance, to the owners of Facilities associated with the affected Interconnecting Element, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable Interconnecting Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of changes, the owners must work together to resolve any coordination issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".
3. In the Figures below, the locations of the interconnecting bus(s) referenced in Requirement 2 are indicated.

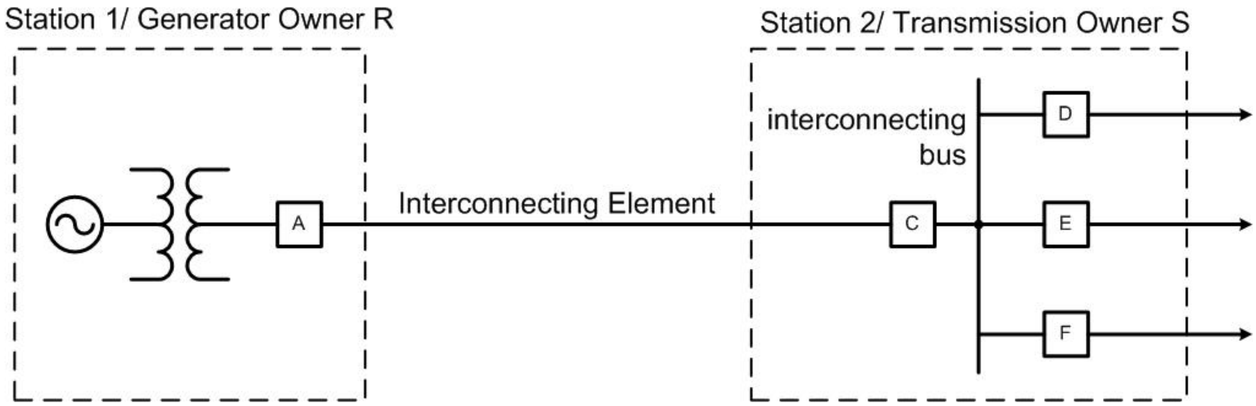
Figure 1



In Figure 1 above, the Interconnecting Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner S is to develop Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2

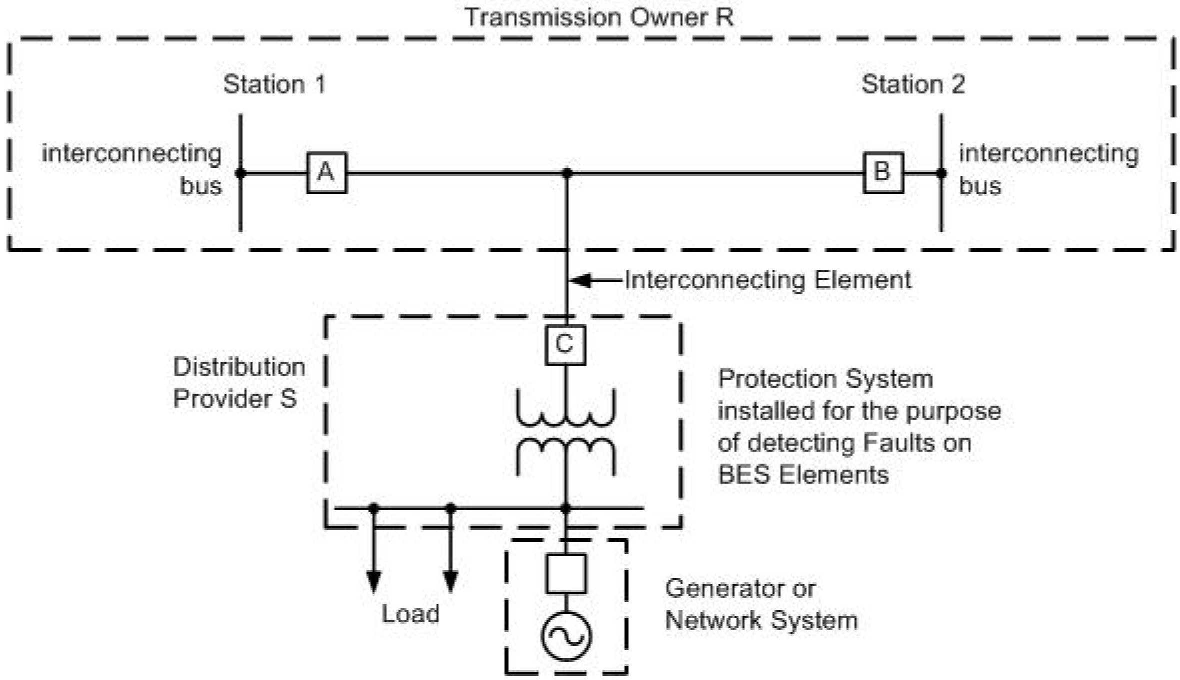


In Figure 2 above, the Interconnecting Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 2, Owner R is to develop Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop Protection System settings associated with Breaker C. Generator Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3



In Figure 3 above, the Interconnecting Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between the Distribution Provider's Breaker C and the point of connection to the line between the Transmission Owner's Breakers A and B. Therefore, the applicable Protection Systems per this standard are those at Breakers A, B and C.

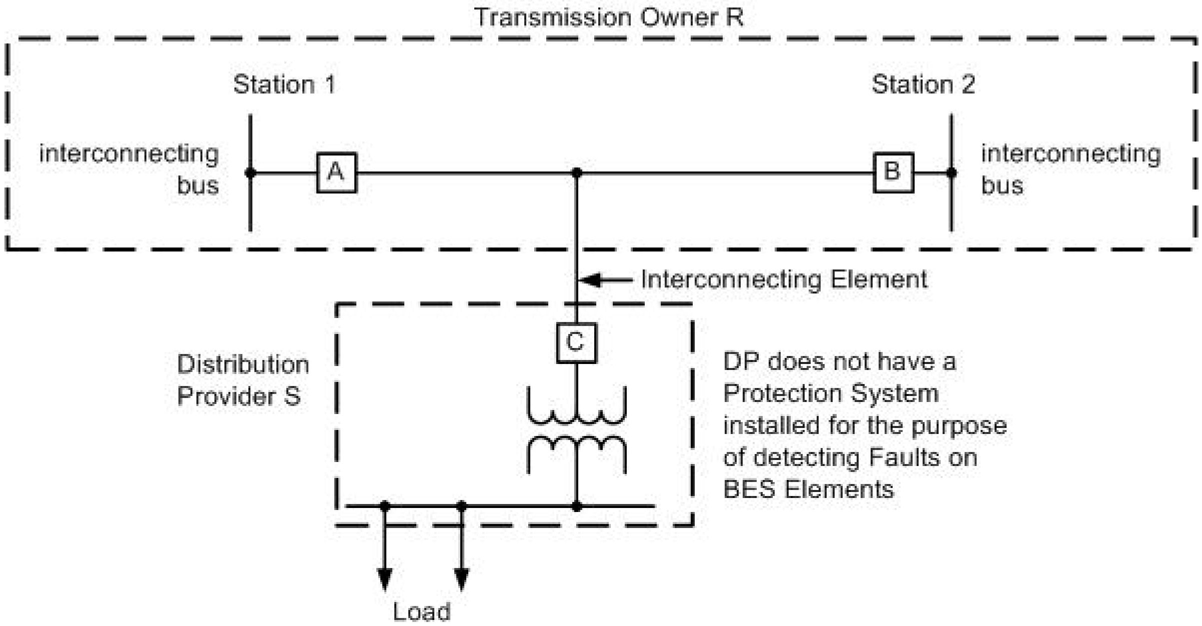
Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is installed for the purpose of detecting Faults on BES Elements.

Protection Systems installed for the purpose of detecting Faults on BES Elements do not include relays that, though they may operate for such Faults, are not installed specifically for that purpose. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized (for whatever reason) while the distribution bank remains energized from a source on the low-voltage side. In this case, the settings of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not specifically installed for the purpose of detecting that Fault.

Figure 4



The configuration above is an example excluded from this standard because the Distribution Provider S does not own Protection Systems installed for the purpose of detecting Faults on BES Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.

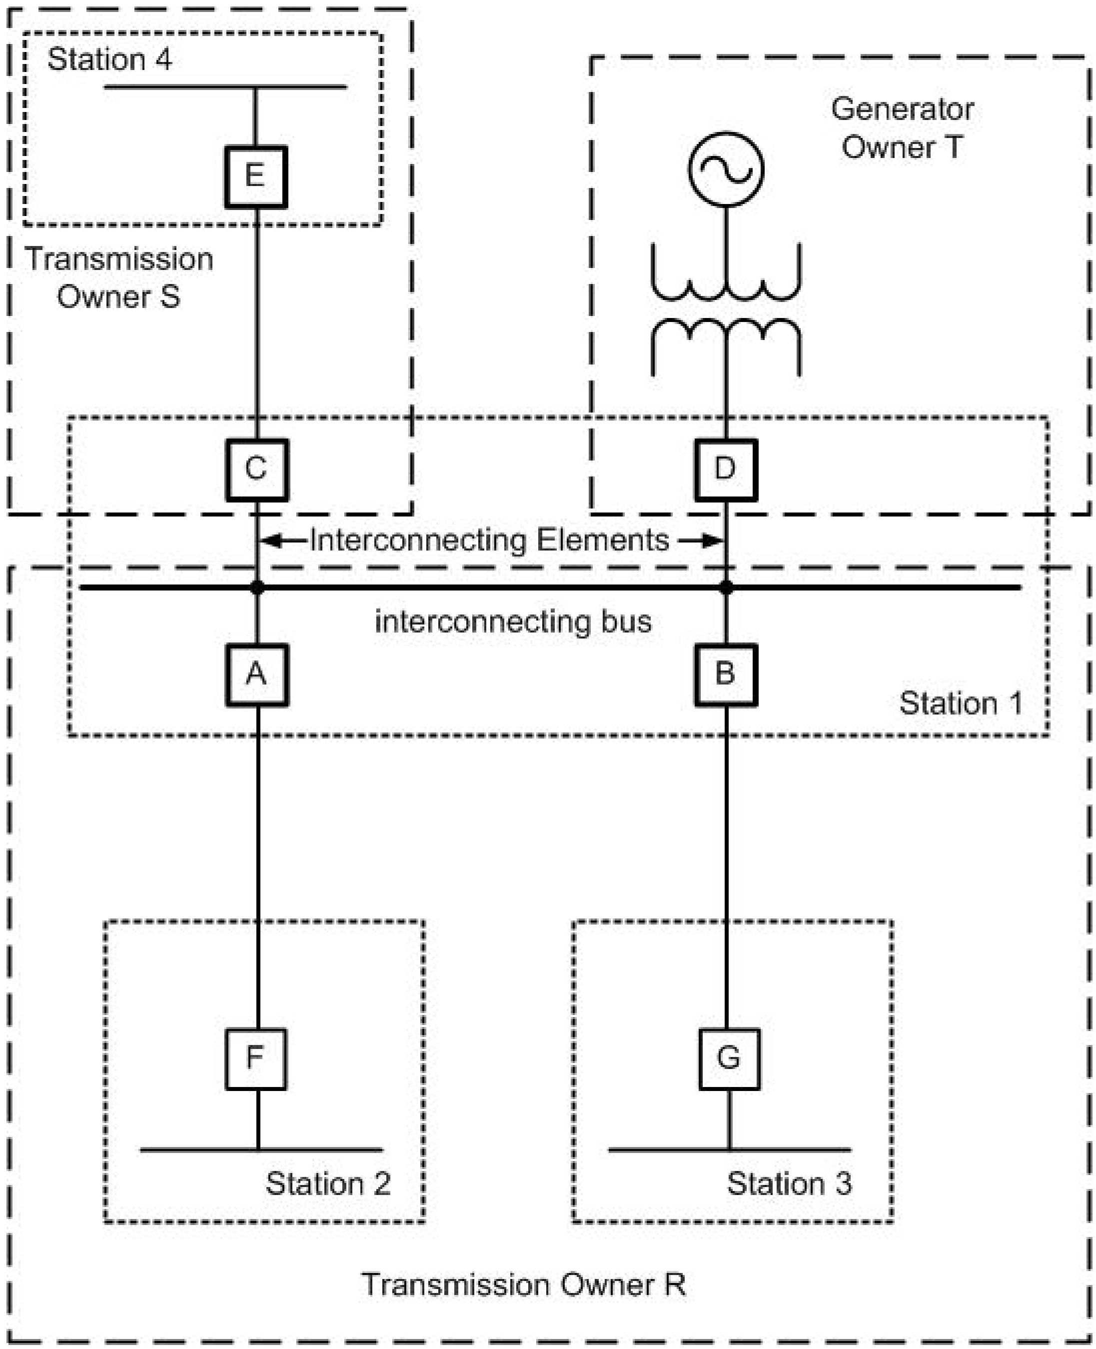


Figure 5 above illustrates the Interconnecting Elements between the Transmission Owners R and S and Generator Owner T. In this example, Transmission Owner S and Generator Owner T are not directly interconnecting to each other at Station 1. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 5:

Owner S is to develop Protection System settings associated with Breakers C and E.

Owner T is to develop Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the generator Protection System. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.
6. Draft 2 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from November 16 – December 17, 2012.
7. Draft 3 of PRC-027-1 was posted for a 30-day formal comment and successive ballot from June 4 – July 3, 2013.
8. Draft 4 of PRC-027-1 was posted for a 45-day formal comment and ballot from September 18 – November 1, 2013. Note: Posting and ballot postponed as of September 27, 2013.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.” This standard incorporates and clarifies the coordination aspects of Requirements R2 and R3 from PRC-001-2. The SPCSDT is soliciting stakeholder feedback on draft 4 of PRC-027-1 during a 45-day formal comment period with parallel ballot.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Ballot	November - December 2013
Final Ballot	March 2014
BOT Adoption	May 2014

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~PRC-027-1 shall become effective on the first day of the first calendar quarter that is 12 months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is 12 months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.~~

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1~~, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms~~:

~~Interconnected~~Interconnecting Element
~~:~~ A Bulk Electric System (BES) Element that electrically joins ~~facilities~~ Facilities:
a) owned by~~:~~
~~a)~~ separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (~~Distribution Provider~~Transmission Owner, Generator Owner, or ~~Transmission Owner~~Distribution Provider)~~.~~

Protection System Coordination Study~~:~~
A study ~~that demonstrates~~documenting that existing or proposed Protection Systems operate in the ~~desired~~intended sequence for clearing Faults.

Other Aspects of Coordination of Protection Systems Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects:

- Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is ~~being~~ addressed in PRC-019-1 by Project 2007-09~~, Generator Verification~~.
- Transmission relay loadability is addressed in PRC-023-2.
- Generator relay loadability ~~will be~~is addressed in PRC-025-1 by Project 2010-13.2, Phase 2 of Relay Loadability: Generation~~, in Project 2010-13.2~~.
- Protective relay response during power swings will be addressed by ~~Phase 3 of~~ Project 2010-13.3, Phase 3 of Relay Loadability: Stable Power Swings.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and are addressed ~~will be improved~~ in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPCSDT ~~believes~~contends that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider (that own Protection Systems identified in the Facilities section 4.2 below)

   4.2 Facilities: ~~For the purpose of the requirements contained herein, the following~~

   Protection Systems ~~owned by each Functional Entity in 4.1 above are those to which these requirements are applicable.~~:

   a) ~~**4.2.1** Protection Systems~~ installed for the purpose of detecting Faults on ~~Interconnected~~Interconnecting Elements ~~of the BES~~, and

   ~~a)~~b) that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC~~-~~SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC~~-~~SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC~~-~~SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focused their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and clarified in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults."*

~~Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.~~

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC-SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they addressed data and data requirements that are now included in Reliability Standard TOP-003-2. The NERC Board of Trustees adopted Reliability Standards TOP-003-2 and PRC-001-2 on May 9, 2012.

Proposed Reliability Standard PRC-027-1 incorporates the aspects of coordination found in Requirements R2 and R3 of PRC-001-2. ~~The SPC SDT revised PRC-001-2. Revisions include the removal of Requirements R2 and R3 (formerly Requirements R3 and R4 of PRC-001-1). These two legacy requirements are being retired because the aspects of coordination they address are incorporated in the proposed Reliability Standard PRC-027-1, Protection System Coordination for Performance During Faults. The SPCSDT believes the training aspects of Requirement R1 would be more appropriately addressed by the PER group of Reliability Standards. Consequently, the drafting team has recommended via the NERC Issues Database that the future drafting team charged with revising PER-005-1 incorporate the reliability objective of Requirement R1 into the revised standard. Until that occurs, Requirement R1 of PRC-001-2 must remain in the standard. In an effort to improve PRC-001-2 until it can be fully retired, the drafting team has provided a measure to accompany Requirement R1. The Applicability section was also updated to clarify which Protection Systems are applicable to Requirement R1. (The 'Facilities' portion of the Applicability section is identical to the new stakeholder-approved and NERC Board of Trustees-adopted PRC-005-2.)~~

With the reliability intent of these two legacy requirements being addressed in PRC-027-1, it is necessary to retire them from PRC-001-2.

Requirements and ~~Other Aspects of Coordination of Protection Systems Addressed by Other Projects:~~

~~Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.~~

- ~~Underfrequency Load shedding programs are addressed in PRC-006-1. Generator performance during frequency excursions is being addressed in PRC-024-1 by Project 2007-09 Generator Verification.~~
- ~~Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed in PRC-024-1 by Project 2007-09, Generator Verification.~~
- ~~Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed in PRC-019-1 by Project 2007-09.~~
- ~~Transmission relay loadability is addressed in PRC-023-2.~~
- ~~Generator relay loadability will be addressed in PRC-025-1 by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.~~
- ~~Protective relay response during power swings will be addressed by Phase 3 of Project 2010-13.3, Relay Loadability.~~
- ~~Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).~~

~~The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.~~

B. ~~Requirements and~~ Measures

Rationale for R1:

Part 1.1 A Protection System Coordination Study (PSCS) is necessary to verify coordination of Protection Systems for existing and new ~~Interconnected~~Interconnecting Elements. The drafting team defines the term "~~Interconnected~~Interconnecting Element" as "A BES Element that electrically joins ~~facilities~~ Facilities: a) owned by~~:~~ ~~a)~~ separate Registered Entities, or b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Distribution Provider, Generator Owner, or Transmission Owner)."

Part 1.1.1 The drafting team ~~believes~~contends 60 calendar months is an appropriate period of time for entities to perform the PSCS required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with ~~Interconnected~~Interconnecting Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team ~~believes~~contends that 12 calendar months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current change at an interconnecting bus, where such conditions may warrant a new PSCS, or to technically justify why no such study is required~~, e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current~~. Refer to the Application Guidelines for Requirement R1 for examples of Protection Systems where technical justifications may be used.

Part 1.1.3 The drafting team ~~believes~~contends that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, Part 3.1, or to technically justify why no such study is needed. The drafting team ~~believes~~contends the timeframe associated with the requirement for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies ~~associated with Requirement R3, Part 3.1~~ is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.1.4 The drafting team contends that entities must perform the studies required when notified of changes identified in Requirement R3, Part 3.3, or to technically justify why no such study is needed. The drafting team ~~believes~~contends that six months is an appropriate period of time for entities to perform the studies required or to technically justify why no such study is needed when details of changes are provided associated with Requirement R3 Part 3.3.

Part 1.2 The drafting team ~~believes~~contends to properly ensure coordination of Protection Systems associated with ~~Interconnected~~Interconnecting Element(s), all entities need to share the summary of results of a PSCS and assess the study results. The drafting team ~~believes~~contends that 90 calendar days is a reasonable time for the entity to provide the results of the PSCS performed in accordance with Requirement R1, Part 1.1 to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s).

Note: In cases where a single group performs an overall coordination study for a given ~~Interconnected~~Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS ~~would be~~is sufficient for use by ~~both Registered Entities~~all entities.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Coordination Study (PSCS) for each of its ~~Interconnected~~Interconnecting Elements as follows:

1.1.1 Within 60 calendar months after the effective date of this standard, if no PSCS for that ~~Interconnected~~Interconnecting Element exists.

1.1.2 Within 12 calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1, or ~~within~~technically justify why such a study is not required.

~~1.1.3~~**1.1.4** Within six calendar months of being notified of a change as described in Requirement R3, Part 3.3~~;~~, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each PSCS~~,~~ or the technical justification pursuant to Requirement R1, Part 1.1, provide to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s~~),~~): a summary of the results of each PSCS performed~~ pursuant to Requirement R1, Part 1.1, (~~, including, at a minimum, the Protection Systems reviewed, the associated Fault ~~currents~~current(s) used, any issues identified, and any revisions or actions proposed~~).~~; or the technical justification.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1,~~ and~~ 1.1.2, 1.1.3, and 1.1.~~3~~4 is a dated PSCS, or the summary of the results of each PSCS (hard copy or electronic file formats) demonstrating the time frames specified or agreed to in Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.~~3~~4 were achieved. Acceptable evidence of a technical justification for not performing a PSCS as specified in Parts 1.1.2, 1.1.3, and 1.1.~~3~~4 may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any ~~aspects~~aspect of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 is dated documentation demonstrating that the summary of the results of each PSCS or the technical justification (hard copy or electronic file formats) were provided within the specified time frame to the owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s).

Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing the results to the applicable entities when changes occur that meet the criteria of Requirement R2. It is important that ~~interconnected~~interconnecting Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. Note: short circuit studies are used to determine the Fault current values at the interconnecting bus where a PSCS exists. These studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team ~~believes~~contends 60 calendar months provides the entities flexibility to ~~either technically justify why Fault current does not affect the Protection System coordination, or~~ schedule and perform the activities specified in Requirement R2, Parts 2.1 and 2.2.

~~The drafting team recognizes the coordination of some types of Protection Systems is unaffected by changes in Fault current and, where technically justified, can be exempted from the short circuit review.~~

Part 2.1 The drafting team ~~believes~~contends maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus are necessary quantities needed to review the coordination.

Part 2.2 The drafting team is including this equation to assure a consistent approach is used by each Transmission Owner when calculating the percent change in Fault current values.

Part 2.2.1 The drafting team ~~believes~~contends the 30-calendar day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element. The drafting team determined that a change in Fault current of 10% indicates an appropriate point at which to provide this information, based on the fact that Protection Systems are typically set with margins above 10%.

R2. For each ~~Interconnected~~Interconnecting Element on its System, the Transmission Owner shall, once every 60 calendar months~~, technically justify why Fault current does not affect the Protection System coordination, or~~: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at ~~the~~its interconnecting bus(s) where a ~~Protection System Coordination Study (~~PSCS~~)~~ is available ~~per~~ pursuant to Requirement R1.

2.2. Calculate the percent change between the Fault current values (single line to ground and 3-phase for ~~the~~its interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\ Change = \left|\frac{Iscs - Ipscs}{Ipscs}\right| x\ 100$$

Where: I_{scs} = Fault current value from present short circuit study

And: I_{pscs} = Fault current value used in the most recent PSCS

2.2.1 Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (I_{scs}) to each owner of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element~~.~~(s).

~~**M3.** Acceptable evidence of technical justification for not performing a short circuit study as specified in Requirement R2, could be documented engineering analyses or assessments that demonstrate why Fault current does not impact any aspects of coordination.~~

~~M4.~~**M3.** Acceptable evidence for Requirement R2, Parts 2.1 and 2.2 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed, and identifies the percent change from the Fault current values used in the most recent PSCS determined by the equation.

~~M5.~~**M4.** Acceptable evidence for Requirement R2, Part 2.2.1 is dated documentation (hard copy or electronic file formats) that the updated Fault current values (I_{scs}), were provided within the specified timeframe to each owner of the Protection System associated with the ~~Interconnected~~Interconnecting Element.

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each ~~Interconnected~~Interconnecting Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting PSCSs by ensuring that the information is provided to the owner(s) of the Protection Systems associated with ~~Interconnected~~Interconnecting Element(s). The drafting team ~~believes~~contends that information about any proposed change or addition (pursuant to Requirement R3, Part 3.1) that requires modification of an entity's short circuit model should be provided to other Protection System owners associated with the ~~Interconnected~~Interconnecting Element. The drafting team ~~believes~~contends that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list provided in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Requirement 1, Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a PSCS, as required in Requirement 1, Parts 1.1.1, 1.1.2, 1.1.3, and 1.1.~~3~~4. The drafting team ~~believes~~contends 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team ~~believes~~contends 30 calendar days is sufficient time to provide the information.

Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same ~~Interconnected~~Interconnecting Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any proposed change or addition listed below; either at an existing or new Facility associated with the ~~Interconnected~~Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the ~~Interconnected~~Interconnecting Element(s).

- New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that alter any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance

- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an ~~Interconnected~~Interconnecting Element, within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days of making the change, details of permanent changes made to Protection Systems associated with the Interconnecting Element during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

~~M6.~~**M5.** Acceptable evidence for Requirement R3, Part 3.1 may include, but is not limited to, documentation (hard copy or electronic file formats) demonstrating that a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) as identified in the bulleted list, was provided to each responsible entity connected to the same ~~Interconnected~~Interconnecting Element.

~~M7.~~**M6.** Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

~~M8.~~**M7.** Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the permanent changes made was provided within 30 calendar days.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with ~~Interconnected~~ Interconnecting Elements ~~affirm~~confirm that the Protection System(s) applied ~~are acceptable per~~were reviewed and a response was provided to the ~~conditions identified in Parts 4.1 and 4.2~~other owner(s). The review assures that the owners of Protection Systems associated with the affected Interconnecting Element are aware of the changes and have responded with comments if necessary.

~~Part 4.1~~ The drafting team ~~believes~~contends 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with ~~Interconnected~~Interconnecting Elements to review the summary results of a PSCS or the technical justification and respond. Note: ~~Per~~Pursuant to Requirement R1, Part 1.2, at a minimum, the summary of the results of a PSCS must include the Protection Systems reviewed, the associated Fault currents used, any issues identified, and any revisions or actions proposed. The response should indicate ~~acceptance with~~ the ~~review~~ results~~/conclusions; or rejection~~ of ~~or disagreement with~~ the ~~review results/conclusions~~PSCS or the technical justification were reviewed and ~~offer of suggestions/modifications to resolve~~, if applicable, any identified ~~coordination~~ issues.

Note: The drafting team recognizes there could be situations where one owner may not agree with the other owner's protection philosophy but they ~~accept the proposed changes since~~ can confirm that there were no identified coordination issues ~~were identified~~.

~~Part 4.2 The drafting team believes that proposed changes or modifications (including project schedules) to Facilities associated with the Interconnected Element, as described in Requirement R3, Part 3.1, or modifications suggested in Requirement R4, Part 4.1 must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.~~Note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 is sufficient for use by all entities.

~~**R4.**~~ Each Transmission Owner, Generator Owner, and Distribution Provider that received a summary of the results of a PSCS or a technical justification explaining why a PSCS is not required (pursuant to Requirement R1, Part 1.2) shall~~: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]~~

~~R5.~~**R4.** ~~Within~~, within 90 calendar days after receipt~~,~~ or according to an agreed upon schedule, review the summary of the results ~~of a PSCS (per Requirement R1, Part 1.2)~~or the technical justification, and respond to the other owner(s~~):~~) either: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

- ~~Accepting~~Confirming that the ~~results, or~~
- ~~Rejecting~~summary of the results was reviewed and ~~suggesting modifications to resolve any identified~~no ~~coordinati~~coordination issues were identified, ~~on issues.~~
- ~~Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1~~ or ~~Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.~~
- Confirming that the summary of the results was reviewed and any identified coordination issue(s) were noted, or
- Confirming that a technical justification was reviewed and no issue(s) were identified, or
- Confirming that a technical justification was reviewed and any identified issue(s) were noted

~~M9.~~**M8.** Acceptable evidence for Requirement R4~~, Part 4.1~~ is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

Rationale for R5: This requirement obligates owner(s) of Protection System(s) associated with Interconnecting Elements to communicate and address any identified coordination issues prior to implementing the proposed Protection System(s) change(s) or addition(s); i.e., the in-service date of the Protection System(s).

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that received a response pursuant to Requirement R4 shall address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s). *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

~~M10.~~**M9.** Acceptable evidence for Requirement ~~R4, Part 4.2~~R5 is dated documentation (hardcopy or electronic file formats) demonstrating that~~,~~ a response pursuant to Requirement R4 was received and that any identified coordination issues were addressed prior to implementation of any proposed Protection System(s) changes or ~~modifications, communications (e.g. email acknowledgements) of those changes were completed, and any identified coordination issues were resolved and accepted~~additions.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System associated with an ~~Interconnected~~Interconnecting Element shall each keep data or evidence to show compliance with Requirements R1, R2, R3, R4, and ~~R4~~R5, and Measures M1 through ~~M10~~M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider that owns a Protection System at a Facility associated with an ~~Interconnected~~Interconnecting Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Application Guidelines

Guidelines and Technical Basis

Purpose:

To coordinate Protection Systems for ~~Interconnected~~Interconnecting Elements, such that Protection System components operate in the ~~desired~~intended sequence during Faults.

This standard requires that separate Registered Entities communicate with each other to coordinate Protection System components on existing ~~Interconnected~~Interconnecting Elements; and communicate with each other prior to the energization of new or modified Protection Systems associated with ~~Interconnected~~Interconnecting Elements. The goal of the coordination is to verify that the Protection Systems intended for sensing Faults will operate in the ~~desired~~intended sequence for internal and external Faults on the ~~Interconnected~~Interconnecting Element.

Requirement R1:

This requirement directs the applicable entities to perform a Protection System Coordination Study (PSCS) for every ~~Interconnected~~Interconnecting Element to verify coordination of existing Protection Systems where no recent study exists; or when Facility configuration changes are made, or where Fault current changes of 10% or more have occurred. In developing the language to define a PSCS, the System Protection Coordination Standard Drafting Team (SPC-SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Coordination Study (PSCS) for use within the PRC-027-1 Reliability Standard as:

> "A study ~~that demonstrates~~documenting that existing or proposed Protection Systems operate in the ~~desired~~intended sequence for clearing Faults."

Formatted: Indent: Left: 1", Hanging: 0.06"

PSCSs comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in PSCSs include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and

sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

Part 1.1.1:

The drafting team ~~believes~~contends applicable entities should have a documented PSCS for each ~~Interconnected~~Interconnecting Element to validate the Protection Systems associated with those ~~Interconnected~~Interconnecting Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team ~~believes~~contends that 60 calendar months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with ~~Interconnected~~Interconnecting Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

~~Parts 1.1.2 and 1.1.3 further direct that PSCSs must be completed under the following two circumstances:~~

Part 1.1.2:

After notification of an identified 10% or greater change in Fault current (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent PSCS and the Fault current values determined pursuant to Requirement R2, Part 2.1), the notified entities must perform a new PSCS of the ~~Interconnected~~Interconnecting Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater change in Fault current may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team ~~believes~~contends the 12-calendar month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 60-calendar month Fault current review.

Part 1.1.3:

After proposing or being notified of a change at a Facility associated with the ~~Interconnected~~Interconnecting Element, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed or notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team ~~believes~~contends the timeframe associated with performing a PSCS for any proposed changes or additions is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3, Part 3.1 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement ~~R4,~~ R5.

Part 1.1.4~~.2.~~:

After being notified of a change at a Facility associated with the Interconnecting Element associated with Requirement R3, Part 3.3, entities must perform a new PSCS, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the notified change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new PSCS be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team ~~believes~~contends that six calendar months is an appropriate period of time for entities to perform the studies required, or to technically justify why no such study is needed~~, when details of changes are provided associated with Requirement R3 Part 3.3~~.

Examples of Protection Systems where technical justifications may be used include:

1. Differential elements
2. Distance elements where infeed is not used in determining reach for the protection scheme.
3. Supervised overcurrent elements enabled by:
   - Loss of potential condition
   - Some communication assisted tripping
   - Switch-Onto-Fault (SOTF)
4. Reverse power, definite time &/or time overcurrent elements:
   - Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.
   - Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).

Requirement R1, Part 1.2 directs the entity performing the PSCS to provide a summary of the study results or a technical justification to the affected ~~Interconnected~~Interconnecting Element owner(s).~~-~~ The drafting team ~~believes~~contends that 90 calendar days is a reasonable time for the entity to provide the results of the

PSCS it performed to the other owner(s) of the Protection System(s) associated with the ~~Interconnected~~Interconnecting Element(s). (Note: In cases where a single group performs an overall coordination study for a given ~~Interconnected~~Interconnecting Element; a single document that meets the requirements for a summary of the results of the PSCS would be sufficient for use by both Registered Entities.) ~~As guidance, the drafting team lists the~~The following inputs and results of a PSCS ~~that may~~must be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.
2. A listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing PSCSs and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated PSCS may be necessary. ~~-~~These variations could result from the accumulation of incremental changes over time. This requirement mandates the Transmission Owner ~~either provide a technical justification stating why Fault current does not affect the Protection System coordination of a specific Interconnected Element or~~ perform a periodic review of Fault currents.

~~**Examples of Protection Systems where technical justifications may be used include:**~~

~~5. Differential elements~~

~~6. Distance elements where infeed is not used in determining reach for the protection scheme.~~

~~7. Supervised overcurrent elements enabled by:~~

- ~~Loss of potential condition~~
- ~~Some communication assisted tripping~~
- ~~Switch-Onto-Fault (SOTF)~~

~~8. Reverse power, definite time &/or time overcurrent elements:~~

- ~~Designed to coordinate during maximum generation with the transmission system under normal operating conditions and under single contingency conditions regardless of Fault current.~~

Formatted: Indent: Left: 1.38"

Formatted: Indent: Left: 1.38", No bullets or numbering

- ~~Designed for the protection of equipment other than for the purpose of detecting Faults on BES Elements even though those relays that may operate for such Faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.).~~

The short circuit study provides the Fault current values used to calculate the percent change between the most recent PSCS and the present Fault current values indicated by the short circuit study performed pursuant to Requirement R2, Part 2.1. ~~-~~This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2. Short circuit studies are typically performed assuming maximum generation and all Facilities in service.

The drafting team ~~believes~~contends that 60 calendar months is an appropriate interval for ~~technically justifying why Fault currents do not affect the Protection System coordination of a specific Interconnected Element, or for~~ reviewing Fault currents. The drafting team ~~believes~~contends studies associated with changes that would affect the coordination in less than 60 calendar months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2.1 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the ~~Interconnected~~Interconnecting Element when short circuit studies indicate that 10% changes in Fault current have occurred at the interconnecting bus(s). ~~-~~The drafting team ~~believes~~contends the 30-calendar day time frame associated with this requirement is reasonable for providing the Fault current information to the ~~interconnected~~interconnecting entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the short circuit studies because they maintain the data required to perform the studies. ~~-~~Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Application Guidelines

Application Guidelines

Requirement R3:

This directs the registered functional entity initiating any proposed change or addition to provide the details to the other affected entities of the ~~Interconnected~~Interconnecting Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. ~~-~~Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its PSCSs to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. ~~-~~The drafting team recognizes that Facility changes at other locations can impact the PSCS of the Facility associated with the ~~Interconnected~~Interconnecting Element; e.g., the addition of a large autotransformer bank or generator not directly connected to the ~~Interconnected~~Interconnecting Element. The drafting team ~~believes~~contends that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. ~~-~~This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule~~ and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2~~.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a PSCS or, absent such agreement, within 30 calendar days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. ~~-~~The drafting team ~~believes~~contends 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

~~Additionally, this requirement~~Requirement R3, Part 3.3 includes a provision for providing details associated with changes to the previously agreed-upon coordination when permanent changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components. ~~-~~Based upon the limited number of instances that would occur under such circumstances, the drafting team ~~believes~~contends 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

Requirement R4directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS or the technical justification, as described in Requirement R1, Part 1.2; and respond that they have reviewed and identified any issues. The drafting team contends 90 calendar days after receipt provides a reasonable time for the owners of Facilities to review.

Requirement R5:

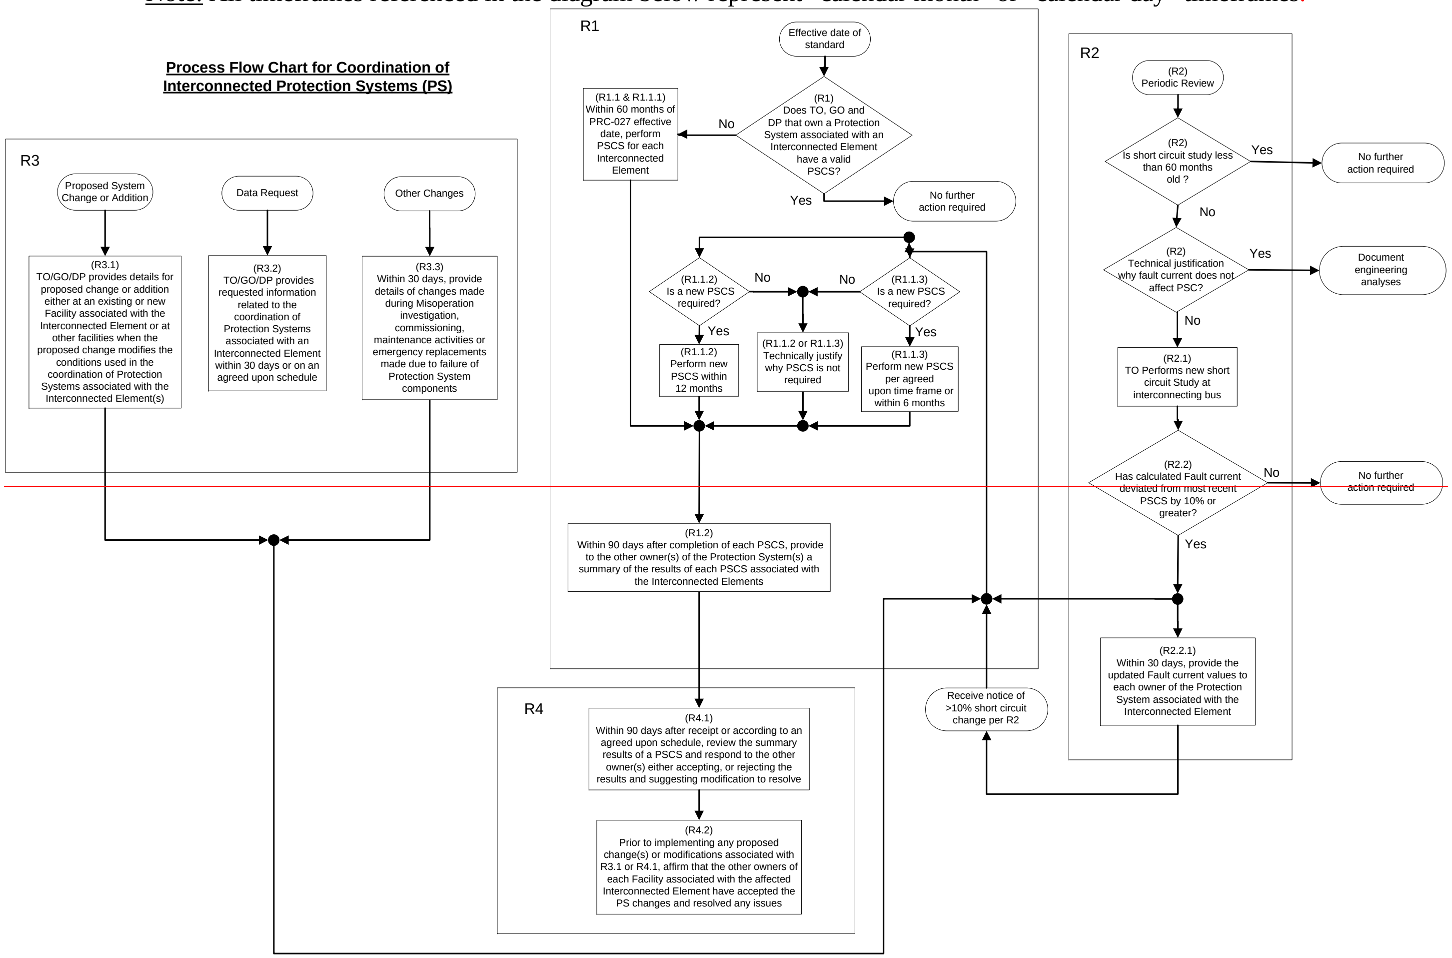
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by ~~gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.~~ensuring owners of Protection System(s) associated with Interconnecting Elements have communicated and addressed any identified coordination issues prior to implementing changes in the Protection System(s) (in-service date).

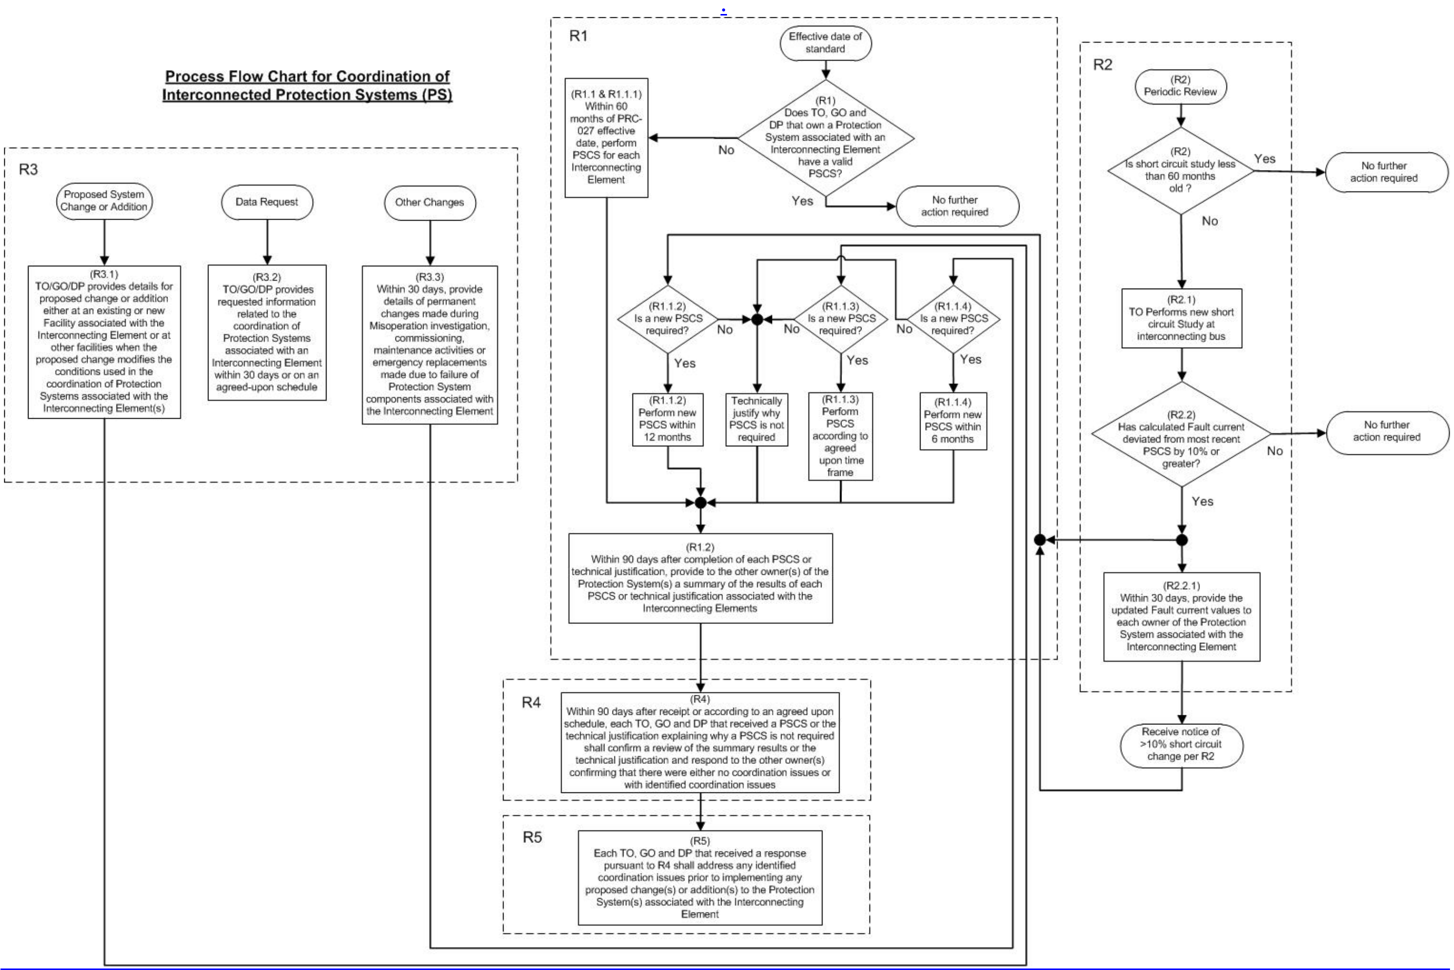
~~Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a PSCS, as described in Requirement R1, Part 1.2; and respond as to whether they accepting or rejecting the results, and if rejecting, suggesting modifications to resolve any identified coordination issues. The drafting team believes 90 calendar days after receipt of the results of a PSCS provides a reasonable time for the owners of Facilities to review the summary results of a PSCS.~~

~~Requirement R4, Part 4.2 directs entities to affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes as described in Requirement 3, Part 3.1 and Requirement 4, Part 4.1 prior to the in-service date of those changes. Any coordination issues identified during the review must be resolved prior to implementing the proposed changes. The purpose of Requirement 4, Part 4.2 is to assure the effects the proposed changes have on Protection Systems at a Facility associated with the Interconnected Element have been considered by all affected entities.~~

Application Guidelines

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:
Note: All timeframes referenced in the diagram below represent "calendar month" or "calendar day" timeframes~~.~~





Process Flow Chart for Coordination of Interconnected Protection Systems (PS)
R1
Effective date of standard
(R1) Does TO, GO and DP that own a Protection System associated with an Interconnecting Element have a valid PSCS?
No
Yes
No further action required
(R1.1 & R1.1.1) Within 60 months of PRC-027 effective date, perform PSCS for each Interconnecting Element
(R1.1.2) Is a new PSCS required?
(R1.1.3) Is a new PSCS required?
(R1.1.4) Is a new PSCS required?
(R1.1.2) Perform new PSCS within 12 months
Technically justify why PSCS is not required
(R1.1.3) Perform PSCS according to agreed upon time frame
(R1.1.4) Perform new PSCS within 6 months
(R1.2) Within 90 days after completion of each PSCS or technical justification, provide to the other owner(s) of the Protection System(s) a summary of the results of each PSCS or technical justification associated with the Interconnecting Elements
R2
(R2) Periodic Review
(R2) Is short circuit study less than 60 months old ?
No further action required
(R2.1) TO Performs new short circuit Study at interconnecting bus
(R2.2) Has calculated Fault current deviated from most recent PSCS by 10% or greater?
(R2.2.1) Within 30 days, provide the updated Fault current values to each owner of the Protection System associated with the Interconnecting Element
Receive notice of >10% short circuit change per R2
R3
Proposed System Change or Addition
Data Request
Other Changes
(R3.1) TO/GO/DP provides details for proposed change or addition either at an existing or new Facility associated with the Interconnecting Element or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s)
(R3.2) TO/GO/DP provides requested information related to the coordination of Protection Systems associated with an Interconnecting Element within 30 days or on an agreed-upon schedule
(R3.3) Within 30 days, provide details of permanent changes made during Misoperation investigation, commissioning, maintenance activities or emergency replacements made due to failure of Protection System components associated with the Interconnecting Element
R4
(R4) Within 90 days after receipt or according to an agreed upon schedule, each TO, GO and DP that received a PSCS or the technical justification explaining why a PSCS is not required shall confirm a review of the summary results or the technical justification and respond to the other owner(s) confirming that there were either no coordination issues or with identified coordination issues
R5
(R5) Each TO, GO and DP that received a response pursuant to R4 shall address any identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element

Example Process

An example of the interaction between entities required to gather the information to perform an accurate study is provided below. This example is given as general guidance only and is not intended to represent all situations that may occur. More detailed examples are provided along with Figures 1-5 in the section that follows this example.

- The initiating entity (Entity A) will contact the ~~interconnected~~interconnecting entity (Entity B) and provide details of the ~~proposed~~ change(s) and may also request up-to-date Protection System information.
- Entities A and B will determine whether a new PSCS is required. In this example both agree that a new study is required. The study may be a joint study, individual studies, or a single study provided by Entity A and reviewed and approved by Entity B. In this example, the latter will occur.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a PSCS using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the PSCS.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, respond as to whether any coordination issues were identified, and if any further action is required.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
    - Ultimately, both entities will collaborate in developing a mutually acceptable solution.

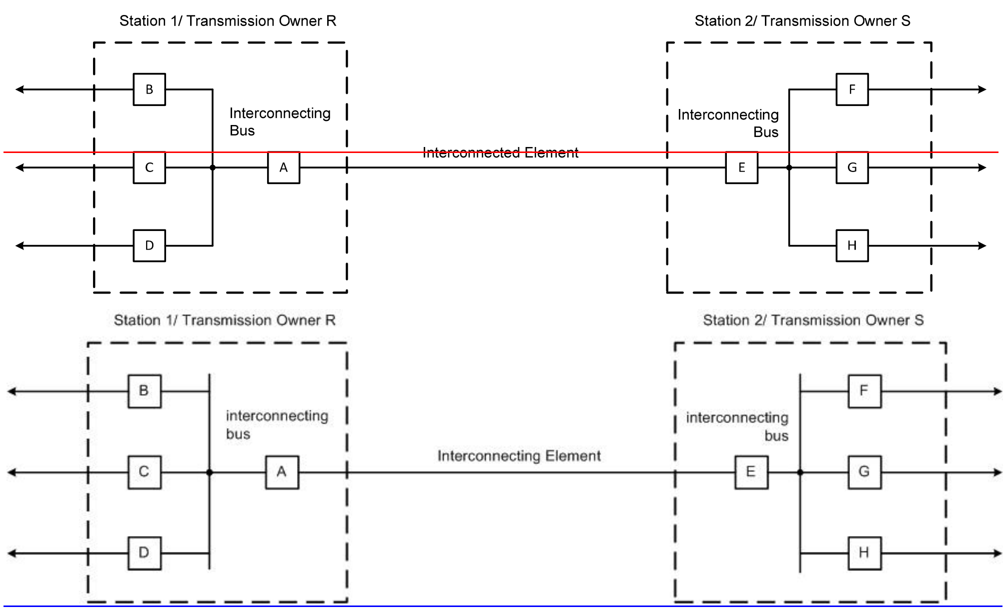
Diagrams

Introduction: The diagrams below are intended to provide guidance, to the owners of Facilities associated with the affected ~~Interconnected~~Interconnecting Element, for meeting the requirements of this standard. These examples are not intended to be inclusive of all situations and are based on the assumption that entities employ the appropriate engineering expertise and due diligence in developing settings for their Protection Systems. The examples given also assume a single owner as the initiator of a Protection System Coordination Study (PSCS) for the applicable ~~Interconnected~~Interconnecting Element. In actuality, any owner or owners may initiate the process. After the reviews of the PSCS or a summary of results, and prior to implementation of changes, the owners must work together to resolve any coordination issues identified during those reviews.

NOTES:

1. Protection System Coordination Studies are typically performed assuming maximum generation and all Facilities in service.
2. Protection Systems of the Transmission Owners, Generator Owners, and Distribution Providers described in the Figures and examples below do not include any systems or components enumerated in the 'Background Section' of this standard under "Other Aspects of Coordination of Protection Systems Addressed by Other Projects".
3. In the Figures below, the locations of the interconnecting bus(s) referenced in Requirement 2 are indicated.

Figure 1

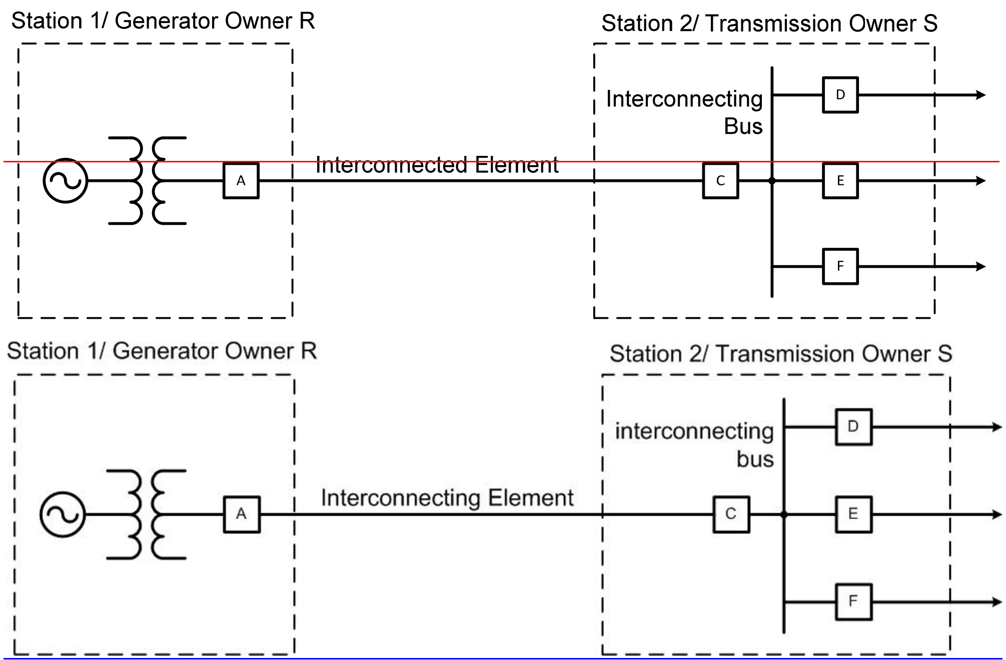


Application Guidelines

In Figure 1 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner S is to develop~~ proposed~~ Protection System settings associated with Breaker E. Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

Figure 2

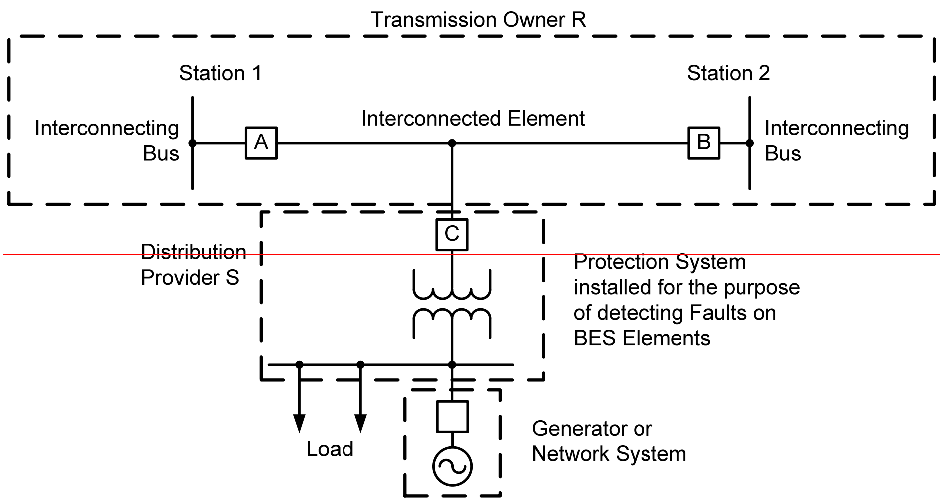


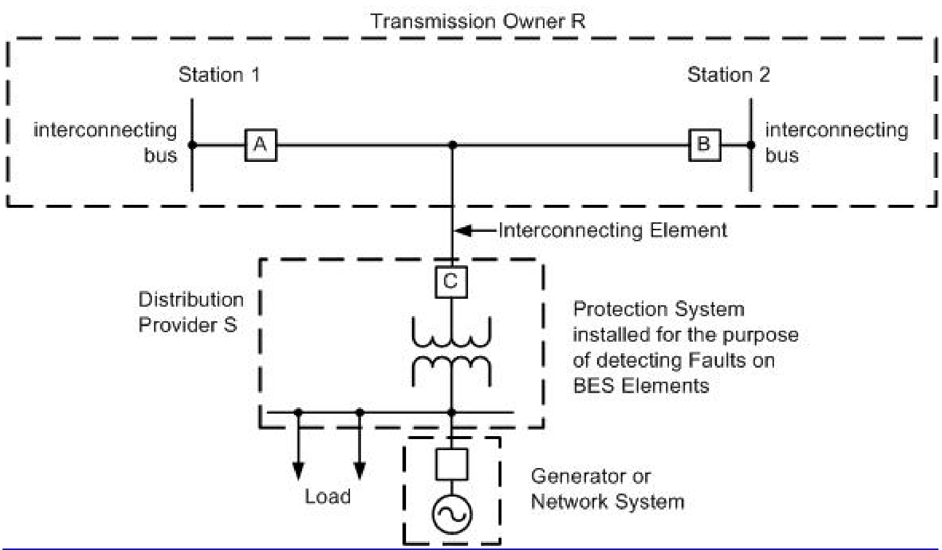
In Figure 2 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Note: Depending on the actual configuration and/or ownership, Breaker A may, or may not, exist as a GSU unit high-side breaker or a line breaker.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 2, Owner R is to develop ~~proposed~~ Protection System settings associated with Breaker A. Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Owner S is to develop ~~proposed~~ Protection System settings associated with Breaker C. ~~Generation~~ Generator Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3





In Figure 3 above, the ~~Interconnected~~Interconnecting Element between the Transmission Owner and the Distribution Provider is the transmission line (or tap) between the Distribution Provider's Breaker C and the point of connection to the line between the Transmission Owner's Breakers A and B. Therefore, the applicable Protection Systems per this standard are those at Breakers A, B and C.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 3, Distribution Provider S is to develop ~~proposed~~ Protection System settings associated with Breaker C. Transmission Owner R is to review the Protection System settings associated with

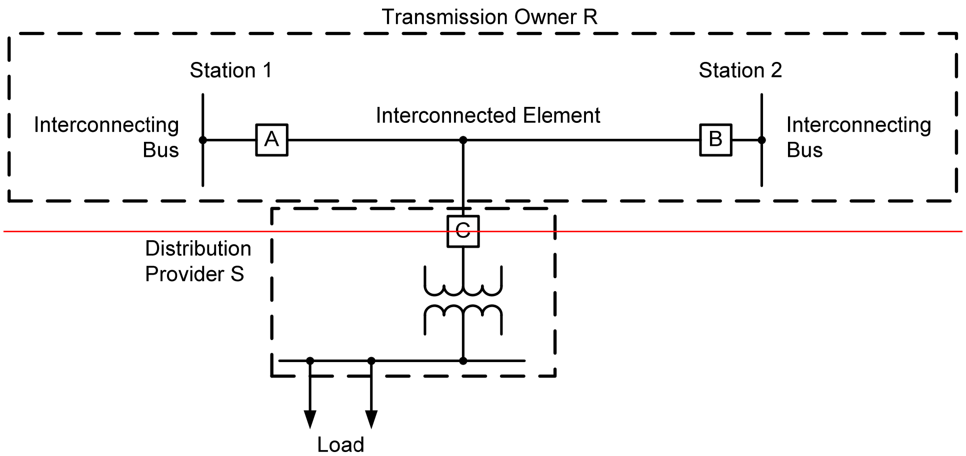
Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

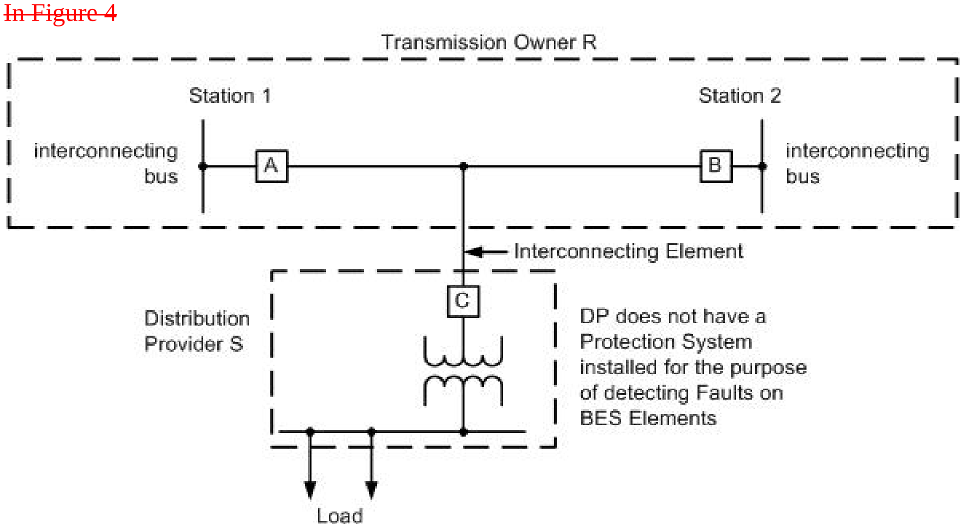
A PSCS is required per this standard for this example if a Protection System at the Distribution Provider's substation is installed for the purpose of detecting Faults on BES Elements.

Protection Systems installed for the purpose of detecting Faults on BES Elements do not include relays that, though they may operate for such Faults, are not installed specifically for that purpose. As an example, reverse power relays are often installed to detect situations where the transmission source for a power transformer becomes de-energized (for whatever reason) while the distribution bank remains energized from a source on the low-voltage side. In this case, the settings of the reverse power relay are typically calculated based on the charging current of the transformer from the low-voltage side. Although relays installed and set in this manner may operate as a result of a Fault on a BES Element, they are not specifically installed for the purpose of detecting that Fault.

Figure 4



~~In Figure 4~~



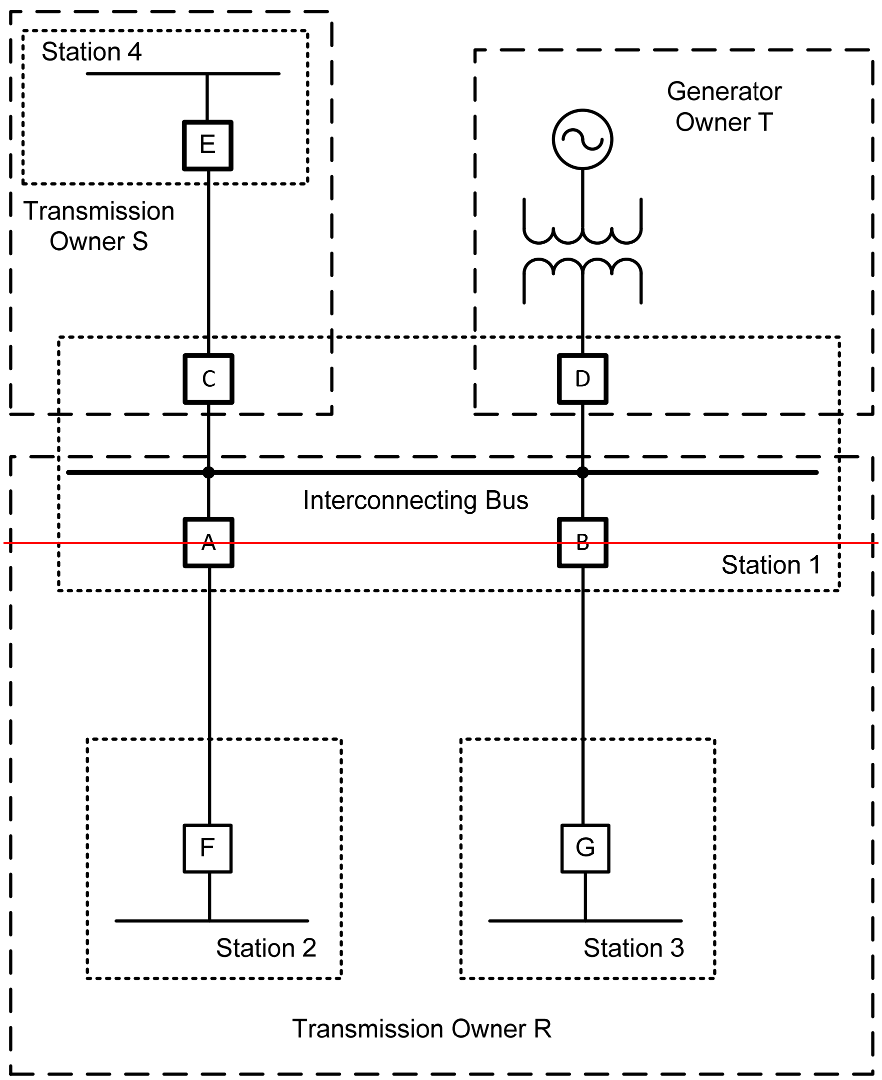
The configuration above~~, the Interconnected Element between the Transmission Owner and~~ is an example excluded from this standard because the Distribution Provider ~~is the transmission line or tap between the line and Breaker C.~~

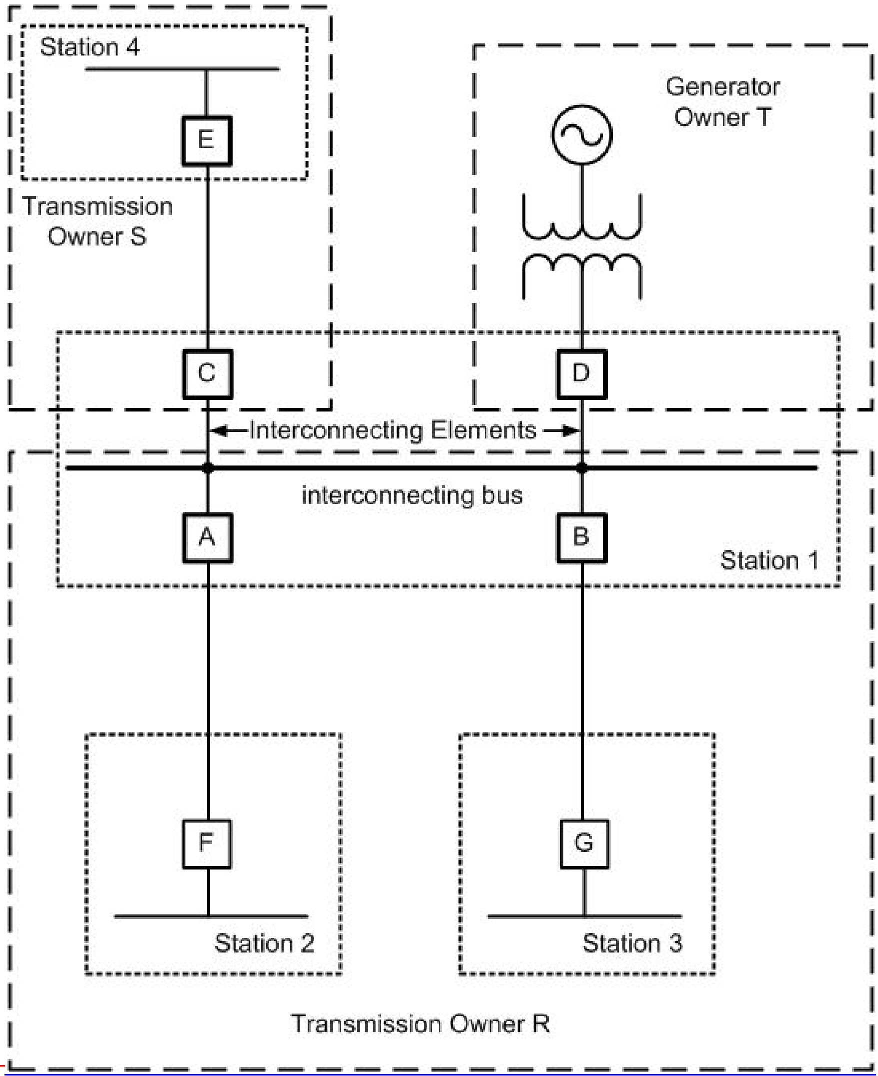
~~**Note:** No specific PSCS is required per this standard for this example since the~~S does not own Protection ~~System at the Distribution Provider's substation is not~~Systems installed for the purpose of detecting Faults on BES Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners

Note: In a large majority of cases, Figure 2 would be applicable for most generator interconnections. In Figure 5 below, Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T.





~~In~~

Figure 5 above~~,~~ illustrates the ~~Interconnected Element~~Interconnecting Elements between the Transmission Owners R and S and Generator Owner T~~ is the common Transmission bus.~~. In this example, Transmission Owner S and Generator Owner T are not directly ~~interconnected~~interconnecting to each other at Station 1. All direct interconnections are between Owner R and each of the other Owners connected to the common bus at Station 1.

Example: For the purposes of conducting the PSCS associated with the Facilities in Figure 5:

Owner S is to develop ~~proposed~~ Protection System settings associated with Breakers C and E.

Owner T is to develop ~~proposed~~ Protection System settings associated with Breaker D, the generator, and its associated equipment.

Owner R is to develop ~~proposed~~ Protection System settings associated with Breakers A, B, F and G.

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S and/or T) for coordination issues with the Protection System settings associated with Breakers A and B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R and/or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R and/or S) for coordination issues with the Protection System settings associated with Breaker D or the generator Protection System. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Implementation Plan

Project 2007-06 System Protection Coordination PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults
- PRC-001-3 System Protection Coordination

Retirements Requested

- PRC-001-2 System Protection Coordination, Requirements R2 and R3

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults	X	X	X			
PRC-001-3: System Protection Coordination				X	X	X

Defined Terms

The standard drafting team proposes the following new definitions for use only within PRC-027-1:

Interconnecting Element
A Bulk Electric System (BES) Element that electrically joins Facilities:
a) owned by separate Registered Entities, or
b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider)

Protection System Coordination Study
A study documenting that existing or proposed Protection Systems operate in the intended sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has addressed observations and recommendations of the NERC SPCTF assessment of PRC-001-1 by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)

Effective Date of New or Revised Standards

PRC-027-1 – Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

PRC-001-3 – System Protection Coordination

PRC-001-3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for Definitions

The two proposed definitions “Interconnecting Element” and “Protection System Coordination Study” shall each become effective concurrently with PRC-027-1.

Retirement

PRC-001-2 – System Protection Coordination shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, PRC-001-2 shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan

Project 2007-06 System Protection Coordination PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults
- PRC-001-3 System Protection Coordination

Retirements Requested

- PRC-001-2 System Protection Coordination, Requirements R2 and R3

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults	X	X	X			
PRC-001-3: System Protection Coordination				X	X	X

Defined Terms ~~in the NERC Glossary~~

The standard drafting team proposes the following new definitions for use only within PRC-027-1~~, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms~~:

Interconnecting Element~~:~~

A Bulk Electric System (BES) Element that electrically joins ~~facilities~~Facilities:

a) owned by separate Registered Entities, or

b) owned by the same Registered Entity that represents multiple functional entity responsibilities (~~Distribution Provider~~Transmission Owner, Generator Owner, or ~~Transmission Owner~~Distribution Provider)

Protection System Coordination Study~~:~~

A study documenting that ~~demonstrates~~ existing or proposed Protection Systems operate in the ~~desired~~intended sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has ~~followed the~~addressed observations and ~~recommendation~~recommendations of the NERC SPCTF assessment of PRC-001-1~~ which had six requirements. The SDT accomplishes this~~ by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. ~~Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.~~

   ~~Note: The drafting team added Measure (M1) to PRC-001-3 related to Requirement R1.~~

Effective Date of New or Revised Standards~~ and Definitions~~

PRC-027-1 ~~-~~– Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months ~~beyond~~after the date that ~~this~~the standard is approved by an applicable ~~regulatory authorities. In those jurisdictions~~governmental authority or as otherwise provided for in a jurisdiction where ~~regulatory approval~~approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months ~~beyond~~after the date ~~this~~the standard is ~~approved~~adopted by the NERC Board of Trustees~~,~~ or as otherwise ~~made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (~~provided for in that ~~recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date~~jurisdiction.

PRC-001-3 – System Protection Coordination

~~Same effective date as PRC-027-1.~~
PRC-001-3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for Definitions

The two proposed definitions ~~(Interconnected Facilities~~"Interconnecting Element" and "Protection System Coordination Study~~)~~" shall each become effective ~~at the same time as~~ concurrently with PRC-027-1.

Retirement~~:~~

~~PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.~~

PRC-001-2 – System Protection Coordination shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, PRC-001-2 shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Unofficial Comment Form

Project 2007-06 System Protection Coordination
4th Draft of PRC-027-1

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the 4th draft of the standard PRC-027-1: Protection System Coordination for Performance During Faults. Comments must be submitted by **8 p.m. Eastern December 18, 2013**. If you have questions please contact Al McMeekin or by telephone at 803-530-1963.

http://www.nerc.com/pa/Stand/Pages/Project-2007-06-System-Protection-Coordination.aspx

Background Information:
The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted the third draft of Reliability Standard PRC-027-1 "Protection System Coordination for Performance During Faults" for comment from June 4, 2013 to July 3, 2013. The drafting team considered all stakeholder comments and suggestions and revised the draft standard. The following is a summary of changes the drafting team made:

- Changed the term "Interconnected Element" to "Interconnecting Element"
- Re-arranged the definition of "Interconnecting Element" for clarity and spelled out "Bulk Electric System" rather than using the acronym "BES"
- Modified the definition of " Protection System Coordination Study" replacing the words "that demonstrates" with "documenting that" and "desired" with "intended"
- Changed the word "desired" to "intended" in the Purpose
- Added the parenthetical phrase "(that own Protection Systems identified in the Facilities section 4.2 below)" to Applicability section 4.1.3 "Distribution Provider"
- The "Other Aspects of Coordination of Protection Systems Addressed by Other Projects" section was moved from the "Background" section to the "Roadmap" section of the standard
- Removed the technical justification for not conducting the Fault current review specified in Requirement R2 and the associated Measure M3
- Modified Requirement 4 and split it into two Requirements, R4 and R5 for clarity
- Requirement R5 mandates that any identified coordination issues be addressed prior to the implementation of any changes or additions to the Protection System(s) associated with the Interconnecting Element
- The VSLs were modified for consistency with the revised requirements
- The Guidelines and Technical Basis section was modified to reflect corresponding changes in the standard
- The Process Flow Chart was updated to reflect changes made to the standard
- The Figures and associated descriptions were modified to provide more clarity

In June of 2013, the Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted Draft 3 of PRC-027-1 for comment and ballot. The SPCSDT is recommending retirement of Requirements R2 and R3 of PRC-001-2 because the reliability objectives of those two requirements are addressed in the new Reliability Standard PRC-027-1 — Protection System Coordination for Performance During Faults, leaving only one requirement in PRC-001-3. Attempting to provide clarity, the SPCSDT included PRC-001-3 in the June posting with a revised Applicability section and a measure for the lone Requirement R1. However, since that posting, the Independent Experts Review Panel (Independent Experts) released its Final Report and Requirements Scoring Spreadsheet which reviewed and assessed the content and quality of the NERC Reliability Standards. The Independent Experts concluded that PRC-001-2, Requirement R1 contains ambiguous language and suggested that it be incorporated into the PER standards. The Independent Experts further suggested that all of the training requirements in NERC's Reliability Standards be consolidated. Because Requirement R1 of PRC-001-3 was identified as appropriate in another body of standards and will be included in the review for consolidation, the requirement will remain unchanged pending ongoing work to implement the Independent Experts recommendations. NERC standards staff is currently reviewing how to address these recommendations and industry concerns with Requirement R1. Consequently, a draft of PRC-001-3 reflecting only the removal of Requirements R2 and R3, and updated pro forma language for the "Effective Date" and "Compliance" sections of the standard is included with this fourth posting of PRC-027-1.

Note: The SPCSDT is not soliciting comments on PRC-001-3 because of the limited changes discussed above.

The SPCSDT is soliciting stakeholder feedback on draft 4 of PRC-027-1 during a 45-day formal comment period with parallel ballot.

Question

Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

1. Please provide any issues you have with this draft of PRC-027-1 along with a proposed solution.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines
Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.
In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has five (5) requirements that incorporate and clarify the reliability intent of Requirements R2 and R3 of PRC-001-2. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All five requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnecting Element to verify that Protection Systems components operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3, R4 and R5, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnecting Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each Interconnecting Element to verify that Protection Systems components operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 does not co-mingle reliability objectives.

NERC VSL Guidelines	Meets NERC's VSL Guidelines for a Severe VSL—This is a binary or "pass-fail" requirement. The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The single proposed VSL is a binary VSL (pass-fail). The responsible entity either 'addressed' or 'did not address' an identified coordination issues prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has ~~four (4~~five (5) requirements that incorporate and clarify the reliability intent of Requirements R2 and R3 of PRC-001-2. The new standard addresses the aspects of coordination for new and changes to existing Protection Systems, as well as requiring an initial and periodic review of existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, reviewing each others' Protection System settings and schemes, and resolving any identified coordination issues.

All ~~four~~five requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Coordination Study for each Interconnect~~ed~~ing Element to verify that Protection Systems components operate in the ~~desired~~intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3, R4 and ~~R4~~R5, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Coordination Studies are performed for every Interconnect~~ed~~ing Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Coordination Study for each ~~Interconnected Facility~~Interconnecting Element to verify that Protection Systems components operate in the ~~desired~~intended sequence during Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 ~~addresses a single objective and has a single VRF.~~does not co-mingle reliability objectives.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study on an Interconnect~~ed~~ing Element as required in Requirement R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Coordination Study at an interconnecting bus as required in Requirement R1, Parts 1.1.2, 1.1.3, and 1.1.4 or technically justified why a study was not required, but was late by less than or equal to 30 calendar days. Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Additional Ballot and Non-Binding Poll Now Open through December 18, 2013

Now Available

An additional ballot for **PRC-027-1** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels is now open through **8 p.m. Eastern, Wednesday, December 18, 2013**.

Background information for this project can be found on the project page.

Instructions for Balloting
Members of the ballot pools associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

Standards Development Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2007-06 System Protection Coordination PRC-027-1

Comment Period: November 4, 2013 – December 18, 2013

Upcoming:
Additional Ballot and Non-Binding Poll for PRC-027-1: December 9-18, 2013

Now Available

A 45-day comment period is open for draft 4 of **PRC-027-1** – Protection System Coordination for Performance During Faults through **8 p.m. Eastern on Wednesday, December 18, 2013**.

Background information for this project can be found on the project page.

Instructions for Commenting

A formal comment period for **PRC-027-1** is open through **8 p.m. Eastern on Wednesday, December 18, 2013.** Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An additional ballot of **PRC-027-1** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted from December 9-18, 2013.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2007-06 System Protection Coordination PRC-027-1

Comment Period: November 4, 2013 – December 18, 2013

Upcoming:
Additional Ballot and Non-Binding Poll for PRC-027-1: December 9-18, 2013

Now Available

A 45-day comment period is open for draft 4 of **PRC-027-1** – Protection System Coordination for Performance During Faults through **8 p.m. Eastern on Wednesday, December 18, 2013**.

Background information for this project can be found on the project page.

Instructions for Commenting

A formal comment period for **PRC-027-1** is open through **8 p.m. Eastern on Wednesday, December 18, 2013.** Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An additional ballot of **PRC-027-1** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted from December 9-18, 2013.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Additional Ballot and Non-Binding Poll Results

Now Available

An additional ballot of **PRC-027-1 – System Protection Coordination for Performance During Faults** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Tuesday, December 31, 2013**.

This standard achieved a quorum but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballot.

Ballot	Non-Binding Poll
Quorum /Approval	Quorum/Supportive Opinions
76.60% / 65.71%	76.63% / 70.75%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Individual Ballot Pool Results

Segment	Organization	Member	Ballot	NERC Notes
1	Ameren Services	Kirit Shah	Affirmative	
1	American Electric Power	Paul B Johnson	Affirmative	
1	American Transmission Company, LLC	Andrew Z Pusztai	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	ATCO Electric	Glen Sutton	Abstain	
1	Austin Energy	James Armke	Affirmative	
1	Avista Corp.	Scott J Kinney		
1	Balancing Authority of Northern California	Kevin Smith	Abstain	
1	BC Hydro and Power Authority	Patricia Robertson	Affirmative	
1	Beaches Energy Services	Joseph S Stonecipher	Affirmative	
1	Black Hills Corp	Eric Egge		
1	Bonneville Power Administration	Donald S. Watkins	Negative	COMMENT RECEIVED
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Negative	COMMENT RECEIVED
1	Central Electric Power Cooperative	Michael B Bax	Affirmative	
1	City of Pasadena	Marco A Sustaita		
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Negative	SUPPORTS THIRD PARTY COMMENTS - (Chang Choi)
1	City Utilities of Springfield, Missouri	Jeff Knottek		
1	City Water, Light & Power of Springfield	Shaun Anders		
1	Clark Public Utilities	Jack Stamper	Affirmative	
1	Cleco Power LLC	Danny McDaniel		
1	Colorado Springs Utilities	Paul Morland	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Affirmative	
1	Consumers Power Inc.	Stuart Sloan		
1	CPS Energy	Richard Castrejana	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Negative	SUPPORTS THIRD PARTY COMMENTS - (MRO NSRF)
1	Dayton Power & Light Co.	Hertzel Shamash	Affirmative	
1	Deseret Power	James Tucker		
1	Dominion Virginia Power	Michael S Crowley	Affirmative	
1	Duke Energy Carolina	Douglas E. Hils	Affirmative	
1	East Kentucky Power Coop.	George S. Carruba	Negative	SUPPORTS THIRD PARTY COMMENTS - ACES
1	El Paso Electric Company	Dennis Malone		
1	Empire District Electric Co.	Ralph F Meyer	Affirmative	
1	Entergy Services, Inc.	Edward J Davis	Abstain	
1	FirstEnergy Corp.	William J Smith	Affirmative	
1	Florida Keys Electric Cooperative Assoc.	Dennis Minton	Negative	SUPPORTS THIRD PARTY COMMENTS - (FMPA)
1	Florida Power & Light Co.	Mike O'Neil	Affirmative	
1	Georgia Transmission Corporation	Jason Snodgrass	Affirmative	
1	Great River Energy	Gordon Pietsch	Negative	SUPPORTS THIRD PARTY COMMENTS - (MRO NSRF)
1	Hoosier Energy Rural Electric Cooperative, Inc.	Bob Solomon		
1	Hydro One Networks, Inc.	Ajay Garg	Negative	COMMENT

				RECEIVED
1	Hydro-Quebec TransEnergie	Bernard Pelletier		
1	Idaho Power Company	Molly Devine	Affirmative	
1	International Transmission Company Holdings Corp	Michael Moltane	Negative	COMMENT RECEIVED
1	JEA	Ted Hobson	Affirmative	
1	KAMO Electric Cooperative	Walter Kenyon	Affirmative	
1	Kansas City Power & Light Co.	Michael Gammon		
1	Lakeland Electric	Larry E Watt	Affirmative	
1	Lee County Electric Cooperative	John W Delucca		
1	LG&E Energy Transmission Services	Bradley C. Young		
1	Long Island Power Authority	Robert Ganley	Affirmative	
1	Los Angeles Department of Water & Power	John Burnett	Negative	NO COMMENT RECEIVED
1	Lower Colorado River Authority	Martyn Turner	Affirmative	
1	M & A Electric Power Cooperative	William Price	Affirmative	
1	Manitoba Hydro	Joe D Petaski	Affirmative	
1	MEAG Power	Danny Dees	Affirmative	
1	Metropolitan Water District of Southern California	Ernest Hahn		
1	MidAmerican Energy Co.	Terry Harbour	Negative	SUPPORTS THIRD PARTY COMMENTS - (NSRF)
1	Muscatine Power & Water	Andrew J Kurriger	Negative	SUPPORTS THIRD PARTY COMMENTS - (MRO NSRF)
1	N.W. Electric Power Cooperative, Inc.	Mark Ramsey	Affirmative	
1	National Grid USA	Michael Jones	Affirmative	
1	Nebraska Public Power District	Cole C Brodine	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPPD & SPP)
1	New York Power Authority	Bruce Metruck	Negative	SUPPORTS THIRD PARTY COMMENTS - (NPCC and NYPA's)
1	New York State Electric & Gas Corp.	Raymond P Kinney		
1	Northeast Missouri Electric Power Cooperative	Kevin White	Affirmative	
1	Northeast Utilities	David Boguslawski	Affirmative	
1	Northern Indiana Public Service Co.	Kevin M Largura	Affirmative	
1	NorthWestern Energy	John Canavan	Affirmative	
1	Ohio Valley Electric Corp.	Robert Mattey		
1	Oklahoma Gas and Electric Co.	Marvin E VanBebber	Abstain	
1	Omaha Public Power District	Doug Peterchuck	Negative	SUPPORTS THIRD PARTY COMMENTS - (Supporting MRO NSRF comments)
1	Oncor Electric Delivery	Jen Fiegel	Affirmative	
1	Orlando Utilities Commission	Brad Chase	Abstain	
1	Pacific Gas and Electric Company	Bangalore Vijayraghavan		
1	PacifiCorp	Ryan Millard	Abstain	
1	PECO Energy	Ronald Schloendorn	Negative	COMMENT RECEIVED
1	Platte River Power Authority	John C. Collins	Affirmative	
1	Portland General Electric Co.	John T Walker	Affirmative	
1	Potomac Electric Power Co.	David Thorne	Negative	COMMENT RECEIVED
1	PPL Electric Utilities Corp.	Brenda L Truhe	Negative	SUPPORTS THIRD PARTY COMMENTS - (Refer to comments submitted for PPL NERC Registered Affiliates)
1	Public Service Company of New Mexico	Laurie Williams	Affirmative	
				SUPPORTS

1	Public Service Electric and Gas Co.	Kenneth D. Brown	Negative	THIRD PARTY COMMENTS - (Comments of Public Service Enterprise Group)
1	Public Utility District No. 1 of Okanogan County	Dale Dunckel	Negative	NO COMMENT RECEIVED - (Small Entity Group)
1	Public Utility District No. 2 of Grant County, Washington	Rod Noteboom		
1	Puget Sound Energy, Inc.	Denise M Lietz	Affirmative	
1	Rochester Gas and Electric Corp.	John C. Allen	Abstain	
1	Sacramento Municipal Utility District	Tim Kelley	Abstain	
1	Salt River Project	Robert Kondziolka	Affirmative	
1	Santee Cooper	Terry L Blackwell	Affirmative	
1	Seattle City Light	Pawel Krupa	Negative	SUPPORTS THIRD PARTY COMMENTS - (Seattle City Light Paul Haase)
1	Sho-Me Power Electric Cooperative	Denise Stevens	Affirmative	
1	Sierra Pacific Power Co.	Rich Salgo	Negative	COMMENT RECEIVED
1	Snohomish County PUD No. 1	Long T Duong	Negative	SUPPORTS THIRD PARTY COMMENTS - (Sacramento Municipal Utility District)
1	South California Edison Company	Steven Mavis	Affirmative

In the rationale for Requirement R1 Part 1.1.1, the SPCSDT acknowledges that "...The drafting team has no evidence there is widespread mis-coordination of Protection Systems associated with Interconnecting Elements that warrants a shorter time frame." We suggest, using the same aforementioned rationale, if there is no widespread mis-coordination, then, why create a mandatory requirement. As currently drafted, the drafting team would place excessive documentation requirements on registered entities for activities already being performed as industry best practices. Per R3, The NSRF recommends to rewrite and update R3 to read: Each TO, GO and DP should provide "when requested" by each TO, GO or DP... As written if an entity misses one piece of information then there we be a required self-report. The fact of pushing information is not a Reliability issue. The applicable entity should pass information when requested to by the asking entity.

We believe the usage of the term "interconnecting bus" within figures 1 through 5 unintentionally causes confusion in identifying the Interconnecting Element. We suggest removing interconnecting bus from the illustrations, and instead, use color coding to clearly indicate the Interconnecting Element. We suggest adding a sentence at the beginning of Figure 5, similar to the other figures, which verbally describes the Interconnecting Element in that particular example.

The requirement for all our NERC sites to perform a Protection System Coordination Study will be an expensive and burdensome effort. We have funded internconnection and system impact studies already. This effort, if critical to the BES is best undertaken by the TO, who has a wider purview of the BES. This standard has the potential to include studies at all of our Wind sites, because the Transmission Owners will be required to perform studies at the interconnecting substations. In the rationale for R1 Part 1.1.1, the drafting team states, "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnecting Elements that warrants a shorter time frame". The time frame to conclude the study is 60 months. If there is no issues now, why perform a study that is due in 5 years? What value is that? This is a poorly organized standard revision, constantly referring to requirements later in in the standard. It makes for a difficult read.

R3.1. Bullets 2 , 3 and 4. Concerned that these state “changes …. that alter any sequence component…”. NextEra Energy recommends this be revised to state “changes…..that significantly alter any sequence component….” The current wording would allow an auditor to ask if we even insignificant changes such as a few inches on a jumper on a 10 mile transmission line. With the work “significantly” added, TOs can define a change that triggers a review as when it would have an effect on relaying.

The Purpose statement “To coordinate Protection Systems for Interconnecting Elements such that Protection System components operate in the intended sequence during Faults” is confusing. Are the protection systems involved specifically for the Interconnecting Element, or between Facilities connected by an Interconnecting Element? It also inappropriate because the standard does not address Protection System coordination among operating entities. According to the NERC White Paper “Power Plant and Transmission System Protection Coordination”, stator ground protection may need to be coordinated with transmission system faults. Stator ground is a generator protection – so is that in scope of the PSCS specified in the standard since this protection is a generator protection, not an Interconnecting Element protection? For Part 3.1, it is not clear what is meant by “Details….. associated with the Interconnecting Element or at other Facilities…..” What is the burden of proof associated with this requirement? In the long term planning horizon, is it implied this assessment be made through short circuit studies? It would be proper to associate Part 3.1 solely with changes/additions “either at an existing or new Facility associated with the Interconnecting Element….”. Changes at other Facilities could mean 1, 2 or 3 busses away and we believe if these changes were significant, they would manifest themselves in a significant change in Fault current levels. Furthermore, in an audit, the burden of proof lies with the owner to show these changes “at other Facilities” don’t affect coordination. Suggest the following change to the wording: “Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s) where such changes result in a change of 10% or greater in either single line-to-ground or three-phase fault current as defined in R2.2.” The Process Flow chart in the Applications Guidelines of the standard needs to be revised to reflect the revisions in the standard.

1) A word search of the Final Report on the August 14, 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of the appropriate use of time delays in relays in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on

voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS's during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although PHI supports the overall desire to ensure that protective systems are properly coordinated; PHI sees little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. The above comment was also submitted with previous drafts of this standard. In previous responses the SDT stated that PRC-027 was being developed in response to FERC Order 693. However, Order 693 only directs NERC to address specific deficiencies in PRC-001 surrounding certain measures and levels of non-compliance relating to the notification and response to the detection of failures in relay protection systems. As such, PHI believes PRC-027 goes well beyond what is was directed by FERC, and the stated purpose of the SAR. PHI urges the SDT to revisit FERC Order 693 and revise this standard as appropriate to address only the stated FERC directives. 2) Based on the arguments presented in the above comments, including the lack of historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions, PHI suggests that NERC conduct a Cost Effective Analysis (CEA) to provide information about cost impacts (e.g., implementation and ongoing compliance resource requirements) of this draft standard and its relative effectiveness in preventing widespread blackouts, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of this standard. 3) PHI finds that splitting Requirement R4 into two requirements (R4 & R5) does little to address the root problem associated with mandating mutual agreement, which essentially R5 requires, since any setting changes cannot be implemented until both parties agree that all identified coordination issues have been addressed. PHI suggests Requirement R5 be removed entirely or extensively re-written to address the concerns outlined below: Requirement R5 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R5 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. It is unreasonable and unfair to hold one party non-compliant due to the failure of

another party to reach agreement. Furthermore, in the example provided above, it is a detriment to reliability to delay implementation of the setting change on breaker D just because mutual agreement could not be reached. It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the "Protection System Study" and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing a clear division of responsibilities and assignment of who will be held non-compliant if agreement cannot be reached is unfair to either party. 4) For the case where one registered entity represents multiple Functional Entities and the same protection group performs all the coordination, the drafting team included the following note: In cases where a single group performs an overall coordination study for a given Interconnecting Element; a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities. However, this reference is only included in the Rationale boxes and the Guidelines and Technical Basis sections and not in the associated Requirements and Measures. The Measures themselves for Requirements R3 and R4 are very specific that acceptable evidence must include dated documentation that the information was supplied/exchanged between Functional Entities. What constitutes acceptable evidence to satisfy R3 & R4 if a single protection group, which is responsible for all protection coordination for both TO and DP functions within the same company, performs all the coordination for both groups? Does the PSCS have to specifically mention that the PSCS was performed by a single protection group on behalf of both Functional Entities? Or, does there need to be dated evidence that some representative from each Functional Entity has reviewed the information and signed off on it? A specific clarification on this point in needed within the wording of the Measures themselves and not just in the Rationale box.

Although appreciative of the drafting team's efforts in developing PRC-027-1, LES does not believe that there will be an improvement to BES reliability that justifies the cost and effort involved in compliance with this new standard. In its response to LES' previous comments, the drafting team contended that PRC-027-1 was necessary "to codify the roles and responsibilities of the interconnecting owners to achieve coordination of Protection Systems that affect the reliability of the BES." Although LES believes PRC-001 would still be adequate for this purpose, at a minimum, the replacement for PRC-001 should be a standard that is much less prescriptive and one that, to a greater degree, acknowledges the necessity of engineering judgment than does the current draft of PRC-027. As an example, R3 requires that functional entities provide details of a proposed change to the other interconnected entities when the change modifies the conditions used in the coordination of Protection Systems. In this instance, it is obvious that some engineering judgment must be exercised in determining if a small change actually modifies the conditions used in coordination. Does the drafting team contend that this determination can be made by one entity or must there be consensus between the interconnected entities? A less prescriptive standard would avoid the compliance questions raised by a situation such as this and allow entities to continue the commonsense approach to coordination that they have taken in the past.

Comments: The statement was made in the 12/5/13 webinar that PRC-027-1 requires nothing more in the way of GO-TO information exchanges than what is already mandated in PRC-001, but PRC-001 requires just that TOs "coordinate" their changes with others while PRC-027-1 makes GOs perform a Protection System Coordination Study (PSCS) for TO changes or provide a technical justification as to why a PSCS is not required. The only inputs that GOs need from TOs are the fault current at interconnecting buses (affects the GO's arc-flash studies) and the grid X/R ratio, so PRC-

001 coordination for TO changes would typically consist for GOs of just obtaining these two values, not requesting and analyzing the detailed TO information cited on p.23 of PRC-027-1 (“power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings”). There remains the technical issue that TO changes do not affect GOs’ Protection System configurations or settings. That is, making GOs perform PSCSs would serve no useful purpose, especially since everything involving tripping elements in the intended sequence (the stated purpose of PRC-027-1) is in the TO’s system. GOs should consequently have no Protection System coordination duties other reporting planned changes prior to implementation and receiving the two inputs cited above, per PRC-001. The following issues and corresponding proposed solutions are offered for consideration of the SDT: 1) Issue: We believe that there exist too many time frame measurements (14) in total for this standard. The burden of tracking these time frames for each interconnection is excessively onerous. The time frames noted in the draft standard are listed here to demonstrate the extent of the problem. The time frames identified are: • 60 months post effective date of the standard, have a PSCS for each IE (R1.1.1) • 12 months post If change > 10%, have a PSCS for IE (R1.1.2) • On an agreed upon time frame (variable) – schedule, have a PSCS for IE (proposed changes) – (R1.1.3) • 6 month post notice of “other” emergency equipment change, PSCS for IE (R1.1.4) • 60 months (recurring), TO calc If (new), % change, communicate (R.2.1, R2.2) • 30 days post ID If(new) change > 10%, notify others (R2.2.1) • Before coordination change/addition, notify others (R3.1) • 30 days post request for info, provide info (R3.2) • On an agreed upon schedule (variable) post request for info, provide info (R3.2) • 30 post change (misop. Investigation, maint., emergency replacement), notify others (R3.3) • 90 days post PSCS finished, provide to others (R1.2) • 90 days post receipt of PSCS, confirm review and state of issues (R4) • On agreed upon schedule post receipt of PSCSS, confirm review and state of issues. (R4) • Before change/addition, address any R4 issues (R5) 1A) Proposed Solution: The drafting team should strive to eliminate any and all that are not absolutely necessary. Perhaps more usage of “mutually agreed upon time frames” could relieve the burden. 2) Issue - Multiple measure #’s used for each Requirement number. 2A) Proposed Solution – Either one of the following: a) separate the multiple requirements embedded within each major Requirement number so that the requirement number and measure number’s match for each requirement, or b) group the various measures listed for each main Requirement number in a single measure. Non-matching numbers for the requirements & measures is confusing. 3) Issue - R3 should state what is to be provided. 3A) Proposed Solution – Add “the following information” after “provide” in the 1st line of R3. 4) Issue - R3.1 is confusing because of the use of “either” and two instances of “or” which follow. Also, no colon introduces the bulleted text. 4A) Proposed Solution – Modify R3.1 to the following: “Details for any proposed change or addition listed below [at existing / new Facilities associated with the Interconnecting Element or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s)]: 5) Issue - An auditor may argue that for the changes referenced in R3.3 an entity proposes to initiate (to change or add replacement equipment), at some instant in time has a plan and intends to make the change, and therefore is subject to R3.1 (and should have notified others prior to the change or addition). 5A) Proposed Solution – In order to prevent potential confusion, would the SDT consider modifying R4 & R5 to include exclusions for a PSCS performed as a result of “other changes” specified in R3.3. 6) Issue - R3.3 wording needs improvement. A reader is looking for what information must be provided as they goes from R3 to 3.1, 3.2, and 3.3. Beginning 3.3 with “Within 30…” makes it difficult to determine what is to be provided. 6A) Proposed Solution – Move “within 30…” to the end of the sentence so that it is immediately evident that the entity shall provide “details of permanent changes…” 7) Issue - The short circuit (R2.2.1) section of the process flow chart in the Application Guidelines section is short circuited. 7A) Proposed Solution –Remove short circuit in the diagram.

Brett Holland
Kansas City Power & Light
What makes the internal lines of a single Registered Transmission Owner any different than a Registered Entity that represents multiple functional entity responsibilities, i.e. Generator Owner, Transmission Owner, and Distribution Provider, where one single group performs the overall coordination study? We propose the following change under the Definitions of Terms Used in

Standard - Interconnecting Element part b) should be changed to read: b) owned by the same Registered Entity that represents multiple functional entity responsibilities (Transmission Owner, Generator Owner, or Distribution Provider) where no one single group performs the overall coordination study for the given Interconnecting Element. This change to the standard does not affect the purpose of the standard, which is to provide coordination. Our proposed change clarifies that where one single System Protection group is performing the coordination that is required, then the communication will take place within the System Protection group and will be accomplished exactly the same way as it would be for internal lines of a single Registered Transmission Owner. - NEXT – We completely agree with the purpose of the standard; to coordinate Protection Systems for Interconnected Elements, such that Protection System components operate in the intended sequence during faults. We believe that the standard needs to take into account the differences between Owners that use communication assisted schemes and those that do not. We believe that the 60 month fault study requirement should not be required for utilities that do not use instantaneous overcurrents or time overcurrents that are always slower than zone 2 time. We propose the following change to R2; R2. For each Interconnecting Element on its System, the Transmission Owner shall technically justify why Fault current does not affect the Protection Coordination, or once every 60 months: If you should choose to accept our proposed change to R2, then the removal of the technical justifications from Requirement R2 in the Application Guidelines cannot be made. It is not true that all primary and backup protection is equal. Note the contrast in the following examples. In a scheme that employs only step distance and overcurrents, Zone 2 would be the primary trip for a fault near the remote end, and the overcurrents or Zone 3 would be the backup. In a scheme that employs communication assisted tripping the piloted scheme would be the primary trip, Zone 2 would be the backup, and the overcurrents or Zone 3 may act as the second layer of backup. The chances of needing the second layer of backup are extremely low. In a scheme that employs two forms of communication assisted schemes, one piloted scheme would be the primary trip, one piloted scheme would be the backup, Zone 2 would be the second layer of backup, and the overcurrents or Zone 3 would be the third layer of backup. The chances of needing the second or third layer of backup are extremely low. Note that during the Webinar on December 5, 2013 the statement below was made that reinforces the fact that R2 for Transmission Owners interacting with Generator Owners is unnecessary if it can be shown that system fault current does not affect the coordination provided. …. "particularly in generation sites, the majority of Fault current being contributed is coming from the generator and it is going to be rare unless you add a generator or retire a generator that the fault current evaluation done by the Transmission Owner at that bus is ever going to change by more than that 10% ……. by using a fault current trigger it may indeed be that they never have to be reviewed." Why should a Transmission Owner be required to periodically perform a short circuit study at a generator bus when the fault contributed by the generator will never change by 10% unless a unit is retired, modified, or added? Requirement R2 specifies a 10% change in fault current as the trigger for a review of the Protection Coordination. We believe that the only time that a Protection Coordination Study should be triggered is if the fault current increases by more than 10%. Since Fault studies are conducted with all generation on, the Fault current calculated by the short circuit study will be greater than the Fault current under most conditions, because all generation is rarely on. Therefore reductions in fault current are relative and a 10% decrease could be the Fault current that the system typically operates at. We propose the following change to 2.2.1; 2.2.1 Within 30 calendar days after identification of an increase of 10% or greater in either single line to ground of 3-phase Fault current, provide the updated Fault current values (Iscs) to each owner of the Protection Systems(s) associated with the Interconnecting Element(s). Due to the reasons presented above we do not agree with the changes made in the Application Guidelines associated to Requirement R2 or the Process Flow Chart portion that map Requirement R2.

Chang G. Choi
On the last page of the Implementation Plan, change "…twelve (12) months after the date that the PRC-001-3 is…" to "…twelve (12) months after the date that PRC-001-3 is…" In the proposed definition of 'Interconnecting Element', the verbiage "owned by the same Registered Entity that represents multiple functional entity responsibilities" poses at least two challenges. First, it seems to

suggest that any BES Element owned by that entity would be an Interconnecting Element. It is believed that this is not the intent of the definition. Consider language like one of the following instead: “owned by the same Registered Entity that represents multiple functional entity responsibilities where more than one of these functional entities are responsible for the electrically joined Facilities” or “owned by the same Registered Entity but represented by multiple functional entity responsibilities.” Second, an additional challenge for Registered Entities that represent multiple functional entity responsibilities may be identifying which Element(s) is/are the Interconnecting Element(s). For example, are transmission Facilities near generation Facilities associated with the Generator Owner function or the Transmission Owner function? Similarly, are transmission Facilities near distribution Facilities associated with the Distribution Provider function or the Transmission Owner function? In these cases, the Registered Entity should be afforded some latitude in defining the Interconnecting Element(s). For example, referring to Figure 3 in the Application Guidelines, assume that there is one owner for all of the equipment represented. Further assume that the Registered Entity considers the Protection System, installed for the purpose of detecting Faults on BES Elements, at Breaker C to be associated with its Transmission Owner function. Then, it appears that there would be no Interconnecting Element in this scenario, according to the proposed definition of an Interconnecting Element. On the other hand, assume that the Registered Entity considers the Protection System, installed for the purpose of detecting Faults on BES Elements, at Breaker C to be associated with its Distribution Provide function. Then, it appears that there would be an Interconnecting Element in this scenario, according to the proposed definition of an Interconnecting Element. It might help to have one or more examples in the Application Guidelines of how part (b) of the proposed definition of an Interconnecting Element would be applied. In the Purpose, remove ‘components’. It should be sufficient to simply state that the purpose is “[t]o coordinate Protection Systems for Interconnecting Elements, such that Protection Systems operate in the intended sequence during Faults.” This purpose statement is also more consistent with the proposed definition of a Protection System Coordination Study. After a PSCS for an Interconnecting Element is developed and is accepted and implemented by all applicable entities, if a mis-operation associated with the Interconnecting Element occurs that is attributed to mis-coordination of one or more of the Protection Systems addressed by the PSCS, would this automatically be considered a violation of PRC-027-1? Under Applicability, change “Distribution Provider (that own…” to “Distribution Provider (that owns…” Consideration should be given to including the following language, presently included in the Rationale for R1, in the body of the standard itself: “In cases where a single group performs an overall coordination study for a given Interconnecting Element, a single document that provides the requirements for a summary of the results of the PSCS is sufficient for use by all entities.” Similarly, consideration should be given to including the following language, presently included in the Rationales for R3 and R4, in the body of the standard itself: “In cases where a single group performs an overall coordination study for a given Interconnecting Element, a single document that describes the information listed in Requirement R3, Parts 3.1 and 3.3 below is sufficient for use by all entities.” In general, how would these exceptions impact an entity’s demonstration of compliance with Requirement R5? In Requirement R1, Part 1.2, the verbiage “…the associated Fault current(s)…” is ambiguous without additional guidance. Should this phrase be interpreted as “[a] listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study,” as stated in the Application Guidelines? If so, what would be an example of Fault currents for an Element, as opposed to a bus? In Requirement R1, Part 1.2, should “the contingencies used in the evaluation” be itemized as being required in the summary of the PSCS? This is mentioned in the Application Guidelines but not in the standard itself. Referring to Requirement R2, what if modeling errors are identified after a short circuit study is conducted? Is this an automatic violation of Requirement R2? In Measurement M4, change “…each owner of the Protection System…” to “…each owner of the Protection Systems…” or “…each owner of the Protection System(s)…” In Requirement R3, Part 3.1, the language “…or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s)” is ambiguous. What might be helpful is one or more examples (possibly within the Application Guidelines) of changes at other Facilities that would not require action pursuant to Requirement R3, Part 3.1. As the standard is written now, it would be easy to interpret that any change at any BES Facility would likely require action pursuant to Requirement R3, Part 3.1. It is not believed that this is the intent of the requirement. If it is the intent, then there would be no need to run short circuit studies at least every 60 calendar months because all changes impacting short circuit current at interconnecting

buses would already be addressed. In Requirement R3, Part 3.3, please confirm that the clause "…made due to failures of Protection System components" applies only to emergency replacements, and not necessarily to Misoperation investigations, commissioning, or maintenance activities. Consider two entities, Entity A and Entity B. Entity A submits a summary of a PSCS to Entity B pursuant to Requirement R1. Entity B then must respond pursuant to Requirement R4. As written, Requirement R5 appears only to require that Entity A address any identified coordination issues prior to implementation. However, Entity A may have identified issues associated with Entity B. It does not appear that the standard requires Entity B to take any action to address issues identified by Entity A. Provided this is a correct interpretation of the standard, would Entity A be permitted to implement the "proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s)" if Entity B elects not to address the issues identified initially by Entity A? On the other hand, if it is an incorrect interpretation of the standard, then additional clarification may be required. In the Application Guidelines, change "Examples of Protection Systems where technical justifications may be used include:" to "Examples of Protection Systems where technical justifications may be used include, but are not necessarily limited to:" In the Application Guidelines, under "Examples of Protection Systems where technical justifications may be used include," consider including "local breaker failure schemes" as a bullet under "Supervised overcurrent elements enabled by:" In the Application Guidelines, under "Examples of Protection Systems where technical justifications may be used include," consider changing "(i.e. transformer overcurrent, reverse power, etc.)" to "(i.e., transformer overcurrent, reverse power, generator phase-balance current, etc.)."

Michelle R DAntuono
Ingleside Cogeneration LP
Although we agree with the technical and logistical requirements incorporated into PRC-027-1, Ingleside Cogeneration still believes that an initial baseline of every interconnection is not necessary. We understand that older Fault studies may meet the intent of a Protection System Coordination Study, but believe where a PSCS does not exist; that commissioning and/or major upgrade testing records are sufficient. An extensive battery of studies and validations take place during these initiatives – and it is a reasonable assumption that the Protection System Fault sequencing was confirmed as well. If there was extensive evidence that Fault coordination was a major contributor to BES-level Disturbances, the effort to re-verify each Interconnecting Element may be justified. However, this evidence is not compelling – and the resources needed to support this effort can be applied to more pressing needs in our view. Should the TO find that the maximum Fault current has increased by 10% or more since their previous study, Ingleside will be prepared to engage in a coordinated follow-up review. The same is true if we or the Transmission Owner make a material change on either side of the Interconnected Element. Otherwise, we believe that the baseline effort serves only to satisfy an administrative purpose that makes little or any improvement in BES reliability.

Requirement R5 requires an entity "that received a response pursuant to Requirement R4 shall address any identified coordination issue(s) prior to implementing any proposed change(s) or addition(s) to the Protection System(s) associated with the Interconnecting Element(s)". In M9 it is stated that "Acceptable evidence for Requirement R5 is dated documentation (hardcopy or electronic fileformats) demonstrating that a response pursuant to Requirement R4 was received". It would be recommended that M9 instead read "demonstrating that IF a response pursuant to Requirement R4 was received…" since receiving a response in a timely or untimely manner is not in the control of the requestor so they should not be held accountable. R2 2.2.1 states "Within 30 calendar days after identification of a change of 10% or greater in either single line to ground or 3-phase Fault current, provide the updated Fault current values (Iscs) to each owner of the Protection System(s) associated with the Interconnecting Element(s)." This 30 day timeline seems too tight compared to its relationship with a 5 year study plan that will involve interface and model discussions with other entities. I recommend this timeline be changed to match the Requirement 1 R1.1.2 with a 12 month

timeline instead of 30 days. Rationale for R3 states “The drafting team contends that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated.” I agree this statement is true. In light of this it would appear that 30 days for 3.2 and 3.3 seems too short. The Part 1.1.1 application guidelines also state: “Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” I believe it is reasonable not to implement additional standard requirements if data does not support it. Note that draft PRC-004-3 has provisions for entities to interface for misoperations so it would be reasonable to evaluate those timelines or eliminate misoperation references altogether from PRC-027 to avoid confusion. In addition R3.3 requires time lines for “emergency replacements” which do not seem realistic since these can be times of great flux. If PRC-004 has longer timelines it seems odd it is so tight in PRC-027. I recommend R3.3 be removed. At a minimum consider changing the time line such as R3 3.2 and if 3.3 from 30 and 90 days to match R4. This will help to minimize the numerous time lines.

IRC Standards Review Committee
Charles Yeung
We have commented several times in the PRC standards proposals, that the requirements in PRC-001 having been retired, must be resolved. Since this has been dismissed as out of scope for the SDT, we ask the SDT to bring this issue to the Standards Committee to be addressed. NERC should develop a protocol to pass issues raised in standards development which may be out of scope of a SDT to be addressed formally by the Standards Committee. The Standards Committee should either respond to the commenter through the standards process available avenues, or provide a response directly to the commenter(s). We again urge the PRC SDT to work with staff and the PER SDT to submit an addendum SAR or a revised SAR to the SC for its approval to post for industry comment, then proceed to retire PRC-001-2 R1 by mapping it into an appropriate PER standard. Further delay in addressing the issue until a new project is initiated may result in dragging the approval of PRC-027-1 for another several months to a year.

On page 22 of the Application Guide item 1, replace ‘bus or’ with ‘Interconnecting’ to clarify by using the defined term Interconnecting Element. This yields: ‘A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the Interconnecting Element at the Facility, and which were reviewed for coordination of protective relays as part of the study, including the contingencies used in the evaluation.’

Michael Falvo
Independent Electricity System Operator
As indicated in a number of our previous comments, we continue to disagree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded or be mapped into another standard. The above view is consistent with the Independent Experts Review Panel’s recommendation. The SDT’s view that the retirement of PRC-001-2 Requirement R1 is outside the scope of this project and the scope of Project 2010-01 (Training) does not provide a satisfactory solution to this issue. In our view, the SDT of either this project or of Project 2010-01 should have submit an addendum or revised SAR to the Standards Committee for approval to post for industry comment, then revise the appropriate PER standard accordingly. We offered the above comment about a year ago. Had an addendum SAR or a revised SAR been posted then, the PRC-001-2 R1 issue would have been fully addressed by now. We are disappointed that over this period, neither NERC staff nor the PRC-027 SDT took the proactive action to proactively address/close out the issue. Today, we still have a requirement that is improper or does not have a proper home. Once again, we urge NERC staff and the SDT to act now

to post an addendum SAR or a revised SAR to fully resolve this issue. Further delay in addressing the issue until a new project is initiated may result in dragging the approval of PRC-027-1 for another several months to a year.

The issue with PRC-027-1 revolves around the applicability of this Standard. In New York State, the NYISO (BA, RC, TOP, and TP) conducts semiannual short circuit studies after soliciting and incorporating additions, corrections, and comments from its member entities (Requirement 2). In addition, whenever an entity or outside developer wishes to add generation or transmission to the NYISO control area, the NYISO conducts the official studies, indicating any changes to circuit breaker duties as a result of such addition(s). These indications also go below a 10% threshold (Requirement 2). Lastly, though the technical validation of new or modified Protection Systems is performed by the TOs, GOs and DPs, in NYS the NYISO is involved from an oversight point of view (Requirement 3) – they require this data submitted to them so they can update the dynamic and steady state models – MOD-010 and MOD-011 – possible overlap of regulation.

(1) R1, 1.1.3 - the opening of this part would be clearer if reworded to say 'Within an agreed upon time frame if notified....' Reference to 'change' should be to a ''proposed change or addition' to to be consistent. (2) R1, 1.1.4 - reference to 'change' should be to a 'permanent change' to be consistent. (3) R1, 1.2 - would be clearer if reworded to insert a (i) after the colon and a (ii) after 'or'. (4) M1 - would be clearer if reworded to insert a (i) before 'a dated PCSC' and insert 'or (ii) if relying on a technical justification' after achieved and in place of 'acceptable evidence of a technical justification'. (5) R2, 2.1 and 2.2 - bus(s) should be bus(es). (6) M3 - reference to 'present Fault current values' should be 'present maximum available Fault current values' to be consistent and reference to 'the equation' should be to 'the equation in Part 2.2'. (7) R3, 3.2 - the timeframe (within 30 calendar days of ..... schedule) at the beginning of the sentence would make the wording of this part more consistent with the rest of the drafting. (8) R3, 3.3 - reference to 'change' should be to the 'proposed change or addition'. (9) M5 - some of the language does not match up with the language of the requirement itself. R3 requires that 'details for any proposed change or addition' be provided, while the measure refers to 'a summary of the future project or technical specifications of the proposed changes'. (10) M6 and M7 - would be helpful for the timeline in these measures to be complete i.e. 'within 30 days of receiving a request' instead of just 'within 30 days'. (11) R4 - reference to 'other owner' would be more precise to say the 'Transmission Owner, Generator Owner or Distribution Provider(s) providing the summary or technical justification'. (12) R4 – it is unclear in R4 whether the receiving owner is the party that is identifying the coordination issues, or whether the receiving owner is noting the coordination issues that are identified by the owner of the summary or technical justification. (13) R5 - not sure the timing of this part works. It requests that the TO, GO or DP shall have received a response prior to implementing any proposed changes or additions, but 1.1.4 and 3.3 are requirements that relate back to permanent changes that have already been made.

We do commend the drafting team for moving this standard in the right direction. 1) The focus of this standard seems to be on the process of executing the Protection System Coordination Study (PSCS) rather than the content of the PSCS, implying that entities don’t need to be told how to do this task. However we feel that a significant reliability gap exists by not outlining what elements need co-ordination (in accordance with the NERC Technical Reference Document “Power Plant and Transmission Protection Coordination, Revision 1”) and this should best be addressed now rather

than later by a FERC NOPR. We are not intending for the standard to be a “How” document but rather a “WHAT” – as in What elements need to be coordinated. As identified by the drafting team, there may be no evidence of miscoordination between traditional protections that detect faults, but for coordination of say generator loss of excitation protection settings or out of step relaying during a fault condition, it is necessary for entities to understand whether these should be considered in their PSCS. At the very least this standard should specifically point to elements whose coordination requirements exist in other standards. 2) In line with comment 1 above, the Purpose statement is confusing. “To coordinate Protection Systems for Interconnecting Elements such that Protection System components operate in the intended sequence during Faults”. Are the protection systems involved specifically for the Interconnecting Element, or between Facilities connected by an Interconnecting Element? So for instance according to the NERC White Paper “Power Plant and Transmission System Protection Coordination”, stator ground protection may need to be coordinated with transmission system faults. Stator ground is a generator protection – so is that in scope of the PSCS specified in the standard since this protection is a generator protection, not an Interconnecting Element protection? 3) For Requirement R3.1, it is not clear what is meant by “Details….. associated with the Interconnecting Element or at other Facilities…..” What is the burden of proof associated with this requirement? In the long term planning horizon, is it implied this assessment be made through short circuit studies? We believe it would be proper to associate R3.1 solely with changes/additions “either at an existing or new Facility associated with the Interconnecting Element….”. Changes at other Facilities could mean 1, 2 or 3 busses away and we believe if these changes were significant, they would manifest themselves in a significant change in Fault current levels. Furthermore, in an audit, the burden of proof lies with the owner to show these changes “at other Facilities” don’t affect coordination. We suggest the following change to the wording: “Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnecting Element; or at other Facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnecting Element(s) where such changes result in a change of 10% or greater in either single line-to-ground or three-phase fault current as defined in R2.2.” Section 1.2 – Retention Period: This section specifies that the default retention period for this standard is “since the last audit”. Consequently, we don’t understand what is the purpose of the second sentence in this section (i.e. “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.”) because there is no such instances.

In draft #3 of the standard, there was requirement 4.2 which stated that “Prior to implementing any proposed change(s) or modifications associated with Requirement R3, Part 3.1 or Requirement 4, Part 4.1, affirm that the other owner(s) of each Facility associated with the affected Interconnected Element have accepted the Protection System(s) changes including the resolution of any identified coordination issues.” There does not seem to have this language in this draft. Was it the SDT intention not to require the entity proposing a change (defined in requirement 3.1) to get agreement with owners of Interconnected Elements prior to implementation?

Comment for Draft 4 of PRC-027-1 – Protection System Coordination for Performance During Faults Measure M9 requires the response to “address” any identified issues. Can the SDT provide examples of a range of responses that would “address” identified issues (even in a guidance document)? For example, if the TO does not agree with the entity that submitted the “identified issues” that the issues are truly valid, can the TO merely respond by a statement saying that the issues are unfounded. Would this be “addressing” the issue or would the TO in this example be required to provide more information such as additional study results? In addition, after providing such additional study results, would the TO then be done with addressing the issue, or would a follow-up

meeting be required if the entity that submitted its concern still disagrees? Please elaborate on what the SDT expects from “address any identified issues.”
Individual
Russ Schneider
Flathead Electric Cooperative, Inc.
The definition of interconnecting element needs to make clear that not only does it have to be a BES element to BES element connection, not just a BES element connecting two different entities. For example a TO to DP shared facility might have some BES elements that are shared, but that really just connect BES to non-BES equipment.

Michael Moltane
ITC
We vote "Negative" on Draft 4 of PRC-027-1 primarily due to enormous increase in administrative burden with no appreciable gain in system reliability. We agree with SDT there is reliability benefit to performing these tasks. However, as the SDT members stated at presentations to RFC Protection Subcommittee and to NATF Workshop, utilities are already doing this work. The SDT’s own rationale states “no evidence there is widespread miscoordination of Protection Systems”. Therefore, the only outcome of this standard is that utilities will greatly increase administrative burden to become auditable. Figure 5 Note statement “Transmission Owner S has no direct Protection Systems located at Station 1 that need to be checked for coordination with Generator Owner T” disagrees with Figure 5 and with the first sentence of the last two paragraphs. Figure 5 shows TO S owns breaker C in Station 1 and by implication also the Protection Systems associated with breaker C. The first sentence of the last two paragraphs specify the review of coordination of the Protection Systems of breakers C and D. Please remove the quoted sentence from the Figure 5 Note. We disagree with changing Figure 5 Interconnecting Element from the common bus to the connection between the bus and breakers. As is, R3 does not require TO R to act as a conduit for exchanging information between TO S and GO T. The last sentence of second-to-last paragraph in Figure 5 attempts to require TO R to act as the conduit for information between the other parties, but this is not found anywhere else in the standard. Please make the common bus the Interconnecting Element and remove statement in Figure 5 specifying TO R is to be a conduit for this information. As R3 is written, this requires each owner on the bus to share changes with each other owner. This should be a reasonable expectation. Why does Figure 3 not specify TO R develop settings for breakers A and B with DP S reviewing for coordination over breaker C and transformer? Why is this coordination around the Interconnecting Element not included? We had similar comments to Draft 3 but our question may have been misinterpreted. What is benefit of Facilities part b)? What is the SDT trying to exclude or include by using the statement “that require coordination”? Is it the intent of SDT in R5 to leave open possibility of implementing proposed change without receiving a response pursuant to Requirement R4? R5 only requires addressing identified coordination issues if the entity “received a response pursuant to Requirement R4”. R4 allows the entity 90 days to respond. The entity making the change could implement the change in this 90 day window without receiving a response and still be compliant. R1.1.3 allows the two parties to reach agreement on the PSCS date which may typically allow time for such exchange, but the entity making the change could move up the change implementation date or the agreed upon date could be less than 90 days prior to the implementation date. R3.3 and R1.1.4 leave out a requirement for a PSCS by the owner with the emergency/commissioning change. R1.1.4 specifies only the party “notified of a change as described in” R3.3 shall perform a PSCS. Is this the intent of the SDT?

PSEG
1.Replace “technically justify” and “technical justification” language is several places. a.Parts 1.1.2, 1.1.3, and 1.1.4 require an owner, as an alternative to performing a PSCS, to “technically justify why such a study is not required.” We recommend that the phrase “technically justify” be replaced

with “state” in Parts 1.1.2, 1.1.3, and 1.1.4. The phrase “technically justify” conjures up detailed documentation, whereas an expert’s statement that is read by another expert (see R4) may be totally understandable and satisfactory. b.The last sentence in M1 should have the phrase “of a technical justification” stricken so that it reads “Acceptable evidence for not performing a PSCS as specified in Parts 1.1.2, 1.1.3, and 1.1.4 may include, but is not limited to, documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspect of coordination.” c.Part 1.2 should also have the phrase “technical justification” removed and be rewritten as follows: “Within 90 calendar days after the completion of Requirement R1, Part 1.1, either provide to the other owner(s) of the Protection System(s) associated with the Interconnecting Element(s): a summary of the results of each PSCS performed, including, at a minimum, the Protection Systems reviewed, the associated Fault current(s) used, any issues identified, and any revisions or actions proposed; or a statement why a PSCS is not required. d.M2 should have the phrase “technical justification” replaced with “statement why a PSCS is not required.” e.In R4, an owner’s “technical justification” must be confirmed by the other owners of Facilities with protection Systems associated with the Interconnecting Element – either with no issues or with issues noted (see the last two bullets in R4). Since one owner’s experts will be communicating with another owner’s experts, a statement why a PSCS is not required is sufficient. We request that “technical justification” be replaced with “statement” the first sentence in R4. We also request that “technical justification” be replaced with “statement why a PSCS is not required” the third bullet fourth bullet in R4. 2.In R2, the team’s rationale for naming the Transmission Owner as the entity responsible for performing the short circuit studies is that they maintain the data necessary to perform the studies – see the R2 textbox. This statement is not correct. Short circuit data under MOD-032-1 will be collected by a Planning Coordinator or a Transmission Planner. In addition, Generation Owners are responsible for some of the data – see Attachment 1 in MOD-023-1, “short circuit” column. However, short circuit data will be used by Transmission Planners in TPL-001-4. In that standard, Transmission Planners are required to perform short circuit analyses to determine whether existing or planned circuit breakers have the interrupting capability for the calculated Fault current. See TPL-001-4 Requirement R2, Part 2.3 as well as Part 2.6, which identifies when prior studies may be used. The SDT should recognize the requirements in TPL-001-4 and take advantage of Fault Current calculations already required by this standard. By having the Transmission Planner perform the Fault current calculation, a consistent short circuit database across a large footprint, such as PJM, will be used. Therefore, “Transmission Owner” should be replaced with “Transmission Planner” in R2. In addition, “Transmission Planner” should be added as an Applicable Entity.

PPL NERC Registered Affiliates
Brent Ingebrigtson
These comments are submitted on behalf of the following PPL NERC Registered Affiliates (PPL): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, PPL; Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. There remains the technical issue that TO changes do not typically affect GOs’ Protection System configurations or settings. Requiring GOs to perform PSCSs would not improve system coordination during faults, especially since everything involving tripping elements in the intended sequence (the stated purpose of PRC-027-1) is in the TO’s system. Currently, the only inputs that GOs need from TOs, are the fault current at interconnecting buses (affects the GO’s arc-flash studies) and the grid X/R ratio. PRC-001 coordination for TO changes would typically consist of GOs obtaining these two values and not requesting and analyzing the detailed TO information cited on p.23 of PRC-027-1 (“power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings”). Consequently, GOs should have no Protection System coordination duties other than reporting and receiving information on planned changes prior to implementation as per PRC-001. In concept, the individual requirements of PRC-027-1 are logical; however, significant efforts will be required for documentation of coordination across Registered Entities which will be required to achieve the totality of (R1-R5) intent. The

concern is that actual system coordination is currently built in to TO/GO processes and that the PRC-027-1 requirements do no more than place focus on documentation of such processes of coordination activity rather than the system coordination itself.
Group
Seattle City Light
Paul Haase
Sacramento Municipal Utility District (SMUD)
Seattle has concerns with this draft in addition to those identified in SMUD's comments. In particular, the present draft creates difficulties for entities with short transmission lines that require use of communication-assisted (pilot) relaying schemes in order to provide proper sectionalizing (coordination) of the transmission system during a fault event. The draft does not address the coordination of pilot schemes, and their backup relays (67N, e.g.). The 67N relays, located at the different buses, cannot be coordinated in our system (and others). In the absence guidance in the draft, Seattle recommends that the language be clarified to allow miscoordination of the backup relays as long as the pilot scheme is in place.

1. It is assumed that PRC-027 PSCS requirements will also apply for Interconnecting Elements between the Transmission System and the high side of the final aggregating step up transformer for BES dispersed generating facilities as described in Inclusion I4 of the recently passed BES Definition. If this indeed the case, an additional bullet should be listed in PRC-027 R3.1 as follows: [• At BES dispersed generating facilities, changes to the aggregating step up transformer or aggregating system which result in a change in impedance.] It may also be beneficial to include a diagram of a typical dispersed generation facility and relevant discussion in the Application guideline similar to that provided for the conventional generator configuration as shown on Fig 2 on page 28 of 32 of the standard. 2. PRC-005-2 and PRC-005-3 have recently been approved by NERC and both of these versions of the Protection System Maintenance Standard exclude the protection systems for power plant system-connected auxiliary transformers from their applicability. This exclusion of the system-connected auxiliary transformer from PRC-005 maintenance requirements is also described in the associated PRC-005 Supplementary Reference Document. In contrast, PRC-025 was also recently approved by NERC and specifically includes relay loadability setting requirements for relays protecting generating plant system-connected auxiliary transformers which are capable of providing plant electric loads during full power operation of the plant. Is it the intention of the drafting team that PRC-027 PSCS requirements apply to Interconnecting Elements that serve to connect the Transmission System to generating plant system-connected auxiliary transformers such as 345 KV line connecting a substation 345 KV breaker and a half scheme node to a plant 345KV/4KV auxiliary source transformer? We do not have a strong opinion whether a PSCS should be required for such interconnections. However, based on the inconsistent treatment provided to these system-connected auxiliary transformers in other standards as cited above, we believe it not only desirable but necessary that the PRC-027 application guideline explicitly state the drafting team’s intentions concerning PSCS requirements for the interconnection between the Transmission System and power plant system-connected auxiliary transformers.

ReliabilityFirst votes in the affirmative for the draft standard but offers the following comments for consideration: 1. Requirement R1, Part 1.2 - ReliabilityFirst believes the reference to "... technical justification pursuant to Requirement R1, Part 1.1" should be changed to correctly reference Requirement R1, Part 1.1.2 and 1.1.3. 2. VSL Requirement R1, Part 1.2 - Requirement R1, Part 1.2 specifically requires "...at a minimum, the Protection Systems reviewed, the associated Fault current(s) used, any issues identified, and any revisions or actions proposed; or the technical justification.". For clarification, if an entity fails to include one of these items in the summary more than 30 calendar days, does the entity fall under the "Severe VSL"? If this is not the SDTs intent, the VSLs will need to be drafted to address entities failing to include the mandatory items.

ATC is recommending an affirmative vote with the following clarifying comments: a. The text in sub-requirement R1.1.2. states "...10% or greater change in Fault current..," however, it is unclear what is considered the baseline. ATC recommends that this be clarified so that it is stated against what point in time the change is being measured. b. The text in Requirement R5 currently states "...shall address any identified coordination issue(s)..." which is vague and could lead to the unlikely event of an uncooperative party either stalling or prohibiting the work. ATC recommends this be clarified or re-written as "...shall address or acknowledge any identified coordination issue(s)..."

Consistent with previous comments, we continue to believe that PRC-027 is overly complex and its implementation will result in an unfair burden to registered entities that will not provide a commensurate increase in BES Reliability. The detailed flowchart included in the draft depicts a complex relationship between the requirements that will be difficult and costly to document in actual practice. Each protection activity that requires PRC-027 compliance tracking will have a unique trajectory through the flowchart creating a complex documentation record to prove that compliance efforts have indeed satisfied the flowchart. That such an intricate flowchart is required to explain the compliance process illustrates this point. From the standpoint of Transmisson Owner, we believe that developing a process to comply with this standard will prove to be a costly venture requiring additional staff just to track the status compliance items and doing little to improve the reliability of the BES. As written, the standard continues to be vague and in practice will be subject to individual interpretation by entities and Compliance Authorities alike. Requirement 3.1 does not provide sufficient clarity about what magnitude of impedance change would trigger an entity to provide details to other entities associated with a Protection System of an interconnected element. We believe that the decision of whether a change is significant should be left to the sound engineering judgment of the Protection engineers. We suggest the following modification to R3.1, Changes to a transmission system Element that result in a significant change in sequence or mutual coupling impedance. Changes to generator unit(s) that result in a significant change in impedance. Changes to the generator step-up transformer(s) that result in a significant change in impedance. Requirement 5 What will qualify as evidence of "addressing" an identified issue? Measurement 9 is

not helpful in providing clear direction to entities as to what is acceptable evidence that an issue identified by R4 has been addressed. What options are availble if an entity receiving notification of an issue does not agree there is an issue?

(1) We continue to believe that this standard should only require coordination between separate companies and not separate functional entities that may be under one corporate umbrella. We are particularly concerned about coordination requirements placed on smaller entities such as generation and transmission cooperatives where a single protection engineer may be responsible for protection system coordination for all transmission, generation and distribution interconnections. Having to document coordination among a single protection engineer is an unnecessary compliance burden on these small entities and the reliability benefit is not commensurate with the additional compliance costs required of the small entity. We ask the drafting team to consider an exception process for small entities to relieve them of unnecessary compliance burdens if this requirement persists. (2) We disagree with the definition of “Interconnecting Element” because the second part of the definition would require a Registered Entity registered as multiple functional entities to coordinate with itself. This definition does not take into account smaller entities that may be registered for multiple functions, but still only have a single protection system engineer. This poses an issue for smaller entities to prove compliance for this coordination among its functions. For example, why should such a small entity be required to show additional evidence of coordination between its functions of TO, GO, and DP for its relaying schemes that a single Protection System engineer determined was appropriate. The settings and schemes themselves are evidence of coordination, and this standard is asking for additional documentation that does not benefit reliability. (3) Requirement R2 should specify an initial performance period for initial compliance consistent with R1. R1 establishes that a Protection System Coordination Study should be completed within 60 months of the effective date of the standard. However, R2 only requires that the TO perform a short-circuit study once every 60 months. Thus, does this mean that the initial short-circuit study for compliance purposes has to be completed prior to the effective date of the standard, or 60 months after the effective date or some time period in between? Given this ambiguity, there will be inconsistent compliance outcomes from region to region and registered entities are bound to interpret this differently than compliance enforcement authorities. To avoid similar issues of compliance violations when PRC-005 was first implemented, we request that the drafting team establish a clear initial compliance period in the implementation plan. (4) R2, part 2.1: We recommend removing short circuit studies for this standard, as there are other standards that require short circuit calculations and data submittals, such as the MOD-B project and short circuit studies and analysis that are required under TPL-001-4. These other standards address short circuit data and analysis and we are concerned of potential overlap and possible double jeopardy of including short circuit studies in PRC-027. (5) We have concerns with the use of “proposed change or addition” for Part 3.1 and believe it will lead to inconsistent enforcement. The term “proposed” is vague. When does an idea for a modification become a proposed change that must be communicated to other TOs, GOs and DPs? For example, if a new generator interconnection is requested and studies indicate that it would require a transmission modification that changes a transmission system Element and alters it impedance, is this a proposed change? When would it become a proposed change, when the interconnection agreement is signed? When the request is submitted? The requirement is not clear which will lead to different opinions between registered entities and compliance enforcement personnel. Additional clarity is needed for when a change must be communicated. (6) The Guidelines and Technical Basis section of PRC-027 has raised several questions. In the purpose, the second paragraph states that “this standard requires that separate registered entities communicate with each other to coordinate Protection System components on existing Interconnecting Elements,” however, we are concerned that the definition of Interconnecting Elements is contradictory. Section “b” of the definition is based on the same registered entity that represents multiple functional entity responsibilities. Which is it? The technical justification states that the standard should apply to separate entities, but the proposed definition states that the standard applies to separate functions, even if those functions are registered to a single entity. We ask that the drafting team provide clarification and suggest that the standard is

applicable to corporate entities and not separate functional entities within a corporate entity. (7) We believe Part 3.2 meets P81 criteria and it should be struck. It is administrative in nature and meets criterion B4 - Reporting because it requires reporting to a third party and the reporting does not provide a material reliability benefit. (8) Requirement R4 meets P81 criteria and should be struck. It is administrative in nature and provides no reliability benefit. More specifically, it meets criterion B4 - Reporting because it requires reporting to a third party without material reliability benefit and criterion B1 – Administrative because it requires responsible entities to perform an administrative function that does not support reliability and is needlessly burdensome. This requirement should be struck. The real reliability requirement is to address coordination issues, which is already covered in R5. (9) The technical justifications for not updating the PSCS provided on page 21 of the Application Guidelines should be codified in the standard. We agree with the technical justifications. For example, there is no need to update a PSCS for a differential protection system for a greater than 10 percent change in fault current per Part 1.1.2. The approach could be modeled after PRC-023 Attachment A. (10) Thank you for the opportunity to comment.

The proposed standard is incorrectly defining the tap line serving a distribution load as an “Interconnecting Element”. The tap line in this case is not a BES Element. PRC-027-1 should only apply to interconnecting TOs or to interconnecting TOs and GOs. The only coordination that makes sense between the TO and the DP is making sure the TO does not trip its BES Element (line) for a fault located within the DP. In this case, the TO and DP would be responsible for detecting and coordinating for a fault on a non-BES element (which is not an “Interconnecting Element” as defined by the proposed standard). The proposed standard seems to attempt to redefine a DP-owned transmission Protection System as a system that simply detects a fault on a BES Element (Interconnecting Element) and requires coordination. That is not consistent with the FERC-approved interpretation of what constitutes a Protection System; i.e., detect BES fault and interrupt BES fault current. IMEA appreciates the need for proper relay coordination between the players (TOs and GOs) on the grid, but this proposed standard seems to incorrectly apply a coordination requirement to the interconnected DPs. Also, during the 12/5/13 PRC-027-1 Webinar, it was noted that the Protection System Coordination Study (PSCS) specified in Requirement 1 must be performed by each party at the ends of an Interconnecting Element. This seems like overkill. The owner of the Interconnecting Element should take the lead on the PSCS, with coordination/support/cooperation of course provided by the interconnected party.
Individual
Joe Tarantino
Sacramento Municipal Utility District
• Requirements are not ‘self-contained’ there are several requirements that reference another process in other requirements; • Allegedly this standard only applies to interconnections, this is not clearly evident in the Interconnected Element definition; • Requirement R1.2 references another owner. SMUD views this as an administrative burden having to document to the ‘other owners’ communication when the ‘owners’ Protection System Coordination Study is conducted by one responsible party. • Several of the requirements contain a ‘zero defect’ concept where if a date is missed it results in an automatic violation.

Frank Gaffney

To us, relay coordination is very important to reliability, more so than many other standards. So, at least in FMPA's view, this standard may actually not go far enough in two ways: 1) Clearing the fault within the critical clearing time: yes, the TPL standards require that we plan the system to be stable considering actual fault clearing times with consideration of a failure of a protection system looking > 1 year into the future; and yes, FAC-011 requires us to define SOLs that are stable in consideration of clearing times for single contingencies (but without protection system failure); but, there is little in the standards that requires us in the operating horizon to make sure we are clearing a fault fast enough to avoid instability for a single line to ground fault with a protection system failure. Maybe PRC-027 is not the right standard to accomplish this goal; however, we would have liked to have seen the purpose of this standard talk about clearing the fault quickly considering a protection system failure as the highest priority, with the proper sequence of tripping as a secondary priority. As protection engineers, we have seen times where we purposely would allow over-tripping for backup protection for some faults to make sure we cleared the fault within the critical clearing time. The standard as proposed makes "operate in the intended sequence" the only priority of the standard and as such may not allow continuation of this practice. 2) Coordinating all BES protection, not just at the boundaries: Another important consideration is that fault clearing, and proper sequencing of fault clearing, is important at all parts of the BES, not just at the boundaries between registrations. The standard as written follows the example of the existing PRC-001 it is replacing which requires coordination only at the boundaries between entities. The standard does expand this scope by requiring vertically integrated utilities to define boundaries between their registrations and coordinate protection systems across those boundaries (e.g., between the generators and the transmission at the interconnection) (as we have witnessed from the GO TO effort, defining those boundaries is not straightforward and is open to conflict). However, as stated previously, what makes the boundaries between registrations different than any other location on the BES from a critical clearing time and sequence of operation perspective? If Protection System coordination throughout the BES was instead required, there would be no need to defined these boundaries and would reflect its importance to reliability. FMPA made these same comments on the prior ballots of this standard, but, to no avail on the SDT. It strikes us as quite odd, when we compare the recently balloted PRC-002 on disturbance monitoring, which has de minimus impact on reliability, and this PRC-027 which is very important for reliability, that the PRC-002 standard is longer, more detailed, and in some ways more onerous (14 requirements) than this proposed PRC-027 (4 requirements). FMPA believes that PRC-002 should not be a standard at all due to its de minimus impact, but also believes that PRC-027 does not go far enough due to its important to reliabiliy. FMPA believes that priorities are misplaced in standards development.

SPP Standards Review Group
Robert Rhodes
We are concerned that the standard as proposed offers a formalized, very prescriptive structure without providing significant reliability gains since most of the requirements are currently captured by the industry in good business practices. We would prefer to have a more generic, less prescriptive standard that provides more of a guideline of what coordination is required rather than the complicated, involved documentation that is required in the current draft. We believe Requirement R1.1.1 is duplicative with Requirements R2 and R2.1 because they are both based on a 60-calendar month time frame. Furthermore, R1.1.1 is a one-shot requirement that would no longer be applicable after the first 60-calendar month cycle. Therefore R1.1.1 should be deleted from the standard. We are confused by the language in Requirement R1.1.2 which appears to require a PSCS within 12 months of determining, or being notified of, a 10% change in fault current. First of all, haven't you already done the study when you determine that the change exists? Secondly, does this require a study within the first 12 months following the standard becoming effective if no study currently exists? Otherwise, a study is not required for 60 months plus the 12 month grace period. Additionally, for smaller entities, especially municipals or cooperatives, without full-time staff to conduct full-blown PSCSs, 12 months may be imposing a very tight schedule on them given considerations for seasonal issues, vendor availability, bidding and approval processes. On Page 24 in the Guideline and Technical Basis section under Requirement 4 in the 1st line, insert a space between R4 and directs. We suggest that all references to calendar days or calendar months which

are preceded by a specific number of days or months be hyphenated. For example, 30-calendar days, 60-calendar days, 12-calendar months, 60-calendar months, etc.

a) R3 should state what is to be provided. As such “the following information” after “provide” in the 1st line of R3. b) R3.1 is confusing because of the use of “either” and two instances of “or” which follow. Suggest removing the ‘either’ and modify ‘existing or new Facility’ to ‘existing/ new Facility’ Also, no colon introduces the bulleted text c) R3.3 wording needs improvement. A reader is looking for what information must be provided as they goes from R3 to 3.1, 3.2, and 3.3. Beginning 3.3 with “Within 30…” makes it difficult to determine what is to be provided. Suggest moving ‘within 30 days’ to the end of the sentence. d) It would be helpful if, where possible, the boxes in the Flow Chart indicated the owner to which it applies. For instance, the box for R2.2.1 should say ‘The TO shall ….’ e) In order to prevent potential confusion, would the SDT consider modifying R4 & R5 to include exclusions for a PSCS performed as a result of “other changes” specified in R3.3. f) The flow chart is helpful to demonstrate the flow of the desired process and the triggers for study review. Minimizing the twists and turns in the presentation would make it even better. Also, there is a short circuited section around box R2.2.1 and the “receive notice of > 10%...” that should be corrected. Please consider replacing that section with the diagram provided under separate cover to the Chair and NERC Standards Coordinator.

Western Electricity Coordinating Council
Steve Rueckert
Over time, Part 1.1.1 of Requirement R1 will become meaningless. After the standard has been effective for five years, it will be outdated unless the intent is to continue to assess whether or not all entities have completed all Protection System Coordination Studies for the first time. Is this something that should be in the implemetnation plan rather than a requirement?
Individual
Rich Salgo
NV Energy
In the rationale statement for R1, part 1.1.1, the SPCSDT acknowledges that there is no “widespread miscoordination of Protection Systems associated with Interconnecting Elements that warrants a shorter time frame,” yet nevertheless specifies a requirement to conduct a PSCS within 60 months for instances where no PSCS exists. Given that there is no widespread miscoordination issue, we suggest that suitable evidence other than a formal PSCS should suffice. Suggest the following language for 1.1.1: "Within 60 calendar months after the effective date of this standard, if sufficient evidence of coordination for that Interconnecting Element does not exist." Also, we are concerned about the Applicability section as it pertains to interfaces between the transmission and distribution systems of an Entity. We believe that, for example, a 138/12.5kV substation transformer should not qualify as an Interconnecting Element, and request clarification in the Applicability section that provides some certainty on that point.
Group
US Bureau of Reclamation
Erika Doot
The Bureau of Reclamation (Reclamation) appreciates the drafting team’s efforts to address stakeholder concerns that an engineering department may perform analysis from both the Transmission Owner (TO) and Generator Owner (GO) perspective. However, adding a note to the rationale for R1, R3, and R4 that “[i]n cases where a single group performs an overall coordination study for a give Interconnecting Element, a single document … is sufficient for use by all entities” does not appear to fully address the concern. For example, one signed and dated document is

unlikely to demonstrate that the GO-arm of the entity reviewed the summary results of the study within 90 days as required by R4. Reclamation requests that the requirements and measures clarify how to document the coordination of a study when an entity acts as a GO on one side of an Interconnecting Element and a TO on the other side of the Interconnecting Element. Reclamation also requests clarification on the scope of R3.1, which references any change at a facility that “modifies the conditions used in the coordination of Protection Systems associated with Interconnecting Elements.” The Application Guidelines associated with R1 suggests that technical justifications may be used to exclude certain differential elements, distance elements, supervised overcurrent elements, and reverse power, definite time, and/or time overcurrent elements from the Protection System Coordination Study (PSCS) requirement. However, R3 appears to require notifications for new installations or modifications of these types of elements when they do not impact conditions for detecting and clearing faults and would not require a PSCS. Reclamation suggests that R3.1 be updated to refer to notifications “when the proposed change impacts the conditions for detecting or clearing faults” rather than “when the proposed change modifies the [seemingly any] conditions … used in the Coordination of Protection Systems.” Reclamation believes that R3.1 should require, “Details for any proposed change or addition listed below; either at an existing or new Facility associated with the Interconnecting Element; or at other Facilities, when the proposed change impacts the conditions for detecting or clearing faults on the BES elements used in the coordination of Protection Systems associated with the Interconnecting Element(s)."

Bonneville Power Administration
Andrea Jessup
BPA reiterates our previously stated concerns expressed in draft 3 comments. BPA concerns stem from two basic issues. First, PRC-027 prevents us from using our judgment to determine when and how to review relay coordination on our interconnections with neighboring entities. This reduces our efficiency and eliminates the flexibility that allows us to most effectively interface with each of our neighboring entities. If it could be shown that there would be an increase in the reliability of the bulk electric system based on this standard, perhaps this standard would be acceptable, but we are not aware of any problem that this standard will correct. The second basic issue that causes BPA concern with this standard is that it contains requirements for which the details of compliance are not adequately addressed. BPA recommends that the meaning and details of the terms Interconnecting Element, Protection System Coordination Study, and interconnecting bus be more clearly defined. These are some of the major terms used in the standard. The standard also relies heavily on the Guidelines and Technical Basis to explain its meaning, but this too falls short and cannot possibly cover every different situation that will be encountered in the application of the standard. Because of these fundamental issues, BPA finds PRC-027 unacceptable. BPA’s suggestion is to draft a much more basic standard. A simple requirement, such as Each Transmission Owner (TO) that owns a Protection System which requires coordination with a Protection System owned by a neighboring TO to prevent the scheme from misoperating shall reach agreement with the neighboring TO on how to set the protective relaying scheme in order to minimize the possibility of it misoperating, along with some simple measures for documentation would be sufficient to insure that neighboring entities work together to coordinate their protection systems while still allowing for flexibility and engineering judgment to be applied.
Individual
John Brockhan
CenterPoint Energy
1. For a Registered Entity that represents multiple functional entity responsibilities, CenterPoint Energy believes the proposed definition for Interconnecting Element, as stated, would require an entity to perform a Protection System Coordination Study (PSCS) on every BES Element in its system. We recommend the wording in item “b)” of the definition be deleted. The concern the SDT appears to be addressing is the coordination of transmission protection systems with generation protection systems. We do not believe a mandatory requirement is needed to address communication and work processes within a vertically integrated entity. NERC Reliability Standard PRC-004 addresses transmission and generation misoperations and is a vehicle that is already in

place that can be used to address Protection System coordination needs, should root analysis identify such a need. In a vertically integrated entity, a corrective action plan would include both transmission and generation protection aspects. 2. CenterPoint Energy recommends that Distribution Providers be removed from the Applicability section. It appears that there would be very few, if any, distribution protection systems that would be applicable to the proposed requirements. We are not aware of any distribution protection systems that must be coordinated with transmission Protection Systems to allow for the proper functioning of the transmission Protection Systems. 3. CenterPoint Energy recommends that the trigger to conduct a Protection System Coordination Study for a 10 percent or greater change in fault current be only for increases in fault current; that is, decreases in fault current should not require entities notify other entities and not require the entities to conduct Protection System Coordination Studies. Protection Systems must operate for a variety of reduced fault current levels in normal system operation, as well as operation during and after major storms. For example in normal operation, there is a substantial decrease in fault current when a generating unit or an autotransformer is unavailable. In storms (hurricanes, extreme cold, etc.), even greater decreases in available fault current can occur. 4. While coordination of Protection Systems is a reliability consideration, CenterPoint Energy recommends reevaluating the need for this standard with consideration that this could instead be addressed by misoperation analysis. NERC Reliability Standard PRC-004 addresses transmission and generation misoperations and is a vehicle that is already in place that can be used to address Protection System coordination needs, should root analysis identify such a need.
Individual
Brian Evans-Mongeon
Utility Services
The applicability section for Distribution Providers requires more specificity. How will a DP become aware that their Protection System requires “coordination for isolating” faulted Interconnecting Elements? Suggest adding language requiring the owner of the Interconnecting Element to notify the Distribution Provider that their Protection System is required to isolate faults on the Interconnecting Element. This will place the burden on the owner of the protected Interconnecting Element to ensure that element is properly protected.
Individual

Modesto Irrigation District
The definition of Interconnecting Element needs to be revised, specifically part b). It is unclear what the intent of part b) is. If you interpret part b) the way it is written, it seems that part b) would exclude BES elements that don't join separate entities if the entity is just a transmission owner, or just a generator owner, etc. Thank you.

Additional Comments:

Tampa Electric
James Rocha

The violation severity level even on insignificant elements should not be based on time but based on the risk to the BES. The requirements create a large documentation and scheduling burden without improved reliability, if passed as proposed.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Coordination of Protection System Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection System components operate in the intended sequence during Faults.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)

   4.2. Facilities:

   4.2.1 Protection Systems installed for the purpose of detecting Faults on BES Elements, and isolating those faulted Elements
5. **Effective Date:** See Implementation Plan
6. **Definitions:**

   Interconnecting Element

   A Bulk Electric System (BES) Element that electrically joins Facilities:

   a) owned by separate Registered Entities, or

   b) assigned to different functional entities (Transmission Owner, Generator Owner, or Distribution Provider) of the same Registered Entity

B. Requirements and Measures

Rationale for Requirement R1:

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement a process to coordinate its BES Protection Systems to operate in the intended sequence during Faults. The process shall include, at a minimum: *[Violation Risk Factor: TBD] [Time Horizon: TBD]*

1.1. A method to review and update data required to develop Protection System settings.

1.2. A quality assurance or review process of the Protection System settings.

1.3. A set of minimum triggers to prompt a review of existing Protection System settings. Specified triggers may be time-based, condition-based, or a combination of the two.

1.4. A procedure to communicate the Protection System settings with Transmission Owners, Generator Owners, and Distribution Providers associated with Interconnecting Elements and seek concurrence that there are no identified coordination issues.

1.5. A procedure to verify any identified coordination issue(s) associated with proposed Protection System settings are addressed prior to implementation.

M1. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has implemented its process to coordinate its Protection Systems, in accordance with Requirement R1 and its Parts.

Rationale for Requirement R2:

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, within 60 calendar months after the effective date of this standard, have documentation that the Protection Systems for the following Elements are coordinated to operate in the intended sequence for clearing faults. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*

2.1. Interconnecting Elements associated with Transmission operated at 200 kV or above.

2.2. Interconnecting Elements associated with BES Generating resource(s) with gross plant/facility aggregate nameplate rating greater than 75 MVA.

2.3. Any monitored Facility of an Interconnection Reliability Operating Limit (IROL).

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity coordinated the Protection Systems for the Elements identified in Requirement R2 within 60 calendar months of the effective date of this standard.

PRC-027-1 (Preliminary Draft 5)

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on this preliminary draft 5 of standard **PRC-027-1 – Coordination of Protection System Performance During Faults**. The electronic comment form must be completed by **8 p.m. Eastern, Tuesday, October 21, 2014.**

If you have questions, please contact Al McMeekin, NERC Standards Developer by email at Al.McMeekin@nerc.net or by telephone at (404) 446-9675.

The project page may be accessed by clicking here.

Background Information

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "*To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection System components operate in the intended sequence during Faults.*" This standard incorporates and clarifies the coordination aspects of Requirements R3 and R4 from PRC-001-1.1. Following draft 4, FERC staff from the Office of Electric Reliability raised significant concerns on the posted draft. The primary concern was that the proposed standard did not address the coordination of Protection Systems within a Transmission Owner's footprint, referred to as "internal" or "intra-entity" Protection Systems. Following those discussions, the SPCSSDT prepared this preliminary draft 5 of PRC-027-1 and now seeks stakeholder input on this proposal during a 21-day informal comment period.

Draft 5 of PRC-027-1 modifies the applicability of the standard to include "*Protection Systems installed for the purpose of detecting Faults on BES Elements, and isolating those faulted Elements*," whereas, prior drafts of the standard limited the applicability to "*Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements.*" This change to the applicability covers the coordination of Protection Systems for all "internal" or "intra-entity" connections between BES Elements.

Prior drafts of PRC-027-1 would not have been easily adaptable to this change, and as a result, the drafting team has altered its approach in the draft. The draft now consists of two proposed requirements.

Requirement R1 mandates an entity to implement a process to coordinate its BES Protection Systems, and stipulates certain attributes that must be included in the documented coordination process. Because entities' Protection System designs and philosophies vary greatly, the drafting team has included necessary flexibility in developing the coordination processes.

Requirement R2 mandates an entity have documentation, within 60 calendar months after the effective date of the standard, that the Protection Systems for the Elements specified in Requirement R2 are coordinated. Requirement R2 is a one-time performance requirement necessary to establish a baseline of coordination.

21-day Informal Comment Period

For this informal posting, the drafting team is soliciting stakeholder feedback on the scope and work product developed thus far. The drafting team intends to take this informal feedback and use it to begin formal development of draft 5 of PRC-027-1 in November. The electronic comment form must be completed by **8 p.m. Eastern Tuesday, October 21, 2014**. Entities may communicate additional feedback directly to the drafting team through its open meetings leading up to the formal posting in November.

Please enter comments in simple text format. **Bullets, numbers, and special formatting will not be retained** (even if it appears to transfer formatting when copying from the unofficial Word version of the form into the official electronic comment form). If you enter extra carriage returns, bullets, automated numbering, symbols, bolding, italics, or any other formatting, that formatting will not be retained when you submit your comments.

- Separate discrete comments by idea, e.g., preface with (1), (2), etc.
- Use brackets [] to call attention to suggested inserted or deleted text.
- Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.
- **Do not use** formatting such as extra carriage returns, bullets, automated numbering, bolding, or italics.
- **<u>Please do not repeat other entity's comments</u>.** Select the appropriate item to support another entity's comments. An opportunity to enter additional or exception comments will be available.
- If supporting other's comments, be sure the other party submits comments.

Questions:

1. Do you agree with the concept of requiring a process to address the coordination of Protection Systems (Requirement R1)? If not, please provide the basis for your disagreement and your proposed alternative(s).

   ☐ Yes
   ☐ No
   Comments:

2. Do you agree that Parts 1.1 through 1.5 of Requirement R1 are essential elements of a successful coordination process? Are there others that should be included? If not, please provide the basis for your disagreement and your proposed revisions, or other additions.

   ☐ Yes
   ☐ No
   Comments:

3. The coordination process **will** include a set of minimum trigger(s) (Part 1.3) to review existing Protection System settings. These triggers will be developed by the drafting team during the standard development process. Please provide any suggestions for appropriate triggers.

   Comments:

4. Requirement R2 mandates entities have documentation, within 60 calendar months after the effective date of the standard, that the Protection Systems for the specified Elements in Parts 2.1 through 2.3 are coordinated. Do you agree with the chosen Elements and do you have any suggestions for others? If not, please provide the basis for your disagreement and your proposed revisions, or other suggestions.

   ☐ Yes
   ☐ No
   Comments:

5. Do you agree with the proposed Measures? If not, please provide the basis for your disagreement and your proposed revisions.

   ☐ Yes
   ☐ No
   Comments:

6. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

No
What is meant by “condition based”? Condition-based (referred to in Part 1.3) should be clarified in the Rationale Box for Requirement R1. It is implicit in requirement R1 that setting development is implicit in the process. The Drafting Team should consider deleting Part 1.5. It is addressed in Part 1.2. A Part should be added to address the implementation of the coordinated settings to Protection System equipment. There is no need for a quality or review process in this standard. As per Paragraph 81, the “how” is not necessary. It is the responsibility of the engineering or technical staff to implement their in-house process.
Yes
A Protection System misoperation should be a trigger. Our comment response to Question 2 suggested that possibly a Part be added. An addition or change to the interconnecting Elements can be used as a minimum trigger.
No
Parts 2.1 through 2.3 address interconnections. FERC was concerned with the standard not addressing the coordination of Protection Systems within a Transmission Owner’s footprint, referred to as “internal” or “intra-entity” Protection Systems. A Part (or Parts) must be added to specifically address that concern. Wording still needs to be added to capture FERC staff’s intent. The technical justification for selecting the 200kV threshold in Part 2.1 needs to be provided.
Yes
A definition for “coordination” should be developed to eliminate some of the variations in Protection System design philosophies. The language in Introduction Section 4. Applicability sub-Part 4.2.1 creates a potential hole in Protection System coordination. In some applications, Protection Systems are installed for the purpose of detecting Faults on non-BES Elements but may impact the BES if they are incorrectly set. For example, a radial delivery point tapped off a BES transmission line may have a blocking relay installed that does not appropriately detect faults in its designated zone of protection, causing the transmission line terminals to trip impacting the BES. Suggest that the wording of 4.2.1 be revised to read: 4.2.1 Protection Systems installed for the purpose of detecting Faults on BES Elements, and isolating those faulted Elements, and including those Protection Systems that if improperly coordinated could result in BES Element tripping. The Purpose of PRC-001-1.1 is “To ensure system protection is coordinated among operating entities.” The Purpose of PRC-027-1 is “To maintain the coordination of Protection Systems installed for the purpose of

detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection System components operate in the intended sequence during Faults." The industry definition of coordination is "Coordination of protective devices is the determination of graded settings to achieve selectivity." "Selectivity in a protective system refers to the overall design of protective strategy wherein only those protective devices closest to a fault will operate to remove the faulted component…". Protection System coordination achieves selectivity, not only with interconnections, but within a Transmission Owner's footprint. PRC-001-1.1 already addresses what PRC-027-1 is addressing. Efforts should be directed at improving PRC-001-1.1 rather than producing a new standard.

Barbara Kedrowski
Wisconsin Electric Power Co
No
While a process is needed to do this work, I don't think requiring a process should be part of the standard. At the end of the process there needs to be documented evidence that the Protection Systems are coordinated (as stated in R2). I think that the standard should focus on the final product, not require a process to get there.
No
: I don't see "develop Protection System settings" between 1.1 and 1.2, but perhaps it is implied. Part 1.5 should be done while developing the settings rather than at the end so if they don't coordinate you have to start all over again. However, this would require getting the neighboring entities related settings (part of 1.4) prior to developing your own settings. We would have a different sequence for coordination, so as stated in question 1, this shouldn't be part of the standard. Part 1.3 seems misplaced as it is when a review is required; this would be needed as part of the standard.
Replacement of protection elements other than like in kind replacements for failures.
No
Along with the definition for Interconnected Element, the Elements listed in parts 2.1 through 2.3 seem unclear. The way I read it if a line connects two Registered Entities, then only the Protection Systems for that line need to be coordinated. I don't think that is what the drafting team intends.
No
As stated in question 1, I don't think developing a process should be part of a standard.
Individual

Yes
No
- For 1.2, rather than a review process of the protection system settings, is it the intent to have a process to review the protection system coordination, or a process to review the development of the protection settings? - Similar for 1.3, the trigger should be for a protection system coordination review? - For 1.4, should it include a procedure to communicate any identified coordination issues on the interconnecting elements with other entities?
It may need very careful considerations to define this trigger; otherwise entities may end up wasting lots of precious resources on doing this review.
No
It is not clear exactly what coordination documentation is required. It is inherent that protection systems at both ends of the interconnecting elements would need to work together properly, but there is no "coordination" required between the protection systems at both ends of the interconnecting elements. Is the intent to require the protection systems on the BES elements adjacent to the interconnecting elements coordinate with that of the interconnecting elements themselves?

Yes
- This version of the standard applies to all BES elements; which is a big shift of direction from previous versions where it applies to the interconnecting elements only. The SDT should take careful pre-cautions that this new standard will not create unnecessary burden for protection system owners. - The title of the standard is confusing. Consider changing to: “Protection System Coordination During Faults”?

Ingleside Cogeneration LP
No
Ingleside Cogeneration LP (“ICLP”) does not see the overriding need to completely overhaul PRC-027-1 just to account for transmission links internal to the TO’s network. In general, the process – which was nearing industry’s approval – will suffice provided those links are limited to a reasonable subset of substation-to-substation connections. In our view, this may require further vetting to properly identify the affected components, but the general concept should not change. It does not make sense to throw away several years of work without taking this step first.
Yes
ICLP does not disagree with the elements of coordination captured in R1.1 through R1.5, but is concerned that the lack of specificity in the criteria could become a major issue. It has been our experience that determinations seemingly left completely to Registered Entities, in this case the TO, GO, and DP; will be overridden by CEAs wherever binding language is not used in the standard (e.g.; in the requirement). This inevitably leads to an uneven assessment of compliance by audit teams – which is in conflict with the fundamental concept of continent-wide standards.
In Draft 4 of PRC-027-1, the industry reached near-consensus that a 10% change in Fault current across an interconnecting bus was the proper trigger. Consistent with our response to Question 1, if the scope of the standard is expanded to only include a subset of substation-to-substation located within the TO’s footprint, that triggering criteria does not need to change. It seems to us that it only becomes an issue if other parameters other than Fault current are considered – which extends beyond the concern expressed by FERC staff.
No
On the whole, ICLP agrees that the 60 month baseline should apply to a limited subset of Interconnecting Elements. However, we do not understand why generator interconnections to the transmission system are not limited to those operating at 200 kV and above – just like the corresponding connections between adjacent TOs are. This would be consistent with other standards – FAC-003-3 comes immediately to mind – who also have focused their efforts on the most critical transmission systems.
No
ICLP believes the Measures are directionally correct, but cannot provide our viewpoint one way or another when the requirements are so undefined.
ICLP was comfortable that the previous drafts of PRC-027-1 clearly identified those relay systems that react to a Fault. However, this latest draft is written at a much higher level – which makes no distinction between relay schemes which may appear to react to a Fault, but are actually triggered by secondary conditions resulting from one. For example, a Generator Owner has many relays that monitor voltage, frequency, and ground current which may damage equipment if action is not taken to isolate it. Based on our reading of PRC-027-1, it may require us to take steps to limit Fault-related transients or adjust relay ride-through thresholds wherever dynamic studies show a risk – even though accurate simulations of such phenomena are difficult to achieve. If this is not the intent, the drafting team may have to provide a list of applicable relays and a list of exclusions. This is the same issue that the development team for the Definition of RAS is addressing – and is not an easy determination. A better solution would be to re-use some of the language deleted from PRC-027-1 Draft 4, which is accurately focused on Fault coordination.

Triggers should include additions or removals of system elements electrically adjacent to existing elements, system misoperations and increases in short circuit levels similar to those proposed in the earlier version of this standard. Decreases in short circuit current are problematic because a system coordination must include maximum short circuit levels but must also allow for generators and other sources to be off line which means the minimum fault currents under normal conditions can be substantially less on an operational basis.
R2.3 applies to “any monitored Facility of an [IROL] while R2.1 and R2.2 apply to Elements. If there is a distinction between monitored Facility and Element it should be specifically clarified. If not, then R2.1, R2.2 and R2.3 should all use the glossary term to either Elements or Facilities consistently.
Yes
Coordination of protection of a single element such as prescribed in section R2 will involve the protections of other electrically adjacent and possibly non-adjacent elements. This cascading effect will be difficult to define may extend far beyond the prescribed Elements and could ultimately involve most of the BES. How will the limits of compliance with this standard be defined. This could also result in a burdensome amount of effort and documentation.
Individual

Oncor Electric Delivery LLC
Yes
No
This question is really two questions that Oncor answers No (Do you agree that Parts 1.1 through 1.5 of Requirement R1 are essential) and No (“Are there others that should be included”) Oncor believes that Part 1.5 should be modified to read; “A procedure to verify any identified coordination issue(s) for all Interconnecting Elements associated with proposed Protection System settings are addressed prior to implementation.” Part 1.5 should not be applicable for an “internal” or “Intra –

entity" processes. Part 1.2 in its "quality assurance or review process" should take care of the requirement for resolving coordination issues prior to implementation of Protection System settings for all "internal" or "intra-entity" Protection System settings.
Yes
Oncor believes that the present Requirement R1 part 1.3 is sufficient ("A set of minimum triggers to prompt a review of existing Protection System settings. Specified triggers may be time-based, condition-based, or a combination of the two"). Adding a list of minimum trigger(s) to Requirement R1 Part 1.3 would imply that an entity does not have the freedom to choose triggers that are not found in the set of minimum triggers of Part 1.3. Therefore Oncor proposes to add these triggers within a "Rational" box.

ATC has no comments.
No
While Parts 1.1 through 1.5 contain elements of what is needed for a successful protective relay setting practice, as proposed, Parts 1.1 through 1.5 appear to pose a heavy administrative burden on the company required to implement its processes. In particular, R1.5 appears particularly impractical. ATC sees very little benefit in a separate process, given that a fundamentally sound setting process should prevent implementation of improper settings. Adding a separate administrative regulatory burden to meet this requirement misdirects resources from higher value tasks. Furthermore, the term "identified coordination issues" is subject to interpretation and needs to be better defined in the standard (R1.4 and 1.5). Finally, ATC suggests clarifying what is expected of the "quality assurance or review process," which would currently be performed in R1.2.
ATC suggests the following triggers: 1) a risk-based trigger based on the company's own installed equipment whereby the company knows which relays are more likely to misoperate; 2) a trigger that evaluates misoperations of similar technologies. If the criteria is too prescriptive, opportunities may be lost to address the most impactful to reliability.
Yes
ATC has no comments.
No
Measure 1 states that, "acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the Responsible Entity has implemented its process to coordinate its Protection Systems…" As written, the measure is very broad and has the potential to generate a large volume of evidence open to various interpretations of regulators.
The process outlined in Requirement 1, Parts 1.1 through 1.5, exhibits characteristics of industry best practices, such as those developed by industry forums and trade groups. ATC recommends that industry best practices continue to be handled outside the NERC Reliability Standards as they have been previously. Placing them in a regulatory framework will lead to inefficiencies due to administrative burden and lead to slower improvement in reliability.

AEP believes that R1 should be limited to the establishment of a process to coordinate BES Protection Systems, rather than the implementation of a process. M1 indicates that registered entities will be required to provide records to demonstrate the application of the developed process

for all BES Elements. A robust coordination process should be focused on ensuring that Protection Systems are set to operate in the intended sequence, rather than on producing documentation that adheres to a reportable format that can be easily understood by all. Registered Entities should be required to establish a coordination process and be trusted to follow the process. This would allow relay engineers to focus their time on ensuring proper coordination rather than preparing documentation. We believe the evidence described in M1 would be acceptable if it was to apply only to Interconnecting Elements. Additionally, AEP has concerns regarding how R1 will be audited and believes that as currently written, that it may be too subjective and open to auditor interpretation. For example, how does one determine what constitutes a quality assurance process? How much latitude would an auditor have to deem the entity's process inadequate and subsequently issue a potential violation of R1 based on Parts 1.1 through 1.5? NERC Standard PRC-005-1 uses a similar approach, requiring entities to "have a Protection System maintenance and testing program" and to implement it. AEP urges the drafting team to consider the difficulties industry has had with PRC-005-1 R1 when drafting PRC-027.
No
While we agree what that these may be essential elements of a successful coordination process, we don't agree that such elements should be within the scope of an audit as their application can be subjective and open to auditor interpretation.
Yes
AEP does not believe that the standard should prescribe a specific set of minimum triggers for all Registered Entities to follow. Entities should be provided the flexibility to define within their process what should prompt a new coordination study. Rather than using the phrase "minimum trigger", AEP believes it would be more appropriate for R1.3 to refer to a defined methodology that includes conditions for performing coordination studies. For example, "A defined methodology to identify what system conditions should prompt a new coordination study". A potential condition described within this methodology could include when settings are reviewed due to a system change (line, transformer, generator). In these cases, coordination in a given area would be reviewed outwardly from the system change until it is determined that no additional settings changes are needed to achieve coordination. AEP believes that this proposed methodology would be adequate to identify changes to system conditions and perform coordination as needed.
No
As stated in our response to Question #1, AEP believes that R1 should be limited to the establishment of a process to coordinate BES Protection Systems, rather than the implementation of a process. M1 indicates that registered entities will be required to provide records to demonstrate the application of the developed process for all BES Elements. A robust coordination process should be focused on ensuring that Protection Systems are set to operate in the intended sequence, rather than on producing documentation that adheres to a reportable format that can be easily understood by all. Registered Entities should be required to establish a coordination process and be trusted to follow the process. This would allow relay engineers to focus their time on ensuring proper coordination rather than preparing documentation. We believe the evidence described in M1 would be acceptable if it was to apply only to Interconnecting Elements.
There are some situations where performing a coordination study does not need to be performed because it does not provide any technical value. The draft should be revised to allow Registered Entities to technically justify why a coordination study does not need to be performed. The previous draft allowed for this, but has been removed. There will be times when a relay setting is found to be incorrect for various reasons. The discovery of such a condition might be due to a Protection System Misoperation. PRC-004-2 allows entities to identify such conditions and take corrective actions as necessary to resolve the relay setting issue. Since in these cases the relay did not operate in the intended sequence, would this become a reportable violation of PRC-027? AEP believes that to best promote reliability of the BES, entities should retain the ability to identify and correct settings issues as they are found without the need to report a violation of a Reliability Standard.

No
We believe that R1 is overly burdensome from a compliance perspective and is not necessary to reach an adequate level of reliability for the BES. Creating a new process and procedure does not add much value and further evaluating compliance with this requirement will be very subjective. Instead SDT could identify the requirements and ask compliance with the same. Changing R1 as below would provide for an adequate level of reliability without creating a lot of unnecessary compliance work. In current draft, propose that the word "implement" in R1 be changed to "have". M1 would accordingly be changed so that the entity could produce the appropriate process documents as evidence for R1. No other evidence would be required.
No
The word "essential" in this statement conveys a weight that is not justified and may lead to complex and unwieldy processes where simple ones will suffice. This is a standard that addresses a problem that has not, in practice, been a problem. I agree these are elements of a successful coordination process, but they create an extreme burden of documentation when simple communications between peers is all that is really needed. We do not believe that triggers are needed to assure protection system coordination. We do not use triggers in any procedures or processes we currently have that prompt a coordination review. Misoperations on our system are essentially non-existent and have been for decades. Thus we propose that the drafting team remove R1.3 as it is not necessary to provide an adequate level of reliability for the BES. The SDT should rather simply require of the Generation owner that any time protection system settings are changed, that needs to be coordinated with TO. This process and procedure requirement with triggers is burdensome and complicated for GOs.
No
The bulk of coordination changes are condition based; they will be required by the addition or reconfiguration of BES facilities or changes to protection systems. Coordination changes required by an increase in fault current levels will almost always be identified in the process of reviewing coordination for the change to BES facilities. Requiring a burdensome process to periodically review and document fault current based triggers adds very little value and adds a layer of unneeded complexity, which can ultimately detract from the goal of creating a more secure protection system. Based on our experience operating a large power system, we do not believe that triggers are necessary to assure coordination and an adequate level of reliability for the BES. We encourage the drafting team to re-think the need for codified triggers to prompt coordination reviews. We believe that selection of triggers should be by the registered entities, based on their own experience and engineering practices, and not designated by the compliance authority. Appropriate triggers might include the addition of a new transmission line (200kV or higher), a new generator (1000 MVA or higher), or a new autotransformer (1000 MVA or higher), change of XFMRS (MPT, UAT and SAT) or Generator or change in any of their parameters.
Yes
We have no suggestions for adding additional circuits. It is our understanding that these R2.1, R2.2, and R2.3 circuits are the only circuits required to be reviewed to meet this standard and we agree with the drafting teams decision. Review of other circuits is necessary to provide an adequate level of reliability. Thus, we suggest that the drafting team clearly reflect this in the Facilities section of

the standard. Specifically 4.2.1 could be changed to read “Protection Systems installed for the purpose of detecting and isolating Faults on the following BES elements; list those specified in R2.1, R2.2, and R2.3. Exelon GO’s question does this include protection for Generator, MPT or SAT in addition to the connecting leads between switchyards and GO owned transformers or just the connecting leads?
No
See Q 1. M1 would accordingly be changed so that the entity could produce the appropriate process documents as evidence for R1. No other evidence would be required.
This is an example of an extremely burdensome standard when there are really very few misoperations that are caused by miscoordination of protection on interconnecting facilities. To make the standard and implementation easier for the GO, SDT needs to identify the specific GO owned relays which should be coordinated with TO. For example distance relays, overcurrent relays; negative sequence relays etc. do require coordination while differential, reverse power, Generator ground etc. do not require any coordination. Same should be done for the TOs relays which require review by the GO.

ACES Standards Collaborators
Jason Marshall
Yes
We are intrigued by this new approach and cautiously optimistic that this approach is an improvement over previous drafts that contained very detailed performance requirements and numerous administrative requirements. While this new approach does appear, in essence, to expand the reach of the standard to all BES Protection Systems from just those Protection Systems for Interconnecting Elements, we believe requiring a process document is a better approach. This is especially true since the performance aspects will be limited to Interconnecting Elements that are 200 kV and above or that are connected to generator(s) with 75 MVA capability and Facilities that are part of an IROL per R2.
No
(1) Overall, we agree with these Elements, but believe that the SDT should provide additional clarifications for small entities. For example, since R1 applies to TOs, GOs, and DPs, can a small entity, such as a small G&T cooperative, have a single process document? If so, the SDT needs to modify Part 1.4 to be clear that it would only apply to communication and coordination with other Registered Entities and not other functional entities assigned to the same Registered Entity. In essence, Part 1.1 would cover “Interconnecting Elements” between the small G&T’s different functional entities , which would make more sense, particularly in cases where there is a single protection engineer. In this situation, how would the protection engineer document their self-communication per Part 1.4? (2) Implementation of Part 1.2 could be a challenge for small entities, especially small distribution cooperatives that own transmission Protection Systems and likely have a single protection engineer. Some guidance on expectations in the quality assurance or review process for these entities would be helpful since they likely cannot implement a peer or supervisory review.
One obvious trigger would be a Misoperation; however, this trigger would need to be coordinated with PRC-004 to avoid overlaps in the standards. Other triggers would include: system topology changes impacting the impedance (a threshold could be set) seen by the Protection System, generation additions, expansions, or retirements.
No
While we do not have an issue with focusing compliance monitoring on the specified Elements identified in R2, we do believe the requirement in its current form meets Paragraph 81 criteria. A Paragraph 81 criterion states that a requirement should be retired if it only compels production of documentation. Since R1 already compels coordination, R2 is would appear to be a documentation requirement that should be struck. The reason documentation became a Paragraph 81 criterion is because documentation is required to demonstrate compliance with other requirements. Furthermore, NERC can compel the production of the documentation via other processes such as compliance monitoring (e.g. audits, spot checks), section 1600 data requests, or possibly even include these specified Elements in the RSAW as part of the data sampling process. Since FERC

ultimately approved these Paragraph 81 criteria when they approved the retirement of the requirements meeting the criteria, we cannot see how R2 should remain in its current form as it is not consistent with a prior Commission order.
No
(1) We are concerned that M1 could cause an auditor to believe that they need to review evidence for every single Protection System setting since it states that the responsible entity must have evidence of implementation. We need to avoid this burdensome compliance approach to be consistent with the RAI. We suggest that the drafting team should work with NERC compliance staff during the development of the RSAW to be clear that a sampling approach will be used. (2) We believe that the M2 is too vague. What kind of records is being asked for? For example, would output from a software package such as Aspen be the desired evidence?
(1) We believe that the main requirement for R1 should ask for a plan rather than a process and that Parts 1.4 and 1.5 should ask for processes. Since setting relays occurs in the operations planning horizon, use of plan and procedure may not technically fit the category of an Operating Plan and Operating Process, as defined in the NERC glossary; however, use of plan and process, as described above, would be consistent with the definitions and may avoid some confusion. It may even make sense to use the defined terms. (2) Since R2 is intended to be an “one-time performance requirement necessary to establish a baseline of coordination”, will this requirement be retired after the baseline is established? We believe it should be. (3) Will a Protection System Misoperation indicate that a violation of R1 has occurred? We would suggest that should not be the case, but an auditor could interpret such a Misoperation as an indication that the Protection Systems did not operate in the “intended sequence during” a Fault. The drafting team should be careful to avoid a Misoperation automatically indicating a violation because it will discourage reporting of Misoperations and the lessons learned entities share with the rest of industry.

ITC
Yes
No
1.5 is not essential because it is part of 1.4 process of seeking concurrence from the other entity. Calling this one aspect out specifically provides no reliability benefit and only increases administrative compliance burden to track dates, etc.
No
We agree the chosen Elements are more critical than others. However we suggest removing this requirement as there is no evidence of widespread miscoordination, per SDT in previous drafts of this standard.
No
M2 needs to include evidence of coordination from prior to effective date of the standard.
Group
Dominion
Connie Lowe
Yes
Yes
Yes
The SDT needs to explain the basis for selecting the 200kV threshold in Part 2.1.
Yes

Dominion is concerned about a potential hole in Protection Coordination created by the language in section 4.2.1. In some circumstances, Protection Systems are installed for the purpose of detecting Faults on non-BES Elements but may impact the BES if they are incorrectly set. For example, a radial delivery point tapped on a transmission line may have a carrier blocking relay installed that does not appropriately detect faults in its designated zone of protection, causing the transmission line terminals to trip, impacting the BES. Dominion believes the language should be modified to include Protection Systems that, if improperly coordinated, could result in a BES Element tripping.
Individual
John Merrell
Tacoma Power
Yes
Tacoma Power agrees with the concept of requiring a process to address the coordination of Protection Systems. However, great caution must be exercised that entities and their ratepayers are not overly burdened for marginal reliability gains. While having such a mandatory and enforceable standard may create additional incentive for entities to periodically review Protection System coordination, mandatory and enforceable standards risk significant administrative cost if not carefully crafted.
No
It is not completely clear what Part 1.1 is trying to achieve. Is this part intended primarily to refer to short circuit models? If so, this should be more clearly stated.
Because this will be a mandatory and enforceable standard, the triggers should be clear and pose minimal burden to entities to monitor even if the triggers do not comprise an all inclusive set. The following four triggers are suggested: -The 3LG or 1LG fault current at the bus to which the protected equipment connects has changed by some percentage (e.g., 10%) relative to a baseline. This approach was proposed in previous drafts of PRC-027-1. This trigger is intended primarily to maintain coordination over time as the power system evolves, resulting in incremental changes that can have a potentially significant cumulative effect. (One possible issue with this trigger is that Generator Owners may not have immediate access to this information and would therefore be dependent on their Transmission Owner to trigger the review.) -An alternative to this trigger could be a time-based trigger. The interval should be no shorter than once every five calendar years, and a ten calendar year interval may be more reasonable. Tacoma Power maintains that an entity should be permitted to choose between a time-based trigger and a trigger based upon changes in Fault current (or a comparable trigger) and that en entity should be able to make this choice either globally or per Protection System (or protected Element). -There is a change in the impedance or topology of a protected element. For example, a line is segmented, a transformer is replaced, or a new power system Element is installed. In general, assessing coordination would go one zone back to include remote backup protection. -There is a material change to a Protection System. This trigger would include cases in which (1) the power system is not changing but a Protection System is or (2) the power system is changing elsewhere and cascading Protection System changes are required. Example of (1): An entity is modifying their protection philosophy. Example of (2): A segmented line resulted in changes one zone back, which resulted in a review of the backup protection one zone further back; if changes are needed, a review may be needed even one zone further back.
No
It seems that Requirement R2 may raise some of the same concerns that FERC staff expressed previously. That is, FERC may expect that baseline documentation of coordination of all Protection Systems applicable to PRC-027-1 be established. This may be true particularly if a trigger will be established based upon a change in bus Fault current. Requiring initial documentation of coordination would have a comparable burden as a time-based trigger. If Requirement R2 is expanded, and if a condition-based trigger is selected that looks at some parameter like bus Fault current, then an entity should only have to monitor for that condition after Requirement R2 has been satisfied in whole. It should also be noted that, if Requirement R2 is expanded, implementation of Requirement R2 could result in some miscoordination during a transition period because it will not be practical to review and change all Protection Systems at once; therefore, there could be a period of elevated risk to the BES. If the drafting team elects to limit Requirement R2 to Interconnecting

Elements, then Part 2.2 seems out of place when one entity may be both the Transmission Owner and Generator Owner and one group is responsible for all of the Protection Systems involved.
Yes
As the drafting team is aware, Protection System coordination will not be maintained under all contingencies (of power system Elements or Protection Systems components). Sensitivity to contingencies will depend upon multiple factors including Protection System philosophy and vintage of Protection System components. This issue should be acknowledged in some form, either within this standard or within application guidelines. Tacoma Power suggests that “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements” be changed to “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements from the BES.” In other words, add “from the BES” at the end. Some Protection Systems installed for the purpose of detecting Faults on the BES may trip non-BES elements as well (e.g., non-BES generation connected to a tap on a transmission line). These portions of the Protection System should be excluded. The drafting team has taken great care to acknowledge that different entities have different philosophies. Tacoma Power does not proposed that Protection System coordination philosophies be included in PRC-027-1, but the lack of standardization of Protection System philosophies may make coordination more difficult to achieve in some cases. Standards like PRC-023 and PRC-025 have taken bold steps to settle philosophical differences among some protection and operations personnel. Might this level of standardization ultimately be needed to help entities coordinate Protection Systems associated with Interconnecting Elements? The NERC definition of Fault is “an event occurring on an electric system such as a short circuit, a broken wire, or an intermittent connection.” It is Tacoma Power’s understanding that the purpose of PRC-027-1 is primarily, if not exclusively, to maintain coordination during short circuits. Broken wires (when there is no accompanying short circuit) and intermittent connections are generally not the subject of coordination studies. Furthermore, coordination during high-impedance Faults, especially during contingency conditions, may not always be possible/practical. Tacoma Power requests that the purpose of the standard be restricted to short circuits, even if this is acknowledged in application guidelines. Alternatively, the definition of Fault could be revised as part of this project. Regarding Requirement R1, some allowance should be acknowledged, perhaps in application guidelines, that an entity may include in its process a mechanism to identify de minimus impacts, which could result in a variance to, or waiver of, the process. The goal is reliability. The drafting team should be applauded for its patience through all of these drafts. It is unfortunate that FERC’s concern was identified after four drafts were balloted, even though none of the earlier drafts addressed “internal” or “intra-entity” coordination.

Yes
Requirement 1.5 seems unnecessary because the process of coordinating settings is not complete until all issues are resolved.
The list of triggers needs to be concise and it needs to be communicated that an entity’s process will not need to include all triggers. Reasonable triggers are: change in fault current, removal or addition of elements to a station/bus, line reconductoring, or time based per the entity’s specification.
Yes
R2 and its subparts 2.1, 2.2, 2.3 provide a clear and acceptable scope of facilities covered by this standard. Requirement R1 aligns with how industry typically performs Protection System coordination. The statement made in the Background section above: “The primary concern was that the proposed standard did not address the coordination of Protection Systems within a Transmission Owner’s footprint, referred to as “internal” or “intra-entity” Protection Systems” appears to propose

greatly increasing scope of facilities to possibly be covered by this standard. We support the scope of facilities as currently stated in R2, but would not agree with increasing the scope of facilities within R2 as we believe them to be adequately addressed within the process for R1.
Yes
The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

Yes
R1.1 is very ambiguous and appears to say that a method to updata "data" is needed for compliance. This is a very ineffective stipulation as it is on the surface very menial (i.e. data collection?). A more useful stipulation might be to have a methodology concerning how the settings should be developed, and what guidelines are used during the coordination analysis. We agree that is it an improvement from the prior version in that the entity can design their coordination process to meet the requirements.
Yes
R1.5 is vague with the use of the phrase "any identified coordination issues." This could be interpreted many different ways depending on the different relay philosophies and methods between TO's, GO's and DP's. What is an "identified coordination issue" to one TO, may not be a "coordination issue" for another TO. See suggested language in our response to question 6.
Yes
It is not clear. Will the requirement change to include the soon to be identified triggers? or is the generic criteria (time, condition) going to remain?
No
The 60 months portion of the requirement seems to be something that should be addressed in the Implementation Plan of the standard, and not stated (repeated) in the requirements section. The requirement should be modified to just state that the registered entities "...shall have documentation that..." Also see response to Question 6
Yes
We read M1 to mean that entities can determine what eveidence is required for coordination based on the self created processes created pursuant to R1 and R1.1-R1.3.
We believe that R1.4 & 1.5 don't belong within R1 since they relate specifically to Interconnecting Elements. We recommend a structuring similar to: R1, R1.1 -1.3 as currently proposed. R2 Each Transmission Owner, Generator Owner, and Distribution Provider with Interconnecting Elements: - associated with Transmision operated = > 200KV - associated with BES Generating resource(s) - Any monitored Facility of an Interconnection Reliability Operating Limit (IROL). shall develop and implement a process to coordinate Protection Systems of the Interconnecting Elements, to include, in addition to requirements stated in R1.1 through R1.3: R2.1 A procedure to communicate the Protection System settings with Transmission Owners, Generator Owners, and Distribution Providers associated with Interconnecting Elements and seek concurrence that there are no concerns with the proposed Protection System settings. R2.2 A procedure to resolve, prior to implmementation, with other entities of Interconnecting Elements any concerns associated proposed Protection System settings.

No
1. 1.3 Does one trigger such as ‘every x years’ meet the intent of a ‘set of minimum triggers’. 2. 1.4 ‘ ... there are no identified coordination issues...’ should read ‘ any identified coordination issues have been addressed (or resolved?)’. Since a needed change in settings may require other changes that will be accomplished after the fact. 3. However, some of the details appear to be duplicative. These include the following two items: 1) R1.1 vs R1.3 where 'method to review' of R1.1 and 'triggers to review' of R3.1 are the same detail; 2) R1.2 vs R1.4 vs R1.5 where 'QA or review process' of R1.2, 'communicate settings and seek concurrence' of R1.4, and 'procedure to verify any identified coordination issues are addressed' of R1.5 all are essentially the same notion.
Yes
See response #1 to Q2. X years, y% change in fault current, change in system within z busses away, addition or retirement of generation within z busses away, etc
Yes
1. We agree with the element identified and believe it is appropriate for our system in that it will cover the intent of the Reliability of the BES. 2. With the scope of Transmission Owner Protection Systems specified by R2.1 being at and above 200kV, does it not follow that the GO Generating resources in the scope of R2.2 should also be limited to those connected at and above 200kV to align the Protection Systems to be compared in R1.4? 3. However, should there be a provision to capture more of the interconnections it the case that the system is comprised of all or a significanbt amount of <200-kV?
Yes
We agree with the present scope related to Interconnecting Elements and believe that there is a reliability benefit to this approach as has been reflected in our past affirmative votes on this Standard. We would not support the expansion of the applicability of R2 to include all elements of the BES nor the inclusion of lines internal to the entity other than those noted in R 2.3.

Yes
No
1.1.: No comment 1.2: Duke Energy suggests removing the phrase “quality assurance” from part 1.2 of Requirement 1. We feel that the idea of “quality assurance” is already inherent in the coordination of Protection Systems in or between entities. Also, “quality assurance” may be viewed as being too subjective to demonstrate compliance during an audit. 1.3: No comment (See question 3.) 1.4: We seek further clarification from the drafting team on part 1.4. Is this requirement already covered in PRC-001, and if so, will it be removed from PRC-001? It appears that if kept, there is potential for non-compliance of two requirements in two different standards. Also, we suggest replacing “procedure” with the term “method” to maintain consistency with part 1.1. 1.5: Duke Energy requests further explanation as to the intent of the drafting team for part 1.5. As currently written, it would be difficult to write a single procedure for numerous coordination issues that could arise. We suggest replacing “procedure” with the term “method”, for the reason mentioned above, as well as to maintain consistency with part 1.1.
Duke Energy prefers that the minimum triggers be Condition-based. We do not prefer Time-based triggers based on the possibility that no fault duties have changed since the last study. We feel that the triggers should be Condition-based, based on a certain percentage of change, if any changes have occurred.
No
Duke Energy asks for clarification from the drafting team on the selection of 75 MVA for subpart 2.2. A concern is that some individual dispersed generating resources operate above 75MVA, and are connected to 115kV. This would require the testing of those 115kV elements. We submit for the drafting team’s consideration, an increase of the 75 MVA level, or the insertion of a caveat to eliminate unnecessary testing. See the suggested language revision for 2.2 below. “Interconnecting

Elements associated with BES Generating resource(s) with gross plant/facility aggregate nameplate rating greater than 75 MVA if operated at 200kV or above. We feel this language revision reduces the likelihood of bringing in those individual dispersed generating resources that operate below the 200kV level.

No
This concept is very confusing. The current wording in R1 requires the entity to carry out or implement a process then R 1.4 and R1.5 require procedures – so procedures within a process. Suggest wording change to “…. shall have a program in place to coordinate…” – that program could include procedures. Of course this has been happening in most places but this will create a huge documentation burden for entities
Yes
Notwithstanding our comments in Q1, these more or less would be necessary steps to ensure coordination. However we offer some comments: R1.1 This requirement is too generic. What does this requirement really mean? Needs more specificity – what kind of data? R1.2 We generally agree with the concept but for this standard should be limited to coordination only R1.3 Do these triggers prompt a review of the coordination across the entire entity’s system? Of course keeping track of all system changes that necessitate a coordination review will be a documentation nightmare for condition based triggers. R1.4 This sub-requirement has 2 actions – communicate the settings, then seek concurrence. Likely needs to be broken up into 2 sub-requirements. We assume this needs to take place initially then subsequently when a review is triggered?
We believe the triggers identified in earlier versions of this standard are adequate. However in line with comments in Q2, how wide of an area needs to be studied?
Yes
Yes
1. The purpose statement is confusing. Is the intention of the standard to assume protection systems are coordinated already and the standard is to “maintain” that co-ordination? 2. Also the wording in the purpose statement “such that the Protection System components operate in the intended sequence during Faults” is misleading. This implies some sort of coordination of the components of the individual protection system, implying the need for SOE etc. Suggest “…such that Composite Protection Systems between Elements operate in the intended sequence during Faults”. 3. Similar to PRC-023 and PRC-026 it will be helpful to have an appendix with the list of elements that will require coordination in this standard (based on the SPCS whitepaper). Previous versions of the standard referenced coordination of other non-fault protections would occur in other standards. Yet for instance there is no requirement in PRC-026 to coordinate out of step protections on adjacent Protection Systems. Otherwise too much latitude will be provided to an auditor.

Aaron Feathers
Yes
No
We do not believe that Requirement 1.5 is essential since it is part of the process in Requirement 1.4. Requirement 1.4 could be modified to add "verify" to combine these two requirements. "1.4 A procedure to communicate the Protection System settings with Transmission Owners, Generator

Owners, and Distribution Providers associated with Interconnecting Elements and [verify] that there are no identified coordination issues."
A 10% or greater change in Fault current is an appropriate trigger. For a time based trigger, not less than 5 calendar years.
Yes
We agree with the chosen elements.
Yes
In general, we agree with the measures. A 5 calendar year interval is preferred over a 60 calendar month interval due to utility budgetary cycles for the funding to perform the routine coordination studies.

No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. There is no apparent need for PRC-027-1. Its purpose, “To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection System components operate in the intended sequence during Faults,” appears to be just a subset of the PRC-001-2 purpose, which is, “To ensure system protection is coordinated among operating entities.” Some explicit duplications are also apparent - R1.1-1.3 of PRC-027-1 are already covered by PRC-019-1 regarding voltage regulating functions, the procedure called-for in R1.5 seems to be nothing more than R2 of PRC-001-2, and the settings of loadability relays are covered by PRC-023 and PRC-025. R1.4 appears to mandate that every Protection System setting implemented by a DP, GO or TO be communicated to all other DPs, GOs and TOs that the entity connects-to, which would create a burdensome flood potentially unnecessary information. Even if R1.4 communications were pared-back to information that the receiving party wants to know, the, “seek concurrence,” portion of R1.4 is too weak. Would sending an email that may never get answered be sufficient? R2 is even more unworkable, requiring coordination among entities without any direction on how this is to be accomplished. Such lack of clarity might not be a problem for vertically-integrated utilities, but in competitive markets there must be a lead entity. An uncooperative entity could otherwise cause all parties that it connects-to to incur a PRC-027 R2 violation. Project 2007-06 should be terminated and, if any gaps in coordination can be found, they should be addressed via updates to PRC-001, PRC-019, PRC-023 and/or PRC-025. In the event that NERC still wishes PRC-027 to proceed it should at least be made inapplicable to GOs, because the only sequence-of-tripping issue for such entities is that they ride-our disturbances until load-shedding schemes have been implemented, and this achievement is ensured by PRC-024.

FirstEnergy agrees with the need for a reliability standard to ensure relay coordination on ties between different Transmission Owners, but does not agree that a reliability standard is needed for internal Transmission Owner coordination. Experience has shown that relay mis-coordination (i.e. relays tripping in the wrong sequence due to timing or pickup setting errors) has been the root cause of a misoperation far fewer times than other setting issues, such as directional element settings. However, FE believes that for the special case of relays that are owned by two different companies does warrant a reliability standard to ensure that the information necessary to perform relay settings coordination flows freely between the Transmission Owners involved.
No
FirstEnergy agrees that, in general, the items listed in Parts 1.1, 1.2 are elements of a successful coordination process. For Part 1.3 FirstEnergy supports the triggers developed previously for draft 4 of this standard. For Part 1.4 and Part 1.5, coordination may not be possible for extreme system conditions. Perhaps incorporating a statement such as “under reasonable contingency conditions” or pointing to contingencies studied as part of PRC-023 attachment B or that are part of TPL standards may be appropriate. Also, Part 1.5 includes the phrase “settings are addressed prior to implementation”. Clarification is requested on this statement. There can be cases where a large system upgrade (such as building a new substation) will require settings changes at many remote substations – most likely ground overcurrent backup settings. What most often happens is that some of these settings can be changed before the new substation goes into service, but in some cases applying settings intended to be used after the new substation is built would negatively affect the reliability of the BES during the time period prior to energization of the new substation. Is Part 1.5 referring to the calculation of settings? Or actual field implementation?
No
Since these triggers will have a large impact on the efforts required to comply with this standard, FirstEnergy supports using the triggers already vetted through the Standards process in draft 4 of this standard.
Yes
FirstEnergy agrees with the spirit of the requirement but believes the initial implementation is better described in an Implementation Plan rather than a one and done requirement. The standard should be clear on any initial requirements in an implementation plan and the requirements should clearly describe any ongoing expectation whether event driven or periodic update driven.
Yes
An implementation plan was not included with this draft. However, FirstEnergy believes that a period of time for entities to create, review and/or update the documents required in 1.1 and 1.2 should be established prior to enforcement action being taken for the other requirements of this standard. Suggest 12 to 18 months.

Please keep this from going down the PRC-005-1 road, where many companies received fines because of poorly written procedures and inconsistent auditing methods and interpretations across regions as opposed to inadequate maintenance. We would be more supportive if the process were created as part of a regional process that was put upon the Planning Coordinators or Regional Entities to create/approve instead of each end user.
No
First, not sure what a quality assurance or review process is. Secondly, Part 1.4 will be problematic if different entities have specific communication procedures for seeking concurrence. Finally, Part 1.5 addresses proposed settings, but what about existing settings.
A trigger should be a change in the impedance or ratings of elements connected to interconnecting busses. However, this change should be set to a percent change not just any minor change (e.g. re-route of a couple of towers). Also, if relevant elements of protection systems located at the interconnected busses are modified, then this could trigger a review as well.

Yes
No
M1 is too open for interpretation.

No
The stated purpose for earlier drafts of this standard was as follows: “To coordinate Protection Systems for Interconnecting Elements, such that Protection System components operate in the intended sequence during Faults.” In this latest draft, the scope and purpose of the standard have been greatly increased to include “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements.” This change from Interconnected Elements to all BES Elements represents a broad increase in regulatory scrutiny to an area where BPA feels it provides little to no increase in system reliability. BPA is aware of no evidence to indicating that widespread mis-coordination of BES Protection Systems is a problem which is in need of a regulatory attention. BPA would prefer that the intent of this standard remain the regulation of information exchange between Functional Entities. BPA proposes R1 be removed from the standard.
No
BPA notes that numerous industry guides, white papers, text books and professional development courses have been devoted to the subject of successful relay coordination. BPA believes it is beyond the scope of this standard to delineate the essential elements of a successful coordination process. BPA would prefer that the intent of this standard remain the regulation of information exchange between Functional Entities. BPA proposes R1 be removed from the standard.
BPA believes Functional Entities must be left to apply their own engineering judgment and resources when developing reasonable triggers for the review of relay settings. BPA does not support a NERC standard to define time, system event, or conditional triggers which all of the industry must follow. To do so will certainly increase the number of unnecessary violation most of which will be of an administrative nature. Take for example the installation of a large transformer at a single substation. Without a doubt settings in the area will require review but how many busses or lines should be involved in this review, to what extent should a wide area coordination study be conducted, can this review wait until the next periodic settings review? Many of these questions are based on engineering judgment and knowledge of the local system which may differ from what is prescribed by the drafting team. BPA would prefer that the intent of this standard remain the regulation of information exchange between Functional Entities. BPA proposes R1 be removed from the standard. If R1 is not removed, BPA suggests at least the development of triggers for settings review must be left to the Functional Entities.
No
The delineation of the 60 calendar months time frame presumes that all Functional Entities will have adopted at a minimum a 5 year time-based review trigger for Protection System settings. As stated earlier, BPA is opposed to the drafting team’s development of a set of minimum triggers. Therefore, BPA proposes that the wording be changed as follows: Each Functional Entity shall document the exchange of information sufficient to coordinate Protection Systems on Interconnecting Elements which meet the BES definition whenever the following conditions are met: 2.1 New Protection System installation. 2.2 Significant change to an existing Protection Systems or its settings. 2.3 Information is requested by a Functional Entity for the purpose of Protection System Coordination.
No
BPA proposes Measure M1 should be removed with all of Requirement 1. BPA suggests Measure M2 should be altered to reflect the recommended changes to R2: Acceptable Evidence includes but is not limited to, electronic or physical dated records demonstrating the exchange of information for changes or additions made to Protection Systems on Interconnecting Elements which meet the BES definition.

CenterPoint Energy
Yes
CenterPoint Energy appreciates FERC’s concerns on coordination of Protection Systems within a Transmission Owner’s footprint, even though it appears protection coordination issues have not been a major factor in events reported through NERC’s Event Analysis program, nor a predominate root cause of reported Misoperations collected for Reliability Standard PRC-004. The preliminary draft of Requirement R1 for Draft 5 of PRC-027-1 appears to be a reasonable and logical approach to establishing a mandatory requirement to address coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements. CenterPoint Energy believes such an approach recognizes several things: the majority of existing Protection Systems have time-proven and fault-proven Protection System set points; entities do have existing processes for protection coordination and have been performing protection coordination studies; and, this will bring in a very large number of Protection Systems into the mandatory scope for coordination, especially on 100 – 200 kV systems. Furthermore, the approach utilizing “triggers” allows coordination of these Protection Systems to be phased-in more gradually and as needed.
No
(1) CenterPoint Energy recommends deleting Requirement R1.2 from the standard as we do not agree that a quality assurance or review process is an essential element for a successful protection coordination process. We expect that there are numerous, existing coordination set points that were successfully established without such a process. CenterPoint Energy is also concerned that the use of “Protection System settings” in Requirement R1.2 is overly broad and could be interpreted to include protection settings not associated with a protection coordination study. (2) If Requirement R1.2 is not deleted, CenterPoint Energy recommends clarifying “Protection System settings” as used in Requirement R1.2. The proposed wording for Requirement R1.2 states: “A quality assurance or review process of the Protection System settings.” CenterPoint Energy recommends rewording Requirement R1.2 as the following: “A quality assurance or review process of the Protection System [coordination study].” (3) In addition, CenterPoint Energy recommends clarifying Requirement R1.5 which currently states: “A procedure to verify any identified coordination issue(s) associated with proposed Protection System settings are addressed prior to implementation.” Requirement R1.5 appears to be related to Requirement R1.4 that provides for communication between entities on Interconnecting Elements. CenterPoint Energy suggests the following wording for Requirement R1.5: “A procedure to verify any identified coordination issue(s) associated with proposed Protection System [set points] [for Interconnected Elements] are addressed prior to implementation.”
Yes
CenterPoint Energy agrees with the chosen Elements in Parts 2.1 through 2.3 and does not have any suggestions for additional Elements to include in Requirement R2.
No
Measure M2 uses the term “Responsible Entity” which is not defined in the proposed standard or in the NERC Glossary of Terms Used in NERC Reliability Standards. As this standard uses Functional Entities in the Applicability section, CenterPoint Energy expects that “Responsible Entity” should be changed to lower case. In addition, Measure M2 appears to indicate that the documentation must be from protection coordination studies performed within the 60 months after the effective date of the standard. This does not allow for the use of documentation of protection coordination studies performed prior to the effective date. CenterPoint Energy recommends clarifying Measure M2 to allow previous protection coordination documentation, especially considering that there are presently many growth and reliability projects in progress. One way to provide clarity is to delete the wording at the end of the sentence after Requirement R2 concerning 60 months after the effective date of the standard. Including modifying the term “Responsible Entity”, Measure M2 would be as follows: “Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the [responsible entity] coordinated the Protection Systems for the Elements identified in Requirement R2[].”

SPP Standards Review Group

Shannon V. Mickens
No
We ask the drafting team to conduct an analysis between FAC-001-1 and PRC-027-1 to ensure that there are no redundancy issues between the documentation. However, we still have concerns about the time commitment for documentation in reference to the internal coordination process and that it will not help improve reliability for the BES Elements. We agree with the concept contained in Requirement R1; however, we don't agree with scope of the internal coordination process for PRC-027-1.
We generally agree that Parts 1.1 through 1.5 of Requirement R1 includes the essential elements for the coordination process. However, we would ask the drafting team to provide more detailed information in the rationale box especially concerning the intent of Requirement R1.4 and R1.5. Some of our confusion was based around why was there a need for two procedures… along with proving compliance on the retrieval and coordination of the required data before implementation.
We would ask the drafting team to re-evaluate Measure M2 for we feel that the language should include coordination information prior to the 60 calendar month period as acceptable evidence.
Group
DTE Electric
Kathleen Black
No
If Documentation of Protection System Coordination is to be required, the specifics of the study should not be prescribed. Previous drafts did not dictate the specifics of a PSCS. However, Part 1.4 of R1 should remain to insure communication with other entities.
No
Each entity should be responsible for determining what makes up their coordination study/process.
This statement seems to already assume that a coordination process will be specified in the standard while Question 1 asks if one should be required.
No
If the intent of draft 5 was to change applicability from interconnecting elements to BES elements, shouldn't R2 be revised accordingly?

Joe Tarantino
Sacramento Municipal Utility District
Yes
SMUD much prefers this process option to the previous options balloted. However, we continue to struggle with the idea that a standard is required to address intra-utility coordination. The greatest risk for a mis-coordination is at the seams between entities, not inside an entity.
Yes
SMUD agrees these steps form a coordination process. However, in smaller utilities, a rigid, formalized process is not required to ensure coordination and instead unnecessarily burdens the process with excessive compliance documentation. In contrast, large utilities require formalized processes and often have very specialized skill sets among their protection engineers and special facilities that require extra care. The SDT will need to develop a flexible process that applies to both.
We urge the SDT to develop flexibility into the process. SMUD currently uses the relay maintenance cycle to review settings. This makes our process time-based and in synch with the times found in PRC-005. We do this so that the relay tech makes only one trip to the relay. We are strongly opposed to any process that requires us to[[arbitrarily]] look for fault current changes and take actions out of cycle.

Yes
SMUD agrees with the three items listed, with the caveat that we feel coordination should be done only at the seams between entities and not internal to the entity.
No
The term “to demonstrate” in M2 leaves it too open at this point to know what depth of detail is needed. We are afraid we would need to show lots of coordination plots for every line, including the elements looking into the line and the elements the line looks out on. It seems to us this could balloon into a lot of paperwork. Perhaps an attestation by the engineer that the coordination was done per the process document would be sufficient?
We encourage the SDT to address functional obligations that would be managed by an internal group who would perform the actions in the requirement(s). This effectively eliminates the need for internal coordination and associate processes. As we have indicated in the previous responses we urge the SDT to allow an entity to coordinate relay settings, data and other associated equipment protection through an internal group.
Individual
Phil Hart
AECI
Yes
No
1. AECI believes the intended structure of this proposed standard is to require a process for all BES elements in a less burdensome R1, and require actual physical documentation in a more expanded, detailed R2. AECI agrees with this approach, however M1 currently does not reflect this approach. If the SDT intent of this standard is aligned with our interpretation, then the measure should not require actual documentation for the elements in R1, rather require only the procedure or process that is stated. Recommended language , [M1. Acceptable evidence includes, but is not limited to, electronic or physical dated records of the Responsible Entity’s process(es) to coordinate its Protection Systems, in accordance with Requirement R1 and its Parts.] 2. If the intent of R2 is to require documentation of coordination for a fewer, but more critical list of elements, then the cutoff levels for generation should reflect this. AECI would suggest the SDT move the 75 MVA cut-off to 1500 MVA to align with industry accepted definition of a generation level that is deemed critical to BES reliability. At the least, the 75 MVA cutoff should be increased to some point, if not 1500 MVA. 75 MVA units have very little to no impact on the BES, and including them in this documentation requirement would only reduce entity focus on those elements that are critical, such as IROL related elements, and 200 kV plus interconnections (which AECI agrees should be documented). 3. AECI believes that requirement 1.2 is too constrictive, and should allow entities other methods to ensure that protection system settings are accurate. One method of this (which AECI is in the process of developing) is using a standardized, reviewed, template for settings construction. Settings that fall out of this template would then be reviewed through some quality assurance program. The current 1.2 is very close to allowing this type of quality review, however please keep in mind this template approach when revising the standard as to not eliminate this option for quality assurance.
No
1. AECI would strongly suggest that for whatever triggers are developed, they be condition based and not time based. Developing time based triggers would lead to monotonous paperwork that would otherwise be unnecessary.
Yes
AECI believes 60 calendar months is a reasonable time for documentation of coordination. To clarify, would the SDT be able to state if there will be any cutoff for the age of documentation that will be acceptable (would coordination documentation from 10 or 20 years ago still be good?).

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection System components operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii). Draft 5 of PRC-027-1 modifies the applicability of the standard to include "Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements," whereas, prior drafts of the standard limited the applicability to "Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements." With this change to the applicability, the coordination of Protection Systems for all "internal" or "intra-entity" connections between BES Elements are addressed.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

N/A

Protection System Issues Addressed by Other Projects:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. Other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

The SPCSDT contends that including aspects of protection coordination other than Fault coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Coordination of Protection System Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Transmission Owner
     - **4.1.2.** Generator Owner
     - **4.1.3.** Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)
   - **4.2. Facilities:**

     Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements
5. **Effective Date:**
   See Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:

Coordinated Protection Systems enhance BES reliability by reducing the risk of power system instability or Cascading by isolating the faulted equipment in a timely manner – leaving the remainder of the System operational and capable of withstanding the next contingency. When Faults occur, properly coordinated protection systems minimize the number of power system Elements removed from service and protect power system equipment from damage. The stated purpose of this standard is: To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults. Requirement R1 captures this intent by mandating an entity establish a process that, when followed, will facilitate consistent results for developing settings for its BES Protection Systems. The drafting team contends the parts listed below are essential elements of the coordination process.

Part 1.1 Reviewing and updating the information required to coordinate Protection Systems maximizes the likelihood that the process of reviewing and developing settings is completed using accurate, up-to-date information. Examples of information that potentially need to be reviewed are: short-circuit databases, line and transformer impedances, station configurations, current and voltage transformer ratios, adjacent Protection System settings, and relay and control functional drawings.

Part 1.2 Reviewing the affected Protection System settings when System changes occur maintains coordination. Examples of System changes are: new or revised Protection System installations, changes to a transmission system Element that alters any sequence or mutual coupling impedance, changes to generator unit(s) that result in a change in impedance, or changes to the generator step-up transformer(s) that result in a change in impedance.

Part 1.3 Periodically reviewing Fault current values and/or existing entity-designated Protection System settings maximizes the likelihood that small incremental changes to the power system have not altered the coordination of the Protection Systems. Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults. For example, a current differential scheme may not need to be included because changes in Fault current will not affect the coordination of this system. However, an instantaneous overcurrent element would need to be reviewed because changes in Fault current may cause this element to operate for Faults outside its zone of protection. Part 1.3 provides entities the flexibility to use a Fault current-based or a time-based methodology, or a combination of the two.

The Fault current-based option requires an entity to first establish a Fault current baseline for Protection Systems at the bus under study to be used as a control point for future Fault current studies. Fault current changes on the System are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. To minimize this risk, the drafting team chose a maximum Fault current deviation of 15 percent (as compared to the entity-established baseline) and a maximum time interval of six calendar years for the Fault current analysis to be performed. The drafting team contends these maximums provide an entity with latitude to choose a Fault current threshold and time interval that best matches its protection philosophy, Protection System maintenance schedule, or other business considerations. (See the Supplemental Materials section for more detailed discussion.)

As a second option, an entity may choose to establish a periodic review of its existing Protection System settings. The maximum time interval for the review is six calendar years. The drafting team assigned a six calendar year time interval because that corresponds to the maximum allowable maintenance period established for certain relays in PRC-005-2; consequently, this allows Protection System settings revisions to be included with associated maintenance.

As a third option, an entity may choose to apply a combination of the two review methodologies based on criteria such as voltage level or Protection System application.

Part 1.4 A quality review of the Protection System settings minimizes the introduction of human error into the development of Protection System settings and helps to ensure the settings produced meet the entity's design specifications for Protection System performance. Peer reviews, automated checking programs, and entity-developed review procedures, are all examples of quality reviews.

Part 1.5 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is critical to the reliability of the BES. Communications among these entities is essential so potential coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A method to review and update the information required to develop new or revised Protection System settings.

1.2. A review of Protection System settings affected by System changes.

1.3. A review of existing entity-designated[1] Protection System settings based on one of the following:

- **Periodic Fault current studies:** A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the bus under study, and evaluated in a time interval not to exceed six calendar years, or
- **Periodic review of Protection System settings:** A time interval, not to exceed six calendar years, or
- A combination of the above.

1.4. A quality review of the Protection System settings prior to implementation.

[1] Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults.

1.5. For new or revised Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, (Transmission Owners, Generator Owners, and Distribution Providers), procedures to:

1.5.1. Communicate the proposed Protection System settings with the other functional entities.

1.5.2. Review proposed Protection System settings provided by other functional entities, and respond regarding the proposed settings. The response should identify any coordination issue(s) or affirm that no coordination issue(s) were identified.

1.5.3. Verify that any identified coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation.

M1. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the responsible entity established a process to develop settings for its BES Protection Systems, in accordance with Requirement R1.

Rationale for Requirement R2:
Implementing the process established in Requirement R1 ensures a consistent approach to the development of Protection System settings such that BES Protection Systems operate in the intended sequence during Faults.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement the process established in accordance with Requirement R1. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M2. Acceptable evidence includes, but is not limited to, electronic or physical dated records to demonstrate that the responsible entity implemented the process established in accordance with Requirement R1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask

an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner and Distribution Provider that owns Protection Systems designed to detect Faults on BES Elements shall each keep data or evidence to show compliance with Requirements R1 and R2, and Measures M1 and M2, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include one Part.	The responsible entity established a process in accordance with Requirement R1, but failed to include two or more Parts. OR The responsible entity failed to establish a process in accordance with Requirement R1.
R2.	N/A	N/A	The responsible entity implemented the process established in accordance with Requirement R1, but failed to implement one Part.	The responsible entity implemented the process established in accordance with Requirement R1, but failed to implement two or more Parts. OR The responsible entity failed to implement the process established in accordance with Requirement R1.

Version History

Version	Date	Action	Change Tracking
1	TBD	Adopted by NERC Board of Trustees	New

Purpose:

To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance BES reliability by reducing the risk of power system instability or Cascading by isolating the faulted equipment in a timely manner – leaving the remainder of the System operational and capable of withstanding the next contingency. When Faults occur, properly coordinated protection systems minimize the number of power system Elements removed from service and protect power system equipment from damage. This standard requires that entities establish and implement a process to coordinate their BES Protection Systems to operate in the intended sequence during Faults.

Requirement R1:

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults.

This requirement directs the applicable entities to establish a process to develop settings for coordinating its BES Protection Systems such that they operate in the intended sequence during Faults. The drafting team contends the items included as elements of the process are key to ensuring the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors in the development of these settings.

In developing this Standard, the System Protection Coordination Standard Drafting Team (SPCSDT) referenced various publications that discuss protective relaying theory and application. The following description of "coordination of protection" is from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

The drafting team acknowledges that entities may have differing technical criteria for the development of Protection System settings based on their own internal tolerances. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge. As such, a single definition or criteria for 'Protection System coordination' is not practical.

The drafting team also recognizes that the coordination of some Protection Systems may seem unnecessary, such as for a line that is protected by dual current differential relays. Where backup Protection Systems are enabled to operate based on current level or apparent impedance with some definite or inverse time delay, it is important to ensure those Protection Systems coordinate with other Elements' Protection Systems such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A method to review and update the information required to develop new or revised Protection System settings.

Two important studies used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers are the short circuit and protective device coordination studies. Having a method of reviewing and updating information to make sure it is correct in short circuit studies and protective device coordination studies is necessary to guarantee that these two studies accurately reflect the physical power system being considered in the development of Protection System relay settings. The results of the studies are only as accurate as the information that their calculations are based on.

A short circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. The results of a short circuit study are used as the basis for protective device coordination studies. Because a short circuit study should, as accurately as possible, model the actual network it is representing in order to calculate true Fault currents, the method of the review and update of information for the short circuit study might include the following:

1. A review of applicable BES line, transformer, and generator impedances to verify they are correct.
2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual system, or how the system will be configured when the proposed relay settings are installed.
3. A review of interconnected Transmission Owner, Generator Owner, or Distribution Provider's information to determine whether their Systems are correctly modeled in the short circuit study.

A protective device coordination study is performed to determine the settings for protective relays to operate in the intended sequence during Faults. Protective device coordination studies are used to evaluate the application of protective devices, identify problem areas in the network, and determine solutions for existing or future device coordination.

A protective device coordination study should, as accurately as possible, represent the actual or proposed protective relaying in the network. The method for reviewing and updating information for the protective device coordination study might include the following:

1. A review of current and voltage transformer ratios, Protection System settings and the relay manufacture's curve characteristics to ensure the information in the protective device coordination study is correct.
2. A review of the adjacent relay settings to ensure those settings coordinate with the relay settings under study.
3. A review of interconnected Transmission Owner, Generator Owner, or Distribution Provider's actual and proposed relay setting changes to determine whether they are accurately represented in the protective device coordination study.

Other information that may be of value includes engineering drawings such as single-line diagrams, three-line diagrams, and relay and control functional drawings.

Part 1.2 A review of Protection System settings affected by System changes.

Reviewing the affected Protection System settings when System changes occur maintains coordination. Examples of System changes are: new or revised Protection System installations, changes to a transmission system Element that alter any sequence or mutual coupling impedance, changes to generator unit(s) that result in a change in impedance, or changes to the generator step-up transformer(s) that result in a change in impedance.

Part 1.3 A review of existing entity-designated Protection System settings based on one of the following:

Periodically reviewing Fault current values and/or existing entity-designated Protection System settings maximizes the likelihood that small incremental changes to the power system have not altered the coordination of the Protection Systems. Based on the Protection System design and/or susceptibility to changes in Fault current, an entity will designate what Protection Systems must be included in the review to ensure these Protection Systems continue to operate in the intended sequence during Faults. For example, a current differential scheme may not need to be included because changes in Fault current will not affect the coordination of this system. However, settings for an instantaneous overcurrent element would need to be reviewed because changes in Fault current may cause this element to operate for Faults outside its zone of protection. Based on stakeholder comments and industry knowledge, the drafting team chose two 'triggers' for initiating a review of existing Protection System settings. Entities have the flexibility to use a Fault current-based or a time-based methodology, or a combination of the two.

- (Option 1) A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the busunder study, and evaluated in a time interval not to exceed six calendar years, or Fault current changes on the System are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. To minimize this risk, the drafting team chose a maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) and a maximum time interval of six calendar years for the Fault current analysis to be performed. The drafting team contends these maximums provide an entity with latitude to choose a Fault current threshold and time interval that best matches its protection philosophy, Protection System maintenance schedule, or other business considerations. The Fault current-based option requires an entity to first establish a Fault current baseline to be used as a control point for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with maximum generation and all Facilities assumed to be in service.

  The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect. These baseline Fault current values can be at the bus level or at the individual Element level. When performing the periodic Fault current comparison, the entity would continue to compare actual Fault current values gathered during the review against the originally established baseline values until a condition occurs that necessitates the establishment of a new baseline.

Example: Baseline is established at 10,000 amps. During the first short-circuit review, it is discovered that Fault current has increased to 11,250 amps (12.5 % change); consequently, no Protection System settings review is required since the increase is below 15% and the baseline value for next review remains at 10,000 amps. However, during the next short-circuit review, the Fault current has increased to 11,500 (15% change); therefore, a review of the Protection System settings is required, and a new baseline of 11,500 amps would be established.

- (Option 2) A time interval, not to exceed six calendar years, or

  As a second option, an entity may choose a time-based methodology to review Protection System settings eliminating the necessity of establishing a Fault current baseline and periodically performing short-circuit studies. This option provides the entity the flexibility to choose an interval of up to six calendar years for performing the Protection System settings review.

- (Option 3) A combination of the above.

  As a third option, an entity has the flexibilityto apply a combination of the two methodologies based on criteria such as voltage level or Protection System applications. For example, an entity may choose the periodic Protection System review (option 2) and review its Facilities operated above 300 kV on a six year interval, while choosing to use the Fault current review (option 1) for its Facilities operated below 300 kV and periodically compare available Fault currents against the Fault current baseline.

Part 1.4 A quality review of the Protection System settings prior to implementation.

A quality review of the Protection System settings prior to implementation reduces the possibility of human error being introduced into the development of the Protection System settings. A quality review is any systematic process of verifying that the developed settings meet the entity's specific requirements for Protection System performance. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of quality reviews.

Part 1.5 For new or revised Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, (Transmission Owners, Generator Owners, and Distribution Providers), procedures to:

Part 1.5 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communications among these entities is essential so potential coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

> **1.5.1** Communicate the proposed Protection System settings with the other functional entities.

Part 1.5.1 mandates entities have a procedure to communicate proposed Protection System settings with other entities. These communications ensure that the other entities have the necessary information to review the settings and determine if there are any coordination issues.

> **1.5.2** Review proposed Protection System settings provided by other functional entities, and respond regarding the proposed settings. The response should identify any coordination issue(s) or affirm that no coordination issue(s) were identified.

Part 1.5.2 mandates the entity receiving proposed Protection System settings have a procedure to review the settings and respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and the initiating entity receives a response. The response must include any identified coordination issues, or affirm that no issues were identified.

> **1.5.3** Verify that any identified coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation.

Part 1.5.3 mandates the entity have a procedure to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures any potential impact to BES reliability are minimized.

The drafting team recognizes there could be instances where coordination issues are identified that pose minimum risk to the reliability of the BES, and the entities, therefore, agree to allow the unmitigated issue to remain. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. The drafting team also recognizes there are situations where entities' protection philosophies differ but they can agree that there were no identified coordination issues.

Requirement R2:

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall implement the process established in accordance with Requirement R1.

This requirement directs the applicable entities to implement the process established in Requirement R1. Implementing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, minimizes the possibility of introducing errors, and maximizes the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes was moved to this section.

PRC-001-3: System Protection Coordination				X	X	X

New or Modified Term(s) Used in NERC Reliability Standards

- None

Effective Date of New or Revised Standards

PRC-027-1 – Coordination of Protection System Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

PRC-001-3 – System Protection Coordination
PRC-001-3 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirement

PRC-001-1.1(ii) – System Protection Coordination

PRC-001-1.1(ii) – System Protection Coordination shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, PRC-001-1.1(ii) shall be retired at midnight of the day immediately prior to the first day of the first calendar quarter that is twelve (12) months after the date that the PRC-001-3 is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Unofficial Comment Form

Project 2007-06 System Protection Coordination PRC-027-1 (Draft 5)

DO NOT use this form for submitting comments. Use the electronic form to submit comments on draft 5 of **PRC-027-1 – Coordination of Protection System Performance During Faults**. The form must be completed and submitted by **8 p.m. Eastern, Friday, May 15, 2015.**

If you have questions, contact Standards Developer, Al McMeekin, (via email) or at (404) 446-9675.

Background Information

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "*To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults.*" Draft 4 of PRC-027-1 was posted for comment and ballot from 11/4/13 - 12/31/13. Following the posting, FERC staff from the Office of Electric Reliability raised concerns regarding the posted draft. The primary concern was that the proposed standard did not address the coordination of Protection Systems within a Transmission Owner's footprint, referred to as "internal" or "intra-entity" Protection Systems. Following discussions with NERC and FERC staff, the SPCSDT prepared a preliminary draft 5 of PRC-027-1 and sought stakeholder input on the conceptual standard during a 21-day informal comment period. Based on stakeholder comments received during the informal comment period, the drafting team modified the proposed standard.

Draft 5 of PRC-027-1 modifies the applicability of the standard to include "*Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements*," whereas, prior drafts of the standard limited the applicability to "*Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements.*" With this change to the applicability, the coordination of Protection Systems for all "internal" or "intra-entity" connections between BES Elements are addressed. PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii); therefore, the SPCSDT is proposing the retirement of those Requirements from PRC-001-1.1(ii). The SPCSDT has included a redlined version of PRC-001-1.1(ii) and a clean PRC-001-3. PRC-001-3 contains the remaining Requirements R1, R2, R5, and R6 as well as updated pro forma language for the "Effective Date" and "Compliance" sections of the standard.

Draft 5 of PRC-027-1 consists of two proposed requirements.

Requirement R1 mandates that entities establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults; and stipulates certain attributes that must be included in the process. Because entities' Protection System designs and philosophies vary greatly, the drafting team has included flexibility in developing the coordination processes.

Requirement R2 mandates that entities implement the process established in accordance with Requirement R1. The drafting team asserts that implementing each of the elements of the process will facilitate a consistent approach in the development of accurate Protection System settings, minimize the possibility of introducing errors, and maximize the likelihood of maintaining a coordinated Protection System.

The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) is posting draft 5 of Reliability Standard PRC-027-1 "Protection System Coordination for Performance During Faults" for comment from April 1, 2015 to May 15, 2015.

Questions:

1. Do you agree that Parts 1.1 through 1.5 of Requirement R1 are the essential elements of a successful coordination process? Are there others that should be included? If not, please provide the basis for your disagreement and any proposed revisions or additions.

   ☐ Yes
   ☐ No
   Comments:

2. Do you agree with the proposed Measures? If not, please provide the basis for your disagreement and your proposed revisions.

   ☐ Yes
   ☐ No
   Comments:

3. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

   ☐ Yes
   ☐ No
   Comments:

4. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

   Comments:
