UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	))	**Docket No. _______**

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF PROPOSED RELIABILITY STANDARDS PRC-027-1 AND PER-006-1 AND RETIREMENT OF PRC-001-1.1(ii)

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5 of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[2] the North American Electric Reliability Corporation ("NERC")[3] hereby submits for Commission approval:

- proposed Reliability Standards PRC-027-1 and PER-006-1 (Exhibit A);
- proposed new and revised definitions to be incorporated into the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary") for the following terms: (1) Protection System Coordination Study; (2) Operational Planning Analysis ("OPA"); and (3) Real-time Assessment ("RTA") (Exhibit A);
- the retirement of Reliability Standard PRC-001-1.1(ii);
- the associated Implementation Plans (Exhibit B); and
- the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (Exhibit F).[4]

---

[1] 16 U.S.C. § 824o (2012).

[2] 18 C.F.R. § 39.5 (2016).

[3] The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006).

[4] Unless otherwise designated, all capitalized terms used herein shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary"), *available at* http://www.nerc.com/files/Glossary_of_Terms.pdf.

As required by Section 39.5(a) of the Commission's regulations,[5] this Petition presents the technical basis and purpose of the proposed Reliability Standards and NERC Glossary definitions, a summary of the development history (Exhibit G), and a demonstration that the proposed Reliability Standards and definitions meet the criteria identified by the Commission in Order No. 672[6] (Exhibit C). The NERC Board of Trustees ("Board") adopted proposed Reliability Standard PRC-027-1 and the definition of Protection System Coordination Study on November 5, 2015, and proposed Reliability Standard PER-006-1 and the modified definitions of OPA and RTA on August 11, 2016.

I. EXECUTIVE SUMMARY

The purpose of the proposed Reliability Standards and the proposed NERC Glossary definitions is to: (1) maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System ("BES") Elements, such that those Protection Systems operate in the intended sequence during Faults; and (2) require registered entities to provide training to their relevant personnel on Protection Systems and Remedial Action Schemes ("RAS") to help ensure that the BES is reliably operated. The reliable and coordinated operation of Protection Systems is essential to Bulk Power System ("BPS") reliability for the following reasons. Protection Systems help maintain reliability by isolating faulted equipment, thereby reducing the risk of instability or Cascading, and leaving the remainder of the BPS operational and more capable of withstanding a future Contingency. In the event of a Fault, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage.

---

5 18 C.F.R. § 39.5(a) (2016).

6 *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, at PP 262, 321-37, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

System reliability is reduced or threatened if a Protection System can no longer perform as designed because of a failure of its relays. Further, the functions, settings, and limitations of Protection Systems are recognized and integrated in deriving System Operating Limits ("SOLs") and Interconnection Reliability Operating Limits ("IROLs").[7]

Issues related to the coordination of Protection Systems are currently addressed in Reliability Standard PRC-001-1.1(ii), which includes the following six requirements:

- *Requirement R1* provides that "[e]ach Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area."

- *Requirement R2* provides that Generator Operators and Transmission Operators shall notify certain other entities of relay or equipment failures that reduce system reliability and take corrective action as soon as possible.

- *Requirement R3* addresses the coordination of new protective systems and changes to existing protective systems.

- *Requirement R4* provides that Transmission Operators must coordinate Protection Systems on major transmission lines and interconnections with certain neighboring entities.

- *Requirement R5* requires Generator Operators and Transmission Operators to coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others.

- *Requirement R6* requires Transmission Operators and Balancing Authorities to monitor the status of each Special Protection System ("SPS") in their area and notify affected entities of any change in status.

As explained further below, NERC is proposing to retire Reliability Standard PRC-001-1.1(ii). The Requirements in PRC-001-1.1(ii) are being replaced by proposed Reliability Standards PRC-027-1 and PER-006-1 and the proposed definitions, or are addressed by Reliability Standards approved by the Commission since the effective date of PRC-001-1, as follows:

---

[7] SOLs and IROLs are vital concepts in NERC's Reliability Standards as they establish acceptable performance criteria both pre- and post-contingency to maintain reliable Bulk Electric System operations.

PRC-001-1.1(ii) Requirement R1: Along with currently-effective Personnel Performance, Training, and Qualifications ("PER") Reliability Standards, proposed Reliability Standard PER-006-1 and the proposed modifications to the definitions of OPA and RTA are designed to improve upon and replace PRC-001-1.1(ii), Requirement R1 in addressing the reliability goal of requiring Generator Operators, Balancing Authorities, and Transmission Operations to be "familiar with" the purpose and limitations of Protection System schemes. Focusing on the certification and training requirements in the PER group of Reliability Standards as the mechanism for ensuring that the necessary personnel are familiar with the purpose and limitations of Protection System schemes will provide more precise and auditable requirements to achieve the reliability objective of Requirement R1 of PRC-001-1.1(ii). Currently-effective PER-005-2, Requirement R6 already requires Generator Operators to provide training to their centrally-located dispatch personnel on how their job functions impact BES reliability. Proposed PER-006-1 adds a requirement in the PER standards that Generator Operators train their plant operating personnel on the operational functionality of Protection Systems and RAS that affect the output of their generating Facilities.[8] For Transmission Operators and Balancing Authorities, the reliability goal of Requirement R1 is addressed by the currently-effective certification and training requirements in PER-003-1 and PER-005-2, respectively.

Additionally, the proposed modifications to the definitions of OPA and RTA further the objective of PRC-001-1.1(ii), Requirement R1 by requiring that Transmission Operators, as well as Reliability Coordinators, consider the functions and limitations of Protection Systems and RAS when performing the OPAs and RTAs required under the Transmission Operations ("TOP") and

[8] The phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 maps to the NERC Glossary terms "Protection Systems" and "Remedial Action Schemes," as explained below.

Interconnection Reliability Operations and Coordination ("IRO") group of Reliability Standards to determine whether there are any actual or expected SOL or IROL exceedances.

PRC-001-1.1(ii) Requirement R2: The reliability goal of PRC-001-1.1(ii) Requirement R2 for Generator Operators and Transmission Operators to notify certain other entities of certain relay or equipment failures and take corrective action as soon as possible is addressed in recently approved Reliability Standards IRO-001-4, IRO-008-2, IRO-010-2, TOP-001-3, and TOP-003-3.[9] As discussed below, these standards collectively require, among others things, that (1) Reliability Coordinators, Balancing Authorities, and Transmission Operators maintain reliability in their area by their own actions or by directing the actions of others (e.g., taking corrective action in event of relay or equipment failure), and (2) require other registered entities to provide Reliability Coordinators and Transmission Operators with data or notifications under certain circumstances, including notifications regarding the status or degradation of Protection Systems and SPS.[10]

PRC-001-1.1(ii) Requirements R3 and R4: Proposed Reliability Standard PRC-027-1 is designed to improve upon and replace Requirements R3 and R4 of PRC-001-1.1(ii) in addressing the reliability objective of Protection System coordination. Proposed Reliability Standard PRC-027-1 provides a clear set of Requirements that obligate applicable entities to (1) implement a process for establishing and coordinating new or revised Protection System settings and (2) periodically study Protection System settings that could be affected by incremental changes in

---

9 These Reliability Standards – along with IRO-002-4, IRO-014-3, IRO-017-1, and TOP-002-4 – were approved in Order No. 817. *Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards*, Order No. 817, 153 FERC ¶ 61,178, 80 Fed. Reg. 73977 (2015).

10 Per the Commission's order approving the revised definition of SPS on June 23, 2016, SPS and RAS are interchangeable terms. *See N. Am. Elec. Reliability Corp.*, Docket No. RD16-5-000 (June 23, 2016) (unpublished letter order). This Petition uses the NERC Glossary terms "RAS" or "SPS" depending on the language in the Requirement the Petition is discussing. If the Petition is discussing a Requirement that uses RAS, for instance, the Petition will refer to RAS when discussing that Requirement.

Fault current to ensure they continue to be appropriate (i.e., that the Protection System continues to operate in the intended sequence during Faults).

PRC-001-1.1(ii) Requirement R5: The reliability objective of coordinating changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others is now primarily addressed by Reliability Standard TOP-003-3, as well as Reliability Standards TOP-001-3, TOP-002-4, IRO-008-2, IRO-010-2, and IRO-017-1, which were developed since PRC-001-1.1(ii) went into effect. As discussed further below, these Reliability Standards require coordination and analysis of changes in conditions that would necessitate changes to the Protection Systems of others, amongst other actions.

PRC-001-1.1(ii) Requirement R6: The reliability objective of requiring Transmission Operators and Balancing Authorities to monitor the status of each SPS in their area and notify affected entities of any change in status is addressed in recently approved Reliability Standard TOP-001-3 and TOP-003-3. Requirements R10 and R11 of TOP-001-3 create an affirmative obligation for Transmission Operators and Balancing Authorities to monitor the status of SPS. Pursuant to TOP-003-3, Transmission Operators and Balancing Authorities must provide notifications regarding any change in Protection System status to other Transmission Operators and Balancing Authorities.

In summary, the proposed Reliability Standards represent an improvement over currently-effective PRC-001-1.1(ii) and more effectively accomplish the reliability goals of ensuring that appropriate personnel are trained on Protection Systems and that Protection System settings are appropriately studied, coordinated, and monitored. For the reasons discussed herein, NERC respectfully requests that the Commission approve the proposed Reliability Standards and NERC

Glossary definitions, and the proposed retirement of PRC-001-1.1(ii) as just, reasonable, not unduly discriminatory, or preferential, and in the public interest.

II. NOTICES AND COMMUNICATIONS

Notices and communications with respect to this filing may be addressed to the following:

III. BACKGROUND

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[11] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duty of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1) of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards.[12] Section 215(d)(5) of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard.[13] Section 39.5(a) of the Commission's regulations requires the ERO to file for Commission approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the

11 16 U.S.C. § 824o (2012).

12 *Id.* § 824(b)(1).

13 *Id.* § 824o(d)(5).

United States, and each modification to a Reliability Standard that the ERO proposes to make effective.[14]

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory, or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA and Section 39.5(c) of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.[15]

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standards were developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[16] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[17] In its ERO Certification Order, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain of the criteria for approving Reliability Standards. The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders.

[15] 16 U.S.C. § 824o(d)(2); 18 C.F.R. § 39.5(c)(1).

[16] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 at P 334, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[17] The NERC Rules of Procedure are available at http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx. The NERC Standard Processes Manual is available at http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf.

Further, a vote of stakeholders and adoption by the NERC Board is required before NERC submits the Reliability Standard to the Commission for approval.

C. Development of the Proposed Reliability Standards

As further described in Exhibit G hereto, proposed Reliability Standard PRC-027-1 and the NERC Glossary term Protection System Coordination Study were developed as part of Project 2007-06 – System Protection Coordination to replace and improve upon Requirements R3 and R4 of PRC-001-1.1(ii). On September 11, 2015, the sixth draft of proposed Reliability Standard PRC-027-1 and the definition for the new NERC Glossary term Protection System Coordination Study received the requisite approval from the registered ballot body. A final ballot for the standard and the definition concluded on October 14, 2015, with a ballot body approval of 80.94%. The NERC Board adopted the standard and definition on November 5, 2015.[18]

PER-006-1 and the revisions to the definitions of OPA and RTA were developed in the second phase of that project, Project 2007-06.2 – Phase 2 of System Protection Coordination to replace and improve upon Requirement R1 of PRC-001-1.1(ii). Project 2007-06.2 also addressed the retirement of Requirements R2, R5, and R6 of PRC-001-1.1(ii). Proposed PER-006-1, the revised definitions of OPA and RTA, and the retirement of PRC-001-1.1(ii), Requirements R2, R5, and R6 received the requisite approval from the registered ballot body on April 25, 2016. Final ballots for the standard, the definitions, and the retirements concluded on May 26, 2016, with ballot body approvals of 82.52% (PER-006-1) and 83.37% (OPA and RTA). The NERC Board adopted the proposed standard, definitions, and retirements on August 11, 2016.

[18] NERC did not immediately file the proposed PRC-027-1 with the Commission following the Board's November 2015 adoption of the standard so as to present to the Commission the retirement of PRC-001-1.1(ii) in its entirety following the adoption of PER-006-1 and the retirement of the remaining requirements in PRC-001-1.1(ii).

IV. JUSTIFICATION FOR APPROVAL

As discussed below and in Exhibit C, the proposed Reliability Standards, NERC Glossary definitions and the retirement of PRC-001-1.1(ii) satisfy the Commission's criteria in Order No. 672 and are just, reasonable, not unduly discriminatory, or preferential, and in the public interest. As noted above, the purpose of the proposed Reliability Standards and the proposed NERC Glossary definitions is to: (1) maintain the coordination of Protection Systems installed to detect and isolate Faults on BES Elements, such that those Protection Systems operate in the intended sequence during Faults; and (2) require registered entities to provide training to their relevant personnel on Protection Systems and RAS to help ensure that the BES is reliably operated. Reliability Standard PRC-001-1.1(ii) currently addresses issues related to the coordination of Protection Systems. As explained further below, NERC proposes to retire Reliability Standard PRC-001-1.1(ii) as the requirements therein are being replaced by proposed Reliability Standards PRC-027-1 and PER-006-1 and the proposed definitions, or are addressed by Reliability Standards approved by the Commission since the effective date of PRC-001-1.

The following section is organized as follows:

1) A discussion of proposed Reliability Standard PER-006-1, the revisions to the definition of OPA and RTA, and the manner in which they, along with currently-effective Reliability Standards PER-003-1 and PER-005-2, replace and improve upon Requirement R1 of PRC-001-1.1(ii).

2) A discussion of proposed Reliability Standard PRC-027-1, the new NERC Glossary term Protection System Coordination Study, and the manner in which they replace and improve upon Requirements R3 and R4 of PRC-001-1.1(ii).

3) A discussion of the manner in which Commission-approved TOP and IRO Reliability Standards replace and improve upon Requirements R2, R5 and R6 of PRC-001-1.1(ii).

4) An explanation of the manner in which Commission-approved TOP and IRO Reliability Standards resolve outstanding Commission directives related to PRC-001-1.1(ii).

5) A discussion on the enforceability of the proposed Reliability Standards.

A. PER Reliability Standards and Retirement of Requirement R1 of PRC-001-1.1(ii)

Reliability Standard PRC-001-1.1(ii), Requirement R1 provides that "[e]ach Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area." This requirement serves an important reliability objective as Protection Systems and RAS are an integral part of reliable BES operation and must be applied and operated reliably.[19] As noted above, Protection Systems help maintain reliability by detecting and isolating faulted equipment, thereby limiting the severity and spread of system disturbances, and preventing damage to protected BES Elements. Further, the functions, settings, and limitations of Protection Systems schemes are critical in establishing SOLs and IROLs. In addition, RAS help maintain BES stability, voltages, and power flows, and limit the impact of Cascading or extreme events.

When Generator Operator, Transmission Operator, and Balancing Authority personnel understand the purpose and functions of Protection System schemes applied in their area, they can operate the BES in a more reliable manner, as follows:

- When Generator Operator personnel understand the purpose and limitations of Protection System schemes, the Generator Operator better understands how those schemes affect the output of their generation facilities and, in turn, are better equipped to operate their generation facilities to maintain reliability.

- When Transmission Operator personnel are familiar with the purpose and limitations of Protection System schemes in their area, the Transmission Operator has a better understanding of the manner in which their system operates and, in turn, can more effectively operate their system within SOLs and IROLs, and identify when the reliability of the system is threatened or reduced.

- When Balancing Authority personnel are familiar with the purpose and limitations of Protection System schemes in their area, the Balancing Authority has a better understanding of the manner in which these schemes affect the maintenance of generation,

[19] The phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 maps to both the NERC Glossary terms "Protection Systems" and "Remedial Action Schemes." As RAS are essentially schemes comprised of Protection Systems, the phrase "Protection System schemes" would include RAS.

load and interchange balance and, in turn, can ensure that Protection Schemes are enabled when needed for reliability.

The language of PRC-001-1.1(ii), Requirement R1, however, has created some uncertainties. First, because the requirement does not specify the type of Generator Operator, Transmission Operator, or Balancing Authority personnel that must be familiar with the purpose and limitations of Protection System schemes, it is unclear to many industry stakeholders which personnel must have the requisite familiarity for the functional entity to satisfy the requirement. There is also uncertainty as to the steps an applicable entity must take to demonstrate that it has the requisite familiarity. For example, applicable entities are uncertain whether the standard requires them to conduct formal training of certain personnel whose job functions relate to or could be affected by Protection System schemes, or whether it is sufficient for the entity to have reference documents discussing the purpose and limitations of Protection System schemes that personnel may review when they deem necessary.

Due to the importance of Protection Systems to the reliable operation of the BPS, the Reliability Standards related to these systems should set clear obligations. To that end, NERC proposes to replace PRC-001-1.1(ii), Requirement R1 with new and existing formal training requirements in the PER group of Reliability Standards. Focusing on formal training requirements will help ensure that the necessary personnel are familiar with and understand the purpose and limitations of Protection System schemes while providing more precise and auditable requirements. The following sections discuss the manner in which proposed Reliability Standard PER-006-1 and currently-effective Reliability Standards PER-003-1 and PER-005-2, collectively provide for formal training requirements for Generator Operators, Transmission Operators, and Balancing Authorities on Protection Systems and RAS, consistent with the objective of PRC-001-1.1(ii), Requirement R1. Further, as discussed below, the revisions to the definitions of OPA and

RTA will also ensure that Transmission Operators, along with Reliability Coordinators, are familiar with and consider the functions and limitation of Protection Systems and RAS as they carry out their reliability functions.

1. Generator Operators

Currently-effective Reliability Standard PER-005-2, Requirement R6 and proposed Reliability Standard PER-006-1 address Generator Operator familiarity with the purpose and limitations of Protection System schemes. As discussed below, these standards provide more precise, auditable and enforceable requirements to meet the objective of Requirement R1 of PRC-001-1.1(ii) by: (1) focusing on formal training requirements; (2) clearly identifying the Generator Operator personnel that must receive training; (3) referencing both Protection Systems and RAS, instead of the undefined term "Protection System scheme;" and (4) clarifying the subject matter of the training on Protection Systems and RAS.

Reliability Standard PER-005-2, Requirement R6 and proposed PER-006-1 improve upon existing Reliability Standard PRC-001-1.1(ii) by establishing formal requirements for all relevant Generator Operator personnel on Protection Systems and RAS. Reliability Standard PER-005-2, Requirement R6, which became effective on July 1, 2016, provides that Generator Operators must use a systematic approach to develop and implement training for dispatch personnel at centrally located dispatch centers "on how their job function(s) impact the reliable operations of the BES during normal and emergency operations."[20] PER-005-2, Requirement R6 thus creates an

---

[20] The specific Generator Operator personnel that must be trained using a systematic approach under PER-005-2 are "[d]ispatch personnel at a centrally located dispatch center who receive direction from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or Transmission Owner, and may develop specific dispatch instructions for plant operators under their control." PER-005-2, Requirement R6 was specifically developed to respond to a specific FERC directive from Order Nos. 693 and 742 to include training requirements for centrally-located dispatch personnel. *Mandatory Reliability Standards for the Bulk-Power System*, 72 Fed. Reg. 16416 (2007), FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007); *System Personnel Training Reliability Standards*, Order No. 742, 133 FERC ¶ 61,159 75 Fed. Reg. 72664 (2010).

affirmative obligation for Generator Operators, using a systematic approach, to (1) identify the manner in which the job functions of centrally-located dispatch personnel could impact the reliable operations of the BES, including among other things, as it relates to the functionality of Protection System schemes, and (2) develop and implement the necessary training to help ensure that the dispatchers carry out their job functions in a manner that will not adversely impact BES reliability. If the dispatch personnel's job function can impact the reliable operation of Protection Systems and RAS, then the Generator Operator must train the dispatcher on the manner in which its job functions could impact Protection Systems and RAS.[21]

Recognizing that PER-005-2, Requirement R6 is limited to centrally-located dispatch personnel, the Project 2007-6.2 standard drafting team ("SDT") developed proposed Reliability Standard PER-006-1 to cover other Generator Operator personnel whose job functions necessitate that they be trained on the purpose and limitations of Protection System schemes. Specifically, "[p]lant personnel who are responsible for the Real-time control of a generator and receive Operating Instruction(s) from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center."[22] It is appropriate to train plant personnel with Real-time control of a generator as it is those individuals whose actions could impact the reliable operation of the BES and who, in turn, need to understand the functionality of Protection Systems and RAS and how they could affect the generation facility at which they have control.[23]

---

[21] For instance, the centrally located dispatchers may need to understand the circumstances for which the functionality or limitations of a Protection System or RAS may create a risk under specific dispatch instructions.

[22] Proposed Reliability Standard PER-006-1 Applicability section 4.1.1.1.

[23] Plant personnel that do not have Real-time control include, for example, fuel handlers, electricians, machinists, or maintenance staff.

For these personnel, proposed PER-006-1 establishes a formal training requirement that that states:

> Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1 on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates.

The proposed standard represents an improvement over existing PRC-001-1.1(ii) in several key respects. First, proposed PER-006-1 specifically references Protection Systems and RAS to avoid confusion as to the scope of the phrase "Protection System schemes," which is used in PRC-001-1.1(ii). As noted above, as RAS are essentially schemes comprised of Protection Systems, the phrase "Protection System scheme" maps to both the NERC Glossary terms "Protection System" and "RAS." To avoid any confusion as to whether RAS must be the subject of training under Requirement R1 of proposed PER-006-1, the SDT specifically referenced Protection Systems and RAS.

Proposed PER-006-1 also uses the phrase "operational functionality" instead of the phrase "purpose and limitations" used in PRC-001-1(ii) to more clearly identify the objective of the training. The phrase "operational functionality" focuses the required training on (1) the manner in which Protection Systems operate and prevent damage to BES Elements, and (2) the manner in which a RAS detects pre-determined BES conditions and automatically takes corrective actions. These are the key elements for which Generator Operator personnel need be aware to reliably operate their facilities. Training on the operational functionality of Protection Systems and RAS may include, among other things, the following topics: the purpose of protective relays and RAS; zones of protection; protection communication systems (e.g., line current differential, direct transfer trip, etc.); voltage and current inputs; station dc supply associated with protective functions; resulting actions, such as tripping/closing of breakers; tripping of a generator step-up transformer, or generator ramping/tripping control functions.

Additionally, PER-006-1 uses the phrase "that affect the output of the generating Facility(ies) it operates" in lieu of the phrase "applied in its area" from PRC-001-1.1(ii). First, NERC Reliability Standards do not use the concept of a Generator Operator area as is done for Balancing Authorities and Transmission Operators. Second, in contrast to Balancing Authorities and Transmission Operators, Generator Operators are not required to monitor or study BES reliability in their area and do not have the same wide area view of BES reliability to know the precise manner in which their facility could affect the BES in Real-time. The focus of Generator Operator reliability functions under NERC's Reliability Standards is thus on the reliable operation of their generation facilities. Consistent with that reliability objective, the phrase "that affect the output of the generating Facility(ies) it operates" properly tailors the scope of training required for Generator Operators. Under proposed Reliability Standard PER-006-1, Generator Operators must identify those Protection Systems and RAS that affect the output of their generation facilities and train the applicable personnel on the operational functionality of those Protection Systems and RAS.

The proposed standard does not specify a periodicity for the required training. NERC expects applicable entities to train their plant operating personnel prior to such personnel performing any Real-time operations. NERC also expects that Generator Operators update the training to reflect any changes to the operational functionality of Protection Systems and RAS.

2. Transmission Operators and Balancing Authorities

For Transmission Operators and Balancing Authorities, the reliability goal of Requirement R1 of PRC-001-1.1(ii) is addressed by the existing certification and training requirements in the

PER group of Reliability Standards, specifically PER-003-1 and PER-005-2. As discussed below, these requirements help ensure that the relevant Transmission Operator and Balancing Authority personnel have the requisite knowledge of Protection Systems and RAS, among other things, to effectively carry out their reliability-related tasks. Further, these requirements help ensure that these personnel receive ongoing training to continue to reinforce the skills and knowledge required for those tasks. The proposed modifications to the definitions of OPA and RTA further the objective of PRC-001-1.1(ii), Requirement R1 by requiring that Transmission Operators consider the functions and limitations of Protection Systems and RAS when performing the OPAs and RTAs required under TOP Reliability Standards to determine whether there are any actual or expected SOL exceedances. These requirements are each discussed in turn, below.

i. PER-003-1 Certification Requirements

Pursuant to Reliability Standard PER-003-1, each Reliability Coordinator, Transmission Operator, and Balancing Authority must staff its Real-time operating positions performing reliability-related tasks with System Operators who have demonstrated minimum competency in the specified areas by obtaining and maintaining the relevant NERC credential. In support of NERC's mission to promote the reliability of the North American BPS, NERC administers a System Operator Certification Program to help ensure that BPS operators have a workforce of system operators that have the skills and qualifications to reliably operate the BPS.[24] The System Operator Certification Program provides the framework for operators to obtain initial certification in one of the following four NERC credentials focusing on a specific functional area of system operations:

[24] NERC maintains the required credentials for over 6,000 system operators working in system control centers across North America.

1) *Reliability Operator*, which focuses on the skills and knowledge required for Reliability Coordinator System Operators;

2) *Balancing, Interchange, and Transmission Operator*, which focusses on the skills and knowledge required for both Transmission Operator and Balancing Authority System Operators;

3) *Transmission Operator*, which focuses on the skills and knowledge required for Transmission Operator-only System Operators; and

4) *Balancing and Interchange Operator*, which focuses on the skills and knowledge required for Balancing Authority-only System Operators.

To obtain any of one these four credentials, an individual must pass the NERC System Operator Certification Exam applicable to that credential. The system operator certification exams test specific knowledge of job skills and Reliability Standards, and are designed to prepare operators to handle the BPS during normal and emergency operations.[25] Once an individual passes any of these exams, s/he must complete NERC-approved continuing education program courses and activities to maintain the certification.

The certification requirements in PER-003-1 help meet the objective of PER-001.1.1(ii), Requirement R1 by mandating that Transmission Operator and Balancing Authority System Operators demonstrate that they have the requisite knowledge about Protection Systems and RAS to maintain reliable operation in their area. Specifically, pursuant to Requirement R2 of PER-003-1, each Transmission Operator must staff its Real-time operating positions performing Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in certain specified areas, including "protection and control", by obtaining

[25] NERC conducts an extensive job analysis survey of certified operators across the industry to provide the basis for the exams. The job analysis survey results in an exam content outline for each of the exams. The exam content outline is the framework used to associate tasks to exam questions. NERC contracts with psychometric consultants who assist a working group of certified system operators in the development and maintenance of each exam. The exam working group consists of subject matter experts from all regions of North America.

and maintaining valid NERC certification as a (1) Reliability Operator, (2) Balancing, Interchange and Transmission Operator, or (3) Transmission Operator.

The exams required for these certifications include, among other things, a specific focus on ensuring that such personnel can demonstrate competency in the area of protection and control.[26] The protection and control area of the exam includes the following six topics: (1) analyzing the impact of protection equipment outages on system reliability; (2) ensuring special protective systems and RAS are enabled when needed for system reliability; (3) maintaining adequate protective relaying during all phases of system restoration; (4) analyzing relay targets, fault locaters and fault recorders to determine a proper restoration plan following a system event; (5) taking action in response to alarms from special protective schemes; and (6) scheduling system telecommunications, telemetering, protection, and control equipment outages to ensure system reliability.

Similarly, Requirement R3 provides that each Balancing Authority shall staff its Real-time operating positions performing Balancing Authority reliability-related tasks with System Operators who have demonstrated minimum competency in certain areas by obtaining and maintaining valid NERC certification as a (1) Reliability Operator, (2) Balancing, Interchange and Transmission Operator, or (3) Balancing and Interchange Operator. While "protection and control" is not a specific area of competency listed in Requirement R3, each of the exams required to obtain the requisite certifications include topics related to Protection Systems.

Specifically, the exams for the (1) Reliability Operator certificate and (2) Balancing, Interchange and Transmission Operator certificate are also used for Reliability Coordinator and

[26] *See*, *e.g.*, NERC's *Transmission Operator Certification Exam Content Outline 2015*, *available at* http://www.nerc.com/pa/Train/SysOpCert/System%20Operator%20Certification%20DL/Transmission%20Operator%20Certification%20Exam%20Content%20Outline%202015.pdf.

Transmission Operator System Operator certification, respectively, and thus include "protection and control" as an area of specific focus. The Balancing and Interchange Operator certificate exam, which is acceptable for Balancing Authority-only System Operators and does not include "protection and control" as a specified area of focus, nevertheless includes five of the six topics related to Protection Systems and RAS that are in the other exams. Specifically, the Balancing and Interchange Operator exam includes, among others, questions related to the following topics: (1) analyzing the impact of protection equipment outages on system reliability; (2) ensuring special protective systems and RAS are enabled when needed for system reliability; (3) maintaining adequate protective relaying during all phases of system restoration; (4) taking action in response to alarms from special protective schemes; and (5) scheduling system telecommunications, telemetering, protection, and control equipment outages to ensure system reliability.[27]

ii. PER-005-2 Training Requirements

In addition to the certification requirements of PER-003-1, Reliability Standard PER-005-2 includes a number of requirements that collectively satisfy the objective of ensuring that Transmission Operators and Balancing Authorities are familiar with the purpose and limitations of Protection System schemes. First, pursuant to Requirement R1, each Transmission Operator and Balancing Authority must use a systematic approach to develop and implement a training program for its System Operators that, among other things, includes regular training on Protection Systems and RAS. Specifically, Requirement R1 requires Transmission Operators and Balancing Authorities to:

- Create a list of BES "company-specific Real-time reliability-related tasks based on a defined and documented methodology" that is updated on an annual basis (Part 1.1).

[27] *See* NERC's *Balancing and Interchange Operator Certification Exam Content Outline 2015*, *available at* http://www.nerc.com/pa/Train/SysOpCert/System%20Operator%20Certification%20DL/Balancing%20and%20Interchange%20Operator%20Certification%20Exam%20Content%20Outline%202015.pdf.

- Design and develop training materials based on the BES company-specific Real-time reliability-related task list (Part 1.2).
- Deliver the training to its System Operators (Part 1.3).
- Conduct an evaluation each calendar year of its training program to identify any needed changes to the training program and implement the identified changes (Part 1.4).

As the certification exams described above indicate, the Real-time reliability-related tasks of Transmission Operator and Balancing Authority System Operators relate to the operation of Protection Systems and RAS. The training programs required under Requirement R1 must thus include training on topics related to Protection Systems and RAS. The proposed revisions to the definitions of OPA and RTA, which, as further discussed below, require Transmission Operators to consider the functions and limitations of Protection Systems and RAS when performing OPAs and RTAs, further highlight that addressing issues related to Protection Systems and RAS are part of a Transmission Operator's Real-time reliability-related tasks and, in turn, should be included in the training program under PER-005-2, Requirement R1.

Additionally, Requirement R3 of PER-005-2 provides that Transmission Operators and Balancing Authorities must verify that its System Operators are capable of performing each of the company-specific Real-time reliability-related tasks identified under Requirement R1. This requirement helps ensure that the System Operator who is engaged in tasks associated with Protection Systems and RAS are capable of performing those tasks. In verifying that capability, Transmission Operators and Balancing Authorities must confirm that the System Operator understands the functions and limitations of the relevant Protection Systems and RAS.

Requirement R4 further reinforces these capabilities by requiring each Transmission Operator and Balancing Authority that "(1) has operational authority or control over Facilities with established [IROLs], or (2) has established protection systems or operating guides to mitigate IROL violations," to provide its System Operators with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES. Simulation training further enhances System Operator understanding of the relevant Protection Systems and RAS and the manner in which they impact BES operations.

Lastly, PER-005-2, Requirement R5 helps ensure that Transmission Operators and Balancing Authorities provide training to personnel who are not System Operators but have job functions that impact Real-time reliability-related tasks related to Protection Systems and RAS. Specifically, Requirement R5 provides that Transmission Operators and Balancing Authorities must "use a systematic approach to develop and implement training for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified" pursuant to Requirement R1.[28] As Operations Support Personnel perform OPAs and RTA in support of outage coordination and establishment of SOLs and IROLs, the required training should include material fostering an appropriate understanding of the functions and limitations of Protection Systems and RAS in their area, consistent with the objectives of PRC-001-1.1(ii), Requirement R1 and the modifications to the definition of OPA and RTA.

iii. Revised OPA and RTA Definitions

As discussed further in Exhibit E hereto, NERC also proposes modifications to the definitions of OPA and RTA to include the functions and limitations of Protection System and RAS as a required input for OPAs and RTAs. The modifications further the objective of PRC-001-1.1(ii), Requirement R1 by requiring entities to consider the functions and limitations of

[28] Operations Support Personnel are "individuals who perform current day or next day outage coordination or assessments, or who determine SOLs, IROLs, or operating nomograms, in direct support of Real-time operations of the Bulk Electric System."

Protection Systems and RAS when assessing anticipated and potential conditions for next-day operations time frame (OPAs) and existing and potential operating conditions in Real-time (RTAs).

Pursuant to Commission-approved Reliability Standard TOP-002-4, Requirements R1 and R2, Transmission Operators are required to: (1) "have an [OPA] that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its [SOLs];" and (2) "have an Operating Plan(s) for next-day operations to address potential [SOL] exceedances identified as a result of its [OPA]."

The Commission approved definition of OPA is:

> An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

To ensure that the functions and limitation of Protection Systems and RAS are inputs into the OPA, NERC is proposing to modify the definition as follows:

> An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to:~~,~~ load forecasts; generation output levels; Interchange; known Protection System and ~~Special Protection System~~ Remedial Action Scheme status or degradation, functions, and limitations; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)[29]

[29] NERC proposes to replace the term "Special Protection System" with "Remedial Action Scheme" to reflect the transition across NERC standards to using RAS. *See N. Am. Elec. Reliability Corp.*, Docket No. RD16-5-000 (Jun. 23, 2016) (unpublished letter order).

Similarly, under Commission-approved Reliability Standard TOP-001-3, Requirements R13 and R14, each Transmission Operator is required to: (1) perform a RTA at least once every 30 minutes; and (2) initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or RTA. The current definition of RTA is:

> An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation; Transmission outages, generator outages, Interchange; Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

As with the modifications to the OPA definition, to ensure that the functions and limitation of Protection Systems and RAS are inputs into the RTA, NERC is proposing to modify the definition as follows:

> An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load; generation output levels; known Protection System and ~~Special Protection System~~ Remedial Action Scheme status or degradation, functions, and limitations; Transmission outages; generator outages; Interchange; Facility Ratings; and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

3. Reliability Coordinators

Although PRC-001.1.1(ii), Requirement R1 does not apply to Reliability Coordinators, it is also important for Reliability Coordinator personnel to understand the functions and limitations of Protection Systems and RAS and consider that information when conducting OPAs and RTAs. The Reliability Coordinator has a central role in maintaining BES reliability, particularly with respect to helping to ensure that the BES is operated within SOLs and IROLs. As such, an understanding of Protection Systems and RAS is vital to the functional obligations of a Reliability Coordinator.

Accordingly, as is the case for Transmission Operators and Balancing Authorities, NERC's currently-approved Reliability Standards require the following to help ensure that Reliability Coordinator personnel have the requisite understanding of Protection Systems and RAS:

- Reliability Coordinators must staff their Real-time operating positions performing Reliability Coordinator reliability-related tasks with System Operators who have demonstrated competency in the area of "protection and control," among others, through the NERC System Operator Certification Program (PER-003-1, Requirement R1).

- Reliability Coordinators must train their System Operators, using a systematic approach, on their Real-time reliability related tasks, which may include tasks related to Protection Systems and RAS (PER-005-2, Requirement R1).

- Reliability Coordinators must verify that their System Operators are capable of performing each of the company-specific Real-time reliability-related tasks identified under PER-005-2, Requirement R1 (PER-005-2, Requirement R3).

- Reliability Coordinators that have (1) operational authority or control over Facilities with established IROLs, or (2) established protection systems or operating guides to mitigate IROL violations, must provide their System Operators emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES (PER-005-2, Requirement R4).

- Reliability Coordinators must provide training, using a systematic approach, to Operations Support Personnel on how their job function(s), including those related to Protection Systems and RAS, impact those BES company-specific Real-time reliability-related tasks identified pursuant to PER-005-2, Requirement R1.

In addition to these Commission-approved certification and training requirements, the modifications to the definitions of OPA and RTA require Reliability Coordinators to consider the functions and limitations of Protection Systems and RAS when conducting OPAs and RTAs to assess whether there are any actual or expected SOL or IROL exceedances, pursuant to Reliability Standard IRO-008-2, Requirements R1, R4 and R5. As the modifications to the definitions of OPA and RTA also apply to the Reliability Coordinator, they serve to enhance the manner in which the reliability objective of PRC-001-1.1(ii), Requirement R1 is met in NERC's Reliability Standards.

B. PRC-027-1 and Retirement of Requirements R3 and R4 of PRC-001-1.1(ii)

Proposed Reliability Standard PRC-027-1 is designed to improve upon and replace Requirements R3 and R4 of PRC-001-1.1(ii) in addressing the coordination of Protection Systems installed to detect and isolate Faults on the BES, such that those Protection Systems operate in their intended sequence during Faults. As noted above, coordinated Protection Systems enhance reliability by reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. Specifically, when Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage.

Proposed Reliability Standard PRC-027-1 provides a clear set of Requirements that obligate entities to (1) implement a process for establishing and coordinating new or revised Protection System settings, and (2) periodically study Protection System settings that could be affected by incremental changes in Fault current to ensure the Protection Systems continue to operate in their intended sequence. Specifically, proposed PRC-027-1 consists of the following three requirements, each of which is discussed in greater detail below:

- Requirement R1 mandates that each Transmission Owner, Generator Owner, and Distribution Provider establish a process for developing new and revised Protection System settings for BES Elements to operate in the intended sequence during Faults. The process must include provisions for coordinating those settings with owners of electrically joined facilities.

- Requirement R2 mandates that, for each BES Element with a Protection System that could be affected by changes in Fault current, applicable entities must, every six years, determine whether the Protection System settings continue to be appropriate by: (1) performing a Protection System Coordination Study; (2) first evaluating whether there were any changes in Fault current that could affect the coordination of Protection System and, if so, performing a Protection System Coordination Study; or (3) a combination of the above two options. The proposed definition for the term Protection System Coordination Study is "[a]n analysis to determine whether Protection Systems operate in the intended sequence during Faults."

- Requirement R3 requires applicable entities to implement the process established according to Requirement R1 for developing new or revised Protection System settings.

Collectively, these Requirements help ensure that Protection Systems are installed in a coordinated manner and operate in the intended sequence to isolate Faults on the BES.

Proposed Reliability PRC-027-1 improves upon Requirements R3 and R4 of PRC-001-1.1(ii) by:

- Assigning the responsibility for performing coordination responsibilities to the owners of the Protection Systems whose functional obligations include setting, coordinating, and maintaining Protection Systems.
- Clarifying that proposed PRC-027-1 pertains to the coordination of Protection Systems associated with Fault clearing.
- Clarifying that the scope of the proposed standard applies to any Protection System installed to detect and isolate Faults on BES Elements, regardless of location (i.e., internal lines as well as tie-lines).
- Adding a Requirement that applicable entities establish and use a process to develop settings for their BES Protection Systems that must contain certain specified attributes.
- Adding a Requirement that applicable entities periodically perform Protection System Coordination Studies and/or review Fault current values for existing Protection Systems applied on BES Elements that are identified as being affected by changes in Fault current to determine whether the settings continue to be appropriate.

The following is a discussion of the applicability of the proposed standard and an analysis of each Requirement.

1. Applicability

Proposed Reliability Standard PRC-027-1 is applicable to Transmission Owners, Generator Owners, and Distribution Providers as these are the entities that own and install Protection Systems for the purpose of detecting Faults in the BES and have the functional obligations to maintain those Protection Systems. Transmission Owners own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES. Generator Owners also have Protection Systems installed for the purpose of detecting Faults on the BES and it is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination. Lastly, Distribution Providers may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of the Distribution Provider.

As the owners of the Protection Systems, these entities should have the obligation to implement a coordinated process for developing new and revised Protection System settings and reviewing those setting on a periodic basis. Under the NERC Functional Model, the reliability tasks related to Transmission, Distribution, and Generation Ownership include design and maintenance of Protection Systems.[30] These functions include developing Protection System settings, evaluating Protection System operations, and identifying Protection System Misoperations. As part of designing the Protection Systems, these entities must coordinate with their neighbors to ensure the Protection System operates in the intended sequence during Faults. In contrast, Transmission Operators and Generator Operators are only concerned with Protection Systems after they are placed in service.

---

30 The Functional Model provides (at p. 44) that Transmission Ownership includes the following task: "Design and authorize maintenance of transmission protective relaying systems and Special Protection Systems." For Distribution, the Functional Model (at p. 46) lists the following as a task: "Design and maintain protective relaying systems, under-frequency load shedding systems, under-voltage load shedding systems, and Special Protection Systems that interface with the transmission system." Lastly, the Functional Model (at p. 50), includes the following task for Generation Ownership: "Design and authorize maintenance of generation plant protective relaying systems, protective relaying systems on the transmission lines connecting the generation plant to the transmission system, and Special Protection Systems." The Functional Model is available at: http://www.nerc.com/pa/Stand/Functional%20Model%20Archive%201/Functional_Model_V5_Final_2009Dec1.pdf

In addition to clarifying the functional entities responsible for performing coordination responsibilities, proposed Reliability Standard PRC-027-1 also clarifies that the standard only applies to coordination of Protection Systems associated with Fault clearing. Aspects of protection coordination other than Fault coordination are addressed by other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-2.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-2.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-2.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-5i.

Additionally, whereas Requirement R4 of PRC-001-1.1(ii) is limited to the coordination of Protection Systems on "major transmission lines," the Requirements of PRC-027-1 apply to any Protection System installed to detect and isolate Faults on BES Elements, regardless of location, size, or whether they are tie-lines or internal lines. Eliminating the phrase "major transmission lines" also avoids the ambiguities involved in determining which lines are "major."

2. <u>Requirement R1</u>

Requirement R1 mandates that each Transmission Owner, Generator Owner, and Distribution Provider establish a process for developing new and revised Protection System settings for BES Elements, such that those Protection Systems operate in the intended sequence during Faults (i.e., are properly coordinated). The process must include provisions designed to ensure that the settings are accurate and coordinated with owners of electrically joined facilities. Specifically, Requirement R1 provides:

> **R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include:
>
> **1.1.** A review and update of short-circuit model data for the BES Elements under study.
>
> **1.2.** A review of the developed Protection System settings.
>
> **1.3.** For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:
>
> **1.3.1.** Provide the proposed Protection System settings to the owner(s) of the electrically joined Facilities.
>
> **1.3.2.** Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.
>
> **1.3.3.** Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.
>
> **1.3.4.** Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

This Requirement applies to changes to Protection System settings for any BES Element. Although the coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the BES Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

The following is a discussion of each Part of Requirement R1:

Part 1.1 helps ensure that applicable entities develop any new or revised Protection System settings using accurate and updated data by requiring them to review and update short-circuit model data for the BES Element(s) under study.[31] A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. These studies form the basis for the development of Protection System settings as they provide the necessary Fault currents used by protection engineers to develop Protection System settings. Requiring a review and, if necessary, an update of short-circuit model data is thus necessary to ensure that the information that forms the basis of the development of Protection System settings is accurate and reflects the physical power system. The review of short-circle model data would include a review of:

- applicable BES line, transformer, and generator impedances and Fault currents;
- the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed; and
- where applicable, interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 further supports the development of accurate Protection System settings by requiring applicable entities to institute a systematic process for verifying that the Protection System settings are correct (i.e., that they meet applicable technical criteria, as defined by the entity). A review of the Protection System settings prior to implementation reduces the possibility

[31] Although Generator Owners and Distribution Providers may not have or maintain short-circuit models, NERC expects these entities to obtain the short-circuit model data from their Transmission Planners, Planning Coordinators, or Transmission Owners.

of introducing human error. Examples of reviews include peer reviews, automated checking programs, and other entity-developed review procedures designed to verify the accuracy of the settings.

Part 1.3 addresses the coordination of Protection System settings between neighboring entities for BES Elements that electrically join Facilities owned by separate functional entities.[32] Communication among neighboring entities is essential for identifying and resolving coordination issues prior to implementation of any new or revised Protection System settings. Part 1.3 creates the following obligations:

- Under Part 1.3.1, applicable entities proposing to change any Protection System setting for BES Elements that electrically join facilities owned by separate functional entities must include in their process provisions for providing proposed Protection System settings to their neighboring entities so as to allow those entities an opportunity to review those settings and determine whether there are any coordination issues.

- Under Part 1.3.2, applicable entities must include in their process provisions for responding to neighboring entities that provided them proposed Protection System setting under Part 1.3.1 by identifying any coordination issues or affirming that no such issues are present. These provisions ensure that the proposed settings are reviewed and that the initiating entity receives a response indicating whether there are any coordination issues to address prior to implementation.

- Under Part 1.3.3, applicable entities must include provisions in their process for verifying that any identified coordination issues are resolved with the neighboring entity prior to implementation, thereby minimizing any potential impact to BES reliability.[33]

[32] The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

[33] There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgment. Further, coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. There could also be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

- Under Part 1.3.4, applicable entities must have provisions for communicating with neighboring entities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure. This Part recognizes that there may be instances under which changes to Protection Systems need to be made without the opportunity to coordinate with neighboring entities in the timeframe contemplated under Parts 1.3.1 through 1.3.3. Nevertheless, those changes need to be coordinated with other entities to address any issues going forward.

3. Requirement R2

The reliability objective of Requirement R2 is to mitigate risks associated with the impact of changes in Fault current on Protection Systems installed to detect and isolate Faults on the BES. Over time, the accumulation of incremental changes in Fault current could affect the coordination of Protection Systems (i.e., the performance of the Protection System during Faults). Entities should thus be required to determine whether there were any changes in Fault current that affected the coordination of Protection Systems and, if so, adjust the settings as necessary to ensure the Protection System continues to operate in the intended sequence during Faults.

To that end, Requirement R2 mandates that, for BES Elements with Protection Systems that could be affected by changes in Fault current, applicable entities must, every six years, determine whether the Protection System settings continue to be appropriate by either: (1) performing a Protection System Coordination Study for each applicable BES Element to determine whether the Protection Systems continue to operate in the intended sequence during Faults; or (2) first evaluating whether there were any changes in Fault current at each BES Element that could affect the coordination of Protection Systems and, if so, performing a Protection System Coordination Study for that BES Element; or (3) using a combination of the above options to conduct a review at each applicable BES Element. Specifically, Requirement R2 provides as follows:

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years; or
- Option 3: Use a combination of the above.

The components of Requirement R2 are discussed further below.

i. BES Element with Protection System Functions Identified in Attachment A

As noted above, the purpose of Requirement R2 is to periodically review Protection Systems that could be affected by changes in Fault current to determine whether the settings continue to be appropriate. Attachment 1 lists those Protection System functions that use current in their measurement to initiate tripping of circuit breakers and, as a result, changes in the magnitude of available Fault current could impact the coordination of these functions. Attachment A provides:

> The following Protection System functions are applicable to Requirement R2 if: (1) available Fault current levels are used to develop the settings for those Protection System functions; and (2) those Protection System functions require coordination with other Protection Systems.
>
> 21 – Distance if:
>
> - infeed is used in determining reach (phase and ground distance), or
> - zero-sequence mutual coupling is used in determining reach (ground distance).
>
> 50 – Instantaneous overcurrent
>
> 51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*. Examples of functions not included in Attachment A are differential relays and Fault detectors as they do not meet the above criteria.[34] Under Requirement R2, if an applicable entity has any BES Elements with the Protection System functions listed in Attachment A, the entity must perform a review of the Protection Systems for that BES Element every six calendar years to determine whether Fault currents have affected the coordination of the Protection System and the settings need to be changed. Requirement R2, however, provides entities flexibility in the manner in which it conducts its review of those Protection Systems by providing three options, as discussed below.

ii. Option 1 – Performing Protection System Coordination Studies

To satisfy its obligation under Requirement R2, an applicable entity may choose to perform a full Protection System Coordination Study every six calendar years for each of its applicable BES Elements. The proposed definition for the new NERC Glossary term Protection System Coordination Study is "[a]n analysis to determine whether Protection Systems operate in the intended sequence during Faults." If the results of the Protection System Coordination Study reveal that the Protection System requires revised settings to operate in its intended sequence during faults, the applicable entity would then initiate its process established pursuant to Requirement R1 to change the settings for those Protection Systems in accordance with the Protection System Coordination Study.

34 For additional information regarding the Protection System functions listed in Attachment A, see the Supplemental Material section of the proposed standard.

In performing a Protection System Coordination Study, applicable entities would evaluate current pickup levels, timing characteristics, impedance characteristics, and fault detector levels of relays to seek the best coordination possible of Protection Systems providing primary and backup protection of BPS Elements.

iii. Option 2 – Comparison of Fault Current Values

Under Option 2, instead of immediately conducting Protection System Coordination Studies for each of its BES Elements with a Protection System function listed in Attachment A, an entity may first choose to compare present Fault current values at each of those BES Element to an established Fault current baseline to determine whether a Protection System Coordination Study is in fact necessary. This option provides entities the flexibility to determine whether there were any changes in Fault current at the BES Element that could affect Protection System coordination prior to expending its resources to perform a full Protection System Coordination Study.

Requirement R2 establishes a Fault current deviation of 15% or greater from a baseline established from the most recent Protection System Coordination Study as the threshold for determining whether a Protection System Coordination Study is necessary.[35] Specifically, if the Fault current comparison for a BES Element indicates a deviation of less than 15% from the established baseline, the applicable entity is not required to conduct a full Protection System Coordination Study for that BES Element. If, however, the Fault current comparison indicates a 15% percent or greater deviation on a BES Element, the applicable entity is then required to conduct a full Protection System Coordination Study for that BES Element to determine whether

[35] As discussed below, entities seeking to use Option 2 for the initial performance of this Requirement must establish a baseline by the effective date of the standard based on short-circuit studies.

the Protection Systems for that BES Element continue to operate in the intended sequence during Faults.

NERC proposes a 15% deviation threshold for determining whether a Protection System Coordination Study is required under Option 2 based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. Accepted engineering practices require entities to consider proper margins while setting relays. Those margins are based on measurement errors, possible errors in fault studies, or unknown system configuration changes that can occur during system disturbances or short term operating conditions. Margins are used to help ensure that the Protection Systems operate as designed during any Fault condition and that relatively small (up to 15%) changes in Fault current do not interfere with that coordination. The 15% maximum deviation provides an entity with latitude, however, to choose a Fault current deviation threshold that is less than 15% to better match its protection philosophy, or other business considerations without creating undue risk to reliability.

If there is a Fault current deviation of 15% or greater and the results of the subsequent Protection System Coordination Study reveal that a Protection System requires revised settings to operate in its intended sequence during faults, the applicable entity would then initiate its process established pursuant to Requirement R1 to change the settings for those Protection Systems in accordance with the Protection System Coordination Study. As with Option 1, the time interval for conducting the Fault current comparison and any subsequent Protection System Coordination Study is six calendar years.

The Fault current values used in the comparison, whether three-phase or phase-to-ground Fault currents, should be determined with all generation in service and all transmission BES

Elements in their normal operating state. Further, the Fault current baseline values used as a point of reference for the Fault current comparisons can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. As described in the footnote 1 of the proposed standards, Fault current baselines may be established for BES generating resources at the generator, the BES aggregation point for dispersed power producing resources, or at the common point of connection at 100 kV or above.

With respect to the timing for establishing the Fault current baselines, footnote 1 in the proposed standard provides that an entity that elects to use Option 2 for its initial performance of this Requirement must establish its baseline by the effective date of the standard and update it each time it performs a Protection System Coordination Study. If an initial baseline was not established by the effective date of this Reliability Standard because the applicable entity chose Option 1 or installed a new BES Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The baseline values at each bus to which a BES Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System.

The following is a hypothetical example of how Option 2 would work in practice for a single BES Element: By the effective date of PRC-027-1, Entity X established an initial Fault current baseline of 10,000 amps at the bus to which the BES Element under study is connected. Consistent with Option 2, within six years of the effective date, Entity X performed a short-circuit review to determine the present Fault current value at the bus. The short-circuit review indicated that the Fault current increased to 11,250 amps, a 12.5% deviation. As the deviation was less than 15%, no Protection System Coordination Study was required for that BES Element. As such, no further action was required and Entity X satisfied its obligations under Requirement R2 for that first six-year interval.

As required by Requirement R2, six years later Entity X performed another short-circuit review to determine the present Fault current value at the bus. The baseline value for this Fault current comparison remains at 10,000 amps because Entity X did not perform a Protection System Coordination Study as a result of the initial comparison and the baseline was not reset. The results of this second Fault current comparison indicated that the Fault current increased to 11,500 (a 15% deviation). To comply with Requirement R2, Entity X must now perform a Protection System Coordination Study, also to be completed within that six-year interval, and a new baseline of 11,500 amps would be established. If the Protection System Coordination Study indicates a need to modify the Protection System settings to ensure that the Protection System operates in the intended sequence, Entity X would use its process developed under Requirement R1 to effectuate those changes. If the Protection System Coordination Study does not indicate that setting changes are necessary despite the 15% deviation, Entity X is not required to take any further action (although its Fault current baseline is reset to 11,500 amps for future comparisons).[36]

iv. Option 3 – Use Combination of Options 1 and 2

Option 3 provides entities the flexibility to use Option 1 at some BES Elements and Option 2 at other BES Elements based on the needs of its system. As Protection Systems at certain BES Elements are more susceptible to Fault current changes than others, applicable entities should have the latitude to choose between Option 1 and Option 2 for each BES Element. Where a BES Element is more susceptible to Fault current changes, the applicable entity may choose to bypass

---

[36] Note that if, as a result of the first Fault current comparison, the entity decided to perform a Protection System Coordination Study even though there was only a 12.5% deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required but the baseline Fault current would be updated to 11, 250 amps.

a Fault comparison (Option 2) and proceed straight to a Protection System Coordination Study (Option 1). In contrast, for BES Elements less susceptible to Fault current changes, the entity may choose Option 2 to do a Fault current comparison and potentially avoid the more resource intensive Protection System Coordination Study. An entity may, for example, choose Option 1 for all of its Facilities operated above 300 kV, while choosing to use Option 2 for its Facilities operated below 300 kV. No matter which option the entity chooses for each of its BES Elements, the entire cycle must be completed every six calendar years.

v. Six-Year Time Interval

NERC proposes a maximum of six-year intervals to perform the review under Requirement R2 so as to balance the resources required to perform Protection System Coordination Studies and the potential reliability impacts created by incremental changes of Fault current over time.[37] Performing Protection System Coordination Studies is a resource intensive activity. These studies require engineers to review Protection Systems at a number of substations to evaluate the coordination between the Protection Systems. This review includes performing fault simulations, creating impedance plots with relay characteristics, and time-overcurrent curve reviews where little or no change may have occurred during the six-year interval. For entities with many BES Elements with Protection System functions listed in Attachment A, significant time and personnel must be devoted to conducting Protection Systems Coordination Studies. To require entities to perform the Protection System Coordination Studies on shorter intervals may be overly burdensome without any additional reliability benefit.

NERC event analysis data supports the six-year intervals. Specifically, NERC reviewed its events analysis data from 2012-2015 to determine the number of instances in which Protection

[37] Entities may choose to do the review in shorter intervals.

System coordination issues led to an event on the BES.[38] During 2012-2015, the number of events reported through the NERC Event Analysis process that had, as part of the event, more than one Misoperation due to incorrect settings is as follows:

- 2012 - three events out of a total of 45 Misoperation events (115 total qualified events)
- 2013 - five events out of a total of 34 Misoperation events (140 total qualified events)
- 2014 - four events out of a total of 34 Misoperation events (171 total qualified events)
- 2015 - five events out of a total of 38 Misoperation events (148 total qualified events)

This data shows that Protection System coordination is not a significant issue on the BES in terms of number of events. From 2012 through 2015, only 11% of Misoperation events (17 events out of 151) and only 2.9% of total events (17 out of 574) involved Protection System coordination issues. Of the 17 events involving coordination issues, five were inter-company and 12 intra-company.[39] Given this data, the burden of requiring entities perform Protection System Coordination Studies at a time interval shorter than six years outweighs the reliability benefit of doing so.

As noted above, Requirement R2 is designed to capture incremental Fault changes that accumulate over time and could affect the coordination of Protection Systems eventually. Any changes to BPS Elements that require changes to Protection System settings will be addressed through the Requirement R1 process and implemented pursuant to Requirement R3. As such, significant accrued Fault current changes will not be likely without some evaluation due to the system changes. Requirement R2 provides assurance that entities do confirm coordination

[38] A coordination event was defined as an event that had more than one Protection System Misoperation. An event resulting from only one Misoperation is not a failure of coordination, but an isolated setting issue.

[39] In total, only 12 events (out of 151 Misoperation events, or 7.9%) were found to be internal to an entity. Overall, that is 12 events out of 574 total events reported to Events Analysis, which is 2.1% of all events.

periodically where no change to a BES Element would have otherwise addressed changes to Protection Systems due to incremental Fault current changes.

4. Requirement R3

The purpose of Requirement R3 is to require applicable entities to use the process they developed under Requirement R1 for the development of any new or revised Protection System settings for BES Elements, whether as a result of a Protection System Coordination Study performed under Requirement R2 or the installation of a new BES Element with Protection Systems. Requirement R3 provides:

> **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

As discussed above, using the Requirement R1 process helps ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

C. Retirement of Requirements R2, R5 and R6 of PRC-001-1.1(ii)

Consistent with Commission orders to eliminate redundancies in NERC's Reliability Standards,[40] NERC is proposing to retire the remaining Requirements in PRC-001-1.1(ii) – Requirements R2, R5, and R6 – as the reliability objectives of these Requirements are addressed by the revised TOP/IRO Reliability Standards approved in Order No. 817.[41] While NERC did not specifically intend on addressing issues related to PRC-001-1.1(ii) when revising the TOP/IRO

---

[40] *See Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing*, 138 FERC ¶ 61,193 at P 81 (2012); *Electric Reliability Organization Proposal to Retire Requirements in Reliability Standards*, 145 FERC ¶ 61,147, 78 Fed. Reg. 78424 (2013).

[41] In Order No. 817, the Commission approved nine revised TOP/IRO Reliability Standards – IRO-001-4, IRO-002-4, IRO-008-2, IRO-010-2, IRO-014-3, IRO-017-1, TOP-001-3, TOP-002-4, and TOP-003-3. *Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards*, Order No. 817, 153 FERC ¶ 61,178 80 Fed. Reg. 73977 (2015).

Reliability Standards, those revisions created certain redundancies with Requirements R2, R5, and R6 of PRC-001-1.1(ii). As such, these Requirements should be retired. The following is a discussion of the manner in which Commission-approved Reliability Standards address Requirements R2, R5, and R6 of PRC-001-1.1(ii).

1. PRC-001-1.1(ii), Requirement R2

The purpose of Reliability Standard PRC-001-1.1(ii), Requirement R2 is to require that, in the event of protective relay or equipment failures that reduce system reliability, Transmission Operators and Generator Operators: (1) notify relevant functional entities of such failures so that the relevant entities can act accordingly to maintain reliability; and (2) take timely corrective action to return the system to a stable state. Specifically, Requirement R2 provides:

> **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:
>
> > **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.
> >
> > **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirements in recently approved Reliability Standards IRO-001-4, IRO-008-2, IRO-010-2, TOP-001-3, and TOP-003-3, however, obviate the need for Requirement R2 of PRC-001-1.1(ii). These TOP/IRO Reliability Standards address both the notification and corrective action components of PRC-001-1.1(ii), Requirement R2, as follows.

Notification of Protective Relay and Equipment Failures: The data specification Requirements in Reliability Standards TOP-003-3 and IRO-010-2 replace and improve upon the notification requirements in PRC-001-1.1(ii), Requirement R2, as discussed below. Reliability

Standards TOP-003-3 and IRO-010-2 establish Requirements for the provision of information and data needed by Transmission Operators, Balancing Authorities, and Reliability Coordinators for reliable operations. Under those standards, the information and data that applicable functional entities must provide to Transmission Operators, Balancing Authorities, and Reliability Coordinators includes, among other things, "notification of current Protection System and [SPS] status or degradation that impacts System reliability." Such notifications would include failures of protective relays or equipment as such failures would impact the status and be considered a degradation of Protection Systems and SPS.[42] These data specification standards are each discussed in turn, below.

Reliability Standard TOP-003-3 provides a mechanism for Transmission Operators and Balancing Authorities to obtain the data needed to fulfill their operational and planning responsibilities. TOP-003-3 consists of the following five Requirements:

- *Requirements R1 and R2* requires each Transmission Operator and Balancing Authority to maintain a documented specification for the data necessary for the Transmission Operator to perform its OPAs, Real-time monitoring, and RTAs, and for the Balancing Authority to perform its analysis functions and Real-time monitoring. The data specification must include, but is not limited to: (i) a list of data and information needed to support these analyses, monitoring, and assessments; (ii) provisions for the notification of current Protection System and Special Protection System status or degradation that impacts System reliability; (iii) a periodicity for providing data; and (iv) the deadline by which the respondent is to provide the indicated data.

- *Requirements R3 and R4* require each Transmission Operator (Requirement R3) and Balancing Authority (Requirement R4) to distribute its data specification to the entities that have the necessary data.

- *Requirement R5* requires each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification pursuant to Requirement R3 or R4 to satisfy the obligations of the documented data specification using: (i) a mutually agreeable format;

42 The "equipment" referenced in PRC-001-1.1(ii), Requirement R2 refer, among other things, to the components of a Protection System, such as the voltage and current sensing devices providing inputs to protective relays or the Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

(ii) a mutually agreeable process for resolving data conflicts; and (iii) a mutually agreeable security protocol.

Similarly, Reliability Standard IRO-010-2 provides a mechanism for the Reliability Coordinator to obtain the information and data it needs for reliable operations and to help prevent instability, uncontrolled separation, or Cascading outages. IRO-010-2 consists of the following three requirements:

- Requirement R1 provides that the Reliability Coordinator must maintain a documented specification for the data necessary for it to perform its OPAs, Real-time monitoring, and RTAs. The data specification must include: (i) a list of data and information necessary to support its performance of OPAs, Real-time monitoring, and RTAs, including non-Bulk Electric System data and external network data; (ii) provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability; (iii) a periodicity for providing data; and (iv) the deadline by which the respondent is to provide the indicated data.

- Requirement R2 provides that the Reliability Coordinator must distribute its data specification to entities that have the required data.

- Requirement R3 provides that each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Operator, Transmission Owner, and Distribution Provider receiving a data specification must satisfy the obligations of the documented specifications using a mutually-agreeable format, process for resolving data conflicts, and security protocol.

The notification obligations in Requirement R2 of PRC-001.1(ii) is thus subsumed in the data specification requirements in Reliability Standards TOP-003-3 and IRO-010-2. For Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their respective analyses, monitoring, and assessment responsibilities under the TOP/IRO Reliability Standards,[43] they must receive Protection System and SPS data from Generator Operators and Transmission Operators, among others. For example, to perform an OPA or RTA, the Transmission Operator and Reliability Coordinator must, by definition, consider the status and degradation of Protection Systems and SPS/RAS such as any protective relay or equipment

[43] *See* TOP-001-3, TOP-002-4, IRO-001-4, IRO-002-4, and IRO-008-3.

failures. Comparably, for a Balancing Authority to satisfy its obligations under TOP-001-3, Requirement R11 to "monitor its Balancing Authority Area, including the status of [SPS] that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency," the Balancing Authority must be aware of the status and degradation of Protection Systems and SPS. To that end, TOP-003-3 and IRO-010-2 specifically require Transmission Operators, Balancing Authorities, and Reliability Coordinators to obtain notifications on the status and degradation of Protection Systems and SPS from, among others, Generator Operators and other Transmission Operators, as is currently required under PRC-001-1.1(ii), Requirement R2. Accordingly, if there is any failure of a protective relay or other components of a Protection System, Transmission Operators, Balancing Authorities, and Reliability Coordinators will be notified.

Reliability Standards TOP-003-3 and IRO-010-2 improve upon PRC-001-1.1(ii), Requirement R2 by clarifying the timing of such notifications.[44] PRC-001-1.1(ii) does not include any time period associated with the notification, making it difficult for entities to know when to provide the notifications from a reliability perspective and for the ERO to measure compliance with the notification requirement. In contrast, TOP-003-3 and IRO-010-2 require the Transmission Operator, Balancing Authority, and Reliability Coordinator to set (i) the periodicity for providing data, and (ii) the deadline for respondents to provide the indicated data. Applicable entities would thus have certainty as to when the notifications must be provided and the ERO would be able to determine whether the notification was provided in a timely manner.

[44] In Order No. 693, the Commission directed NERC to determine the appropriate timeframe for the notifications, as discussed further below. Order No. 693 at P 1445.

Providing Transmission Operators, Balancing Authorities, and Reliability Coordinators the authority to set the deadlines for providing the various data helps ensure that required notifications are provided within a timeframe designed to maintain reliable operations. Specifically, Transmission Operators, Balancing Authorities, and Reliability Coordinators must establish the periodicity and deadlines in a data specifications to allow those entities to perform their functional obligations specified in NERC's Reliability Standards. If certain data is needed to perform an RTA, for instance, it must be provided every 30 minutes as Reliability Coordinators and Transmission Operators must perform RTAs every 30 minutes.[45] As RTAs, by definition, require Reliability Coordinators and Transmission Operators to consider the status and degradation of Protection Systems and SPS in assessing current operating conditions every 30 minutes, NERC expects that they would require entities to provide notification of protective relay or equipment failures within 30 minutes from the time the failure is discovered, if not sooner, and the Reliability Coordinator and Transmission Operator will include that information in its next RTA.

Corrective Action: Commission-approved Reliability Standards TOP-001-3 and IRO-001-4 more clearly address the reliability objective in PRC-001-1.1(ii), Requirement R2 of requiring Transmission Operators and Generator Operators to take corrective action to address protective relay and equipment failures that reduce system reliability. Pursuant to Reliability Standards TOP-001-3, Requirements R1 and R2, and IRO-001-4, Requirement R1, each Transmission Operator, Balancing Authority, and Reliability Coordinator must "act to maintain the reliability of its [area] via direct actions or by issuing Operating Instructions."[46] Under these Requirements, if there is an event on the BES that reduces (or threatens to reduce) system reliability, such as protective

---

45 *See* TOP-001-3, Requirement R13, IRO-008-2, Requirement R4.

46 IRO-001-4, Requirement R1 uses the word "address," not "maintain," where TOP-001-3, Requirements R1 and R2 use the word "maintain."

relay or equipment failures, Transmission Operators, Balancing Authorities, and Reliability Coordinators have an affirmative obligation to take corrective action to maintain reliability, whether by their own actions or by directing the actions of others through the issuance of an Operating Instruction.[47] As provided in TOP-001-3, Requirements R3-R6, and IRO-001-4, Requirements R2 and R3, any functional entity, including a Generator Operator or another Transmission Operator, that is the subject of such an Operating Instruction must: (1) comply with the Operating Instruction, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements; or (2) inform the entity that issued the Operating Instruction that it cannot comply with an Operating Instruction.

The affirmative requirements for Transmission Operators, Balancing Authorities, and Reliability Coordinators to act to maintain reliability in their area and issue Operating Instructions, when necessary, and for entities to comply with any Operating Instructions eliminate the need for a separate obligation such as that in PRC-001.1(ii), Requirement R2 for Generator Operators and Transmission Operators to take corrective action to address protective relay and equipment failures. Under the data specification requirements in Reliability Standards TOP-003-3 and IRO-010-2, if a Generator Operator or Transmission Operators notifies a Balancing Authority, Reliability Coordinator, or another Transmission Operator of a change in status or degradation of a Protection System or RAS (including protective relay or equipment failure that would reduce system reliability), compliance with Reliability Standards TOP-001-3 and IRO-001-4 requires the Transmission Operator, Balancing Authority, and/or Reliability Coordinator to maintain reliability by taking corrective action themselves or issuing an Operating Instruction to direct the notifying

[47] As defined in the NERC Glossary, an Operating Instruction is "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System."

Generator Operator or Transmission Operator to take specific corrective action to resolve any operational issues resulting from the failure. If the Generator Operator or Transmission Operator is directed to take corrective action pursuant to an Operating Instruction, the Generator Operator or Transmission Operator must comply with those instructions according to the TOP/IRO standards.

Additionally, pursuant to TOP-002-4, Requirement R2 and R3, IRO-008-2, Requirements R2 and R3, if, as a result of an OPA, a Transmission Operator or Reliability Coordinator identifies an actual or expected SOL or IROL exceedance as a result of an issue on the system, it must develop an Operating Plan to mitigate any such exceedances and inform other functional entities of their role in the Operating Plan.[48] If the issue on the system relates to protective relay or equipment failures, the Operating Plan would address the corrective action necessary to mitigate the reliability impact of those failures and identify the appropriate entity to take such action so as to return the system to a secure and reliable state in a timely manner.

Further, pursuant to TOP-001-3, Requirement R14, each Transmission Operator must initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or RTA. Similarly, under IRO-008-2, Requirement R5, if the results of its RTA "indicate an actual or expected condition that results in, or could result in, a [SOL] or [IROL] exceedance within its Wide Area," the Reliability Coordinator must notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan.

48 *See* TOP-001-3, Requirement R14, TOP-002-4, Requirement R2 and R3, IRO-008-2, Requirements R2 and R5.

The framework established by the TOP/IRO Reliability Standards for requiring corrective action improves upon Requirement R2 of PRC-001-1.1(ii) by: (1) providing Reliability Coordinators, Balancing Authorities, and Transmission Operators the authority to determine the appropriate corrective action based on the data specifications; and (2) setting clearer expectations for the timeframes under which the corrective action must be taken.[49] Requirement R2 of PRC-001-1.1(ii) assigns the responsibility to determine the appropriate corrective action to the Generator Operator and Transmission Operator whose protective relay or equipment failed. In contrast to the construct in PRC-001-1.1(ii), the framework in the TOP/IRO Reliability Standards appropriately assigns corrective actions to those functional entities in the best position to identify the corrective actions that are necessary to return the system to a secure and reliable state.

The TOP/IRO Reliability Standards assign the responsibility to determine the appropriate corrective actions to those functional entities – Reliability Coordinators, Balancing Authorities, and Transmission Operators – with a wide-area view of the BES and greater understanding of the actions necessary to return the system to a secure and reliable state. As explained above, the TOP/IRO standards establish a framework where, under TOP-003-3 and IRO-010-2, information and data regarding protective relay and equipment failures, among other things, are sent to those functional entities with a broader view of BES conditions – e.g., from a Generator Operator to Transmission Operator and Balancing Authority, and from a Transmission Operator to a Balancing Authority, Reliability Coordinator, or other Transmission Operators. Those functional entities are then required, pursuant to TOP-001-3, TOP-002-4, IRO-001-4, IRO-002-4, and IRO-008-2 to: (i) monitor and analyze BES conditions with the appropriate inputs,[50] (ii) determine whether any

---

49 In Order No. 693, the Commission directed NERC to determine the appropriate timeframe taking corrective action, as discussed further below. Order No. 693 at P 1441.

50 Specifically, as described above, Transmission Operators are required to: (1) perform OPAs pursuant to TOP-002-4, Requirement R1; (2) perform RTAs every 30 minutes pursuant to TOP-001-3, Requirement R13; and

corrective action is necessary,[51] and (iii) either take that corrective action themselves or require other functional entities to take that corrective action.[52] This framework improves reliability by placing the responsibility to determine the appropriate course of action with those entities best equipped to make those determinations through monitoring and analyzing system conditions.

Moreover, the framework established by the TOP/IRO Reliability Standards avoids the uncertainties associated with the timing element in PRC-001-1.1(ii) that Generator Operators and Transmission Operators take corrective action "as soon as possible." The objective of the "as soon as possible" language is to require entities to take corrective action on a timely basis to maintain reliable operations without specifying a uniform (or one-size-fits-all) time period to be applied in every instance. A uniform timeframe for corrective action is not appropriate because various protective relays or equipment failures present different levels of risk to reliable operation. Whereas certain failures would cause more immediate reliability issues and entities should act in a shortened timeframe (e.g., within 30 minutes or less), other failures may not cause such immediate risks to reliability and entities should have additional time to correct the issue.

---

(3) perform Real-time monitoring under TOP-001-3, Requirement R10. Similarly, Reliability Coordinators are required to: (1) perform OPAs pursuant to IRO-008-2, Requirement R1; (2) perform RTAs every 30 minutes pursuant to IRO-008-2, Requirement R4; and (3) perform Real-time monitoring pursuant to IRO-002-4, Requirement R3. Balancing Authorities are also required to perform Real-time monitoring pursuant to TOP-001-3, Requirement R11.

[51] Based on the results of the OPAs, Transmission Operators are required to develop an Operating Plan for next-day operations to address actual or expected SOL exceedances and inform entities of their role under the plan, pursuant to TOP-002-4, Requirements R2 and R3. If the results of an RTA or Real-time monitoring indicate an actual or expected SOL exceedance, the Transmission Operator must initiate its Operating Plan. Similarly, Reliability Coordinators must (1) develop a coordinated Operating Plan for next-day operations to address actual or expected SOL and IROL exceedances identified as a result of its OPA and inform entities of their role under the plan, pursuant to IRO-008-2, Requirements R2 and R3, and (2) if its RTA indicates an actual or expected condition that results in, or could result in, a SOL or IROL exceedance, notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, pursuant to IRO-008-2, Requirement R5.

[52] Pursuant to Reliability Standards TOP-001-3, Requirements R1 and R2, and IRO-001-4, Requirement R1, each Transmission Operator, Balancing Authority, and Reliability Coordinator must "act to address the reliability of its [area] via direct actions or by issuing Operating Instructions."

Nevertheless, the phrase "as soon as possible" has created certain uncertainties for entities as to the timeframe under which they must take corrective action.

The Commission-approved TOP/IRO Reliability Standards, however, provide Reliability Coordinators, Balancing Authorities, and Transmission Operators the authority to set the appropriate timeframes for corrective action. If a Reliability Coordinator, Balancing Authority, or Transmission Operator issues an Operating Instruction directing other entities to take corrective action, the Operating Instruction would include a timeframe for such action. Similarly, if, as a result of an OPA, a Transmission Operator or Reliability Coordinator develops an Operating Plan to address actual or expected SOL or IROL exceedances, the Operating Plan could include the timeframe for any corrective action. The timeframes for any corrective action may thus be known to the entity required to take the action as well as the ERO in determining whether the applicable entities took corrective action on a timely basis.

This construct also improves reliability by assigning the responsibility to determine the appropriate timeframe to those functional entities with a wider view of the BES and greater understanding of the actions necessary to return the system to a secure and reliable state. As discussed above, Reliability Coordinators, Balancing Authorities, and Transmission Operators are responsible for monitoring and analyzing system conditions. As a result, these entities are in the best position to understand the appropriate timeframe for corrective action.

With the exception of IROL exceedances, the Commission-approved TOP/IRO Reliability Standards provide these entities the flexibility to develop the timeframe for corrective action based on their judgment of the facts and circumstances before them. As noted above, a uniform timeframe for all corrective action is not appropriate as different reliability issues present different levels of risks to reliable operation. Some issues require immediate attention to maintain reliability while others may be addressed on a longer time horizon. Nevertheless, Reliability Coordinators, Balancing Authorities, and Transmission Operators must set timeframes for corrective action consistent with their obligations under the Reliability Standards to maintain reliable operation. Should the Transmission Operator or Reliability Coordinator, for instance, identify an actual or expected SOL exceedance, they must develop and initiate a coordinated Operating Plan to mitigate the SOL exceedance that include timeframes for corrective action to mitigate a SOL exceedance. Although the TOP standards do not specify a timeframe by which Transmission Operators must mitigate SOL exceedances (that are not also IROL exceedances), the Transmission Operator must take action or direct others to take action on a timely basis or it could potentially violate its obligation to maintain reliability in its area (TOP-001-3, Requirement R1).

For IROL exceedances, TOP standards specifically require corrective action within 30 minutes. Reliability Standard TOP-001-3, Requirement R12 prohibits Transmission Operators from "operat[ing] outside any identified [IROL] for a continuous duration exceeding its associated IROL T_v," which is not to exceed 30 minutes. Accordingly, if a protective relay or equipment failure would cause an IROL exceedance, the Transmission Operator must take corrective action itself, or issue an Operating Instruction to another entity to take corrective action, within 30 minutes, if not sooner, or else the Transmission Operator would potentially violate TOP-001-3, Requirement R12.

2. <u>PRC-001-1.1(ii), Requirement R5</u>

The reliability objective of Requirement R5 of PRC-001-1.1(ii) to coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others is now primarily addressed by Reliability Standard TOP-003-3, as well as Reliability Standards TOP-001-3, TOP-002-4, IRO-008-2, IRO-010-2, and IRO-017-1. As discussed further below, these Reliability Standards collectively require coordination and analysis of changes in system conditions that would necessitate changes to, among other things, the Protection Systems of others.

Requirement R5 of PRC-001-1.1(ii) provides:

> **R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:
>
> > **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.
> >
> > **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.

Given the scope of Commission-approved Reliability Standard TOP-003-3, however, there is no longer a reliability need for a separate Requirement in PRC-001.1(ii) to address advanced notification of changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others. As further described above, TOP-003-3 provides a mechanism for Transmission Operators to obtain the data needed to fulfill their operational and planning responsibilities, including the data needed to support their OPAs, Real-time monitoring, and RTAs. Among other things, a Transmission Operator must receive data from other entities regarding changes in generation, transmission, load, or operating conditions that could affect its system, including any such changes that may necessitate modifications to its Protection Systems or RAS.

Without such data, a Transmission Operator cannot perform an OPA, consistent with TOP-002-4, to effectively projects system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. Similarly, without such data, a

Transmission Operator cannot perform an RTA, consistent with TOP-001-3, to effectively assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. A Transmission Operator must thus include in its data specifications a requirement that other entities, such as Generator Operators and other Transmission Operators, provide notice of any changes in generation, transmission, load, or operating conditions that may necessitate changes to its Protection Systems or RAS. NERC anticipates that, as part of its OPAs and RTAs, the Transmission Operator would, where necessary, verify whether any of the changes noted by Generator Operators or other Transmission Owners necessitate changes to its Protection Systems and RAS in order to maintain reliable operation. If any such changes are necessary, the Transmission Operator would include them in its Operating Plan or otherwise make the necessary changes to the Protection Systems or RAS to satisfy its obligation under TOP-001-3, Requirement R1 to take action to maintain reliability in its area.

Additionally, the data specification requirements in IRO-010-2 and the obligations in IRO-008-2 that Reliability Coordinators perform OPAs and develop coordinated Operating Plans, where necessary, further the reliability objective of Requirement R5 of PRC-001.1(ii) by including coordination with the next-day Operating Plans provided by Transmission Operators and Balancing Authorities. Like the Transmission Operator, the Reliability Coordinator has an obligation to evaluate system conditions in the day-ahead timeframe (i.e., OPAs) and in Real-time (i.e., RTAs) pursuant to IRO-008-2 and obtain data from other functional entities to perform those evaluations pursuant to IRO-010-2. Under these standards, the Reliability Coordinator must receive data on changes to generation, transmission, load or operating conditions and evaluate, via OPAs and RTAs, whether any action is necessary to maintain reliability, including making changes to Protection Systems and RAS.

The outage coordination requirements of IRO-017-1 also enhance coordination between functional entities. Reliability Standard IRO-017-1 (Outage Coordination) is a new Reliability Standard designed to ensure that outages are properly coordinated in the operations planning time horizon and Near-Term Transmission Planning Horizon. The Reliability Coordinator must establish an outage coordination process that, among other things, provides for the communication of outage schedules, assignment of coordination responsibilities, and evaluation of the impact of transmission and generation outages. The process helps identify whether any outages necessitate changes in Protection Systems or RAS. Outage information is also an input to OPAs and RTAs.

3. PRC-001-1.1(ii), Requirement R6

Pursuant to PRC-001-1.1(ii), Requirement R6, Transmission Operators and Balancing Authorities must monitor the status of each SPS in their area and notify affected Transmission Operators and Balancing Authorities of any change in status. This reliability objective is now addressed in approved Reliability Standards TOP-001-3 and TOP-003-3, making a separate requirement in PRC-001-11(ii) unnecessary. Specifically, Requirements R10 and R11 of TOP-001-3 create an affirmative obligation for Transmission Operators and Balancing Authorities to monitor the status of SPS. Specifically, TOP-001-3, Requirements R10 and R11 provide as follows:

> **R10.** Each Transmission Operator shall perform the following as necessary for determining [SOL] exceedances within its Transmission Operator Area:
>
> **10.1.** Within its Transmission Operator Area, monitor Facilities and the status of Special Protection Systems, and
>
> **10.2.** Outside its Transmission Operator Area, obtain and utilize status, voltages, and flow data for Facilities and the status of Special Protection Systems.
>
> **R11.** Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Special Protection Systems that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

The Commission-approved IRO standards also improve upon Requirement R6 of PRC-001-1.1(ii) by requiring the Reliability Coordinator to monitor the status of SPS. Specifically, IRO-002-4, Requirement R3 provides:

> **R3.** Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

With respect to the notification element of Requirement R6 of PRC-001-1.1(ii), the data specification Requirements in TOP-003-3 and IRO-010-2 require entities to provide "notification of current Protection System and Special Protection System status or degradation that impacts System reliability." A separate requirement in PRC-001-1.1(ii) requiring these notifications is therefore unnecessary.

D. Resolution of Outstanding Commission Directives Related to PRC-001-1.1(ii)

In Order No. 693, the Commission approved Reliability Standard PRC-001-1 and also issued certain directives related to the meaning of the phrases "corrective action" and "as soon as possible" in Requirement R2.[53] Accordingly, the scope of Project 2007-06.2 included consideration of outstanding Commission directives from Order No. 693 related to PRC-001-1.1(ii). The following is a description of each of the Commission's outstanding directives and a discussion of the manner in which the TOP/IRO Reliability Standards approved in Order No. 817 address each of those directives.

Clarifying the Term Corrective Action: In Order No. 693, paragraphs 1439-1441, the Commission directed NERC to clarify that the term "corrective action" refers to "transmission

[53] Order No. 693 at PP 1433-49.

operators taking operator control actions" and "does not refer to troubleshooting, repairing or replacing failed relays or equipment" performed by field maintenance personnel.[54] As discussed above, NERC proposes to retire Requirement R2 of PRC-001-1.1(ii) as the new TOP/IRO standards address, in a more precise fashion, the reliability objective of requiring Transmission Operators and Generator Operators to take corrective action following protective relay or equipment failures. Pursuant to Reliability Standards TOP-001-3, Requirements R1 and R2, and IRO-001-4, Requirement R1, each Transmission Operator, Balancing Authority, and Reliability Coordinator must "act to maintain the reliability of its [area] via direct actions or by issuing Operating Instructions." The focus on action "to maintain [] reliability" and Operating Instructions, which is defined as a "command by operating personnel responsible for Real-time operation…to change or preserve the state, status, output, or input" of an Element or Facility of the BES, clarifies that the required action relates to operator control actions done on a timely basis to support reliable operations, not long-term action such as replacing failed relays and equipment.

Time for Corrective Action: In paragraphs 1444-1445 and 1449 of Order No. 693, the Commission discussed the appropriate timeframe for "corrective action" and directed NERC to develop a modification to PRC-001 to clarify the timeframe for taking corrective action. The Commission stated that the requirement for System Operators to take corrective action when protective relay or equipment failure reduces system reliability should be treated the same as the requirement for returning a system to a secure and reliable state after an IROL violation, i.e., as soon as possible, but no longer than 30 minutes after a violation as a longer time limit would place an entity in violation of relevant IROL or TOP Reliability Standards.[55] As discussed above, the

[54] Order No. 693 at PP 1439-41. Operator control actions include removing the facility without protection from service, generation re-dispatch, transmission re-configuration, etc.

[55] *Id*. at PP 1443, 1449.

timeframes for corrective action when protective relay or equipment failure reduces system reliability are now addressed in the TOP/IRO standards. Those standards, as approved by Commission, provide Reliability Coordinators, Balancing Authorities, and Transmission Operators the authority to set the appropriate timeframes for corrective action, although those timeframes must be consistent with their other requirements, including their affirmative obligation to maintain reliability in their area and not to operate outside of an IROL for longer than 30 minutes.

Timeframe for Notification of Failures: The Commission also directed NERC to modify the standard to determine a timeframe under which Generator Operators and Transmission Operators must provide the notifications of protective relay or equipment failures.[56] As discussed above, the timeframe for these notifications is now established in the data specifications required in TOP-003-3 and IRO-010-2. The periodicity and deadlines in the Transmission Operator's, Balancing Authority's, and Reliability Coordinator's data specifications must be set to allow those entities to perform their functional obligations. For instance, if certain data, such as the status of Protection Systems and RAS, is needed to perform an RTA, it must be provided every 30 minutes as Reliability Coordinators and Transmission Operators must perform RTAs every 30 minutes.[57]

PRC-001 Measures and VSLs: The Commission directed NERC to correct certain references in the Measures and VSLs to non-existent requirements.[58] As NERC proposes the retirement of PRC-001-1.1(ii), there is no need to correct these references.

E. Enforceability of the Proposed Reliability Standards

The proposed Reliability Standards include VRFs and VSLs. The VRFs and VSLs provide guidance on the way that NERC will enforce the requirements of the proposed Reliability Standards. The VRFs and VSLs for the proposed Reliability Standards comport with NERC and Commission guidelines related to their assignment. Exhibit F provides a detailed review of the VRFs and VSLs, and the analysis of how the VRFs and VSLs were determined using these guidelines.

The proposed Reliability Standards also include measures that support each requirement by clearly identifying what is required and how the ERO will enforce the requirement. These measures help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.[59]

V. EFFECTIVE DATE

NERC respectfully requests that the Commission approve the proposed Reliability Standards and definitions, and the retirement of PRC-001-1.1(ii) to become effective as set forth in the proposed Implementation Plans, provided in Exhibit B hereto. The proposed Implementation Plans for proposed Reliability Standards PER-006-1 and PRC-027-1, provided in Exhibit B hereto, provide that the proposed standards and definitions shall become effective on the first day of the first calendar quarter that is 24 months following the effective date of the Commission's order approving the standards. The 24-month implementation period will provide applicable entities sufficient time to (1) develop the training program required under proposed PER-006-1, (2) integrate the functions and limitations of Protection Systems and RAS into their OPAs and RTAs, and (3) develop and implement the process required by proposed PRC-027-1.

[59] Order No. 672 at P 327.

Applicable entities need to devote considerable resources to the development of the program and process required by the proposed standards and, in turn, require substantial lead time prior to implementation.

During the 24-month implementation period, entities must continue to comply with the Requirements in PRC-001-1.1(ii) until the proposed standards become effective, with the exception of Requirements R2, R5 and R6. Those Requirements, which, as discussed above, are being replaced by the TOP/IRO standards approved in Order No. 817, are proposed to be retired on March 31, 2017. The new TOP/IRO standards become effective on April 1, 2017.

VI. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- the proposed Reliability Standards and associated elements included in Exhibit A, effective as proposed herein;
- the proposed Implementation Plans included in Exhibit B;
- the proposed new and revised definitions to be incorporated into the NERC Glossary included in Exhibit A; and
- the retirement of Commission-approved Reliability Standard PRC-001-1.1(ii), effective as proposed herein.

Respectfully submitted,

/s/ Shamai Elstein

Counsel for the North American Electric Reliability Corporation

Date: September 2, 2016

Exhibit A

Proposed Reliability Standards and Definitions

Exhibit A-1

Proposed Reliability Standard PRC-027-1

A. Introduction

1. **Title:** **Coordination of Protection Systems for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner

   4.1.2. Generator Owner

   4.1.3. Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)

   4.2. Facilities: Protection Systems installed to detect and isolate Faults on BES Elements.

5. **Effective Date:** See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit model data for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.3.1. Provide the proposed Protection System settings to the owner(s) of the electrically joined Facilities.

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.3.3. Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

1.3.4. Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity established a process to develop settings for its Protection Systems, in accordance with Requirement R1.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[1] or,
- Option 3: Use a combination of the above.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

---

[1] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance with Requirements R1, R2, and R3, and Measures M1, M2, and M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.
R2.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option

				2, or Option 3, in accordance with Requirement R2.
R3.	N/A	N/A	N/A	The responsible entity failed to utilize the process established in accordance with Requirement R1.

Version History

Version	Date	Action	Change Tracking
1	November 5, 2015	Adopted by NERC Board of Trustees	New standard developed under Project 2007-06

Attachment A

The following Protection System functions[2] are applicable to Requirement R2 if: (1) available Fault current levels are used to develop the settings for those Protection System functions; and (2) those Protection System functions require coordination with other Protection Systems.

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions utilize current in their measurement to initiate tripping of circuit breakers. Changes in the magnitude of available Fault current can impact the coordination of these functions.
2. See the PRC-027-1 Supplemental Material section for additional information.

[2] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Purpose

The Purpose states: To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance reliability by isolating faulted equipment, reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. This standard requires that entities establish and implement a process to coordinate their Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current data upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults.

The reliability objective of this requirement is to have applicable entities establish a process to develop settings for coordinating their Protection Systems, such that they operate in the intended sequence during Faults. The parts that are included as elements of the process ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of settings.

This standard references various publications that discuss protective relaying theory and application. The description of "coordination of protection" is from the pending revision of IEEE Standard C37.113-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Entities may have differing technical criteria for the development of Protection System settings based on their own philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge; as such, a single definition or criterion for "Protection System coordination" is not practical.

The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. However, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the BES Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A review and update of short-circuit model data for the BES Elements under study.

The short-circuit study provides the necessary Fault currents used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners. Including a review and, if necessary, an update of short-circuit study information is necessary to ensure that information accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of a short-circuit study are only as accurate as the information that its calculations are based on.

A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. Because the results of short-circuit studies are used as the basis for protective device coordination studies, the short-circuit model should accurately reflect the physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances and Fault currents.

2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 A review of the developed Protection System settings.

A review of the Protection System settings prior to implementation reduces the possibility of introducing human error. A review is any systematic process of verifying the developed settings meet the technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures.

Part 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

Requirement R1, Part 1.3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.3.1 1.3.1. Provide the proposed Protection System settings to the owners of the electrically joined Facilities.

Requirement R1, Part 1.3.1 requires the entity to include in its process a provision to provide proposed Protection System settings to other entities. This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.3.2 requires the entity receiving proposed Protection System settings to include in its process a provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response indicating Protection System coordination issues were identified, or affirmation that no issues were identified.

Part 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.3.3 requires the entity to include in their process a provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability is minimized.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Note: There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgment. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. Further, there could be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

> **Part 1.3.4** Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2

This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[3] or,

[3] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

- Option 3: Use a combination of the above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six-calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which a BES Element is connected. Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. This option allows the entity to choose an interval of up to six-calendar years to perform the Fault current comparisons and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

As described in the footnote for Requirement R2, Option 2, an entity that elects to initially use Option 2 must establish its baseline prior to the effective date of the standard. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current baseline values can be updated or established when a Protection System Coordination Study is performed. The baseline values at each bus to which a BES Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject

Protection System. The footnote also states that the Fault current baselines may be established for BES generating resources at the generator, the BES aggregation point for dispersed power producing resources, or at the common point of connection at 100 kV or above.

> **Example:** Prior to the effective date of PRC-027-1, an entity intending to use Option 2 of Requirement R2 establishes an initial baseline; e.g., 10,000 amps at the bus to which the BES Element under study is connected. A short-circuit review performed on March 1, 2024, for example, identifies that the Fault current has increased to 11,250 amps (12.5 percent deviation); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next comparison (to be performed no later than December 31, 2030) remains at 10,000 amps because no study was required as a result of the initial comparison. During the next six-year interval, Fault current comparison identifies that the Fault current has increased to 11,500 (15 percent deviation); therefore, a Protection System Coordination Study is required (and must also be completed no later than December 31, 2030), and a new baseline of 11,500 amps would be established.
>
> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six-calendar-year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

The Protection System functions listed in Attachment A utilize AC current in their measurement to initiate tripping of circuit breakers and the coordination of these functions is susceptible to changes in the magnitude of available short-circuit Fault current. These functions are included in Attachment A based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. Examples of functions not included in Attachment A because they do not meet both of the criteria are differential relays and Fault detectors. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

The following provide additional information regarding the Protection System functions in Attachment A.

A “51 – AC inverse time overcurrent” relay connected to a CT on the neutral of a generator step-up transformer, referred to as “51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT Method)” in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are “51 – AC Inverse time overcurrent” relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a “50 – Instantaneous overcurrent” function used in conjunction with a “62 – Time-delay” function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed “21 – Distance” function, which is a “21 – Distance” function with a “62 – Time-delay” function. Another example would be a definite-time overcurrent function, which is a “50 – Instantaneous overcurrent” function with a “62 – Time-delay” function. A “50 – Instantaneous overcurrent” function used for supervising a “21 – Distance” function would not be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing “21 – Distance” functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is not used in determining the setting, “21 – Distance” functions would not be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, “21 – Distance” functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

The 67 – AC directional overcurrent function utilized in Protection Systems for Transmission lines can be instantaneous overcurrent, inverse time overcurrent, or both instantaneous overcurrent and inverse time overcurrent. For example, in a communication-aided directional comparison blocking (DCB) scheme, the instantaneous overcurrent function is set very sensitive. When a single line-to-ground Fault occurs on a Transmission line, the Fault is detected by a number of Protection Systems for other Transmission lines. Signals from communication equipment are transmitted and received to block the other Protection Systems for the non-faulted Transmission lines from operating, thereby providing the coordination. A 67 – AC directional overcurrent function used in a permissive overreaching transfer trip scheme (POTT) relies on a signal from the remote end to operate and, therefore, does not require coordination with other Protection Systems.

Instantaneous overcurrent and/or inverse time overcurrent for a 67 – AC directional overcurrent function are utilized in a non-communication-aided Protection System for Transmission lines. As communication is not used to prevent operation for Faults outside a Protection System’s zone of protection, coordination is necessary with other Protection Systems for buses, transformers, and other Transmission lines. The instantaneous overcurrent function should be set to not overreach the end of the Transmission line. The inverse time overcurrent function should be set to coordinate with the inverse time overcurrent function of other Protection Systems. Changes in the magnitude of available Fault current can affect the coordination.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes will be moved to this section.

Rationale for Requirement R1:

Coordinated Protection Systems enhance reliability by isolating faulted equipment, thus reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. The stated purpose of this standard is: "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults." Requirement R1 captures this intent by requiring responsible entities establish a process that, when followed, allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing Protection System settings.

Part 1.1 Reviewing and updating the short-circuit model data used to develop new or revised Protection System settings helps to assure that settings are developed using accurate, up-to-date information. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners.

Part 1.2 A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

Part 1.3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is essential to the reliability of the BES. Communication and review of proposed settings among these entities are necessary to identify potential coordination issues and address the issues prior to implementation of any proposed Protection System changes.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include provisions to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

Rationale for Requirement R2:

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires Transmission Owners, Generator Owners, and Distribution Providers to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Requirement R2 provides entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six-calendar years, a Protection System Coordination Study for each of its Protection Systems identified in Attachment A. The six-calendar-year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current-based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new BES Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. In a time interval not to exceed six-calendar years following the effective date of this standard, an entity must perform a Fault current comparison. If the comparison identifies a deviation less than 15 percent, no further action is required for that six-year interval; however, if the comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the BES Element is connected, the entity must also perform a Protection System Coordination Study during the same six-year interval. The baseline Fault current value(s) will be re-established whenever a new Protection System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current-based option for existing BES Elements as well as establishing baselines for new BES Elements by performing Protection System Coordination Studies. The footnote also states that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA).

Option 3 provides the entity the choice of using both the time-based and Fault current-based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current-based methodology for Protection Systems at other Facilities.

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

Exhibit A-2

Proposed Reliability Standard PER-006-1

A. Introduction

1. **Title:** **Specific Training for Personnel**

2. **Number:** **PER-006-1**

3. **Purpose:** To ensure that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the Bulk Electric System.

4. **Applicability:**

    4.1. Functional Entities:

    4.1.1. Generator Operator that has:

    4.1.1.1. Plant personnel who are responsible for the Real-time control of a generator and receive Operating Instruction(s) from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center.

5. **Effective Date:** See Implementation Plan for Project 2007-06.2.

B. Requirements and Measures

R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M1. Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training. This evidence may be documents such as training records showing successful completion of training that includes training materials, the name of the person, and date of training.

C. Compliance

1. **Compliance Monitoring Process**

    1.1. Compliance Enforcement Authority:

    "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

    1.2. Evidence Retention:

    The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Operator shall keep data or evidence of Requirement R1 for the current year and three previous calendar years.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Project 2007-06.2 Implementation Plan[1]

[1] http://www.nerc.com/pa/Stand/Project200706_2SystemProtectionCoordinationDL/Project_2007_06_2_Imp_Plan_Draft_1_2016_03_10_Clean.pdf

Version History

Version	Date	Action	Change Tracking
1	August 11, 2016	Adopted by the NERC Board of Trustees	New standard developed under Project 2007-06.2

Guidelines and Technical Basis

Requirement R1

The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, applicable plant personnel responsible for Real-time control of a generating Facility must be trained on how the operational functionality of Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility. Although, training does not have to be Facility-specific, the standard applies to plant operating personnel associated with the specific Facility to which they have Real-time control. This does not include plant personnel not responsible for Real-time control (e.g., fuel or coal handlers, electricians, machinists, or maintenance staff).

A periodicity for training is not specified in Requirement R1 because the GOP must ensure its plant personnel who have Real-time control of a generator are trained. The Generator Operator must also ensure it provides applicable training that results from changes to the operational functionality of the Protection Systems and Remedial Action Schemes that affect the output of the generation Facility(ies).

The phrase "operational functionality" focuses the training on how Protection Systems operate and prevent possible damage to Elements. It also addresses how RAS detects pre-determined BES conditions and automatically takes corrective actions.

Considerations for operational functionality may include, but are not limited to the following:

- Purpose of protective relays and RAS
- Zones of protection
- Protection communication systems (e.g., line current differential, direct transfer trip, etc.)
- Voltage and current inputs
- Station dc supply associated with protective functions
- Resulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions

Requirement R1 focuses on the operational functionality of Protection Systems and Remedial Action Schemes specific to the generating plant and not the Bulk Electric System.

This requirement focuses on those systems that are related to the electrical output of the generator. Protective systems which trip breakers serving station auxiliary loads (e.g., such as pumps, fans, or fuel handling equipment) are not included in the scope of this training. Furthermore, protection of secondary unit substation (SUS) or low voltage switchgear transformers and relays protecting other downstream plant electrical distribution system components are not in the scope of this training, even if a trip of these devices might eventually result in a trip of the generating unit.

Rationale

Rationale for Requirement R1: Protection Systems and Remedial Action Schemes (RAS) are an integral part of reliable Bulk Electric System (BES) operation. This requirement addresses the reliability objective of ensuring that Generator Operator (GOP) plant operating personnel understand the operational functionality of Protection Systems and RAS and their effects on generating Facilities.

Proposed Definitions

Clean Version of Proposed Definitions

Proposed Definitions

Project 2007-06 System Protection Coordination
Project 2007-06.2 Phase 2 of System Protection Coordination

Proposed Definitions

This section includes the three proposed new or modified definitions that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval, in accordance with the associated implementation plan.

New or Modified Term(s) for Glossary of Terms Used in NERC Reliability Standards

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Operational Planning Analysis (OPA)

An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to: load forecasts; generation output levels; Interchange; known Protection System and Remedial Action Scheme status or degradation, functions, and limitations; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Real-time Assessment (RTA)

An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load; generation output levels; known Protection System and Remedial Action Scheme status or degradation, functions, and limitations; Transmission outages; generator outages; Interchange; Facility Ratings; and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Effective Date of New or Revised Standards

PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Reliability Standard PRC-027-1 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and PER-006-1, and the proposed definitions for "Operational Planning Analysis" and "Real-time Assessment." NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and PER-006-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).

authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for New or Modified NERC Glossary Terms

The NERC Glossary Term "Protection System Coordination Study" shall become effective on the effective date for PRC-027-1.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

PRC-001-1.1(ii) – System Protection Coordination shall be retired at midnight of the day immediately prior to the day that PER-006-1 and PRC-027-1 become effective.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Exhibit B-2

Implementation Plan for Project 2007-06.2 – Phase 2 of System Protection Coordination

Implementation Plan

Project 2007-06.2 Phase 2 of System Protection Coordination

Requested Approvals

- PER-006-1 – Specific Training for Personnel
- Definition of "Operational Planning Analysis"
- Definition of "Real-time Assessment"

Requested Retirements

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Applicable Entities

- Generator Operator (applicable to PER-006-1 only)
- Reliability Coordinator (applicable to definitions only)
- Transmission Operator (applicable to definitions only)

General Considerations

There are a number of factors that influence the determination of the implementation period for the proposed standard and revised definitions. The following factors address the Balancing Authority, Generator Operator, and Transmission Operator:

1. The effort and resources by the Generator Operator to provide training to plant personnel to address the operational functionality of Protection Systems and Remedial Action Schemes at individual generating Facilities in PER-006-1 that the Generator Operator may not have been addressing under PRC-001-1.1(ii), Requirement R1.

2. Maintain consistency with the Implementation Plan of the approved Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards[2] that are applicable to the Balancing Authority and Transmission Operator. This

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and PER-006-1, and the proposed definitions for "Operational Planning Analysis" and "Real-time Assessment." NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and PER-006-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).
[2] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

project explains how the retirement of PRC-001-1.1(ii) Requirements R1, R2, R5, and R6 are addressed by the TOP/IRO sets standards.

3. Maintaining consistency with the Implementation Plan of the approved TOP/IRO standards[3] that are applicable to the Balancing Authority and Transmission Operator in the application of the revised definitions of "Operational Planning Analysis" and "Real-time Assessment" (effective January 1, 2017) in the *NERC Glossary of Term Used in NERC Reliability Standards*. See the Project 2007-06.2 Mapping Document for additional details.

4. The amount of time needed by the Transmission Operator in PRC-001-1.1(ii), Requirement R1 and Reliability Coordinator (not applicable to PRC-001-1.1(ii)) to train on Protection Systems and Remedial Action Schemes in order to be capable of integrating their functions and limits into their Operational Planning Analysis and Real-time Assessment.

Effective Dates

PER-006-1 – Specific Training for Personnel

Where approval by an applicable governmental authority is required, Reliability Standard PER-006-1 – Specific Training for Personnel shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Operational Planning Analysis and Real-time Assessment

Where approval by an applicable governmental authority is required, the definitions "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) in the NERC Glossary of Terms Used in NERC Reliability Standards shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the definition, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

Requirement R1

PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 shall be retired immediately prior to the effective date of PER-006-1 (*Specific Training for Personnel*) and the revised definitions of

[3] Id.

"Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), or as otherwise provided for by an applicable governmental authority.

Requirement R2, R5, and R6

PRC-001-1.1(ii) – System Protection Coordination, Requirement R2, R5, and R6 shall be retired at midnight of March 31, 2017, or as otherwise provided for by an applicable governmental authority.

Requirements R3 and R4

See Project 2007-06 System Protection Coordination Implementation Plan.[4]

Retirement of Existing Standards and Definitions

The currently-approved definitions of "Operations Planning Analysis" and "Real-time Assessment" shall be retired immediately prior to the effective date of the revised definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), or as otherwise provided for by an applicable governmental authority.

[4] http://www.nerc.com/pa/Stand/Project%20200706%20System%20Protection%20Coordination%20DL/Implementation_Plan_PRC-027-1_clean_10012015.pdf

Exhibit C

Order No. 672 Criteria

EXHIBIT C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standards meet or exceed the criteria.

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]**

The proposed Reliability Standards achieve the specific reliability goals of: (1) maintaining the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System ("BES") Elements, such that those Protection Systems operate in the intended sequence during Faults; and (2) requiring registered entities to provide training to their relevant personnel on Protection Systems and Remedial Action Schemes ("RAS") to help ensure that the BES is reliably operated. The proposed Reliability Standards articulate clear objectives for each of the areas.

2. **Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]**

The proposed Reliability Standards are clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. The proposed Reliability

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at PP 321, 324.

[3] Order No. 672 at PP 322, 325.

Standards clearly articulate the actions that applicable entities must take to comply with the standards.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standards comport with NERC and Commission guidelines related to their assignment, as discussed further in Exhibit F. The assignment of the severity level for each VSL is consistent with the corresponding requirement. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standards include clear and understandable consequences in accordance with Order No. 672.

4. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner. [5]

The proposed Reliability Standards contain measures that support each requirement by clearly identifying what is required to demonstrate compliance. These measures help provide clarity regarding the manner in which the requirements will be enforced, and help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

---

4 Order No. 672 at P 326.

5 Order No. 672 at P 327.

5. **Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]**

The proposed Reliability Standards achieve the reliability goals effectively and efficiently in accordance with Order No. 672. The proposed Reliability Standards clearly articulate the objectives that applicable entities must meet and provide entities the flexibility to tailor their processes and plans required under the standard to best suit the needs of their organization.

6. **Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]**

The proposed Reliability Standards do not reflect a "lowest common denominator" approach. To the contrary, the proposed Reliability Standards contains significant benefits for the Bulk-Power System. The requirements of the proposed Reliability Standards help ensure that entities coordinate their Protection Systems with neighbors and are familiar with the operational functionality of the relevant Protection Systems and RAS.

7. **Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]**

The proposed Reliability Standards apply throughout North America and do not favor one geographic area or regional model.

---

[6] Order No. 672 at P 328.

[7] Order No. 672 at P 329-30.

[8] Order No. 672 at P 331.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

The proposed Reliability Standards have no undue negative impact on competition. The proposed Reliability Standards require the same performance by each applicable entity. The standards do not unreasonably restrict the available transmission capability or limit use of the Bulk-Power System in a preferential manner.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The proposed effective dates for the proposed Reliability Standards are just and reasonable and appropriately balance the urgency in the need to implement the standard against the reasonableness of the time allowed for those who must comply to develop and implement the necessary procedures and policies. The proposed implementation periods will allow applicable entities adequate time to meaningfully implement the requirements. The proposed effective dates are explained in the proposed Implementation Plan, attached as Exhibit B.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standards were developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards. Exhibit G includes a summary of the development proceedings, and details the processes followed to develop the proposed Reliability Standards. These processes included, among other things, comment and balloting periods. Additionally, all meetings of the drafting

---

9 Order No. 672 at P 332.

10 Order No. 672 at P 333.

11 Order No. 672 at P 334.

team were properly noticed and open to the public. The initial and additional ballots achieved a quorum and exceeded the required ballot pool approval levels.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has identified no competing public interests regarding the request for approval of the proposed Reliability Standards. No comments were received that indicated the proposed Reliability Standards conflicts with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

No other negative factors relevant to whether the proposed Reliability Standards are just and reasonable were identified.

Mapping Document for Project 2007-06 System Protection Coordination

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Mapping of Requirements from PRC-001-1.1(ii) to PRC-027-1

Project 2007-06 System Protection Coordination

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.	Being proposed to be moved to a new TOP Reliability Standard by Project 2007-06.2 Phase 2: System Protection Coordination	N/A
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	Being proposed for retirement by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. • Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition. R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.	PRC-027-1: Requirements R1 and R2 Note: Applicability changed to GO, TO and DP	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: 1.1 A review and update of short-circuit models for the BES Elements under study. 1.2 A review of the developed Protection System settings. 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to: 1.3.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities. 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified. 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		associated BES Elements are addressed prior to implementation. 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during: 1.3.4.1. Implementation or commissioning. 1.3.4.2. Misoperation investigations. 1.3.4.3. Maintenance activities. 1.3.4.4. Emergency replacements made due to failures of Protection System components. R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: • Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or • Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years; or • Option 3: A combination of the above. R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.
R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.	PRC-027-1: Requirements R1 and R2 Note: Applicability changed to GO, TO and DP	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: 1.1 A review and update of short-circuit models for the BES Elements under study. 1.2 A review of the developed Protection System settings. 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to: 1.3.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified. 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation. 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during: 1.3.4.1. Implementation or commissioning. 1.3.4.2. Misoperation investigations. 1.3.4.3. Maintenance activities. 1.3.4.4. Emergency replacements made due to failures of Protection System components. R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		with Protection System functions identified in Attachment A: • Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or • Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years; or • Option 3: A combination of the above. R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.
R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others: R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could	Being proposed for retirement by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
require changes in the Transmission Operator's Protection Systems. R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.		
R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Remedial Action Scheme in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.	Being proposed for retirement by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Exhibit D-2

Mapping Document for Project 2007-06.2 – Phase 2 of System Protection Coordination

Mapping Document

Project 2007-06.2 Phase 2 of System Protection Coordination

Revisions or Retirements to Already Approved Standards

This mapping document explains how each of the existing Requirements (R1, R2, R5, and R6) of PRC-001-1.1(ii) (*System Protection Coordination*)[1] are being revised or retired. If a requirement is being proposed for revision, the revised, new, and/or supporting requirement(s) will be identified in the center column. If a requirement is being proposed for retirement, the center column will describe the proposed action and any requirement(s) used to support the action. Revisions and retirements will be accompanied by an explanation or justification listed in the right column. Capitalized terms, unless otherwise noted, are those found in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary").[2] References to regulatory directives are specifically related to Order No. 693 ("Order").[3] Standards or definitions listed as "existing" are enforceable and those listed as "approved" have been adopted by the NERC Board of Trustees and approved by the Federal Energy Regulatory Commission ("FERC"). Check the NERC website for effective dates. The functional entities discussed in the mapping document are the Balancing Authority (BA), Generator Operator (GOP), Planning Coordinator (PC), Reliability Coordinator (RC), Transmission Operator (TOP), and Transmission Planner (TP). The term "TOP/IRO" refers to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) sets of Reliability Standards that were filed under NERC Project 2014-03 – Revisions to TOP and IRO Standards[4] and approved by FERC.[5] The explanation herein assumes that the term, "Special Protection

[1] Federal Energy Regulatory Commission (FERC) approved PRC-001-1.1(ii), effective May 29, 2015.

System"[6] (SPS) will be replaced by the term "Remedial Action Scheme"[7] (RAS). In the referenced Reliability Standards herein the term SPS may be replaced by RAS; therefore, the term RAS will be used in the "Comments" column throughout.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing)[8,9] **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be	PRC-001-1.1(ii), Requirement R1 is proposed for retirement.	**Introduction** The reliability objective of PRC-001-1.1(ii), Requirement R1 is to ensure that the BA,

[6] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Special Protection System is defined as "[a]n automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme."

[7] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), the proposed definition of Remedial Action Scheme is defined as "[a] scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as: Meet requirements identified in the NERC Reliability Standards; Maintain Bulk Electric System (BES) stability; Maintain acceptable BES voltages; Maintain acceptable BES power flows; Limit the impact of Cascading or extreme events." See definition for additional information on the definition of RAS.

[8] Order No. 693 at P 1418. "Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems."

[9] Order No. 693 at P 1435. "Protection systems on Bulk-Power System elements are an integral part of reliable operations. They are designed to detect and isolate faulty elements on a power system, thereby limiting the severity and spread of disturbances and preventing possible damage to protected elements. If a protection system can no longer perform as designed because of a failure of its relays, system reliability is reduced or threatened. In deriving SOLs and IROLs, moreover, the functions, settings, and limitations of protection systems are recognized and integrated. Systems are only reliable when protection systems perform as designed. This is what PRC-001-1 means in linking a reduction in system reliability with a protection relay failure or other equipment failure."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
familiar with the purpose and limitations of Protection System schemes applied in its area. **Operational Planning Analysis (Approved)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages;	Being "familiar with the purpose and limitations of Protection System schemes" will be clarified as (1) being "familiar with their purpose," and (2) being "familiar with their limitations" as follows: • The phrase "Protection systems schemes" maps to the NERC Glossary terms of Protection Systems and Remedial Action Schemes. • Being "familiar with the purpose" is addresses by existing and proposed training standards. • Being "familiar with the limitations" together with the clarification found in Order No. 693 at P 1418 and P 1435 along with the revised	GOP, and TOP are "familiar with the purpose and limitations of Protection System[12] schemes applied in its area." The reliability objective of the phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 is also intended to include RAS. The functions and limitations of a Protection Systems and RAS are critical in establishing System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL) such that the Bulk Electric System[13] (BES) is operated within these limits. The following explains how being familiar with the purpose and limitations of Protection Systems and RAS will be addressed according to issue beginning with

[12] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Protection System is defined as:
"Protection System -
- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."

[13] See Glossary of Terms Used in NERC Reliability Standards (updated December 7, 2015).

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Real-time Assessment (Approved)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	definitions of NERC Glossary defined terms of Operational Planning Analysis and Real-time Assessment address the reliability objective of PRC-001-1.1(ii), Requirement R1 as explained in the Comments column to the right. **PER-006-1 (New)** **4.** Applicability: **4.1.** Functional Entities: **4.1.1.** Generator Operator that have: **4.1.1.1.** Plant personnel who are responsible for the Real-time control of a generator and receive direction from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This does not include personnel at a centrally located dispatch center.	"familiarity with their limitations" and then "familiarity with their purpose." **Familiar with their limitations** When the BA, GOP, and TOP are familiar with the limitations of Protection Systems and RAS, the entities are able to operate the BES in such a manner that Protection Systems and RAS will be operated within their limits and be able to detect and isolate faulty Elements, thereby, limiting the severity and spread of system disturbances, and preventing possible damage to protected Elements. When the GOP is familiar with the operational functionality of Protection Systems and RAS by being trained on how Protection Systems operate and prevent possible damage to Elements, the GOP is capable of operating to its full capability within its area, meaning the output of its generation Facilities. When the BA is familiar with the limitations of Protection Systems and RAS, it is capable

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. **PER-003-1 (Existing)** **R1.** Each Reliability Coordinator shall staff its Real-time operating positions performing Reliability Coordinator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining a valid NERC Reliability Operator certificate: **1.1.** Areas of Competency **1.1.1.** Resource and demand balancing **1.1.2.** Transmission operations **1.1.3.** Emergency preparedness and operations	of maintaining generation, Load, and Interchange balance. The BA ensures that RAS in its area are enabled when needed for system reliability. When the TOP is familiar with limitations of Protection Systems and RAS, it will be capable of identifying when system reliability is reduced or threatened. In operating to established SOLs and IROLs, it is important that the functions and limitations of Protection Systems and RAS are recognized and integrated by the TOP into operating the BES reliably. The BES is only reliable when Protection Systems and RAS perform within their limitations. **Familiarity with the Purpose** Familiarity with the purpose of Protection Systems and RAS is achieved through training, as explained below, according to each applicable entity (BA, GOP, and TOP) in PRC-001-1.1(ii) and the RC that is not applicable to this standard, but has been

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.1.4. System operations **1.1.5.** Protection and control **1.1.6.** Voltage and reactive **1.1.7.** Interchange scheduling and coordination **1.1.8.** Interconnection reliability operations and coordination **R2.** Each Transmission Operator shall staff its Real-time operating positions performing Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificates: **2.1.** Areas of Competency **2.1.1.** Transmission operations **2.1.2.** Emergency preparedness and operations **2.1.3.** System operations **2.1.4.** Protection and control	included to address a potential gap in reliability. **Familiarity with the Purpose (GOP)** For the GOP, the Reliability Standard PER-006-1 (*Specific Training for Personnel*) proposes to replace PRC-001-1.1(ii), Requirement R1. The PER-006-1 standard identifies applicable GOP personnel that are responsible for the Real-time control of a generator and that receive Operating Instructions from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This applicability removes ambiguity over which personnel of the GOP are intended to be familiar with the purpose Protection Systems and RAS. Centrally located personnel are not included here because they are addressed by PER-005-2 (*Operations Personnel Training*). Personnel at centrally located dispatch centers will receive company-specific Protection System and RAS training, if identified, as a reliability-

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	2.1.5. Voltage and reactive **2.2.** Certificates • Reliability Operator • Balancing, Interchange and Transmission Operator • Transmission Operator **R3.** Each Balancing Authority shall staff its Real-time operating positions performing Balancing Authority reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificate: **3.1.** Areas of Competency **3.1.1.** Resources and demand balancing **3.1.2.** Emergency preparedness and operations **3.1.3.** System operations **3.1.4.** Interchange scheduling and coordination	related task via the PER-005-2, Requirement R6. Here the GOP must use "…a systematic approach to develop and implement training to its personnel identified in Applicability Section 4.1.5.1. of this standard, on how their job function(s) impact the reliable operations of the BES during normal and emergency operations." Being trained using a systematic approach on the purpose (i.e., functions, including limitations) Protection Systems and RAS will enable the GOP centrally located dispatch personnel to ensure reliable operation of its Facilities on the BES. The phrase "…purpose and limitations…" in PRC-001-1-1(ii), Requirement R1 is addressed in the proposed Requirement R1 through the use of "operational functionality." The phrase "operational functionality" as described in the PER-006-1 – Supplemental Material describes that training is expected to cover how Protection Systems operate within their limitations and prevent possible damage to Elements. It also

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	3.2. Certificates • Reliability Operator • Balancing, Interchange and Transmission Operator • Balancing and Interchange Operator **PER-005-2 (Approved)** **R1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use a systematic approach to develop and implement a training program for its System Operators as follows: **1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall create a list of Bulk Electric System (BES) company-specific Real-time reliability-related tasks based on a defined and documented methodology. **1.1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall review, and update if necessary, its list of BES company-specific Real-time reliability-	addresses how RAS detect pre-determined BES conditions and automatically take corrective actions. The criteria that comprises operational functionality mirror the components listed under the NERC Glossary term "Protection System." By doing so, reduces the ambiguity of the phrase "purpose and limitations." The phrase "…applied in its area" is addressed by the PER-006-1 by using "…that affect the output of the generating Facility it operates." Lastly, the proposed PER-006-1 Requirement R1 includes both Protection Systems and RAS to eliminate confusion over the phrase "Protection System schemes." **Familiarity with the Purpose (BA)** For the BA, the PRC-001-1.1(ii), Requirement R1 is proposed for retirement on the basis that the BA obtains an appropriate level of familiarity with the purpose of Protection

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	related tasks identified in part 1.1 each calendar year. **1.2.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall design and develop training materials according to its training program, based on the BES company-specific Real-time reliability-related task list created in part 1.1. **1.3.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver training to its System Operators according to its training program. **1.4.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation each calendar year of the training program established in Requirement R1 to identify any needed changes to the training program and shall	Systems and RAS under PER-003-1 (*Operating Personnel Credentials*), Requirement R3 and PER-005-2, Requirements R1, R3, R4, and R5 as explained below in detail. The BA is certified under PRC-003-1 as a System Operator.[14] Although there is no specific area of competency for protection and control similar to the Reliability Coordinator and Transmission Operator certifications, the NERC *Balancing and Interchange Operator Certification Exam Content Outline 2015*[15] (BI Exam) does contain the same five topics applicable to RC and less one topic applicable to the TOP. The topic that is not included is to "analyze relay targets, fault locaters and fault recorders to determine a proper restoration plan" and is not germane to BA operations. The job-task

[14] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operator is defined as: An individual at a Control Center of a Balancing Authority, Transmission Operator, or Reliability Coordinator, who operates or directs the operation of the Bulk Electric System (BES) in Real-time.

PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing	PRC-001-1.1(ii), Requirements R2, R2.1., and R2.2. are proposed for retirement. Corrective action in Requirements R2, R2.1. and R2.2. is covered by: **TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission	**Introduction – Corrective Action** The directive at P 1449 (#3) of the Order states that: "…transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements…" This directive is addressed in the TOP/IRO standards that were developed since the Order was issued because the BA, RC, and TOP can issue Operating Instructions[22] to maintain the reliability of its respective area. The following describes how the TOP/IRO Reliability Standards achieve the reliability objective with regard to "corrective actions." **Corrective Action by the GOP – R2.1.** TOP-003-3 (*Operations Reliability Data*)

[22] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Instruction is defined as "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Authorities. The Transmission Operator shall take corrective action as soon as possible. **PRC-001-1.1(ii) (Existing)**	Operator Area via its own actions or by issuing Operating Instructions. **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. **TOP-003-3 (Approved)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the GOP because the TOP will be aware of current Protection System and SPS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the TOP receives such notification. TOP-001-3 (*Transmission Operations*) Furthermore, the TOP will act to maintain the reliability of its Transmission Operator Area[23] (TOP Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R1. TOP-003-3 (*Operations Reliability Data*)

[23] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Transmission Operator Area is defined as "[t]he collection of Transmission assets over which the Transmission Operator is responsible for operating."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Similarly, TOP-003-3, Requirement R2 and part 2.2. that was developed since the Order was issued, addresses corrective action by the GOP because the BA (i.e., Host BA[24]) will be aware of current Protection System and RAS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the BA receives such notification. The BA will act to maintain the reliability of its Balancing Authority Area[25] (BA Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R2. **Corrective Action by the TOP – R2.2.** TOP-003-3 (*Operations Reliability Data*)

[24] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Host Balancing Authority is defined as:

1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries.
2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.

[25] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area."

		Coordinator Area[26] (RC Area) by issuing Operating Instructions.
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing	PRC-001-1.1(ii), Requirements R2, R2.1, and R2.2. are proposed for retirement. The time frame for corrective action in Requirements R2, R2.1. and R2.2. is covered by:	**Introduction – Time frame for corrective actions** The directive at P 1441 directs the ERO to clarify the term "corrective action" consistent with the discussion in the Order when it modifies PRC-001-1 in the Reliability Standards development process. The reasoning for addressing a time frame for corrective actions is amplified in P 1443 of the Order, which states that: "As explained above *[in the previous paragraphs of the Order*], the requirement for system operators to take corrective control action when protective relay or equipment failure reduces system reliability should be treated the same as the requirement for returning a system to a secure and reliable state after an

[26] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Authorities. The Transmission Operator shall take corrective action as soon as possible. **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its		Interconnection Reliability Operating Limit (IROL) violation, i.e., as soon as possible, but no longer than 30 minutes after a violation. A longer time limit would place an entity in violation of relevant IROL or TOP Reliability Standards."[27] At P 1444 of the Order, FERC directed NERC to consider the comments of the California PUC regarding the term "as soon as possible" as applicable to the maximum time frame for corrective action through the Standards development process. At P 1445 of the Order, FERC directed NERC, through the Reliability Standards development process, to determine the appropriate amount of time after the detection of relay failures, in which relevant transmission operators must be informed of such failures.

[27] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Interconnection Reliability Operating Limit is defined as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.	The Order at P 1449 (#3) directs NERC to clarify that, after being informed of failures in relays or protection system elements that threaten reliability of the Bulk-Power System, transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes after they receive notice of the failure. **PRC-001-1.1(ii), R2.1. & R2.2. (time frame for corrective actions)** For the reasons explained below, a less than one-hour time frame criteria for corrective action will achieve the reliability objective directed in the Order at P 1441, 1444, 1445, and 1449 (#2 and #3). TOP-001-3 (*Transmission Operations*)

Standard: PRC-001-1.1(ii) – System Protection Coordination

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the	**R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.	Requirement R13 requires the TOP to ensure that a Real-time Assessment[28] ("RTA") is performed at least once every 30 minutes and initiate its Operating Plan[29] to mitigate a System Operating Limit[30] (SOL) exceedance identified as part of its Real-time[31] monitoring or RTA in TOP-001-3, Requirement R14. The RTA requires inputs to include current Protection System and RAS status (change in status is implied) or

[28] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Real-time Assessment is defined as "[a]n evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"

[29] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Plan is defined as "[a] document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan."

[30] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operating Limit is defined as "The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings)
- Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)"

[31] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), Real-time is defined as "[p]resent time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)"

	System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment.	which would include inputs from Protection System and RAS status (change in status is implied) or degradation that are necessary to maintain generation-Load-Interchange balance. TOP-003-3, Requirement R4 mandates the BA distribute its documented specification to those entities that have the required data, which includes the BA, RC, and TOP. TOP-003-3, Requirement R5 builds upon the previous Requirements R1, R2, R3, and R4 described above. Requirement R5 mandates that any TOP that receives a data specification (pursuant to Requirement R3 or R4) satisfy the obligations of the documented specifications using: a mutually agreeable format, a mutually agreeable process for resolving data conflicts, and a mutually agreeable security protocol. **Common to both the GOP and TOP** IRO-010-2 (*Reliability Coordinator Data Specification and Collection*)

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	IRO-010-2 (Approved) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Requirement R1, mandates the RC have a documented specification for the data necessary for the RC to perform an OPA, Real-time monitoring, and RTA. Both the OPA and RTA, by definition, require an evaluation to reflect inputs from known Protection System and RAS status (change in status is implied) or degradation (including failure). IRO-010-2, Requirement R2 mandates the RC distribute its documented specification to those entities that have the required data, which includes the BA, RC, and TOP. IRO-010-2, Requirement R3 builds upon the previous Requirements R1 and R2 described above. Requirement R3 mandates that a TOP that receives a data specification (pursuant to Requirement R2) satisfy the obligations of the documented specifications using: a mutually agreeable format, a mutually agreeable process for resolving data conflicts, and a mutually agreeable security protocol.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		Therefore, the reliability objective of PRC-001-1.1(ii) Requirement R2, R2.2. mandates the TOP to notify its RC and affected BA and TOP of protective relay and equipment failures is addressed by the documented specification for the data required in TOP-003-3, Requirement R1, part 1.2. for the TOP and Requirement R2, part 2.2. for the BA, and IRO-010-2, Requirement R1 for the RC. The documented data specifications is required to be distributed by the TOP and will require the RC per IRO-010-2, Requirement R3 and the BA and TOP per TOP-003-3, Requirement R5 to provide current Protection System and RAS status (change in status is implied) or degradation that impacts System reliability.
PRC-001-1.1(ii) (Existing) **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.	**PRC-027-1 (NERC Board approved)** The mapping of PRC-001-1.1(ii), Requirements R3, R3.1 and R3.2 are addressed in a different project. See Project 2007-06 System Protection Coordination	N/A

Evaluation of Proposed Definitions for Project 2007-06.2 – Phase 2 of System Protection Coordination

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Evaluation of Proposed Definitions

Project 2007-06.2 – Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of "Operating Planning Analysis" (OPA) and "Real-time Assessment" (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective of PRC-001-1.1(ii) – *Protection System Coordination*, Requirement R1 to "be familiar with the purpose and limitations of Protection System schemes in its area," the two definitions are being modified to include the phrase "…functions, and limitations…" to ensure the Transmission Operator (TOP), consider the functions and limitations of Protection Systems and Remedial Action Schemes (RAS) in their OPA and RTA evaluations. The PRC-001-1(ii) standard is not applicable to the Reliability Coordinator (RC), however, the modifications to the definitions affect this entity. Revising the definitions to require the RC and the TOP to integrate the functions and limitations (i.e., purpose and limitations) into its OPA and RTA will ensure that the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL).

Proposed Definitions

This section includes the Reliability Standards and the associated requirements where the two modified terms are found. These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions, (1) an administrative update to replace "Special Protection System" to "Remedial Action Scheme" (RAS), and (2) the addition of the phrase "…functions, and limitations…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and limitations" into these evaluations. The proposed definition revisions also have an effect on the Reliability Coordinator that is not applicable to PRC-001-1.1(ii). The bold text in the "Proposed Definitions" column accentuate the revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Definitions (Effective January 1, 2017)	Proposed Definitions
Operational Planning Analysis An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)	**Operational Planning Analysis (OPA)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	**Real-time Assessment (RTA)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Evaluation

The following is an evaluation of the potential impacts the modifications to the above definitions may have on the expected performance by the RC and TOP. The evaluation is limited to the Reliability Standards that will be or become in effect upon approval of the revised definitions.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	The OPA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and limitations" of Protection Systems and RAS needed to perform an OPA.
IRO-008-2 - Reliability Coordinator Operational Analyses and Real-time Assessments (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall perform an *Operational Planning Analysis* that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its *Operational Planning Analysis* as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The RC must integrate the "functions and limitations" of Protection Systems and RAS in order to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area. **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. This requirement references that the results of the OPA are used by the RC to have a coordinated Operating Plan(s) for next-day operations to address potential SOL and IROL exceedances.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its *Operational Planning Analyses* and Real-time Assessments. **1.5.** Provisions for periodic communications to support reliable operations.	The OPA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-002-4 – Operations Planning (Effective April 1, 2017) **R1.** Each Transmission Operator shall have an *Operational Planning Analysis* that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its *Operational Planning Analysis* as required in Requirement R1.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The TOP must integrate the "functions and limitations" of Protection Systems and RAS in order to assess whether its planned operations for the next day within its TOP Area will exceed any of its SOLs. **Requirement R2** The OPA definition revision has no impact on the TOP in this requirement. The TOP is using information resulting from its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessment.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	The RTA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and limitations" of Protection Systems and RAS needed to perform an RTA.
IRO-008-2 – Reliability Coordinator Operational Analyses and Real-time (Effective April 1, 2017) **R4.** Each Reliability Coordinator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a *Real-time Assessment* indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.	**Requirement R4** The RTA definition revision has an impact on the RC in this requirement. The RC must include the "functions and limitations" among other prescribed inputs from the definition of RTA. **Requirement R5** The RTA definition revision has no impact on the RC in this requirement. The RC is notifying others based on the results of its RTA that an actual or expected condition that results in, or could result in, a SOL or IROL exceedance within its Wide Area.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-009-2 - Reliability Coordinator Actions to Operate Within IROLs (Effective January 1, 2016) **R2.** Each Reliability Coordinator shall initiate one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirement R1) that are intended to prevent an IROL exceedance, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*. **R3.** Each Reliability Coordinator shall act or direct others to act so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*.	**Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The RC will be taking an action to prevent an IROL exceedance, as identified in the RC's RTA. **Requirement R3** The RTA definition revision has no impact on the RC in this requirement. The RC will be acting or directing others so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the RC's RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	**Requirement R1** The RTA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limitations" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and *Real-time Assessments*. **1.5.** Provisions for periodic communications to support reliable operations.	The RTA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-001-3 – Transmission Operations (Effective April 1, 2017) **R13.** Each Transmission Operator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or *Real-time Assessment*.	**Requirement R13** The RTA definition revision has an impact on the TOP in this requirement. The TOP must include the "functions and limitations" among the other prescribed inputs from the definition of RTA. **Requirement R14** The RTA definition revision has no impact on the TOP in this requirement. The TOP will be initiating its Operating Plan to mitigate a SOL exceedance identified in its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessment*.	**Requirement R1** The RTA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and limitations" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

Analysis of Violation Risk Factors and Violation Severity Levels

Exhibit F-1

Analysis of Violation Risk Factors and Violation Severity Levels for Reliability Standards PRC-027-1

Violation Risk Factor and Violation Severity Level Justification Document

Project 2007-06 System Protection Coordination

This document provides the standard drafting team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in Federal Energy Regulatory Commission (FERC) approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the

preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System (BPS). In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance
Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
NERC VRF Discussion	A VRF of Medium is appropriate for this requirement because failure by an entity to establish a process to develop settings for its Bulk Electric System (BES) Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures, or to hinder restoration to a normal condition.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS. Requirement R1 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R1 mandates that entities establish a process to address all aspects of BES Protection System coordination, including the updating of modeling information and the exchange of Protection System data with other owners, when applicable.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The requirement utilizes Parts to specify items that must be addressed within the settings development process. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R1 and R2, which are related to developing and documenting a Protection System Maintenance Program and have VRFs of Medium.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of Medium is appropriate for this requirement because failure by an entity to establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the BPS. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures, or to hinder restoration to a normal condition.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the High and Severe VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSLs use language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based upon a single violation, not a cumulative number of violations.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is Medium	
NERC VRF Discussion	A VRF of Medium is appropriate for this requirement because failure to periodically perform a Protection System Coordination Study for existing Protection Systems could lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the BES or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BES. Requirement R2 relates to one of these areas; specifically, protection systems and their coordination. Requirement R2 mandates that entities periodically perform Protection System Coordination Studies or Fault current comparisons to verify Protection Systems remain coordinated.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-010-1, Requirement R3, which relates to periodically performing comprehensive assessments to evaluate the effectiveness of UVLS Programs.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is Medium	
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of Medium is appropriate for this requirement because failure to periodically perform a Protection System Coordination Study for existing Protection Systems could lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option 2, or Option 3, in accordance with Requirement R2.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."

the Current Level of Compliance	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the proposed VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSLs use language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4	The VSLs are based upon a single violation, not a cumulative number of violations.

Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF Justifications for PRC-027-1, Requirement R3	
VRF for Requirement R3 is High	
NERC VRF Discussion	A VRF of High is appropriate for this requirement because failure by an entity to utilize its process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could place the BES at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS. Requirement R2 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R3 mandates that entities utilize their process established in Requirement R1 that incorporates all actions necessary to to develop settings for its BES Protection Systems to operate in the intended sequence during Faults.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.

VRF Justifications for PRC-027-1, Requirement R3	
VRF for Requirement R3 is High	
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R3 and R4, which are related to implementing time-based and performance-based maintenance program(s) respectively for Protection Systems.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of High is appropriate for this requirement because failure by an entity to utilize its process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could place the BES at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The responsible entity failed to utilize the process established in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the Severe VSL is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSL uses language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based upon a single violation, not a cumulative number of violations.

Exhibit F-2

Analysis of Violation Risk Factors and Violation Severity Levels for Reliability Standards PER-006-1

Violation Risk Factors and Violation Severity Level Justifications

Project 2007-06.2 Phase 2 of Protection System Coordination
PER-006-1 – Specific Training for Personnel

This document provides the Protection System Coordination Phase 2 Standard Drafting Team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for the proposed PER-006-1 – Specific Training for Personnel.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria – Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability

to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[1] *North American Electric Reliability Corp.*, 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] *Id*. at footnote 15.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria – Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels,[3] FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance[4]

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties[5]

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement[6]

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations[7]

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	In this requirement, each Generator Operator (GOP) is required to train its plant personnel on the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The PRC-001-1.1(ii), Requirement R1 that will be replaced by PER-006-1, Requirement R1 has a VRF of High. The VRF of High is associated with the performance of the Balancing Authority (BA) and Transmission Operator (TOP) as they have a greater responsibility for ensuring reliable operation of the bulk electric system. The requirement for these entities to be familiar with the purpose and limitations of Protection System schemes in its area is addressed by the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards and various requirements identified in the project mapping document. These requirements are appropriately assigned VRFs of Medium and High, therefore, does not require the GOP to also have a VRF of High. The Medium VRF is consistent with the training Requirements in the PER-005-2 (*System Personnel Training*) Reliability Standard, which includes the GOP, BA, TOP, and Reliability Coordinator.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This Requirement is consistent with the intent of Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The Requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The Requirement with a Medium VRF is consistent with the training Requirements in PER-005-1 and PER-005-2 that will become effective July 1, 2016.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: A VRF of Medium is consistent with the NERC VRF definition because GOP plant personnel could gain knowledge of the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility without specific training. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This Requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

Proposed VSL – PER-006-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • one applicable personnel at a single Facility, or • 5% or less of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • two applicable personnel at a single Facility, or • more than 5% and less than or equal to 10% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • three applicable personnel at a single Facility, or • more than 10% and less than or equal to 15% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • five or more applicable personnel at a single Facility, or • more than 15% of the total applicable personnel of the Generator Operator. **OR** The Generator Operator failed to provide training as described in Requirement R1 to its applicable personnel.

VSL Justifications – PER-006-1, Requirement R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is a gradated VSL for partial performance from a Lower to High VSL and a VSL of Severe for severe or complete failure of the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The currently effective PRC-001-1.1(ii) did not have VSLs assignments. The proposed VSLs do not lower the current level of compliance because they are consistent with the approved PER-005-2, Requirement R6 for which PER-006-1, Requirement R1 is based upon.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This Requirement has a binary component and utilizes a VSL of Severe for complete failure in addition to incremental VSLs for partial performance. The VSLs provide a non-preferential way to apply violation levels to both small and large entities. Violations may be assessed at the greater of the number of personnel at the plant level or a percentage of personnel at the entity level. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the corresponding Requirement, and is therefore consistent with the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Exhibit G

Summary of Development History and Complete

Record of Development

Exhibit G-1

Summary of Development History and Record of Development for Project 2007-06 System Protection Coordination

Summary of Development History for Project 2007-06 System Protection Coordination

Summary of Development History

The development record for proposed Reliability Standard PRC-027-1 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived from the standard drafting team selected to lead each project in accordance with Section 4.3 if the NERC Standards Process Manual.[2] For this project, the standard drafting team consisted of industry experts, all with a diverse set of experiences. A roster of the standard drafting team members is included in **Exhibit H**.

II. Standard Development History

A. Standard Authorization Request Development

Project 2007-06 – System Protection Coordination was initiated on May 7, 2007 as a Standard Authorization Request ("SAR") to address the directive from FERC in Order No. 693,[3] and other issues identified by the System Protection and Control Task Force pertaining to PRC-001. The System Protection Coordination Standard Drafting Team ("SPC SDT") divided their project into two phases. In Phase 1 of the project, the SPC SDT addressed Requirements R3 and R4 of PRC-001.1(ii) and developed Reliability Standard PRC-027-1 to address outstanding issues in Project 2007-06. The SAR was approved by the Standards Committee and was posted for a 30-day informal comment period from June 11, 2007 through July 10, 2007.

[2] The NERC *Standard Processes Manual* is available at http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf.

[3] Order No. 693, *Mandatory Reliability Standards for the Bulk-Power System*, 72 Fed. Reg. 16416 (2007) (to be codified at 18 C.F.R. pt. 40).

B. First Posting – Formal Comment Period, Ballot and Non-Binding Poll

Proposed Reliability PRC-027-1[4] was posted for a 45-day public comment period from May 21, 2012 through July 5, 2012, with an initial ballot held from June 26, 2012 through July 5, 2012. Several documents were posted for guidance with the first draft, including a Comment Form, Mapping Document, Implementation Plan, the Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") Justification document and the Technical Justification document. The initial ballot received 84.24% quorum, and 23.82% approval. The Non-binding Poll for VRFs and VSLs reached quorum at 82.26% of the ballot pool, and the standard and associated documents received support from 25.19% of the voters. There were 76 sets of responses to the posting, including comments from approximately 198 different individuals from approximately 139 companies representing all 10 of the industry segments.[5]

C. Second Comment Period, Successive Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-027-1 was posted for an additional 30-day public comment period from November 16, 2012 through December 17, 2012, with a successive parallel ballot held from December 7, 2012 through December 17, 2012. The successive ballot reached quorum at 76.47% of the ballot pool, and the standard and associated documents received support from 33.23% of the voters. The Non-binding Poll reached quorum at 75.58% of the ballot pool, and the standard and associated documents received support from 34.80% of the voters. There were 82 sets of comments, including comments from approximately 220

---

[4] The SPC SDT initially posted a draft of PRC-001-2 in 2009. After a second draft went through a NERC Quality Review in December 2010, the SPC SDT decided to focus its knowledge and expertise on developing a new results-based Reliability Standard.

[5] NERC, *Consideration of Comments*, Project 2007-06, System Protection Coordination, *available at* http://www.nerc.com/pa/Stand/Project%20200706%20System%20Protection%20Coordination%20DL/2007-06_C_of_C_11162012_Final_draft_ahm.pdf.

different individuals and approximately 157 companies, representing all 10 of the industry segments.[6]

D. Third Comment Period, Successive Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-027-1 was posted for an additional 30-day formal comment period from June 4, 2013 through July 3, 2013, with an additional parallel ballot held from June 24, 2013 through July 3, 2013. The additional ballot reached quorum at 77.65% of the ballot pool, and the standard and associated documents received support from 52.71% of the voters. The Non-binding Poll reached quorum at 77.12% of the ballot pool, and the standard and associated documents received support from 52.48% of the voters. There were 67 sets of comments, including comments from approximately 196 different individuals and approximately 130 companies, representing all 10 of the industry segments.[7]

E. Fourth Comment Period, Additional Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-027-1 was posted for an additional 45-day comment period from November 4, 2013 through December 31, 2013, with a successive parallel ballot held from December 9, 2013 through December 31, 2013. The successive ballot reached quorum at 76.60% of the ballot pool, and the standard and associated documents received support from 65.71% of the voters. The Non-binding Poll reached quorum at 77.63% of the ballot pool, and the standard and associated documents received support from 70.75% of the voters.

F. Fifth Comment Period, Additional Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-027-1 was posted for an additional 45-day comment period from April 1, 2015 through May 15, 2015, with an additional parallel ballot held from May 6, 2015 through May 15, 2015. The additional ballot reached quorum at 82.53% of the ballot pool, and the standard and associated documents received support from 39.65% of the voters. The Non-binding Poll reached quorum at 81.65% of the ballot pool, and the standard and associated documents received support from 38.65% of the voters.

G. Sixth Comment Period, Additional Ballot and Non-Binding Poll

Proposed Reliability Standard PRC-027-1 was posted for an additional 45-day formal comment period from July 29, 2015 through September 11, 2015, with an additional parallel ballot held from September 2, 2015 through September 11, 2015. The additional ballot reached quorum at 84.34% of the ballot pool, and the standard and associated documents received support from 69.77% of the voters. The Non-binding Poll reached quorum at 82.22% of the ballot pool, and the standard and associated documents received support from 70.00% of the voters. There were 64 sets of comments, including comments from approximately 162 different individuals and approximately 112 companies, representing all 10 of the industry segments.[8]

H. Final Ballot

Proposed Reliability Standard PRC-027-1 was posted for a 10-day final ballot period from October 5, 2015 through October 14, 2015. The ballot for the proposed Reliability Standard and associated documents reached quorum at 89.16% of the ballot pool, and the

[8] NERC, *Consideration of Comments*, Project 2007-06 System Protection Coordination, (October 5, 2016), *available at* http://www.nerc.com/pa/Stand/Project%20200706%20System%20Protection%20Coordination%20DL/2007-06_System_Protection_Coordination_Comment_Report_10012015.pdf.

standard received sufficient affirmative votes for approval, receiving support from 80.94% of the voters.[9]

I. Board of Trustees Adoption

Proposed Reliability Standard PRC-027-1 was adopted by the NERC Board of Trustees on November 5, 2015.[10]

Complete Record of Development for Project 2007-06 System Protection Coordination

Project 2007-06 System Protection Coordination

Related Files | 2007-06.2 Phase 2 of System Protection Coordination

Status:
A final ballot for **PRC-027-1 – Coordination of Protection Systems for Performance During Faults** concluded **8 p.m. Eastern, Wednesday, October 14, 2015.** The ballot results can be accessed via the links below. The standard will be submitted to the Board of Trustees for adoption. Once TOP-009-1 is approved by ballot and adopted by the Board of Trustees, PRC-027-1 will be filed with the appropriate regulatory authorities in conjunction with TOP-009-1 to achieve the complete retirement of PRC-001-1.1(ii).

Retirement of PRC-001-1.1(ii)
In conjunction with Project 2007-06.2 Phase 2 of System Protection Coordination, NERC is proposing the complete retirement of PRC-001-1.1(ii). In Phase 2, Requirement R1 is being incorporated into the proposed Reliability Standard TOP-009-1. Requirements R2, R5, and R6 are proposed for retirement as the reliability objectives of those requirements are addressed by other TOP/IRO standards. See the Mapping Document on the Phase 2 project page for an explanation of how the reliability objectives of Requirements R1, R2, R5, and R6 are addressed. The remaining two Requirements R3 and R4 of PRC-001-1.1(ii) are addressed by PRC-027-1. See the Project 2007-06 System Protection Coordination Mapping Document below. The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of Reliability Standards PRC-027-1 and TOP-009-1. NERC is proposing the retirement of PRC-001-1.1(ii) in the implementation plans associated with both projects.

Background
Project 2007-06 System Protection Coordination originated in 2007 to address directives from FERC Order 693 and other issues identified by the System Protection and Control Task Force pertaining to PRC-001. The System Protection Coordination Standard Drafting Team (SPCSDT) has developed Reliability Standard PRC-027-1 with the stated purpose: "*To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults*" to address all of the outstanding issues. PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

Draft 5 of PRC-027-1 was posted for formal comment and ballot from April 1 – May 15, 2015. The standard received affirmative votes totaling 39.63 percent. The drafting team appreciated the feedback industry stakeholders provided and has incorporated many of the suggested revisions into draft 6 of the standard. In accordance with section 4.13: Additional Ballots of the Standards Process Manual, the drafting team is not providing written responses to the comments with this posting because significant revisions to the standard were made and an Additional Ballot will be conducted.

Draft 6 of PRC-027-1 consists of three proposed requirements.

Requirement R1 mandates that an entity establish a process for developing new and revised Protection System settings for BES Elements to operate in the intended sequence during Faults; and stipulates certain attributes that must be included in the process.

Requirement R2 mandates that an entity periodically perform Protection System Coordination Studies and/or compare existing Fault current values to established Fault current baselines for Protection Systems applied on BES Elements that are identified as being affected by changes in Fault current. The applicable Protection System functions are identified in Attachment A.

Requirement R3 mandates that an entity utilize the process established in accordance with Requirement R1.

Standard(s) Affected: PRC-027-1 - System Protection Coordination, Retirement of PRC-001-1.1(ii) - System Protection Coordination

Purpose/Industry Need
Coordinated Protection Systems enhance reliability by isolating Faults, thus reducing the risk of BES instability or Cascading and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements removed from service and protect equipment from damage.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Standard Authorization Request Form

Title of Proposed Standard **PRC-001-1 — System Protection Coordination (Project 2007-06)**	
Request Date	May 7, 2007

SAR Requestor Information		**SAR Type** (*Check a box for each one that applies.*)
Name NERC System Protection and Control Task Force (Attachment A)	☐	New Standard
Primary Contact Charles Rogers (SPCTF Chairman)	☒	Revision to existing Standard
Telephone 517-788-0027 Fax 517-788-0917	☐	Withdrawal of existing Standard
E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination"

The drafting team will also make the improvements to the standard identified in Attachment C – "Reliability Standards Review Guidelines" to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes

5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Appendix B — SYSTEM PROTECTION AND CONTROL TASK FORCE **9**

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities
4.2. Transmission Operators
4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

> **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

> **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:
>
> ~~R2.1.~~If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.
>
> ~~R2.2.~~If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

Not only new protective systems and changes to protective systems should be coordinated. A

> **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
>
> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

> **R4.** Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

> **R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others:
>
> **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems.
>
> **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

R6.	Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures
Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

R1.2 – Generators
Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d'), sub transient reactance (X_d"), and the associated time constants (T_{do}, T_{do}', and T_{do}") for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.

R1.3 – Transmission Lines
Recommend specifying the positive and zero sequence impedance, including mutual impedances

R1.5 – Transformers
Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

> "The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes."

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the "Draft Reliability Standards Development Plan: 2007–2009", which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, "System Protection Project (2009-01)", and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, 'Regional Reliability Organization' with 'Regional Entity'

Fill-in-the-blank Requirements
Do not include any 'fill-in-the-blank' requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Maureen E. Long
Standards Process Manager

June 11, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Comment Periods Open

The Standards Committee (SC) announces the following standards actions:

SAR for System Protection Coordination (Project 2007-06) Posted for 30-day Comment Period June 11–July 10, 2007

The SAR for Project 2007-06 — System Protection Coordination proposes to address the FERC directives in Order 693 and to address a number of technical shortcomings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

The purpose of the proposed standard is to assure that protection system application and performance issues are coordinated among all related entities. Please use this comment form to submit comments on this SAR.

SAR for Protection System Maintenance & Testing (Project 2007-17) Posted for 30-day Comment Period June 11–July 10, 2007

This SAR for Project 2007-17 — Protection System Maintenance and Testing proposes to merge the requirements from the following standards into a single standard to reduce the costs of compliance while also improving efficiencies:

- PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing
- PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs
- PRC-011-0 — UVLS System Maintenance and Testing
- PRC-017-0 — Special Protection System Maintenance and Testing

The SAR also proposes to address the FERC directives in Order 693 and to address a number of technical shortcomings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

The purpose of the proposed standard is to ensure all transmission and generation protection systems affecting the reliability of the bulk power system are maintained and tested to support reliable operation performance when responding to abnormal system conditions. Please use this comment form to submit comments on this SAR.

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: None
   Comments:

   Business Practice: No
   Comments:

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: Development of intercompany short circuit modeling should be cover in a separte MOD standard. Maintaining one large overall regional short circuit model is neither practical nor necessary. Standard methods to exchange short circuit data of tie-line plus one breakered bus into the neighboring systems should be adeqaute and be developed. Otherwise Ameren agrees with SPCTF recommendations.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☐ Yes

   ☒ No

   Comments: There might not be a directly reliability driver for improving this standard, but the standard should be improved to better clarify responsibilities.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: None
   Comments: None

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: Possibly
   Comments: AEP and other utilities, with many years of experience serving customers and supporting the electric grid, have voluntarily integrated protection coordination processes into the core of their work practices . AEP fully supports improvements if they truly foster reliability and availability benefits to bulk power transfers. More Standards, Requirements, and Business Practices are not always better. If Standards create burdens on a utility's physical resources and budgets, then some mechanism must be available to allow for the needed changes.

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: For clarifying protective systems, the standard should not use the term Bulk Electric System, but should instead specify a voltage threshold for impacts to bulk system transfers - specifically; 'Facilites operated 200 kV and above and Regionally-defined, Operationally Significant facilities operated greater than 100 kv, but less than 199 kV'. The term 'affects' also needs to be clarified. Inclusion of all facilities greater than 100 kV does not benefit the reliability of national bulk power transfers. For example, the loss or misoperation of a 138 kV line serving a localized load center would not be detremental to bulk power transfers multiple busses away.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments: Standard has much room for improvement.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments: Moving R6 regarding SPS monitoring and status notification to more appropriate PRC SPS section makes sense.

   Have concern about NERC SPCTF recommendation of merging system short-circuit databases for perfoming wide-area fault studies. See additional comments below.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:
   Comments:

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: Data entry and maintenance procedures for proposed wide-area short circuit model would need to be developed.
   Comments: Creating and maintaining the proposed wide-area short-circuit database, although useful, might prove quite difficult to implement.

   Among our concerns:

Impedance units- Ohms or per unit? If per unit, using what common base?

CAPE to ASPEN & ASPEN to CAPE conversion issues?

Need for unique and consistent bus numbers for all busses in combined database.

If using CAPE, coordination and application of database categories.

Who would be responsible for merging the databases and then maintaining the common database? How often would the databases be remerged to reflect system changes?

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☐ Yes

   ☒ No

   Comments: Under the section of Detailed Description it is stated:

   "This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination"

   It seems that it would be more effective to pull the PRC-001 standard from the scope of of the 2006-06 project which deals with mulitple standards and allow this SDT to focus on all aspects of the PRC-001. The SPCTF raised concerns with PRC-001 in both the planning and operations time-frame and it does not appear that the 2006-06 project is scoped to address the SPCTF items.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☐ Yes

   ☒ No

   Comments: FE agrees with the SPCTF that the TO, GO and DP should be added to the applicability section of this standard as many of the requirements will originate from these entities. However, it may be necessary to to add the Tranmission Planner (TP) entity for "planning" related requirements. For example, the existing R3 requires coordination of new or revised protections systems. It may be short-sighted to assume that the TO is the entity who would coordinate this work; there may be situations where a Transmission Planner performs this work and is best suited to share the information with neighboring system owners/planners as well as the Planning Coordinator.

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☒ No

   Comments: It is not clear based on the information presented how all the functional entities are involved. As an example, no reference is noted in the documents for PC responsibility. Is it inferred that if a coordination model is developed on a wide area basis, the PC will be the responsible entity?

   Functional Model entity definitions, tasks, and obligations must be followed while developing applicability of the requirements.

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:
   Comments:

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice:
   Comments:

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments:
   The IESO commends NERC, the SDT and the SPCTF (White Paper) for providing clarifications and improvements in the system protection areas.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

   Business Practice: None
   Comments:

6. If you have any other comments on this SAR that you haven’t provided above, please provide them here.

   Comments:
   1. The MRO commends NERC and the SDT for taking the necessary steps to remove the vagueness and ambiguity in the requirements; as well as the need to have clarity and measurability now that the industry has transitioned to mandatory and enforceable standards.

2. The SPCTF Assessment of PRC-001-1 did not mention how they would address "Corrective Actions" listed in R2. The MRO requests that the SDT expand on what the scope of these "Corrective Actions" is meant to be (e.g. real-time, or after the fact repair or replacement of defective equipment).

   Comments: I am concerned with the language proposed by FERC and the comparison to reactions to IROL's. Will FERC's requirement apply to a single protection system that has a redundant protection system? Will FERC's requirement apply to a system that is in an "overexposed" state? Will FERC's requirement apply to a system that may be exposed to slow 30 cycle of less tripping. These conditions must be identified in detail as to what will need to meet the "returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes." FERC requirement

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☐ Yes

   ☒ No

   Comments: Consideration should be given to splitting this effort among 2 or 3 standards to address the operating, operations planning, and planning horizons. Consideration should also be given to moving the operating training requirements to another standard (if not already covered by an existing standard).

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments: The requirements for the PC, TO, GO, and DP (planning horizon) should be in a separate standard than those for the RC, BA, TOP, and GOP (operating and operations planning horizons).

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: none

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments: We agree that there is a need to improve the requirements of Standard PRC-001-0 and Standard MOD-011-0 as described in the supplemental document "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination". It is important to modify ambiguous statements such as "...corrective action needs to be taken..." and "must be done...as soon as possible...". By making the improvements described in the SAR, the standard will provide the applicable entities with more definitive requirements that will allow entities to provide specific responsibilities to internal work groups within the standard utility organization.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments: Another important change described in this SAR is the requirement to have an up-to-date accurate model of the transmission system for protection studies. It is extremely important to develop these accurate models to allow enhance the reliability of the bulk-electric system. There are efforts underway in the southwest that apply directly to the development of this type of model by late 2007.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments: We agree that the applicable entities for this standard be modified to include the various "Owner" entities as described in the NERC Functional Model Version 3.

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: N/A
   Comments: Not aware of any Regional Variance requirements

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: N/A
   Comments: Not aware of any Business Practice needs

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: N/A

Consideration of Comments on 1st Draft of System Protection Coordination SAR (Project 2007-06)

The System Protection Coordination SAR requesters thank all commenters who submitted comments on the first draft of SAR. This SAR was posted for a 30-day public comment period from June 11 through July 10, 2007. The requesters asked stakeholders to provide feedback on the standard through a special SAR Comment Form. There were 17 sets of comments, including comments from 72 different people from more than 48 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

The SAR drafting team made two changes to the SAR based on stakeholder comment:

- Added the Transmission Planner as a reliability function that may be assigned requirements in the revised standard
- Added a sentence to clarify that the monitoring requirements in PRC-001 will not be included in the scope of revisions addressed under this project as they are already being addressed under Project 2006-06 — Reliability Coordination.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving the SAR forward to the standard drafting stage of the standards development process.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/System_Protection_Project_2007-06.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

Index to Questions, Comments, and Responses

1. Do you agree that there is a reliability-related need to improve the requirements in this standard? 6
2. Do you agree with the proposed scope of this SAR? 8
3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)? 11
4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area. 14
5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us. 15
6. If you have any other comments on this SAR that you haven't provided above, please provide them here. 17

1. **Do you agree that there is a reliability-related need to improve the requirements in this standard?**

Summary Consideration: Most commenters agreed that there is a reliability-related need for this SAR. There were no changes made in response to these comments.

Question #1			
Commenter	**Yes**	**No**	**Comment**
AEP		☑	There might not be a directly reliability driver for improving this standard, but the standard should be improved to better clarify responsibilities.
Response: The SAR DT agrees with the comment that the standard should be improved to better clarify responsibilities, but the drafting team also believes that clarifying responsibilities is reliability related.			
SWTC	☑		We agree that there is a need to improve the requirements of Standard PRC-001-0 and Standard MOD-011-0 as described in the supplemental document "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination". It is important to modify ambiguous statements such as "...corrective action needs to be taken..." and "must be done...as soon as possible...". By making the improvements described in the SAR, the standard will provide the applicable entities with more definitive requirements that will allow entities to provide specific responsibilities to internal work groups within the standard utility organization.
Response: The SAR DT thanks you for your support.			
ATC	☑		Standard has much room for improvement.
Response: The SAR DT agrees with the comment.			
PSC SC	☑		
SERC EC PCS	☑		
BPA	☑		
Consumers Energy	☑		
IESO	☑		
SRP	☑		
Manitoba Hydro	☑

MRO	☑		

Question #1			
Commenter	**Yes**	**No**	**Comment**
HQTE	☑		
FRCC	☑		
IRC SRC	☑		
FirstEnergy	☑		

2. **Do you agree with the proposed scope of this SAR?**

Summary Consideration: Most commenters agreed with the proposed scope of the SAR. The SAR DT modified the SAR to clarify that it will coordinate with other DTs to ensure that all requirements in PRC-001will be addressed by one and only one drafting team. The monitoring requirements will be transferred to the DT working on Project 2006-06 for Reliability Coordination.

Question #2			
Commenter	**Yes**	**No**	**Comment**
SERC EC PCS		☑	Consideration should be given to splitting this effort among 2 or 3 standards to address the operating, operations planning, and planning horizons. Consideration should also be given to moving the operating training requirements to another standard (if not already covered by an existing standard).
Response: The SDT will coordinate with the Reliability Coordination standard drafting team working on Project 2006-06 to address these issues. The SAR DT believes that the monitoring requirements should be addressed by the Reliability Coordination SDT, however for coordination and understanding, the SAR DT believes the remaining requirements should be in one standard.			
FirstEnergy		☑	Under the section of Detailed Description it is stated: "This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination" It seems that it would be more effective to pull the PRC-001 standard from the scope of of the 2006-06 project which deals with mulitple standards and allow this SDT to focus on all aspects of the PRC-001. The SPCTF raised concerns with PRC-001 in both the planning and operations time-frame and it does not appear that the 2006-06 project is scoped to address the SPCTF items.
Response: The SAR DT modified the SAR to clarify that it will coordinate with other drafting teams to ensure that all requirements in PRC-001 will be addressed by one and only one drafting team. The monitoring requirements will be transferred to the DT working on project 2006-06 Reliability Coordination)			
FRCC	☑	☑	Incorporating assessments by subject matter experts such as this NERC SPCTF / Planning Committee assessment into the NERC Standards revision SAR project is an efficient way to supplement project SARs and allows for valuable input at the front-end of the standards process.

			Attachments A and C are not included in the SAR and Attachment B is identified as "Supporting Material". It may be clearer to include all applicable documents within the SAR including relevant excerpts from any FERC assessments and requested changes to the standard.
Response: The SAR DT will ensure that all attachments are clearly labeled and all pertinent documents are included in the final posting.			
SWTC	☑		Another important change described in this SAR is the requirement to have an up-to-date accurate model of the transmission system for protection studies. It is extremely important to develop these accurate models to allow enhance the reliability of the bulk-electric system. There are efforts underway in the southwest that apply directly to the development of this type of model by late 2007.
Response: The SAR DT agrees with your observation- please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a separate SAR to revise MOD-011.			
ATC	☑		Moving R6 regarding SPS monitoring and status notification to more appropriate PRC SPS section makes sense. Have concern about NERC SPCTF recommendation of merging system short-circuit databases for perfoming wide-area fault studies. See additional comments below.
Response: The SAR DT agrees that R6 should be addressed in another standard; however, the SAR DT believes it belongs in a standard that addresses a broader range of monitoring activities. Please see the summary consideration of comments

IRC SRC	☑		

3. **Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?**

Summary Consideration: Based on stakeholder comments, Transmission Planners have been added to the list of applicable entities.

Question #3			
Commenter	**Yes**	**No**	**Comment**
FRCC			This question may be better addressed as the standard is drafted.
Response: The SAR DT is required to identify the proposed applicability. The applicability will be finalized during standard drafting			
CP9 RSWG		☑	recommend that Transmission Planners be added
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
HQTE		☑	recommend that Transmission Planners be added
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
FirstEnergy		☑	FE agrees with the SPCTF that the TO, GO and DP should be added to the applicability section of this standard as many of the requirements will originate from these entities. However, it may be necessary to add the Transmission Planner (TP) entity for "planning" related requirements. For example, the existing R3 requires coordination of new or revised protections systems. It may be short-sighted to assume that the TO is the entity who would coordinate this work; there may be situations where a Transmission Planner performs this work and is best suited to share the information with neighboring system owners/planners as well as the Planning Coordinator.
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
IESO	☑	☑	It is not clear based on the information presented how all the functional entities are involved. As an example, no reference is noted in the documents for PC responsibility. Is it inferred that if a coordination model is developed on a wide area basis, the PC will be the responsible entity? Functional Model entity definitions, tasks, and obligations must be followed while developing applicability of the requirements.
Response: the SAR DT checked all the functional entities that are currently assigned responsibility for requirements in PRC-001 and also checked those functional entities that are expected to be assigned requirements based on the SPTCF analysis of PRC-001. Please see the SPTCF report posted as a supporting document on the website.			

Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in another SAR for modifications to MOD-011. As envisioned, a new requirement may need to be developed to support the orignial R1 which says: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area. Although the original R1 is not written in a format that is easy to measure, the SAR DT believes the intent of R1 is to ensure that real-time operating personnel have information about protection schemes so they will know what actions to take when the protection schemes are not in service. The SAR DT believes the Planning Coordinator may be the best functional entity to provide this data to the real-time operating personnel. As envisioned, this discussion will take place with stakeholders during standard drafting. The standards process requires that DTs consider the Functional Model elements when developing standards.			
IRC SRC	☑	☑	It is not clear based on the information presented if all the functional entities involved are identified in the scope of the standard. As an example, no reference is noted in the documents for TP responsibility. It is inferred that if a coordination model is developed on a wide area basis, the PC will be the only responsible entity. However there may be requirements for the TP as well.
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
SERC EC PCS	☑		The requirements for the PC, TO, GO, and DP (planning horizon) should be in a separate standard than those for the RC, BA, TOP, and GOP (operating and operations planning horizons).
Response: While the SAR DT agrees that some requirements for entities providing real time operations should be transferred to other standards, for coordination and understanding the SAR DT believes the remaining requirements should be in one standard.			
SWTC	☑		We agree that the applicable entities for this standard be modified to include the various "Owner" entities as described in the NERC Functional Model Version 3.
Response: The SAR DT agrees - thank you for your comments.

Ameren	☑		
MRO	☑		

4. **If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.**

Summary Consideration: The stakeholders who submitted comments did not identify any regional variances.

Question #4		
Commenter	**Regional Variance**	**Comment**
PSC SC	N/A	
SERC EC PCS	None.	
AEP	None.	None.
BPA		No known variance.
Consumers Energy	N/A	
SWTC	N/A	Not aware of any Regional Variance requirements.
ATC	N/A	
Manitoba Hydro	None	No variance necessary.
CP9 RSWG	N/A	No Regional Variance
Ameren	None	
MRO	None	
HQTE		No Regional Variance
FRCC	N/A	
FirstEnergy		Aware of none

5. **If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.**

Summary Consideration: The stakeholders who submitted comments did not identify any specific business practice that need to be developed to support the modifications to PRC-001 proposed with this SAR.

Question #5		
Commenter	**Business Practice**	**Comment**
AEP	Possibly	AEP and other utilities, with many years of experience serving customers and supporting the electric grid, have voluntarily integrated protection coordination processes into the core of their work practices . AEP fully supports improvements if they truly foster reliability and availability benefits to bulk power transfers. More Standards, Requirements, and Business Practices are not always better. If Standards create burdens on a utility's physical resources and budgets, then some mechanism must be available to allow for the needed changes.
Response: Please monitor the work of the SDT and advise us if added burdens are created and advise us of the need for any business practice or other mechanism necessary.		
ATC	Data entry and maintenance procedures for proposed wide-area short circuit model would need to be developed.	Creating and maintaining the proposed wide-area short-circuit database, although useful, might prove quite difficult to implement. Among our concerns: Impedance units- Ohms or per unit? If per unit, using what common base? CAPE to ASPEN & ASPEN to CAPE conversion issues? Need for unique and consistent bus numbers for all busses in combined database. If using CAPE, coordination and application of database categories. Who would be responsible for merging the databases and then maintaining the common database? How often would the databases be remerged to reflect system changes?
Response: Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a SAR proposing changes to MOD-011.		
PSC SC		N/A
SERC EC PCS	None.	
Consumers Energy	N/A	
SWTC	N/A	Not aware of any Business Practice needs.
Manitoba Hydro	None	No comments
CP9 RSWG		No Business Practice

Question #5		
Commenter	**Business Practice**	**Comment**
Ameren	No	
MRO	None	
HQTE		No Business Practice
FirstEnergy		Aware of none

6. **If you have any other comments on this SAR that you haven't provided above, please provide them here.**

Summary Consideration: The SAR DT did not make any changes to the SAR based on modifications proposed by stakeholders in response to this question.

Question #6	
Commenter	**Comment**
AEP	For clarifying protective systems, the standard should not use the term Bulk Electric System, but should instead specify a voltage threshold for impacts to bulk system transfers - specifically; 'Facilites operated 200 kV and above and Regionally-defined, Operationally Significant facilities operated greater than 100 kv, but less than 199 kV'. The term 'affects' also needs to be clarified. Inclusion of all facilities greater than 100 kV does not benefit the reliability of national bulk power transfers. For example, the loss or misoperation of a 138 kV line serving a localized load center would not be detremental to bulk power transfers multiple busses away.
Response: The comment will be referred to the SDT when convened for consideration when drafting the standard.	
FRCC	The Drafting team should coordinate any system protection terminology introduced or re-defined within this standard with other system protection related SARs (i.e. Disturbance monitoring, System Protection Maintenance and Testing) to ensure common terminology is appropriately defined in the standards glossary.
Response: This coordination is required by the standards process. The comment will be referred to the SDT when convened for consideration when drafting the standard.	
SRP	I am concerned with the language proposed by FERC and the comparison to reactions to IROL's. Will FERC's requirement apply to a single protection system that has a redundant protection system? Will FERC's requirement apply to a system that is in an "overexposed" state? Will FERC's requirement apply to a system that may be exposed to slow 30 cycle of less tripping. These conditions must be identified in detail as to what will need to meet the "returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes." FERC requirement
Response: The comment will be referred to the SDT when convened for consideration when drafting the standard.	
ATC	Background Information Section on this comment sheet should read: Please e-mail your comments on this form to sarcomm@nerc.net with subject "Protection Coordination SAR" in subject line, not "Protection Maintenance SAR" as stated.
Response: Thank you for your comment	
Ameren	Development of inter-company short circuit modeling should be cover in a separate MOD standard. Maintaining one large overall regional short circuit model is neither practical nor necessary. Standard methods to exchange short circuit data of tie-line plus one breakered bus into the neighboring systems should be adequate and be developed. Otherwise Ameren agrees with SPCTF recommendations.
Response: Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a SAR proposing changes to MOD-011.	
MRO	The MRO commends NERC and the SDT for taking the necessary steps to remove the vagueness and ambiguity

	in the requirements; as well as the need to have clarity and measurability now that the industry has transitioned to mandatory and enforceable standards. The SPCTF Assessment of PRC-001-1 did not mention how they would address "Corrective Actions" listed in R2. The MRO requests that the SDT expand on what the scope of these "Corrective Actions" is meant to be (e.g. real-time, or after the fact repair or replacement of defective equipment).
Response: These issues are discussed in FERC Order 693 and will be considered by the SDT	
IESO	The IESO commends NERC, the SDT and the SPCTF (White Paper) for providing clarifications and improvements in the system protection areas.
Response: Thank you	
IRC SRC	The SRC commends NERC, the SDT and the SPCTF for providing this clarification and improvements in the system protection areas.
Response: Thank you	
PSC SC	N/A

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Standard Authorization Request Form

Title of Proposed Standard	**PRC-001-1 — System Protection Coordination (Project 2007-06)**
Request Date	May 7, 2007
Revised Date	July 27, 2007

SAR Requestor Information		**SAR Type** (*Check a box for each one that applies.*)
Name NERC System Protection and Control Task Force (Attachment A)	☐	New Standard
Primary Contact Charles Rogers (SPCTF Chairman)	☒	Revision to existing Standard
Telephone 517-788-0027 Fax 517-788-0917	☐	Withdrawal of existing Standard
E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

The PRC 001 standards drafting team will coordinate the transfer of monitoring related requirements to appropriate other standards through coordination with the standards drafting teams associated with project 2006-06 (Reliability Coordination)

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled “NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination”

The drafting team will also make the improvements to the standard identified in Attachment C – “Reliability Standards Review Guidelines” to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Appendix B — SYSTEM PROTECTION AND CONTROL TASK FORCE 9

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities
4.2. Transmission Operators

4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.

> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Not only new protective systems and changes to protective systems should be coordinated. A requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

R4. Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

> **R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others:
>
> **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems.
>
> **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

> **R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures

Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately

apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

R1.2 – Generators
Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d'), sub transient reactance (X_d"), and the associated time constants (T_{do}, T_{do}', and T_{do}") for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.

R1.3 – Transmission Lines
Recommend specifying the positive and zero sequence impedance, including mutual impedances

R1.5 – Transformers
Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

> "The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes."

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the "Draft Reliability Standards Development Plan: 2007–2009", which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, "System Protection Project (2009-01)", and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;
or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative

conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature; or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon
The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels
The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more

significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.

- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, ‘Regional Reliability Organization’ with ‘Regional Entity’

Fill-in-the-blank Requirements
Do not include any ‘fill-in-the-blank’ requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, ‘Associated Documents’.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

The PRC 001 standards drafting team will coordinate the transfer of monitoring related requirements to appropriate other standards through coordination with the standards drafting teams associated with project 2006-06 (Reliability Coordination)

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled “NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination”

The drafting team will also make the improvements to the standard identified in Attachment C – “Reliability Standards Review Guidelines” to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☒ ~~☐~~	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage. Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes

5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Appendix B — SYSTEM PROTECTION AND CONTROL TASK FORCE 9

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities
4.2. Transmission Operators

4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

> **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

> **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:
>
> **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.
>
> **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

> **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
>
> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Not only new protective systems and changes to protective systems should be coordinated. A requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

> **R4.** Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

R5.	A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others: **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems. **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

R6.	Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures

Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately

apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

> **R1.2 – Generators**
> Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d'), sub transient reactance (X_d"), and the associated time constants (T_{do}, T_{do}', and T_{do}") for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.
>
> **R1.3 – Transmission Lines**
> Recommend specifying the positive and zero sequence impedance, including mutual impedances
>
> **R1.5 – Transformers**
> Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

> "The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes."

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the "Draft Reliability Standards Development Plan: 2007–2009", which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, "System Protection Project (2009-01)", and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.

- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, 'Regional Reliability Organization' with 'Regional Entity'

Fill-in-the-blank Requirements
Do not include any 'fill-in-the-blank' requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

The Standards Committee announces the following standards actions:

Nominations for Project 2006-01 System Personnel Training Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking additional industry experts to serve on the System Personnel Training Standard Drafting Team. The new members will join the already-formed drafting team in developing the following standard:

- PER-005 — System Personnel Training

If you are interested in serving on this standard drafting team, please complete this nomination form and return it to sarcomm@nerc.net by August 29, 2007 with "System Personnel Training SDT" in the subject line. For questions, please contact Linda Clarke at 610-310-7210 or linclrke@msn.com.

Nominations for Project 2007-06 System Protection Coordination Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking industry experts to serve on the System Protection Coordination Standard Drafting Team. The drafting team will work on modifications to the following standard:

- PRC-001 — System Protection Coordination

If you are interested in serving on this standard drafting team, please complete this nomination form and return it to sarcomm@nerc.net by August 29, 2007 with "System Protection Coordination SDT" in the subject line. For questions, please contact Al Calafiore at 678-524-1188 or at al.calafiore@nerc.net.

Nominations for Project 2007-17 Protection System Maintenance and Testing Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking industry experts to serve on the Protection System Maintenance and Testing Standard Drafting Team. If you are interested in serving on this team, please complete this nomination form and return it to sarcomm@nerc.net with "Protection System Maintenance SDT" in the subject line by August 29, 2007. For questions, please contact Al Calafiore at 678-524-1188 or at al.calafiore@nerc.net.

The drafting team will work on revising the following standards:

- PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing
- PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs
- PRC-011-0 — UVLS System Maintenance and Testing
- PRC-017-0 — Special Protection System Maintenance and Testing

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1, to coordinate Protection Systems utilized to protect Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards. This standard incorporates and enhances the coordination aspects of Requirements R3 and R4 from PRC-001-1 (now R2 and R3 of PRC-001-2). The SPC SDT is requesting a posting for stakeholder comments under a 30-day formal comment period.

Anticipated Actions	Anticipated Date
Post first draft of standard for 30-day Formal Comment Period.	May 2012
45-day Formal Comment Period with Parallel Initial Ballot	August 2012
30-day Formal Comment Period with Parallel Successive Ballot	November 2012

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is three months beyond the date that this standard is approved by applicable regulatory authorities, where such explicit approval is required. Where no regulatory approval is required, the standard shall become effective on the first day of the first calendar quarter that is three months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise prescribed by the laws or regulations of the applicable ERO governmental authorities. For Facility interconnections between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the glossary.

Terms:

Interconnected Facilities: BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2 Facilities:

   Protection Systems installed at Interconnected Facilities.

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focus their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and enhanced in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."*

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the SDT for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 SDT retired Requirements R2, R5, and R6 of PRC-001-1 because they address data and data requirements that are included in the proposed Reliability Standard TOP-003-2. The SPC SDT is incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 in a new standard (as recommended by the SPCTF assessment), and focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1. The SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard.

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

Other Aspects of coordination of Protection Systems addressed by other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency Load shedding programs are addressed by PRC-006-1 (Project 2007-01 Underfrequency Load Shedding – pending FERC approval) and generator performance during frequency excursions is being addressed by PRC-024-1 in Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed by PRC-024-1 in Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed by PRC-019-1 in Project 2007-09.

- Transmission relay loadability is addressed in PRC-023-1 and, pending FERC approval, PRC-023-2.
- Generator relay loadability will be addressed by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.
- Protective relay response during power swings will be addressed in Phase 3 of Project 2010-13.3, Relay Loadability.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults as follows:

1.1.1 Within 36 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Facility exists that was performed on or subsequent to June 18, 2007.

1.1.2 Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.

1.1.3 When proposing or being notified of a change at the Interconnected Facility, as described in Requirement R3, Part 3.1 or Part 3.3, unless the entity can demonstrate such a study is not required.

1.2. Provide to each affected Interconnected Facility owner a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the Protection System(s) reviewed, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each Protection System Study.

Rationale for R1:

Part 1.1 Protection System Studies are necessary to verify coordination of Protection Systems for existing and new Interconnected Facilities. The SDT defines the term "Interconnected Facilities" as "BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities."

Part 1.1.1 Protection System studies performed after June 18, 2007 (the effective date of PRC-001-1) and in accordance with PRC-001-1 are sufficient to meet Requirement R1, Part 1.1.1. The SDT believes that 36 months is an appropriate period of time for entities to perform the studies required where no study exists. The SDT has no evidence there is widespread miscoordination between Interconnected Facilities that warrants a shorter time frame.

Part 1.1.2 The SDT believes that 6 months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current deviation, where such conditions may warrant a new Protection System Study, or to justify why no such study is needed, i.e., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.

Part 1.1.3 The SDT believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to justify why no such study is needed. The SDT believes that specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.2 The requirement provides for the communication of the results of a Protection System Study to allow the interconnected owner to review the results. The SDT believes to properly ensure coordination of Protection Systems of Interconnected Facilities all entities need to assess the study results. The SDT believes that 90 calendar days is a reasonable time for the entity to provide the results of the Protection System Study performed in accordance with Requirement R1 to the Interconnected Facility owner.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts is a dated Protection System Study, or the summary results of each Protection System Study (either in hard copy or electronic file formats) meeting the time frames specified in Parts 1.1.1. and 1.1.2., or documentation demonstrating why a study is not required for changes described in Parts 1.1.2. and 1.1.3.

M2. Acceptable evidence for Requirement R1, Part 1.2. is dated documentation demonstrating each affected entity received, within the specified time frame, the summary results of each Protection System Study (hard copy or electronic file formats) sent, pursuant to Requirement R1, Part 1.2.

R2. For each Interconnected Facility, each Transmission Owner shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. Perform a short circuit study to determine the present Fault current values, not less than once every 24 months.

2.2. Calculate the percent deviation between the Fault current values (single line to ground and 3-phase for the bus(s) or Element(s) under consideration) used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation:

$$\%\,Deviation = \left(\frac{Vscs - Vpss}{Vpss}\right) x\ 100$$

Where: V_{scs} = Fault current value from present short circuit study

And: V_{pss} = Fault current value used in the most recent Protection System Study

2.3. Where the calculation performed, pursuant to Requirement R2, Part 2.2, indicates a deviation in Fault current of 10% or greater, notify each owner of the Interconnected Facility, at which the 10% or greater deviation applies, within 30 calendar days after identification.

M3. Acceptable evidence for R2, Part 2.1 is dated documentation (hard copy or electronic file formats) containing the present Fault current values from the short circuit study for each Interconnected Facility analyzed.

M4. Acceptable evidence for R2, Part 2.2 is dated documentation (hard copy or electronic file formats) that identifies the percent deviation from the most recent Protection System Study Fault current values determined by

Rationale for R2: This requires a periodic review of Fault currents and notification to the applicable entities when deviations occur that meet the Requirement R2 criteria. It is important that Interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the Fault current studies because they maintain the data necessary to perform the studies. The SDT determined that 10% was an appropriate point at which to require notification, based on the fact that Protection System elements that can be affected by Fault current are typically set with margins above 10%.

Part 2.1 Short circuit databases are customarily updated annually, so the SDT believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation. The SDT believes studies associated with changes that would affect the coordination in less time would be triggered by other requirements in this standard.

Part 2.2 The SDT is requiring this formula to assure a consistent approach is used by each Transmission Owner when calculating the percent deviation in Fault current vales.

Part 2.3 The SDT believes the 30-day time frame is reasonable for sending notification(s) to the interconnected entity(s).

the formula pursuant to Part 2.2.

M5. Acceptable evidence for R2, Part 2.3 is documentation (hardcopy or electronic file formats) demonstrating identification of a deviation in Fault current values 10% or greater, along with documentation (hard copy or electronic file formats) demonstrating each affected entity received notification of such within the specified timeframe.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility, the details (e.g., project schedule, protective relaying scheme types and settings) as follows: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

> Rationale for R3: This requires the transfer of appropriate information to the entities of each Interconnected Facility due to circumstances identified in Parts 3.1 3.2, and 3.3.
>
> Part 3.1 The reliability objective of this requirement is to enable the process of conducting Protection System Studies by ensuring that the information is provided to the Interconnected Facility owner(s) in a timely manner. The SDT believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. This requirement also pertains to changes identified as a result of studies performed in Part 1.1.
>
> Part 3.2 The purpose of this requirement is to provide a means for an entity to receive requested information from an interconnected owner in a timely manner in order to perform a Protection System Study, as required in Parts 1.1.1, 1.1.2, 1.1.3. The SDT believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.
>
> Part 3.3 The SDT believes 30 calendar days after the conditions noted in Parts 3.3.1 and 3.3.2 is sufficient time to provide the information.

3.1. For any change or additions listed below; either at an existing or new Interconnected Facility, or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities.

- New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to line lengths and/or conductor size or spacing
- Additions, removals, or replacements of transmission system Element(s)
- Changes to generator unit(s), including replacements, re-ratings, and impedances
- Replacement of the generator step-up transformer(s)

3.2. According to an agreed-upon schedule with a Transmission Owner, Generator Owner, or Distribution Provider, or absent such an agreement, within 30 calendar days of receiving a request for information.

3.3. Within 30 calendar days after:

3.3.1 Corrections are made when Protection System errors are found during Misoperation investigations, commissioning, or maintenance activities.

3.3.2 Emergency replacements are made due to failures of Protection System components.

M6. Acceptable evidence for R3, Part 3.1 is documentation (hard copy or electronic file formats) demonstrating each affected entity received project details for the changes identified in the bulleted list. Evidence may include, but is not limited to, a summary of the future project or technical specifications of the proposed changes.

M7. Acceptable evidence for R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was delivered according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

M8. Acceptable evidence for R3, Part 3.3 and its subparts is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made pursuant to Parts 3.3.1 and 3.3.2. was received within 30 calendar days.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Within 90 calendar days after receipt, confirm agreement with the summary results of a Protection System Study, as described in Requirement R1, Part 1.2.

4.2. Prior to the in-service date of any planned change at the Interconnected Facility, confirm the affected Interconnected Facility owners agree with the Protection System(s) changes, as described in Requirement R3, Part 3.1.

4.3. Within 30 calendar days after receipt:

4.3.1 Confirm the Protection System(s) changes are acceptable pursuant to notification received per Requirement R3, Part 3.3.1.

4.3.2 Confirm the Protection System(s) changes are acceptable pursuant to notification received per Requirement R3, Part 3.3.2.

Rationale for R4: This requirement ensures owners of Interconnected Facilities confirm that the Protection System(s) applied on each of its Interconnected Facilities is acceptable per the conditions identified in Parts 4.1, 4.2, and 4.3.

Part 4.1 The SDT believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to resolve differences and reach agreement.

Part 4.2 The SDT believes that proposed modifications (including project schedules) to Interconnected Facilities, as described in Requirement R3, Part 3.1, must be communicated and agreed to prior to the in-service date. Agreement assures that the coordination of Protection Systems for Interconnected Facilities is achieved.

Part 4.3 The SDT believes 30 calendar days is a reasonable time for the owners of existing Interconnected Facilities to resolve differences and reach agreement for the conditions noted in Parts 4.3.1 and 4.3.2. Note: Parts 4.3.1 and 4.3.2 reference Requirement R3, Parts 3.3.1 and 3.3.2 which pertain to corrective or Emergency changes.

M9. Acceptable evidence for R4, Parts 4.1, 4.2, and 4.3 is dated documentation (hardcopy or electronic file formats) demonstrating confirmation was achieved within the respective time frame(s).

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity; or if the Responsible Entity is owned, operated or controlled by the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e., another Regional Entity) to be responsible for compliance enforcement.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at an Interconnected Facility shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures M1 through M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at an Interconnected Facility is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Long-term Planning	Medium	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required, but was late by less than or equal to 10 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by 10 calendar days or less.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.1, but was late by more than 30 calendar days. OR The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required, but was late by more than 10 calendar days but less than or equal to 20 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required, but was late by more than 20 calendar days but less than or equal to 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required but was late by more than 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 30 calendar days. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The responsible entity failed to perform a Protection System Study on an Interconnected Facility per R1, Parts 1.1.1, 1.1.2, or 1.1.3, or document why a study was not required. OR The responsible entity failed to provide Protection System Study results in accordance with R1, Part 1.2.
R2	Long-term Planning	Medium	The Transmission Owner performed a short circuit study, as described in R2, Part 2.1, but was late by less than or equal to 30 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 30 calendar days but less than or equal to 40 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 40 calendar days but less than or equal to 50 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 50 calendar days. OR The Transmission Owner failed to perform a short circuit study, as described in R2, Part 2.1. OR The Transmission Owner failed to calculate the percent deviation between the Fault currents, according to the formula designated in

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			OR The Transmission Owner notified the Interconnected Facility owner of the changes in Fault currents, but was late by less than or equal to 10 calendar days.	OR The Transmission Owner notified the Interconnected Facility owner of the changes in Fault currents, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	OR The Transmission Owner notified the Interconnected Facility owner of the changes in Fault currents, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	R2, Part 2.2. OR The Transmission Owner notified the Interconnected Facility owner of the changes in Fault currents, but was late by more than 30 calendar days. OR The Transmission Owner failed to notify the Interconnected Facility owner of the changes in Fault currents.
R3	Operations Planning	Medium	The responsible entity provided the requested information per R3, Part 3.2, but was late by 10 calendar days or less.	The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity failed to provide information to the owners of the Interconnected Facilities for any proposed change identified in R3.1. OR The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 30 calendar days.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by 10 calendar days or less.	OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 30 calendar days. OR The responsible entity failed to provide the requested information.
R4	Operations Planning	Medium	The responsible entity confirmed agreement with the summary results of the Protection System Study per R4, Part 4.1, but was late by 10 calendar days or less.	The responsible entity confirmed agreement with the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity confirmed agreement with the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity confirmed agreement with the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 30 calendar days. OR The responsible entity failed to confirm agreement with the summary results of the Protection System Study per R4, Part 4.1. OR The responsible entity failed to confirm acceptance of the planned changes pursuant to R4, Part 4.2

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			OR The responsible responded to the confirmation request per R4, Part 4.3, but was late by 10 calendar days or less. Guidelines and Technical Basis

Requirement R1:

This requirement directs the performance of Protection System Studies for every Interconnected Facility to verify coordination of existing Protection Systems where no recent study exists or when Facility configuration or Fault current deviations of 10% or more have occurred. In developing the language to define Protection System Study, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the SDT defined the term Protection System Study for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

Protection System Studies comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The SDT believes applicable entities should have a documented Protection System Study for each Interconnected Facility to validate the Protection Systems perform in a manner consistent with the purpose of this Standard. Additionally, the SDT believes that 36 months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The SDT also has no evidence there is widespread miscoordination between Interconnected Facilities that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

It should be noted that Protection System studies performed after June 18, 2007 (the effective date of PRC-001-1) are sufficient to meet Requirement R1.

Parts 1.1.2 and 1.1.3 further direct that Protection System Studies must be completed under the following two circumstances:

1. After notification of an identified 10% or greater deviation in Fault current, the notified entities must perform a new Protection System Study of the Interconnected Facility or document why a study is not required. The SDT recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater deviation in Fault current may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, "… unless the entity can demonstrate that such a study is not required." The SDT believes the six-month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 24-month Fault current review.
2. After proposing or being notified of a change at an Interconnected Facility, entities must perform a new Protection System Study, or document why a study is not required. The SDT recognizes that, based on the scope of the proposed change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, "… unless the entity can demonstrate that such a study is not required." The SDT believes that specifying a single time frame for evaluation of the wide variety of conditions that may be associated with a particular change is not appropriate. This is because the SDT sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R1, Part 1.2 requires the entity performing the Protection System Study to provide a summary of the study results to the affected owners of Protection Systems applied at Interconnected Facilities. As guidance, the SDT lists the following inputs and results of a Protection System Study that may be included in the summary provided pursuant to this requirement:

1. Data used to determine Fault currents in performing the study, along with a listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Interconnected Facility under study.
2. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Interconnected Facility, and were reviewed for coordination of protective relays as part of the study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Interconnected Facility that were identified by the study.

4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The SDT investigated various inputs that would trigger a review of the existing Protection System Studies and determined, through the experience of the SDT members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates a periodic review of Fault currents and includes the calculation of the percent deviation between the Fault current values used in the most recent Protection System Study and the present Fault current values indicated by the short circuit study performed pursuant to this requirement. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.3.

Polling of SDT membership and various protection engineering committees indicates that short circuit databases are customarily updated annually. Based on this information, the SDT believes that requiring a 24-month periodic review of Fault currents provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation, as described in Requirement R2, Part 2.2. The SDT believes studies associated with changes that would affect the coordination in less than 24 months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.3 further directs the Transmission Owner to, within 30 calendar days, inform Interconnected Facility owners when short circuit studies indicate that 10% deviations in Fault current have occurred at the Interconnected Facility. The SDT believes the 30-day time frame associated with this requirement is reasonable for sending notification to the interconnected entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the Fault current studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This requires the Interconnected Facility owners to evaluate the impact to their Protection Systems due to proposed changes by requiring the registered functional entity initiating the changes to provide the details to the other affected entities of the Interconnected Facility. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its Protection System Studies to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The SDT recognizes that Facility changes at other locations can impact the Protection System Study of the Interconnected Facilities; e.g., the addition of a large autotransformer bank or generator not directly associated with the Interconnected Facilities. The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a Protection System Study or, absent such agreement, within 30 days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The SDT believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed-upon coordination when: (1) Protection System errors are found during misoperation investigations, commissioning, or maintenance activities; (2) Emergency replacements are made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the SDT believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

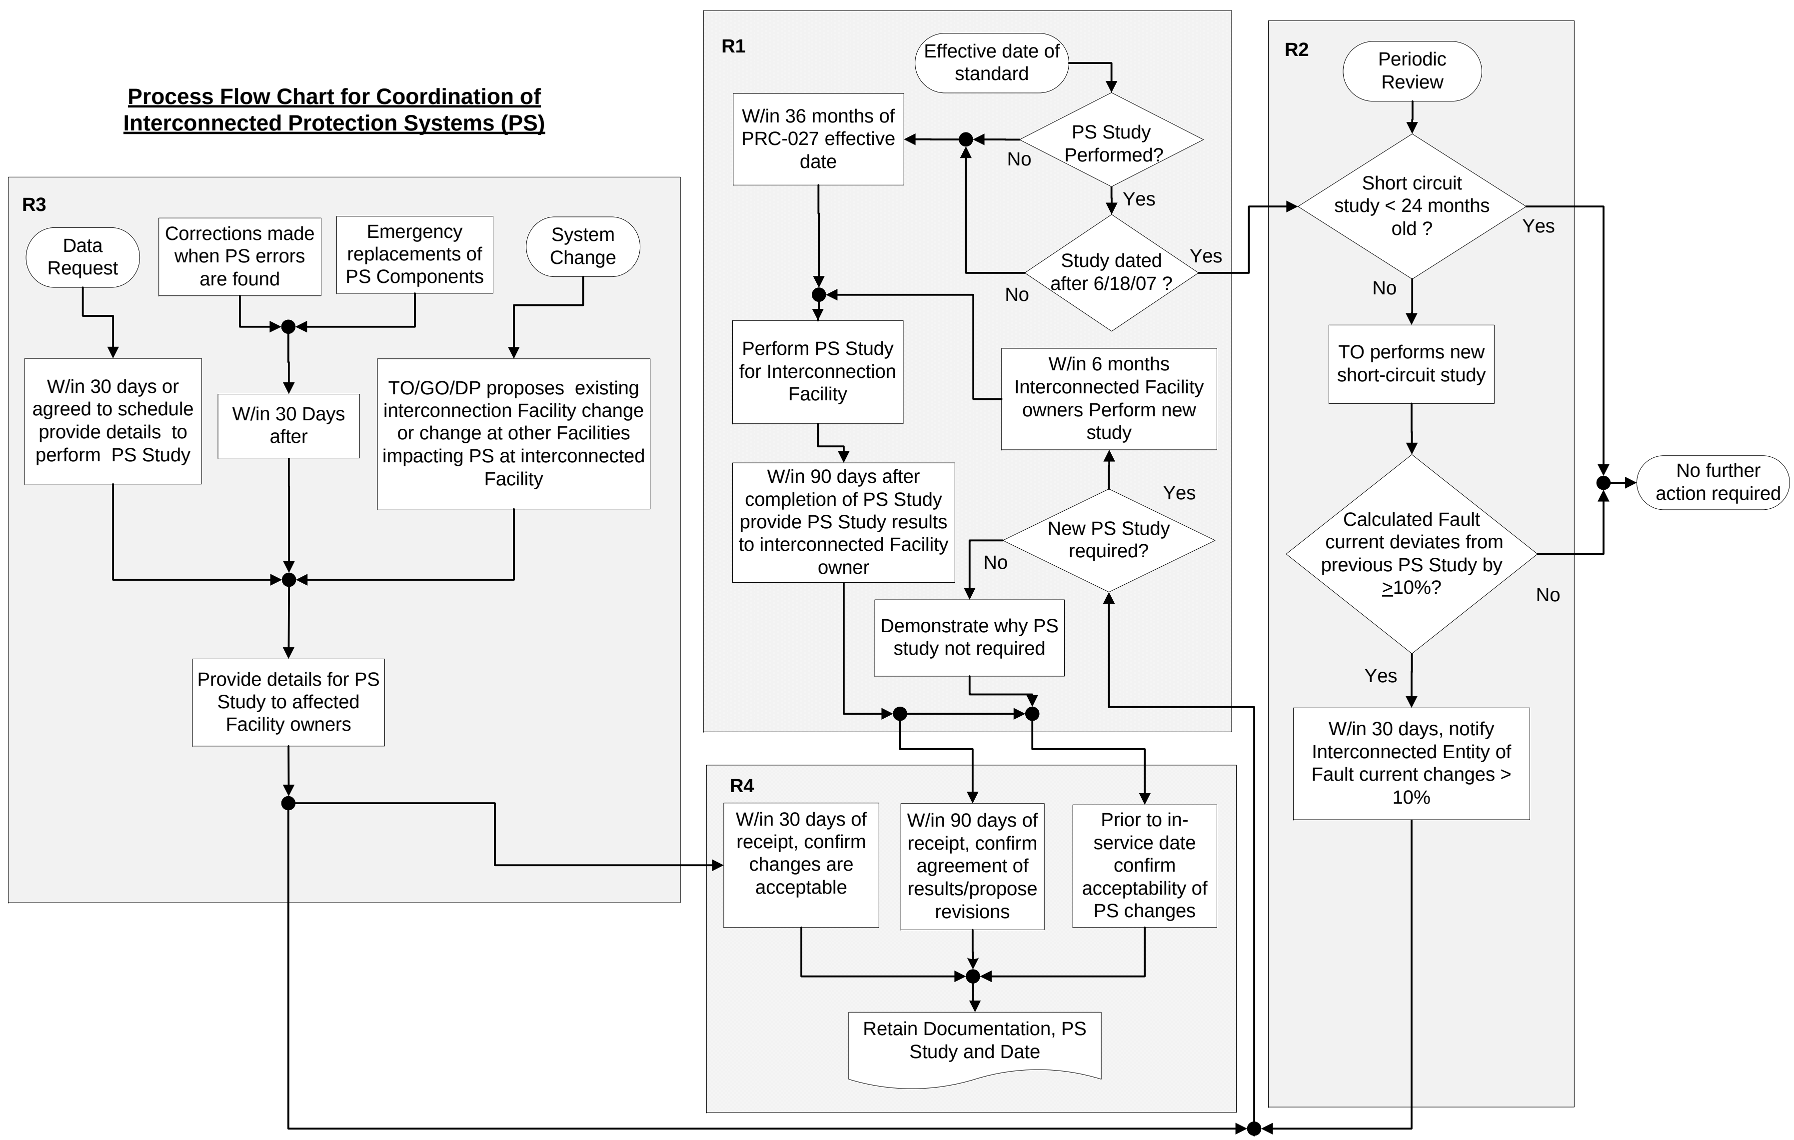
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Interconnected Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to confirm agreement with the summary results of a Protection System Study, as described in Requirement R1, Part 1.2; or absent such agreement, propose revisions to achieve acceptable results. The SDT believes 90 calendar days after receipt of the results of a Protection System Study provides a reasonable time for the owners of Interconnected Facilities to resolve differences and reach agreement that their Protection Systems are coordinated.

Requirement R4, Part 4.2 directs entities to confirm that planned changes described in Requirement 3.1 are acceptable prior to the in-service date of those changes. The purpose of this requirement is to assure the effects that planned changes have on Protection Systems at Interconnected Facilities have been considered by all affected entities.

Requirement R4, Parts 4.3.1 and 4.3.2 direct confirmation within 30 calendar days that changes are acceptable when corrections are made due to Protection System errors found during misoperation investigations, commissioning, or maintenance activities, or when Emergency replacements are made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the SDT believes 30 calendar days provides adequate time for achieving such agreement.

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:



Example Process

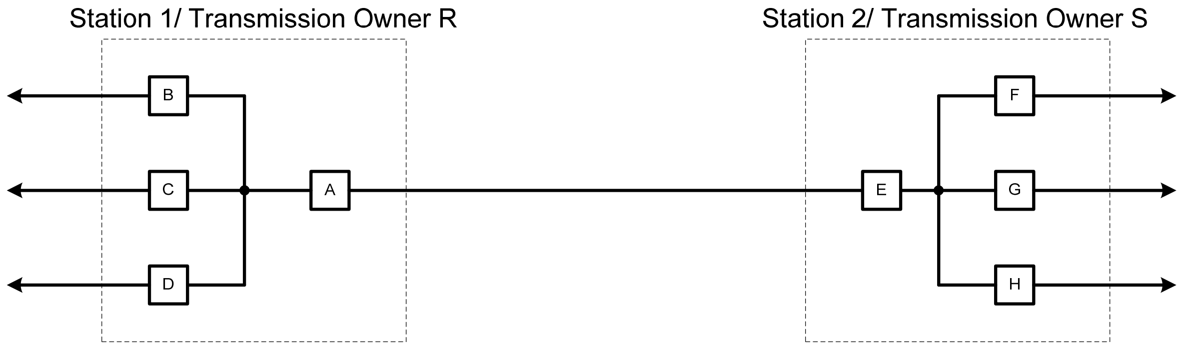
An example of the interaction between entities required to gather the information to perform an accurate study is below.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and request up-to-date Protection System information.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a Protection System Study using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the Protection System Study.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, confirm agreement that coordination is achieved.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
- Documentation of the final agreement is required prior to implementation of planned changes.

Diagrams

Introduction: The diagrams below are intended to provide guidance related to the responsibilities associated with the purpose of this standard between owners of Interconnected Facilities. After the reviews and prior to implementation of the changes, the owners must reach agreement on the final settings to achieve coordination of the Protection Systems.

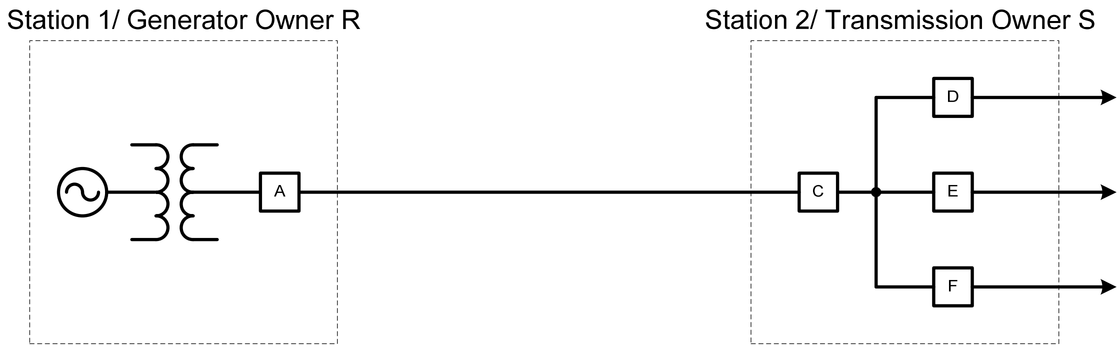
Figure 1



In Figure 1 above, the interconnecting Element between the Transmission Interconnected Facilities (Station 1 – Transmission Owner R and Station 2 – Transmission Owner S) is the transmission line between Breakers A and E.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 1, the responsibility for Owner S is to verify that the Protection System settings associated with Breaker A (provided by Owner R) do not result in coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, the responsibility for Owner R is to verify that the Protection System settings associated with Breaker E (provided by Owner S) do not result in coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

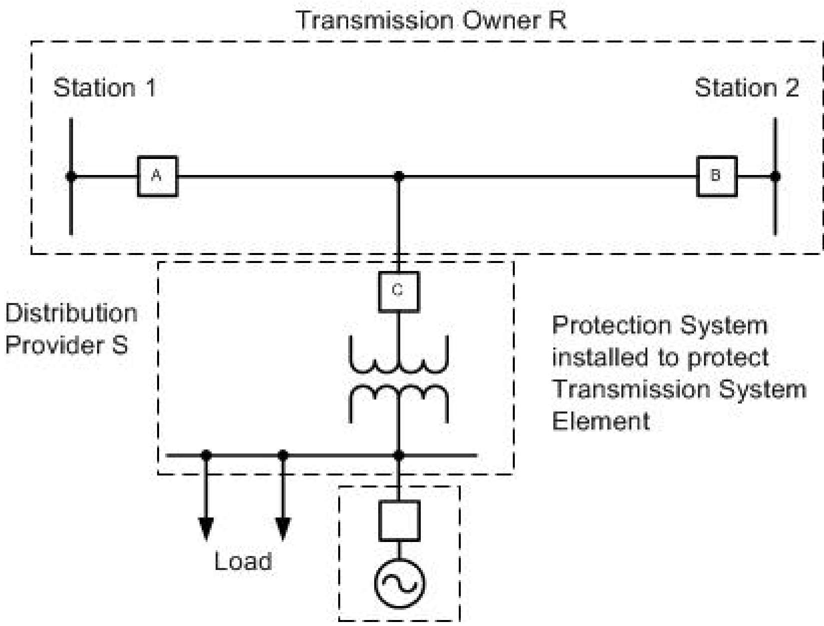
Figure 2



In Figure 2 above, the interconnecting Element between the Transmission to Generation Interconnected Facilities (Station 1 – Generation Owner R and Station 2 – Transmission Owner S) is the transmission line or bus between Breakers A and C.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 2, the responsibility for Transmission Owner S is to verify that the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems do not result in coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, the responsibility for Generation Owner R is to verify that the Protection System settings associated with Breaker C (provided by Owner S) do not result in coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3

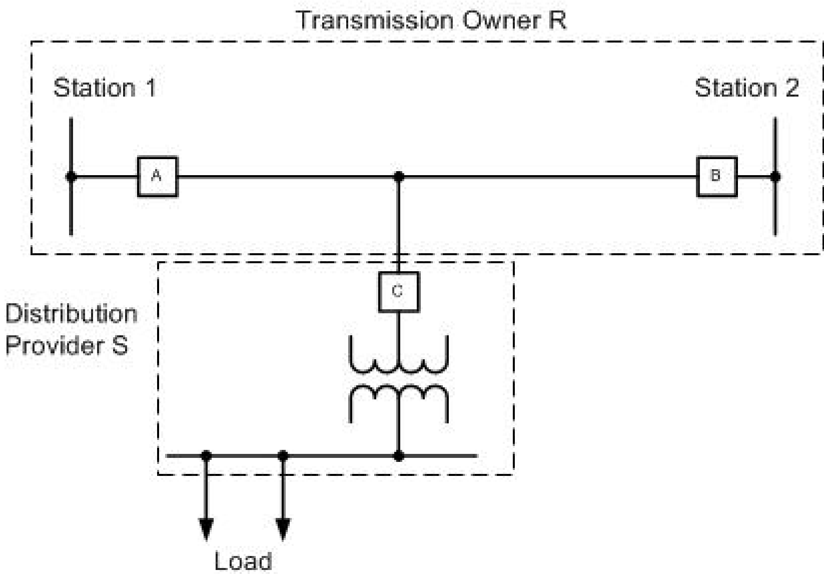


In Figure 3 above, the interconnecting Element between the Transmission Owner to Distribution Provider (with a generator) Interconnected Facilities (Transmission Owner R line between Breakers A and B – Distribution Provider S) is the transmission line or tap between the line and Breaker C.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 3, the responsibility for Transmission Owner R is to verify that the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) and the generator Protection Systems do not result in coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2. Likewise, the responsibility for Distribution Provider S is to verify that the Protection System settings associated with Breakers A and B (provided by Owner R) do not result in coordination issues with the Protection System settings associated with Breaker C and the generator Protection Systems. In order to perform this verification, it will be necessary that the Generator Owner provide Distribution Provider S with its generator Protection System settings.

Note: A Protection System Study is required per this standard for this example if a Protection System at the Distribution Provider's substation is designed to protect BES transmission system Elements.

Figure 4

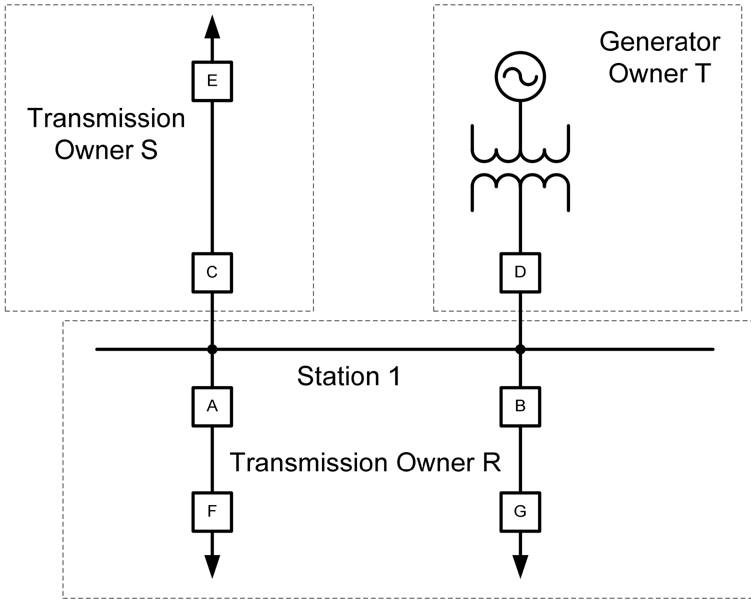


In Figure 4 above, the interconnecting Element between the Transmission Owner to Distribution Provider Interconnected Facilities (Transmission Owner R line between Breakers A and B – Distribution Provider S) is the transmission line or tap between the line and Breaker C.

Note: No specific Protection System Study is required per this standard for this example since the Protection System at the Distribution Provider's substation is not designed to protect BES transmission system Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners



In Figure 5 above, the interconnecting Element between the Transmission Owners R and S and the Generation Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at Transmission Station 1, and all direct interconnections are between Owner R and each of the other Owners connected to the bus.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 5:

The responsibility for Owner R is to verify that the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S or T) do not result in coordination issues with the Protection System settings associated with Breakers A, B.

The responsibility for Owner S is to verify that the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R or T) do not result in coordination issues with the Protection System settings associated with Breaker C. To perform this verification, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

The responsibility for Owner T is to verify that the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R or S) do not result in coordination issues with the Protection System settings associated with Breaker D or the Protection Systems associated with generator Protection Systems. In order to perform this verification, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Unofficial Comment Form for 1st Draft of PRC-027-1: Protection System Coordination for Performance During Faults

Project 2007-06

Please **DO NOT** use this form to submit comments on the 1st draft of the standard for Protection System Coordination for Performance During Faults. Comments must be submitted by **July 5, 2012**. If you have questions please contact Al McMeekin at al.mcmeekin@nerc.net or by telephone at 803-530-1963. Please submit comments here.

http://www.nerc.com/filez/standards/System_Protection_Project_2007-06.html

Background Information:

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPC SDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. Additionally, the SPC SDT determined that Requirement R1 in PRC-001-1 (a requirement for the Transmission Operator, Balancing Authority and Generator Operator to "be familiar with the purpose and limitations of protection system schemes applied in its area") is unrelated to coordination of protection systems and belongs in another project. The two remaining requirements, Requirements R3 and R4 of PRC-001-1 address the coordination of new and existing protective systems. These aspects of coordination are incorporated in the proposed standard PRC-027-1 Protection System Coordination for Performance during Faults.

The SPC SDT responded to the comments from the initial posting of PRC-001-2 and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC quality review in December 2010, which resulted in substantial changes to the standard. After informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team members decided to focus their knowledge and expertise on developing a new results-based standard with the stated purpose completely within the scope of the original SAR: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."

The SPC SDT is presenting the first draft of PRC-027-1 for stakeholder review and comment.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The SDT established the following Purpose for this standard: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."

   Do you agree with this Purpose? If not, please provide specific suggestions for changes to the purpose in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. The SDT assigned the Applicability of PRC-027-1 to Transmission Owners, Generator Owners and Distribution Providers that own the Protection Systems applied at the Interconnected Facilities that require coordination for isolating generation and Transmission Faults. Are you aware of other functional entities that should be included in the Applicability? If so, please provide specific suggestions in the comment area and the reason for including those functional entities.

   ☐ Yes

   ☐ No

   Comments:

3. In Requirement R1, the SDT allowed a responsible entity 36 months to have a documented Protection System Study completed for each Interconnected Facility if the responsible entity does not already have a Protection System Study for that Interconnected Facility performed on or subsequent to June 18, 2007 (the effective date of PRC-001-1). Do you agree with this time frame? If not, please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. In Requirement R2, the SDT established a +/- 10 % change in an Interconnected Facility's Fault current value as a criterion for notifying interconnected entities to give the interconnected entity a "heads up" that a review of the existing documented Protection System Study may be warranted.

   Do you agree with the +/- 10 % Fault current threshold for initiating this review? If not, please provide an alternative means along with a technical justification for determining a threshold.

   ☐ Yes

☐ No

Comments:

5. In Requirement R3, the SDT included a list of proposed changes that impact the coordination of Protection Systems and would initiate a need to inform other entities. Do you agree that this is an appropriate and inclusive list? If not, please provide specific suggestions for additions or deletions with your reasoning(s) in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. In Requirement R4, the SDT required that agreement must be reached prior to implementation of proposed Protection System changes except under the conditions identified in Requirement 3, Part 3.3. Do you agree with this need? If not, please specify reasons in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirement R4, the SDT established a 90 day time frame for responding to a request for agreement with a Protection System Study. Do you agree with this time frame? If not, please provide specific suggestions with your reasoning(s) in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. The team included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments? If not, please provide specific suggestions for change.

   ☐ Yes

   ☐ No

   Comments:

9. If you have any other comments **<u>that you have NOT provided in response to the above questions</u>**, please provide them here. (Please do not repeat comments that you provided elsewhere.)

   Comments:

Project 2007-06 System Protection Coordination Mapping Document

Mapping Document Showing Translation of PRC-001-2 – System Protection Coordination to PRC-027-1 – Protection System Coordination for Performance During Faults

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area.	Retained	NA
R2. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **R2.1** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. **R2.2** Each Transmission Operator shall	PRC-027-1, R1, R3, & R4 Note: Applicability changed to GO, TO and DP	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **1.1.** Perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults as follows: **1.1.3.** When proposing or being notified of a change at the Interconnected Facility as described in Requirement R3, Part 3.1 or Part 3.3, unless the entity can demonstrate such a study is not required. **1.2.** Provide to each affected Interconnected Facility owner, a summary

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.		of the results of each Protection System Study performed pursuant to this requirement, (including at a minimum, the Protection System(s) reviewed, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each Protection System Study. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility the details (e.g., project schedule, protective relaying scheme types and settings) as follows: **3.1.** For any change or additions listed below; either at an existing or new Interconnected Facility, or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities. • New installation, replacement with different types, or modification of protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios • Changes to line lengths and/or conductor size or spacing • Additions, removals, and/or replacements of transmission system Element(s) • Changes to generator unit(s), including replacements, re-ratings, and impedances

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		• Replacement of the generator step-up transformer(s) **3.2.** According to an agreed-upon schedule with a Transmission Owner, Generator Owner, or Distribution Provider; or absent such an agreement, within 30 calendar days of receiving a request for information. **3.3.** Within 30 calendar days after: **3.3.1.** Corrections are made when Protection System errors are found during Misoperation investigations, commissioning, or maintenance activities. **3.3.2.** Emergency replacements are made due to failures of Protection System components. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **4.2.** Prior to the in-service date of any planned change at the Interconnected Facility, confirm the affected Interconnected Facility owners agree with the Protection System(s) changes, as described in Requirement R3, Part 3.1. **4.3.** Within 30 calendar days after receipt: **4.3.1.** Confirm the Protection System(s) changes are acceptable pursuant to notification received per Requirement R3, Part 3.3.1.

NERC

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		4.3.2. Confirm the Protection System(s) changes are acceptable pursuant to notification received per Requirement R3, Part 3.3.2.
R3. Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.	PRC-027-1, R1, R2, R3, & R4 Note: Applicability changed to GO, TO and DP	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **1.1.** Perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults as follows: **1.1.1.** Within 36 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Facility exists that was performed on or subsequent to June 18, 2007. **1.1.2.** Within six calendar months after determining, or being notified of, a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required. **1.2.** Provide to each affected Interconnected Facility owner a summary of the results of each Protection System Study performed pursuant to this requirement, (including at a minimum, the Protection System(s) reviewed, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each Protection System Study. **R2.** For each Interconnected Facility, each Transmission Owner shall:

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		2.1. Perform a short circuit study to determine the present Fault current values, not less than once every 24 months. **2.2.** Calculate the percent deviation between the fault current values (single line to ground and 3-phase for the bus(s) or Element(s) under consideration) used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1 using the following equation: Where: V_{scs} = Fault current value from present short-circuit study And: V_{pss} = Fault current value used in the most recent Protection System Study **2.3.** Where the calculation performed pursuant to Requirement R2, Part 2.2 indicates a deviation in fault current of 10% or greater, notify each owner of the Interconnected Facility at which the 10% or greater deviation applies, within 30 calendar days after identification. **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility the details (e.g., project schedule, protective relaying scheme types and settings) as follows:

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		3.2. According to an agreed-upon schedule with a Transmission Owner, Generator Owner, or Distribution Provider; or absent such an agreement, within 30 calendar days of receiving a request for information. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **4.1.** Within 90 calendar days after receipt, confirm agreement with the summary results of a Protection System Study, as described in Requirement R1, Part 1.2.

PRC-001-3: System Protection Coordination				X	X	X

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions:

Interconnected Facilities: BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is three months beyond the date that this standard is approved by applicable regulatory authorities, where such explicit approval is required. Where no regulatory approval is required, the standard shall become effective on the first day of the first calendar quarter that is three months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise prescribed by the laws or regulations of the applicable ERO governmental authorities. For Facility Interconnections between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

PRC-001-3 – System Protection Coordination

Same effective date as PRC-027-1.

Effective Date for Definitions

The two proposed definitions (Interconnected Facilities and Protection System Study) shall become effective at the same time as PRC-027-1.

Retirement:

PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric

System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: *"To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems do not remove power system Elements from service except for those required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."* PRC-027-1 has four (4) requirements that incorporate and enhance the reliability intent of Requirements R3 and R4 of PRC-001-1. The new standard addresses the aspects of coordination for new Protection Systems, as well as changes to existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, and reaching agreement on Protection System settings and schemes.

All four requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Studies are performed for every Interconnected Facility to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required but was late by less than or equal to 10 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by 10 calendar days or less.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.1, but was late by more than 30 calendar days. OR The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required but was late by more than 10 calendar days but less than or equal to 20 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required but was late by more than 20 calendar days but less than or equal to 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity performed a Protection System Study on an Interconnected Facility per R1, Part 1.1.2, or documented why a study was not required but was late by more than 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 30 calendar days. OR The responsible entity failed to perform a Protection System Study on an Interconnected Facility per R1, Parts 1.1.1, 1.1.2, or 1.1.3, or document why a study was not required. OR The responsible entity failed to provide Protection System Study results in accordance with R1, Part 1.2.

VSL Justifications – PRC-027-1, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to periodically review, calculate the percent deviation in fault current values used as inputs for updating Protection System Study(s), and to notify Interconnected Facility owners of requisite deviations in fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R2 is similar in scope to Requirements R1, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R2 facilitates a periodic review of Fault currents and notification of Interconnected Facility owners. This requirement is similar to Requirement R6 of BAL-005-0.2b in that it also requires the comparison of calculated data and possible notification of other entities; and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to periodically review, calculate the percent deviation in fault current values used as inputs for updating Protection System Study(s) and to notify Interconnected Facility owners of requisite deviations in fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R2 addresses a single objective and has a single VRF.

Technical Justification

PRC-027-1 Protection System Coordination for Performance During Faults

The purpose of the proposed PRC-027-1 reliability standard is to coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC reliability standards. This purpose is consistent with NERC's goal to create and implement reliability standards that enable or support at least one of the eight defined Reliability Principles. The requirements of the proposed PRC-027-1 reliability standard directly support the following Reliability Principles:

> Reliability Principle 1 – Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions, as defined in the NERC Standards.
>
> Reliability Principle 3 – Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
>
> Reliability Principle 7 – The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Reliability Standard PRC-001-1, as assessed by the NERC System Protection and Control Task Force (SPCTF) in its report of December 7, 2006, does not assign responsibility to the appropriate functional entities, contains several fundamental flaws within the requirements, and mixes training, operational, and planning related requirements in one standard. Primarily, as stated in the conclusion of this assessment, the SPCTF asserts:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

With the development of the proposed PRC-027-1 reliability standard, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1. In the proposed standard, the SDT properly assigns the applicable functional entities and builds upon the planning horizon requirements of PRC-001-1 that are applicable to Protection System coordination related to system Faults (Requirements R3 and R4). The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1.)

2. Assigning responsibility to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.

3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project.

   Note: The proposed disposition of Requirements R2, R5, and R6 of PRC-001-1 is posted on the Project 2007-03 page. The Project 2007-03 SDT is recommending retirement of Requirements R2, R5, and R6 of PRC-001-1 because they address data and data requirements which are covered in TOP-003-2. For Project 2007-03, the SDT included a redlined version of PRC-001-1 and a clean version of PRC-001-2 with the conforming changes, along with a mapping document and implementation plan describing the translation of the legacy requirements into TOP-003-2.

4. Leaving the legacy Requirement R1 of PRC-001-1 in PRC-001-2 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

The proposed PRC-027-1 reliability standard includes four requirements that build upon the reliability objectives of Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2), and further provide a defense-in-depth strategy for ensuring Bulk Power System (BPS) reliability associated with Protection System coordination for Interconnected Facilities between owners by:

- Requiring a documented Protection System Study of the Protection Systems applied on the Interconnected Facilities between owners, within 36 months of the effective date of the proposed standard.
- Establishing criteria for a periodic review of the previously-documented Protection System Study of the Protection Systems applied on the Interconnected Facilities between owners.
- Continuing the requirement that installing new Protection Systems and making changes to existing Protection Systems will require interaction between owners to ensure no coordination issues exist prior to implementation of these changes.
- Establishing, where applicable, time frames for one entity to respond to requests by other entities for information and/or concurrence related to Protection System Studies associated with Interconnected Facilities.

Individually, the requirements of the proposed PRC-027-1 reliability standard construct a defense-in-depth strategy and improve upon the existing PRC-001-1 Reliability Standard Requirements R3 and R4, (now R2 and R3 of PRC-001-2) as detailed by the following:

Requirement R1:

This requirement directs that Protection System Studies are performed for every Interconnected Facility defined as: “Facilities that are electrically joined by one or more Element(s) and are owned by different functional entities;” to verify coordination of existing Protection Systems where no recent study exists or when Facility configuration or Fault current deviations of 10% or more have occurred. In developing the language to define a Protection System Study, the SDT considered various reference books discussing protective relaying theory and application, along with the following description of “coordination of protection” from the pending revision of IEEE C37.113 Guide for Protective Relay Applications to Transmission Lines:

> *“The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault.”*

Using the reference material cited above as guidance, the SDT defines the term Protection System Study as:

“A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.”

Protection System Studies comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The SDT believes applicable entities should have a documented Protection System Study for each Interconnected Facility to validate the Protection Systems perform in a manner consistent with the purpose of this standard. Additionally, the SDT believes that 36 months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The SDT also has no evidence there is widespread miscoordination between Interconnected Facilities that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

It should be noted that Protection System Studies performed after June 18, 2007 (the effective date of PRC-001-1) are sufficient to meet Requirement R1.

Requirement R1, Parts 1.1.2 and 1.1.3 further direct that Protection System Studies must be completed under the following two circumstances:

1. After notification of an identified 10% or greater deviation in Fault current, the notified entities must perform a new Protection System Study of the Interconnected Facility, or document why a study is not required. The SDT recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater deviation in Fault current may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, "… unless the entity can demonstrate that such a study is not required," The SDT believes the six months time frame associated with this requirement represents a reasonable amount of time to perform the studies required after identification by the 24-month Fault current review.

2. After proposing or being notified of a change at an Interconnected Facility, entities must perform a new Protection System Study, or document why a study is not required. The SDT recognizes that, based on the scope of the proposed change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new Protection System Study be performed; therefore, this part of the requirement includes the statement, "… unless the entity can demonstrate that such a study is not required." The SDT believes that specifying a single time frame for evaluation of the wide variety of conditions that may be associated with a particular change is not appropriate. This is because the SDT sees the entity initiating any change as having the incentive to move this along in a timely fashion to keep the associated project on schedule and to confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R1, Part 1.2 requires that the entity performing the Protection System Study provide a summary of the study results to the affected owners of Protection Systems applied at Interconnected Facilities. As guidance, the SDT lists the following inputs and results of a Protection System Study that may be included in the summary provided pursuant to this requirement:

1. Data used to determine Fault currents in performing the study along with a listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Interconnected Facility under study.
2. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Interconnected Facility and were reviewed for coordination of protective relays as part of the study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Interconnected Facility that were identified by the study.

4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The SDT investigated various inputs that would trigger a review of the existing Protection System Studies, and determined through the experience of the SDT members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates a periodic review of Fault currents and includes the calculation of the percent deviation between the Fault current values used in the most recent Protection System Study and the present Fault current values indicated by the short circuit study performed pursuant to this requirement. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.3.

Polling of SDT membership and various protection engineering committees indicates that short circuit databases are customarily updated annually. Based on this information, the SDT believes that requiring a 24-month periodic review of Fault currents provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation as described in Requirement R2, Part 2.2. The SDT believes studies associated with changes that would affect the coordination in less than 24 months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.3 further directs the Transmission Owner to, within 30 calendar days; inform Interconnected Facility owners when short circuit studies indicate that 10% deviations in Fault current have occurred at the Interconnected Facility. The SDT believes the 30-day time frame associated with this requirement is reasonable for sending notification to the interconnected entity(s), and is consistent with other NERC Reliability Standards.

In Requirement R2, the Transmission Owner is identified as the functional entity responsible for performing the Fault current studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This requires the Interconnected Facility owners to evaluate the impact to their Protection Systems due to proposed changes by requiring the registered functional entity initiating the changes to provide the details to the other affected entities of the Interconnected Facility. Documentation provided to these other owners may include, but is not limited to, power system configurations; protection schemes; schematics; instrument transformer ratios; type of relay(s); communication equipment applied for protection; and Protection System settings. The recipient will incorporate the applicable information into its Protection System Studies to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The SDT recognizes that other Facility changes not directly associated with the interconnection can impact the Protection System Study of the Interconnected Facilities; e.g., the addition of a large autotransformer bank or generator not directly associated with the Interconnected Facilities. The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part P.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a Protection System Study; or absent such agreement, within 30 days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The SDT believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously-agreed upon coordination when: (1) Protection System errors are found during Misoperation investigations, commissioning, or maintenance activities; (2) Emergency replacements are made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the SDT believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Interconnected Facility owners in communicating Protection System(s) design and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

Requirement R4, Part 4.1 directs applicable entities to confirm, within 90 days of receipt, agreement with the summary results of a Protection System Study, as described in Requirement R1, Part 1.2; or absent such agreement, propose revisions to achieve acceptable results. The SDT believes 90 calendar days after receipt of the results of a Protection System Study provides a reasonable time for the owners of Interconnected Facilities to resolve differences and reach agreement that their Protection Systems are coordinated.

Requirement R4, Part 4.2 directs entities to confirm that planned changes described in Requirement 3.1 are acceptable prior to the in-service date of those changes. The purpose of this requirement is to assure the effects that planned changes have on Protection Systems at Interconnected Facilities have been considered by all affected entities.

Requirement R4, Parts 4.3.1 and 4.3.2 direct confirmation within 30 calendar days that changes are acceptable when corrections are made due to Protection System errors found during Misoperation investigations, commissioning, or maintenance activities, or when Emergency replacements are made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the SDT believes 30 calendar days provides adequate time for achieving such agreement.

Conclusion

The proposed PRC-027-1 reliability standard builds upon the effectiveness of Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2). It also corrects the assignment of applicability of these requirements to the owners of the applicable Protection Systems. It establishes a structured roadmap of entity-to-entity communication and a process to ensure proper coordination of Protection Systems applied on Interconnected Facilities. Within this roadmap, as each requirement is combined with the other requirements, the standard achieves a defense-in-depth strategy for assuring proper coordination of Protection Systems applied on Interconnected Facilities. As such, the proposed PRC-027-1 reliability standard satisfies the overall objective of a true, reliability-based standard appropriate for approval of the NERC Board of Trustees and other applicable regulatory authorities.

Standards Announcement

Project 2007-06 – System Protection Coordination

Ballot Pools Forming: May 21 – June 19, 2012
Formal Comment Period Open: May 21 – July 5, 2012

Upcoming Ballots:
Initial Ballot and Non-Binding Poll: June 26 – July 5, 2012

Now Available

A formal comment period for PRC-027-1 – Protection System Coordination for Performance During Faults is open through 8 p.m. Eastern on Thursday, July 5, 2012 and ballot pools are forming through 8 a.m. Tuesday, June 19, 2012.

Instructions for Joining Ballot Pool(s)

Two ballot pools are being formed. Registered Ballot Body members must join the first ballot pool to be eligible to vote in balloting of standard PRC-027-1, and a second, separate ballot pool to be eligible to cast an opinion in the non-binding poll of the associated VRFs and VSLs. Registered Ballot Body members may join each of these ballot pools at the following page: Join Ballot Pool

Note that there is no requirement to join both of these ballot pools; Registered Ballot Body members who are only interested in voting during the ballot of the standard are not required to join the ballot pool for the non-binding poll, and vice versa.

During the pre-ballot windows, members of the ballot pools may communicate with one another by using their "ballot pool list servers." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pool list servers for these ballot pools are:

Initial ballot: bp-2007-06_PRC-027-1_in@nerc.com
Non-binding poll: bp-2007-06_NB_PRC-027-1_in@nerc.com

The ballot pools are open **through 8 a.m. Eastern on Tuesday, June 19, 2012.**

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Thursday, July 5, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Commenters and voters must submit comments through the electronic comment form. Due to modifications to NERC's balloting software, voters are no longer able to submit comments via the balloting software.

Next Steps

An initial ballot of the standard and non-binding poll of the associated VRF/VSLs will be conducted beginning on Tuesday, June 26, 2012 through 8 p.m. Eastern on Thursday, July 5, 2012.

Background

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPC SDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. Additionally, the SPC SDT determined that Requirement R1 in PRC-001-1 (a requirement for the Transmission Operator, Balancing Authority and Generator Operator to "be familiar with the purpose and limitations of protection system schemes applied in its area") is unrelated to coordination of protection systems and belongs in another project. The two remaining requirements, Requirements R3 and R4 of PRC-001-1 address the coordination of new and existing protective systems. These aspects of coordination are incorporated in the proposed standard PRC-027-1 Protection System Coordination for Performance During Faults.

The SPC SDT responded to the comments from the initial posting of PRC-001-2 and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC quality review in December 2010, which resulted in substantial changes to the standard. After informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team members decided to focus their knowledge and expertise on developing a new results-based standard with the stated purpose completely within the scope of the original SAR: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."

PRC-027-1 is a results-based reliability standard that is important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

The SPC SDT is presenting the first draft of PRC-027-1 for stakeholder review and comment.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. Project 2007-06 – System Protection Coordination

Initial Ballot and Non-Binding Poll Results

Now Available

An initial ballot of PRC-027-1 – Protection System Coordination for Performance During Faults and a non-binding poll of the associated VRFs/VSLs concluded Thursday, July 5, 2012.

Voting statistics for each ballot are listed below, and the Ballots Results page provides a link to the detailed results.

Approval	Non-binding Poll Results
Quorum: 84.24%	Quorum: 82.26%
Approval: 23.82%	Supportive Opinions: 25.19%

Next Steps

The drafting team will consider all comments submitted, and based on the comments will determine whether to make additional changes. If the drafting team decides to make substantive revisions, the drafting team will submit the revised standard and consideration of comments received for a quality review prior to posting for a parallel formal 30-day comment period and successive ballot.

Background

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPC SDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. Additionally, the SPC SDT determined that Requirement R1 in PRC-001-1 (a requirement for the Transmission Operator, Balancing Authority and Generator Operator to "be familiar with the purpose and limitations of protection system schemes applied in its area") is unrelated to coordination of protection systems and belongs in another project. The two remaining requirements, Requirements R3 and R4 of PRC-001-1 address the coordination of new and existing protective systems. These aspects of coordination are incorporated in the proposed standard PRC-027-1 Protection System Coordination for Performance During Faults.

Group
Dominion
Mike Garton
No
Dominion supports the stated purpose up to the comma. The qualifying language after the comma is ambiguous and not supported in the Requirements of this standard.
No
Yes
Yes
Yes
Yes
Yes
Dominion is concerned that a YES vote will also endorse the revision, also part of this project, to PRC-001-3, which is would then be reduced to only one requirement that is not measurable and does not contribute to the purpose of the standard. The Measure for the requirement has also been removed. The standard should be retired or mapped to another standard.
Individual
Michael Falvo
Independent Electricity System Operator
No
We agree with the first part of the purpose statement, but do not find it necessary to include the second part since “meeting the system performance specified within requirements established in

other approved NERC Reliability Standards" is universally true for all standards. No one single standard can assure reliability on its own; multiple standards must be complied with to meet one or more reliability objectives and performance targets. We suggest to remove the part "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".
No
Yes
No
We do not agree or disagree with the 10% deviation threshold. In the Technical Justification document, the SDT indicates that "The SDT investigated various inputs that would trigger a review of the existing Protection System Studies, and determined through the experience of the SDT members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary." Lacking statistical or detailed studied results, this basis is as good as any. However, there does not appear to be any assessment made on the potential BES reliability risks when the Fault current deviates by less than 10%. Many Protection Systems' settings are linked to Fault current level and as such, deviation as low as a few percent may render a Protection relay not operating as intended. We suggest the STD to assess the risk of not conducting a verification study for the Protection Systems when Fault current deviates from past values at a lower range to either confirm that a 10% deviation would be a safe trigger, or revise it according to the findings of the risk assessment. (NTD: we may also suggest that a Protection System Study should be required for every BES modification that is in the electrical proximity of the Interconnected Facility and is expected to modify the Fault current levels.)
Yes
No
We agree with the need to provide an agreement to the study results and to confirm acceptability of the proposed changes (other than those conditions identified in Requirement 3, Part 3.3), but R4 is unclear in a number of aspects, as follows: 4.1 There is no requirement or provision for the receiving entities to express disagreement, with rationale, and R4 does not require resolving the differences. Both need to be added. 4.2 Based on the language in Part 4.1, we assume R4 applies to the receiving entities. Hence we interpret 4.2 to require the receiving entities to confirm with the sending (or the initiating) entities of their agreement with the proposed changes. In that vein, the wording in 4.1 "confirm the affected Interconnected Facility owners" is unclear as to who needs to confirm with whom. Suggest to reword 4.1 to: "Prior to the in-service date of any planned change at the Interconnected Facility, confirm with the Interconnected Facility owners that initiated the changes that agreement with the Protection System(s) changes as described in Requirement R3, Part 3.1. was reached." 4.3 requires that the receiving entities confirm with the initiating entities of the changes made under Part 3.3, for which prior agreements are not necessary or perhaps possible. However, there is no requirement or provision for the receiving entities to express a disagreement, with rationale, and suggest alternative setting changes, or resolve the differences. This needs to be provided.
Yes
Yes
We generally agree with the VRFs and the VSLs for the requirements as presented, but we have concerns with some of the requirements and hence reserve our comments until we see revisions made to these requirements.
1. As a general comment, we do not support defining new terms which have limited applications (e.g. for use in one or very few standard) and which are short and therefore can be equally effectively expressed in the requirement that the term or its intended meaning is used. Adding new terms to the NERC Glossary when not absolutely necessary creates unnecessary maintenance workload and dependency among standards that use the same term, making it far more difficult to revise a

standard without addressing the ripple effects. While we do not oppose to defining the term Interconnected Facilities as it serves to clarify and provide the boundary of the Facility, and we see its potential application to other standards, we disagree with defining the term “Protection System Study”. The definition contains an objective “operate in the desired sequence for clearing Faults” that should be stipulated in the standard requirements themselves. Further, as suggested below, the requirements that this term is used can be easily revised to convey the meaning of the definition: R1, 1.1 Perform a study for each Interconnected Facility to verify that Protection Systems operate in the desired sequence for clearing Faults and remove from service only those Elements required to isolate Faults as follows: 1.1.1 Within 36 calendar months after the effective date of this standard, if no such study for that Interconnected Facility exists that was performed on or subsequent to June 18, 2007 R1, 1.2 Provide to each affected Interconnected Facility owner a summary of the results of each study performed pursuant to Part 1.1 of this requirement, (including, at a minimum, the Protection System(s) reviewed, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each study. R2, 2.2 Calculate the percent deviation between the Fault current values (single line to ground and 3-phase for the bus(s) or Element(s) under consideration) used in the most recent study performed under Part 1.1 of R1 and the Fault current values.... Vpss = Fault current value used in the most recent study R4, 4.1 Within 90 calendar days after receipt, confirm agreement with the summary results of a study as described in Requirement R1, Part 1.2. Conforming changes can be made to the associated Measures and VSLs. 2. We do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. If this is a training requirement, it should be transferred to the appropriate PER standards. c. Measures M1 is removed from the standard. This does not conform with the Elements of a Reliability Standard template, specifically those specified in the “Mandatory and Enforceable Sections of a Standard”. d. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. However, leaving this not measurable and unnecessary requirement in PRC-001-3 is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT could have proposed a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee’s advice/direction for appropriate actions. 3. The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after “where such explicit approval is required” in the Effective Dates Section on P. 2, to the following effect: “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.”
Individual
Thad Ness
American Electric Power
No
AEP recommends the removal of the language, “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards”. AEP recommends as an alternative to the removal of the language, modification of the language to reference the TOP standards that should be adhered to in conjunction with PRC-027.
No
No
36 months is not adequate for unique Protection System Studies to be conducted for the TO, GO, and DP. The interface and coordination requirements as written will require close communication with a vast number of interconnected facilities. In addition the generation landscape changes over the next few years with the large number of generation retirements and additions will continually change the short circuit model. AEP feels that these contributing factors will lead to time requirements above the proposed 36 months currently in the standard. AEP would require a minimum of 60 months to

complete this work as the AEP system exists today. An added complication that will impact this time requirement is the approval of FERC Order 1000, which could result in additional interfacing TO's inside AEP's footprint. In addition, NERC's rationale for R1 states that "the SDT has no evidence there is widespread miscoordination between Interconnected Facilities that warrants a shorter time frame." If this is the case, then there should be no issue with extending this timeframe. Using the word "demonstrates" within the definition for Protection System Study could be interpreted as requiring an actual, operational test rather than a simulation study. We recommend changing the definition to "a study that demonstrates that the existing or proposed Protection System design will enables the Protection System to operate in the desired sequence for clearing Faults." Is using the defined term "Protection System" appropriate? Does it possible bring things into scope (CTs, PTs, Station batteries) which should not?
Yes
Yes
No
The 90 Day window will not be sufficient during the initial R1 time frame. AEP suggests 180 days during the R1 compliance window.
No
AEP has suggested adjusting the time requirements, as stated in Question 3 and 7. These time requirements should be included and the VSLs should be scaled accordingly.
We agree with the comment in the background section that the SAR written for this project was focused on System Protection Coordination, and we recommend that PRC-001 R1 should be moved to another standard more focused on operations or training. TOP-006 R3 might be a more appropriate standard for such a requirement. For R1, the standard needs to clearly state the boundaries of the required study(ies). In addition, detail is needed regarding the depth of study away from the point of interconnection, and how far into the generating unit auxiliary system or interconnecting system must be evaluated. Based on the redline provided where R3 and R4 have been removed, and assuming the SDT is not willing to moving the sole remaining requirement to another standard, the title and purpose of resulting PRC-001 would need to be changed. If PRC-001 R1 remains as it is, the phrase "familiar with the purpose and limitations of protection system schemes" needs additional clarity. Doing so might help prevent a CAN from being developed to provide such clarity. AEP suggests the time requirement on R4.3 associated with R3 needs to be extended to 60 days.

Yes
We agree with the purpose of the standard. We disagree with the execution of this purpose. This standard only addresses a very narrow reliability issue. Does the SDT really believe that this narrow concern needs all the documentation called for in the standard? At a minimum, a Protection System Study, proof that you checked for a +/- 10% Fault current change regularly, and proof that you have communicated with other registered entities on these issues? And this will be for every interconnection. We feels this is regulatory overkill and not indicative of a results based standard.
No
No
There is no need to have a Protection System Study available for review for every Interconnected Facility. The study is useful only as an intermediate product that leads to relay settings and as a basis for both entities to agree that their planned settings will coordinate. The results based objective is that the registered entities communicate and coordinate together. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard has been met.
No

We do not agree with this requirement. The selection of a +/- 10% threshold is entirely arbitrary. For instance, some entities will set Z1 to 80%, leaving a 20% margin for error. Some entities will set it at 90%. The SDT should allow entities to decide for themselves when a review is needed. As we stated before, the results based objective is to communicate and coordinate. Not to prove whether the fault current at a certain bus is +/- XX% greater than it was at some time in the past. Furthermore, the SDT itself states there is no proof that failure to coordinate protection systems is causing reliability issues. If entities allow their systems to become uncoordinated, we would expect it to come to light as a Misoperation and be handled under PRC-004. We do not agree it is the TO's responsibility to maintain a short circuit model for other entities. What responsibility does the TO take on if it models a generator's short circuit capability incorrectly? This is a very real concern among transmission protection engineers when attempting to model large wind farms with their proprietary models.
Yes
We agree with the list in R3.1. We feel that R2, R3.2 and R3.3 are unnecessary. Instead, the list in R3.1 should act as a trigger requiring both entities to document communication agreeing that coordination exists prior to putting the changes into effect. No communication under R3.3 should be required if the changes restore the system to its original state – replacing a failed relay like for like.
Yes
We agree that the entities should agree prior to any changes being implemented. The only date of interest, in our opinion, is the in-service date of any proposed changes. If agreement is reached prior to the field changes being made, then that is all that matters.
No
No, we do not agree. R4.2 should apply here. R4.1 and R4.3 should be eliminated. If one entity proposes making settings changes, then agreement must be reached prior to implementing the changes. We feel all these timelines are unnecessarily burdensome to remember and quite arbitrary. If one entity feels it cannot get another entity to respond or to reach agreement on coordination, they can always ask their RE for assistance in maintaining the reliability of the system. Since all these activities occurred long before the mandatory standards existed and are covered under the present PRC-001, we do not feel the REs will be swamped with calls if R4.1 and R4.3 are eliminated.
We note that the formulas in R2 use V for current. For clarity's sake, we believe current should be denoted using the letter I.

Southwest Power Pool NERC Reliability Standards Development Team
Jonathan Hayes
No
We would ask that the team revise the second part of the purpose to lead in with "In accordance with the system performance specified within requirements established in other approved NERC Reliability Standards" If left as is it reads like you are required to do both the first and second parts of the purpose. This proposed language requires the initial goal of this standard and references that it will do so under the system performance specified in NERC standards.
No
Yes
Yes
No
In R3 we would suggest that re-rating could be use as a temporary procedure which is addressed in the TOP standards and if the drafting team needs to include these types of re-ratings that they be more specific to exclude the temporary re-ratings. Changes to generator unit(s), including replacements, Output change that causes a change in the protection system, and impedances
No
We agree with the need but feel it needs to be more detailed to include wording that would address

that the coordinated owner has all appropriate data to perform the study before his 30 day timeline begins. We would also like to see a conflict resolution process included under this requirement.
Yes
Yes
In R2 the 24 month time period needs to be changed to 60 months. If fault currents are already being calculated for changes to the system there should be little to no need for a more current check of the fault currents. We feel like the 24 months could be burdensome to smaller entities. We would ask that PRC001-3 be retired and the requirement in it to be moved to a SAR for an existing PER training standard. It also seems incomplete that a standard with a single requirement has no measures. Is there a need for the defined term “Protection System Study” in this standard to also be a new term in the NERC glossary of terms? Is there other wording that could be used in place of this new term since it is only being used as part of this standard?

No
Yes
As a TO our experience has been that many GOs do not reply to requests for information. If the 36 month window cannot be met by a TO because information requests are ignored what recourse does the TO have to avoid a penalty for non-compliance?
Yes
Please clarify where the fault is to be placed and where the deviation is to be observed. One possibility is to place the fault at a bus at one end of the tie and then determine the devieation in the current in each element connected to said bus.
Yes
Yes
Yes
In the event that someone hands you a study of their entire system or of all their interconnections you should only be responsible for reviewing study results for those interconnections in which you are a participant. Furthermore, what if you don’t agree with the study results you’ve been handed? The text as written literally commands you to agree with them! The text should be reworded to require a response (not necessarily agreement) within 90 days and relative only to the portion of the study applicable to interconnections you participate in.
Yes
1.Regarding the definition of “Interconnected Facilities,” when the functional and operating entities are part of the same corporate entity documented correspondence within that same corporate entity seems of little benefit. In fact, it could be the same individual wearing two hats in the same corporate entity who would have to document communications with him/herself. 2. Example process on page 22 should not automatically make it the responsibility of entity B to propose a solution to a problem discovered by entity A quite possibly resulting from system modifications initiated by entity A. Whether entity A or entity B is in a better position to propose a solution depends entirely on the circumstance and there needs to be flexibility as to who is obliged to come up with a fix. 3. Application Guidelines, Fig. 2 and Fig. 5 require the TO to verify "...the generator Protection Systems..." coordinate with the TO's systems. The scope of generator protection systems should be narrowed to just distance relays and overcurrent relays that look out onto the TO's system. If the

high side winding of the transformer that interconnects to the TO is ungrounded and zero sequence overvoltage protection is provided for the transmission, then that would be appropriate to include in the scope of TO responsibilities too. The expertise in other types of generator protection likely resides with the GO and not the TO so it would be best if the GO handled the coordination of those other types of protection. 4. Application Guidelines, Fig. 3 requires the TO to verify the DP's and the GO's protection systems coordinate with the TO's. Yet the GO doesn't even connect directly to the TO. It should be the DO that checks coordination of the GO with the DP for faults on the transmission side of the DP's substation transformer (assuming the DP has installed transmission protection at the sub) and the TO that checks coordination of the DP's transmission protection with the TO. If all of the transmission protection is back at the GO (in other words the DP has installed no transmission protection at its sub) then to do as this app guide suggests the TO will require an accurate short circuit model of the DP's system between the GO and the TO. Furthermore it would require that the DP keep the TO continuously appraised of changes to the DP's system that impact the short circuit representation. Considering the proliferation of distributed generation being interconnected to distribution systems the burden should be on the DP not on the TO supplying the DP to verify coordination of what could be a multitude of interconnections to the DP. Furthermore, the scope of the text "....generator protection systems...." should be narrowed so a TO or DP is not responsible for the coordination of devices it doesn't even own, maintain or set. When study work is required to interconnect a GO to an entity, the entity is commonly reimbursed by the GO for study work. Yet this app guide requires a TO to perform study work for the benefit of a GO which does not even directly interconnect with it so how will the TO be reimbursed for it's efforts?

1)The language in the Statement of Purpose needs to be reworded. The phrase "remove from service only those elements required to isolate faults" may restrict certain protection practices in widespread use today, where coordination on tapped distribution facilities is achieved via auto-reclosing rather than via coordinated time delays. For example, a BES line (protected by a high speed DCB or POTT pilot scheme) is tapped by a distribution provider as demonstrated in Figure 3 of the Application Guidelines. Very often for distribution taps like these, rather than requiring the distribution provider to establish a costly transmission class pilot scheme terminal at breaker C with communication links to A & B, it is common to let the pilot scheme reach into (but not thru) the transformer at C. For faults in the transformer the high speed transformer relays will operate to trip and lockout breaker C. However, the pilot scheme at A & B will also trip simultaneously. Breaker C will lockout and A & B will auto-reclose to restore the line. Coordination is achieved via auto-reclosing. For faults on the line, A & B will trip via the pilot scheme, and if generation happens to be running either C will trip, or the generator will trip depending on scheme design. Reclosing at A & B would be delayed and / or voltage supervised to ensure generation has been removed prior to auto-reclosing. In the above scenarios since the line tripped for a fault in the transformer, or the generator tripped for a fault on the line, it would violate the requirement to "remove from service only those elements required to isolate faults". The language used in the proposed definition of Protection System Study is slightly better, using the phrase "demonstrates ... Protection Systems operate in the desired sequence for clearing faults". The problem here is who determines what is the "desired sequence"? Would a scheme, which is purposely designed as described above and acknowledged by the Transmission Planner and Transmission Operator, be considered to operate in the "desired sequence" for clearing faults? 2)The language in the standard needs to be re-visited to enable these types of protection interfaces with distribution providers having limited generation resources connected downstream. Also, if system reliability was truly an issue for this example, the interconnection should not have been a simple tap on the line, but rather a ring bus should have been established at the interconnection point.
No
No
Each owner should already possess information demonstrating that their protective devices are set to "coordinate" with adjacent protection systems. However, the documentation that presently exists may not be in the form of a formal "coordination study" in a format suitable for audit purposes. Some

guidance should be provided indicating what form of documentation is expected, especially by the TO. For instance, on transmission tie lines between different TO's coordination of zone distance elements is fairly straightforward and can be accomplished without a traditional "coordination study". Also settings on pilot schemes need to be exchanged in order to allow for proper operation, but this is also not what is considered a traditional "coordination study". On the other hand, coordination between GO's and TO's is even more complicated. Without some direction as to what specific documentation is required it is difficult to estimate how many existing interconnection points would have to be re-visited in order to produce the required auditable documentation. Some specific examples of what specific type of documentation is required would be helpful. To be safe, most likely all interconnection points would be revisited to ensure adequate compliance documentation. Also, for each revised Protection Study produced (per R1.1) a formal review (R1.2) and approval (R4.1) would be required. As such, with the large number of interconnection points on the system a 60 month time frame would be more appropriate. The SDT acknowledged that they had no evidence that there is widespread miscoordination between Interconnected Facilities when establishing the arbitrary 36 month requirement.
No
The 10% threshold would be acceptable providing the following changes were made to Requirements R2.1 and R2.2: R2.1 – Re-word Requirement R2.1 to read: "Perform a short circuit study to determine the present maximum available fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities, not less than once every 24 months. R2.2 – Re-word Requirement R2.2 to read: "Calculate the percent deviation between the maximum available Fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation..." The existing wording requires one to "calculate the percent deviation between the fault current values ... for the bus(s) or Elements(s) under consideration". Including the phrase "or Element(s) under consideration" increases the complexity of the periodic fault screening requirement significantly. Instead of performing a relatively easy bus fault summary routine (available in most batch short circuit programs) individual branch current in various coordination pairs must be examined. Take for example the system shown in Figure 1 in the Application Guidelines. Instead of just screening the available bus fault current at the point of interconnection (the ownership boundary between the two entities), fault current in each "element under consideration" used in the Protection study must be calculated. This would mean determining fault current flows through breakers A, B, C, D, E, F, G, & H) under various fault scenarios and comparing them to those used in the previous coordination study. This is far from a simple task and not conducive to a "batch" screening tool. The intended purpose of R2.2 is to catch external system changes that have over time led to gradual increases in fault current that may require the Protection System Study to be re-examined. A simple year to year bus fault comparison would serve this purpose. System changes at, or immediately adjacent to, the interconnection point, which could lead to a re-distribution of fault currents through the effected element(s), would be caught elsewhere under R3.1 "Additions, removals, or replacements of transmission Elements".
No

1)Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? 2)Requirement R4.3 requires confirmation of agreement within 30 days of being notified of corrections made due to as found setting errors or emergency replacements of Protection System components. Again, what if the changes are not acceptable to the other party? Which entity is found not compliant, the one who proactively made the changes or the one who won’t confirm agreement? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. 3)It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the “Protection System Study” and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing some outlet for a dispute resolution process seems unfair to either party. As such, we suggest Requirement R4 be removed entirely or extensively re-written to address the concerns outlined above.
No
We suggest Requirement R4 be removed entirely or extensively re-written to address the concerns outlined in our response to Question 6.
No Comments
1)The SDT states that “the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays”. However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. 2)The mention of “the appropriate use of time delays in relays” in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload

conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. 3)The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. 4)Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS's during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. 4)Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although we support the overall desire to ensure that protective systems are "properly coordinated"; we see little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. 5)PRC-001 With the vast majority of the requirements from PRC-001-1 being removed, the Title and Purpose of proposed standard PRC-001-3 no longer seem appropriate for the content remaining therein and should be revised. The only remaining requirement in PRC-001-3 states that "Each Transmission Owner, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area. This does not seem to be a Protection System Coordination issue. 7) The definition of Interconnected Facilities should reference Registered Entities rather than functional, operating, or corporate entities. BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities Registered Entities (TOs, GOs, and/or DPs). 8) Is Facility and/or Element the best term(s) to use in the definition? It seems to say Elements that are joined by Elements? If not, should the definition be further revised. NERC Glossary of terms for Element: Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. NERC Glossary of terms for Facility: A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.) 9) Does joint own lines and stations create issues? Should the definition or standard make a distinction between principal owner and financial owners?

Yes
This seems like an adequate time, but it is unclear that smaller transmission dependent utilities really need to do this to maintain reliability and if their ratepayers would see any reliability benefit.
Yes
No
Comments: R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination studies and this seems appropriate. We believe that R3 should focus more on DPs and

GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward
Yes
Yes
No
Comments: We note that for R1.1.2 VSLs ratchet up very quickly despite the SDT contention in “guidelines and Technical Basis” that they have no evidence of widespread miscoordination between Interconnected Facilities and that miscoordination is not the predominate cause of reported Misoperations. The 10-20-30 day ratchet just seems arbitrary.

The goal of this standard is to address co-ordination of protection systems between neighbouring entities. To achieve this goal, the efforts should focus on the co-ordination of protections between entities as outlined and described in the NERC SPCS paper “Power Plant and Transmission System Protection Co-ordination – Technical Reference Document (TRD),” dated July 2010. This standard should include the review/study of all protections requiring coordination not the ones dealing with faults only as identified in the above TRD. There should be one comprehensive study/report not spread out into 7-8 standards. If so, there are still protection elements that require coordination that have not been addressed such as: open-phase, loss-of-field, over-excitation, out-of-step, and negative sequence normal unbalance, etc. We don’t see how a standard for Protection system co-ordination can rely on other standards to achieve the goal of co-ordinating protections for both Faults and other conditions that challenge co-ordination. The Purpose should be: “To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate from abnormal system conditions, while meeting the system performance specified within requirements established in NERC TPL Reliability Standards.” If the above suggestions are not taken into consideration and the SDT decides to keep the requirements in the current form, the statement“...while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.” should be changed to include exact reference to standards or at least group of standards the SDT is referring to.
Yes
This is related to our comments from Question 1. We believe that the Planning Coordinators (PC) shall be included. PCs are accountable to conduct studies to determine critical clearing times, stable and unstable power swings, etc., to determine coordination. Transmission and Generator Owners do not have access to such information or the tools/experience to conduct such studies. In addition to this there is a possibility that the entity in charge of day-to-day operation of the Interconnection Facilities (likely registered as TOP only) doesn’t own the facility and consequently is not registered as a TO. In this case, such facility or the facilities would be out of scope of this standard. We believe that the SDT should refine the Applicability section to encompass the above mentioned cases. From a reliability point of view, we think that this standard should not be applicable to Distribution Providers because the TO is mostly responsible of coordination of the protection with the DP.
No
Hydro One would like to suggest that 60 months would be a more realistic span of time needed in order to formally complete a documented study, or derive a time frame based on the number of interconnections that an entity must conduct studies for. Whether the systems are co-ordinated or not, the work needs to be carried out and documented. In the case of Hydro One there are almost 300 individual generator connections that belong to other entities many of whom do not have onsite protection experts. Most of these connections do not have a formal documented protection co-ordination study. Statements in R1.1.2 and 1.1.3: “unless the entity can demonstrate such a study is not required.” and its corresponding measure: ” or documentation demonstrating why a study is not required for changes described in Parts 1.1.2 and 1.1.3” are vague and don’t give much guidance on

what would be the appropriate evidence in this case. Suggest adding examples of documents that can be used to demonstrate compliance.
No
Hydro One agrees with the need of a defined fault current threshold. However, we'd like to suggest a 20% threshold instead as most protection settings, if coordinated properly, must coordinate with system normal and under credible minimum system conditions, therefore, it is our opinion that a 10 % change should generally not affect coordination.
No
While we agree with the principle of exchanging information, R3.1 is confusing "...or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities." We believe that this statemant is too inclusive. It implies that changes in facilities other than the Interconnected Facility need to be communicated and is too open for interpretation. Suggest the scope be better defined and limited only to changes at the Interconnected Facility.
Yes
Yes
Yes
1. This standard has been written on the basis that one of the Entities initiates the process and that both, assuming 2 only, conduct their own independent Protection System Studies; and then at the end of the process they agree, etc. Based on our experience, it is more efficient that both parties work in cooperation to conduct the Protection System Study and that they produce one report document which is then approved by both entities as meeting adequate coordination requirements.The Protection System Studies report shall be dated, and include the fault values at the time of assessment and should be filed as compliance evidence. 2. The SDT states "The SDT has no evidence there is widespread miscoordination between Interconnected Facilities...." This is contrary to the NERC TRD that indicated that there was plenty of co-ordination issues during the 2003 Blackout. Suggest removing this statement as it is contradictory and serves no purpose since the documented Protection System study has to take place regardless. 3. We feel the standard would be more useful to the industry if a list of applicable Protection System elements that require co-ordination is presented in the requirements section in line with the NERC white paper. Much like PRC-023 that identifies specific elements and corresponding numbers, we feel this approach would result in proper Protection System studies being undertaken for elements that are affected by this standard. The SDT claims some elements will be covered in other standards so the scope of elements that need co-ordination needs some clarity. 4. PRC-001-3 lists "first day of the first calendar quarter twelve months following" as the Effective Date. However, the implemenation plan states that the effective date is the same as for PRC-027-1 which is "first day of the first calendar quarter that is three months beyond". Please clarify and ensure consistency. 5. Hydro One is questioning the purpose and existence of PRC-001-3 in its current form. It contains only one requirement that is very vague and not measurable. Suggest that the SDT retires that standard as a part of this project 6. To avoid confusion we ask the SDT to establish 1 to 1 correspondence between the requirements and measure. For example R2 measures should be M2 or M2.1, M2.2 rather than M3 and M4.

ReliabilityFirst
No
It may be appropriate to trigger a coordination review based on multiple criteria. For instance, perhaps coordination should be verified at the interconnection at least once every 7 years, as well as whenever the available fault current at the point of interconnection changes by more than 10%. There

may be other better indicators when coordination should be checked as well such as a percentage change in system impedances at the interconnecting buses. RFC also questions whether there is a justification for choosing the 10% criteria (rather than say 5%)
No
ReliabiltiyFirst beleives the VRF for Requirement R4 should be High since it requires completion of the coordination activities. Lack of coordination of Protection Systems can result in larger scale outages.
ReliabilityFirst offers the following comments for consideration: 1. Requirements R1, R2 and R4 a. Requirements R1, R2 and R4 do not follow the format of a typical Results Based Standard requirement (i.e. the parent requirement simply states "the entity shall:"). Result Based Standard risk based requirements should be in the following format: "who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome." ReliabilityFirst recommends modifying these three standards to conform to the Results Based Standard format. 2. Requirement R2 a. ReliabilityFirst questions why Transmission Owners only need to perform a short circuit study on Interconnected Facilities and not their internal system Facilities as well (Requirement R2). ReliabilityFirst believes it would be beneficial for Transmission owners to be required to determine present fault current values (and calculate the percent deviation between the Fault current values) for all internal system Facilities. 3. Need for PRC-001-1 Requirement R1 a. ReliabilityFirst believes PRC-001-1 Requirement R1 is ambiguous and believes the intent is covered in the NERC PER-003-1 standard. It will be very hard for an applicable entity to show that they are “familiar” with the purpose and limitations of protection system schemes applied in its area. Since ReliabilityFirst believes R1 does not enhance reliability, ReliabilityFirst recommends retiring PRC-001-1 Requirement R1 consistent with the effective date of the NERC PER-003-1 standard (effective date of 10/01/2012).

PRC-001-3 has a single requirement with no associated measure. Any standard requirement whose implementation can address a reliability gap in the Bulk Electric System should possess a quality that can be measured. The SDT should modify PRC-001-3 and provide a measure for Requirement R1 or redact the standard in its entirety.

Brenda Hampton
Yes

No
Yes
Yes
No
Luminant agrees with R3.1 and 3.2. Luminant suggests that the language in this requirement be revised so it is clear what is to be provided between the parties.
No
Luminant agrees with the need to reach an agreement on relay coordination based on the specific circumstances in R3.3.1 and R3.3.2. However, the time period to reach agreement of 30 days should be replaced with an agreed upon time schedule by all parties.
No
Luminant recommends that the time frame should be “according to an agreed-upon documented schedule between Transmission Owner, Generation Owner, or Distribution Provider. Luminant would recommend the removal of the 90 day requirement. 90 days may not fit all circumstances. It should be left between the parties to determine the timeline of the project and reaching agreement. This is what should be documented to ensure coordination of activities between the affected parties.
No
Based on the comments on Q6, the VSL would need to be modified. Q7 and 9, the VSLs would change accordingly to accommodate an agreed-upon time frame for acceptable relay coordination and a method for resolving issues surrounding obtaining an acceptable coordination where differences occur.
Comment on Requirement R1.2. The time frame listed may not be adequate under all circumstances or situations. Luminant recommends that the language be changed in this requirement as follows: “… Protection System Study performed pursuant to this requirement (including at a minimum, the Protection System(s) reviewed, any issued identified, and any revisions proposed) shall be in accordance to an agreed-upon schedule with a Transmission Owner, Generation Owner, of Distribution Provider.” The corresponding measures will also need to be modified if this language is accepted.

Yes, Transmission Operators may own protection systems but not the interconnected element due to cost sharing agreements among Entities, for example. The applicability should be expanded to cover the Entity responsible for operation of the protection system element and interconnection.
No
No, Should a Protection System Study under R1 result in triggering of the other Requirements in the Standard, more time may be needed. An Entity could easily find themselves responding to multiple inquiries from Interconnectors while performing their own Studies. Additional time should be allowed to address the results of the Protection System Studies triggered during this implementation timeframe.
No
No, We are unsure whether a 10% trigger level is appropriate in this context as the location of the fault is not specified in this Requirement. Faults used to properly set a protective relay will be made at multiple locations and with various source conditions. The Requirement should be more specific in order to achieve consistent coordination among entities.
Yes
Yes
Yes
Yes, There appears to be no mechanism in the Requirement addressing if coordination changes are not acceptable. This should be addressed as 90 days could easily be exceeded in this scenario.
Yes
During our review it appears that an Entity will need to maintain an exceedingly large list of contacts for all Interconnected Facilities in order to ensure that the appropriate personnel receive and respond appropriately to Protection System coordination requests as Required by this Standard. With the probability of regular turnover occurring (retirements, transfers, etc.) at Interconnected Facilities, it would be helpful for a master list of Interconnected Facility Contacts for Protection Systems be held by a centralized Entity, such as a Reliability Coordinator, in order for an Entity to meet the timeframes specified and facilitate reliability via compliance with this Standard. This Standard will enforce consistent communication between Entities which is necessary for coordination of Protection Systems. It does not however, guide an Entity to set relays that will ensure proper coordination. Having a separate Entity verify coordination is desirable, but differences in experience, expertise, and analysis tools between Entities will not ensure proper coordination if methods of checking are not also part of the Requirements.

Austin Energy (AE) agrees with the need to coordinate Protection System changes; however, AE believes R4.2 is not sufficiently clear. As written, one could interpret it to mean that a Facility owner must obtain consent on the changes listed under R3.1, not just the Protection System changes (such as relay settings). AE does not believe it appropriate to require a Facility owner to gain consent on the actual change to the Facility itself (such as changes to line lengths/conductor size or replacement of transmission system Element(s), generator units or generator step-up transformer). The Guidelines and Technical Basis (p 20 of PRC-027-1 Draft #1) states, "The purpose of this requirement is to assure the effects that planned changes have on Protection Systems at Interconnected Facilities have been considered by all affected entities." AE agrees with this concept and believes the SDT sufficiently covers it through R1.1.3 and R4.1. AE recommends striking R4.2 from the Standard.
No
Austin Energy (AE) believes that 90 days is sufficient for responding to summary results of a Protection System Study, but it is not always sufficient for completing the iterative discussions that often take place to resolve questions and potential concerns. The Guidelines and Technical Basis (p19 of PRC-027-1 Draft #1) states, "R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to confirm agreement with the summary results of a Protection System Study ...; or absent such agreement, propose revisions to achieve acceptable results." AE asks the SDT to include this "absent such agreement" concept in R4.1 and extend the timeline to accommodate such revisions to one that is mutually agreed upon by the impacted parties.
Yes
Austin Energy (AE) agrees with PRC-027-1 in concept and is prepared to change our vote to affirmative once the SDT addresses the items in these comments. In addition to those provided as part of the specific questions, AE provides the following comments for consideration: (1) AE requests the SDT to identify a timeframe for R1.1.3. The Guidelines and Technical Basis (p17 of PRC-027-1 Draft #1) states, "The SDT believes that specifying a single time frame for evaluation of the wide variety of conditions that may be associated with a particular change is not appropriate ..." The

flowchart on page 21 shows a system change that triggers the need for a new study leading to a box that requires the study be performed within six months. Please remove the conflicting information. (2) AE supports a timeframe that requires a Protection System Study in accordance with a mutually agreed-upon schedule that includes confirmation of agreement with summary results (per R4.1) prior to the in-service date of any planned change. AE suggests the SDT identify this timeframe in R1.1.3 and delete R4.2. (3) AE requests that the SDT change the values in the % Deviation formula (R2.2) from VSCS and VPSS to ISCS and IPSS since V is typically used for voltage. AE also requests the SDT change the variable definitions from “fault current value …” to “fault current magnitude …” to clarify that the phase angle is not included.

No
The purpose of PRC-001-1 was “To ensure system protection is coordinated among operating entities.” With the rewrite of PRC-001 to PRC-027, the standard drafting team has expanded the purpose to specify that only elements required to isolate faults are removed from service and that system performance established in other NERC standards is met. The two additions to the purpose of PRC-027 should be removed for the reasons described below. The statement in the purpose, “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards”, only serves to unnecessarily complicate the purpose statement. BPA recognizes that the NERC standard does not void the requirements of other NERC standards, therefore, there is no need to state in the purpose that other NERC standards must be met. The statement in the purpose, “such that those Protection Systems remove from service only those Elements required to isolate faults”, drastically expands the scope of PRC-027 over PRC-001. With this new purpose, BPA believes this puts NERC in the position of micromanaging how protection systems are applied. Although most protection schemes are intended to remove only the faulted element, it is not necessarily a problem if additional elements are removed, and there might even be reasons to remove additional elements. In some cases it might be significantly less expensive to design a scheme that allows the removal of additional elements. Protection engineers need to have the flexibility to apply protection schemes that meet the requirements of the project at hand. Creating standards with absolute requirements on how protection schemes are applied and set will eliminate the flexibility necessary to implement effective and efficient protection schemes. The Standard Drafting Team (SDT) does not have the ability to foresee all possible protection scenarios, and to create a standard whose purpose is to remove from service only those elements required to isolate faults will create unnecessary expense and difficulty. BPA strongly recommends that the statement “such that those Protection Systems remove from service only those Elements required to isolate faults” be removed from the purpose and that the standard be modified to eliminate this requirement.
No
No
This question assumes that the requirement to perform a protection system study is acceptable, and the question focuses only on the timeframe allowed. In BPA’s opinion, the requirement to have a protection system study is objectionable and cause for disapproval of the standard. Therefore, the timeframe is irrelevant. In addition, the standard fails to make clear just what a protection system study is, either in the definition, the requirements, or the guidelines that follow. BPA believes that R1 is ambiguous and unacceptable.
No
This question assumes that the requirement to perform a mandatory short-circuit study every 24 months is acceptable, and the question focuses only on the percent change of the study results that will require notification. BPA believes that a short-circuit study should not be required and the percent change that triggers notification is irrelevant.
No
BPA believes that it is not practical to list all of the possible changes that could impact the coordination of protection systems. Any such list will likely lead to unnecessary notification in most cases, while failing to recognize unusual situations that could cause miscoordination. BPA is in favor of

a simplified approach where notification is provided to the owner of the remote terminal(s) whenever a change is made to the protection scheme at one terminal.
No
In many cases, one party of the interconnection is simply implementing the protection system changes provided by the other entity. Requiring the agreement of this party implies that the entity understands what is going on and is not a practical use of time and resources.
No
BPA believes that requiring an agreement from all parties could prevent the implementation of emergency changes.
No
BPA believes that in general, the VRFs and VSL's are too high.
Interconnections are no more prone to misoperations than other power system elements. A logical conclusion is that if the requirements of this standard are put in place for interconnected facilities, they should be put in place for all power system elements. The industry is quickly approaching a prescriptive environment in the protective relaying field which attempts to replace experience and judgment with a massive set of rules. These rules will never be able to eliminate miscoordination and misoperations, and the more rules we have, the more time and resources are diverted from dealing with the critical issues that arise. Entities are no longer free to use experience and judgment to decide what work is most important and instead, focus time and energy on the relentless schedule of NERC requirements. The purpose of the original System Protection Coordination Standard, PRC-001, was to ensure that protection systems were coordinated among entities. This should require only a simple exchange of data between entities when new facilities are added or changes are made. BPA implores the SDT to reduce the burden of the proposed standard by simplifying it and returning to the basic original purpose.

Don Jones
Texas Reliability Entity
No
We support this reliability objective, but feel that it may fall short of fulfilling all of the required Protection System coordination needs, resulting in a gap in the Standards. The major issue that we see in Protection System coordination is with coordination studies conducted WITHIN an individual entity, not between two or more entities. Using the Misoperation data as an indication, for CY2011, out of 202 total Misoperations in the ERCOT region, 46% were due to "Incorrect settings/logic design", however, less than 2% of the Misoperations occurred on Interconnected Facilities between different entities. This suggests the main problem with Protection System coordination is internal to an entity, not between two different entities. This Standard, as well as PRC-001, are somewhat silent as to what internal coordination should be considered "Good Utility Practice", even though there have been instances where internal coordination was not done.
No
Yes
Yes
Using a +/- 10% change is a good threshold, with the understanding that if a change in fault current value of less than 10% results in a need to change relay settings, then Requirement R3.1 will cover the coordination between entities in that case. Additional comment: For R2.1, Does the SDT also want to consider other system studies in addition to short circuit studies (e.g. critical clearing time studies at generation facilities needed for breaker failure coordination, equipment rating studies, or stability studies)?
Yes
Yes

Yes
Yes
In the Severe VSL for R4.3, the word “entity” was left out after “The responsible . . .”
Requirement R1.1.3: While we agree with the SDT rationale that R3 notifications may occur weeks or years prior to the change, we feel that a time frame should be included in this requirement rather than leaving it open-ended. We suggest that the Protection System Study be completed at least 60 calendar days prior to the in-service date for R3.1 and within 30 days after receiving notification for R3.3. If the SDT agrees with this, then an appropriate VSL should also be drafted.

It is not clear what this list should include. Should the protection changes on the interconnected facilities only be included? Or should it include the protection changes on the adjacent elements? Also, for the changes of power system elements, should those connected directly to the interconnecting bus be included or it should also include changes beyond that?
Yes
No
This 90 day time frame may be too long, since an agreement is required from the interconnecting parties before the proposed protection changes can be implemented.
Yes
Regarding R1, it is not clear what specifically the Protection System Study should include. - According the application guidelines on page 17, it states: “Data used to determine Fault currents in performing the study”, what data does this refer to? - Also it states that it should include “listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Interconnected Facility, and were reviewed for coordination of protective relays as part of the study”. It is not clear if it should include a list of all the enabled protection elements and their settings of the protection system package or the package only. Should it include the protection system on the interconnected facilities only or on the immediate adjacent elements as well? - The Application guidelines say it should list any issues associated with the relay settings. It is not clear what should be considered as issues. Does a protection mis-coordination occur only under contingencies (such as primary protection element fails) consider an issue? Do backup protection elements have to coordinate with backup protection elements? Regarding R2, it is not clear what fault current value should be used for the short circuit study. Should it be the total fault current of the interconnecting bus? Or should it be the total fault current of the interconnecting bus excluding the contribution from the interconnected facilities?

Reword the Purpose to state as follows: “To allow for the coordination of Protection Systems at

Interconnected Facilities to prevent equipment damage while maintaining proper selectivity during Faults." This phrasing is more consistent with NERC Reliability Standard language where adherence with other reliability standards is not explicitly stated.
No
We agree that applicability of the overall standard should be limited to the Transmission Owners, Generator Owners and Distribution Providers; however, requirements for conducting the Protection System Coordination Study should only apply to the Transmission Owners, Generator Owners and Distribution Providers that have ownership of the protective relay portion of the Protection System. Requirement R1 should read as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System that owns a Protection System shall:”
Yes
Requirement R1 should read as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System shall:” Requirement R1.1.2 should read as follows: Within 6 calendar months after determining or being notified of a change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.
No
A 10% change in fault current is not an appropriate criterion or "trigger" for relay coordination review. It does not meet the standard’s purpose to ensure speed and selectivity requirements associated with protection system coordination. Requirement R2 should read as follows: “For each Interconnected Facility, each Transmission Owner that has ownership of the protective relay portion of the Protection System shall: “ Requirement R2.2: LCRA TSC recommends not including this requirement. Requirement R2.3: Should the SDT decide to include requirement R2.2, then rephrase R2.3 as follows: “Where the calculation performed, pursuant to Requirement R2, Part 2.2, indicates a deviation in Fault current of 10% or greater, notify each non-transmission owner of the Interconnected Facility, at which the 10% or greater deviation applies, within 30 calendar days after identification. As an alternative requirement to R2.2 and R2.3, LCRA TSC recommends the following language to R2.1, 2.2 and 2.3: 2.1. Perform a short circuit study to determine the present Fault current values, not less than annually. 2.2. Pursuant to Requirement R2, Part 2.1, provide summary results to each directly impacted non-Transmission Owner entity at the Interconnected Facility, within 30 calendar days after completion of the short circuit study. 2.3 Delete
No
Requirement R3 should read: Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System shall provide to each directly impacted Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility, the details (e.g., project schedule, protective relaying scheme types and settings) as follows: The first bullet of requirement R3.1 should read: New installation, replacement with different types, or modification of: protective relays or protective function settings that result in a direct impact on protection system coordination to an entity at that Interconnected Facility. The second bullet of requirement R3.1 should read: • Changes to positive or zero sequence line impedance by more than 5 percent
No
Each Transmission Owner, Generator Owner, and Distribution Provider shall: 4.1. Within 90 calendar days after receipt, confirm acceptance with the summary results of a Protection System Coordination Study, as described in Requirement R1, Part 1.2. 4.2. Prior to the in-service date of any planned change at the Interconnected Facility, confirm the affected Interconnected Facility owners accept the Protection System(s) changes, as described in Requirement R3, Part 3.1
Yes
No
Objectives of R2 and R4 are mostly associated with interchange of information and the associated Violation Risk Factor for these two requirements (R2 and R4) should be LOW.
General Comment: First, as industry comments are considered by the SDT, the standard must continue to take into consideration that the fundamental objective of a protection system is to

prevent equipment damage that may occur as a result of a short circuit by ensuring fault isolation. The secondary objective is to maintain the power delivery capability in the rest of the system during a fault. This must not be compromised. Second, setting of protective relays is an art and finding a balance between dependability and security is already a challenge and may be an area of disagreement amongst owners (in some cases entities may end up “agreeing to disagree”). The standard should not take away the protection system owner’s responsibility and right to set its own protection systems by requiring “Approval” from other interconnection entities at the Interconnected Facility. Specific Comments: Title of the proposed standard The title for this standard is misleading since it only applies to locations that contain Interconnected Facilities. LCRA TSC suggests changing the title to “Protection System Coordination for Interconnection Facilities” Terms Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems maintain proper selectivity while clearing Faults.

No
Yes
The standard does not specify M2 violation reporting responsibility or assignment of violation due to non-responsiveness of the interconnected entity. Clarification needs to be made as to what is considered acceptable evidence that the affected entity received the study results under measure M2. Would a registered mail confirming receipt at an address be considered acceptable evidence; if not what type of document service would be considered acceptable?
Yes
Similar comments on measure M5 as contained in item 3 above on measure M2. This provision should become effective 36 months after the effective date of the standard.
Yes
Yes
Concievably, there could be non-reliability based reasons why an entity might not provide concurrence. An alternate avenue should be considered as allowable, such as the requesting entity working through the RC to obtain response from a non-responsive entity. Similar comments on measure M9 as contained in item 3 above on measure M2. Measure M9 does not account for non-acceptance under R4.3 or R4.1 as restudy or expanded studies may be required and result in a M9 violation.
Yes
1) It appears that clarification is needed in the Application guidelines with respect to the Generator Owners, Distribution Providers and Transmission Owners. If they are the same corporate entity, do the examples indicate as such and would coordination be required as specified? (It is presumed YES but not clear…e.g. GO "R" and TO "S" could be the same corporate entity). Figure 5 implies the letters "R", "S", and "T" refers to different corporate entities since there is a Transmission Owner R and a Transmission Owner S along with a Generator Owner T. If these letters do not indicate different corporate entities, then is it the intention of the SDT that all GO and DP facilities that connect directly to the BES be treated as "Interconnected Facilities"?. 2) Additional clarification in the Application Guide (figure 3) is required as it would imply that proof is required that generation on a tapped substation does not pose a risk to the transmission system. 3) The dates and documentation requirements for this standard will require an equivalently complex system or database for tracking in order to prove compliance. From review of the standard it appears that tracking of ~8 dates and associated supporting documents will be required for each interconnection study. Additional implementation time should be included in the standard for proper processes and tools to be in place

prior to perform study or re-study work. 4)Most study work would be initiated by R3.2 and typically involve multiple data requests for varying items and with associated responses providing the information. If each email request needs a corresponding response, then much time will be required to match emails topic for topic to meet this measure. The result will be multiple of same measure for study work, increasing tracking time for engineering. (i.e. more tracking time and less engineering time per engineering FTE). If the measure is to be based on first request to last response then this would easier to implement. 5) As existing studies will fall under the measures of this document, with no grandfathering, it is likely existing studies will need to be re-evaluated. As a result, consulting services for competent protection engineering services may become limited and may impact the ability in meeting the 36 month requirement. 6) Larger regional studies with interconnection impacts may be the outcome of more localized studies. Such studies could be recommended as a result of R2 of this document or future year models under R3.1. The time-frames specified in this standard may not be sufficient and no exception method is provided for expanded study work. (i.e.-studies beyond what is would be considered typical for an interconnection study).

Chris Scanlon
Exelon
No
The current Purpose for PRC-027-1 should more clearly and concisely state the purpose of the standard by relating the purpose of the standard to the definition of Protection System Study (the key element of the proposed PRC-027). The statement, “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards”, is likely to be subject to interpretation by registered entities and auditors alike and cause confusion. The specific Standards should be referenced in a footnote, or the reference should be removed. [For the purposes of this comment and the suggested revision, Exelon removed the reference since we believe this is the best option]. Exelon suggests the following revised Purpose "To ensure Protection Systems at Interconnected Facilities operate in the desired sequence to isolate a fault." In our experience, the term “coordinate” (or “coordination”) caused confusion in PRC-001-1 and therefore Exelon proposes that the term be omitted. In PRC-001-1, the term “coordination" was unofficially accepted as either the correspondence or communication between entities (i.e., via email, memo, fax, etc.), or as the time response relationship associated with backup protection elements. Thus, to avoid this confusion and to match to the proposed Protection System Study definition, Exelon removed it from our suggested Purpose statement above. If the SDT believes that the term "coordination" should remain, it should be clearly defined. Given the Protection System Study definition, a suggested definition for coordination would be “operation of Protection Systems in the desired sequence to isolate a fault”.
Yes
Agree, all entities should be included if they are responsible for engineering of protection systems protecting BES elements at Interconnected Facilities.
No
Exelon cannot agree to the time frame proposed without understanding the scope of work involved in the required protection system study. The current definition of Protection System Study (PSS) is not clear enough to avoid confusion. To better define the "study" as referenced in PRC-027-1 and to ensure that applicable entities know what they’re required to do, the definition of PSS needs to clarify the elements of the protection system and power system conditions the study is run similar to how required Transmission Planning studies are defined. With this in mind, Exelon suggests the following definition for "Protection System Study": A study that demonstrates that existing or proposed Protection Systems operate in the desired sequence for clearing a fault. The study is conducted with a single power system element out of service and all Protection System elements in service, and with all power system elements in service and a failure of a single protective relay, communication system, ac current input, ac voltage input, or DC control circuit (these can be further defined using the information and Table from Order 754). Exelon suggests that “summary results of a protection system study” should also be defined with clear parameters established. Unless the specific particulars are established, Exelon predicts that there will be confusion as auditors attempt to decide whether or not a piece of evidence will qualify as a “summary” of a Protection System Study. This is similar to the ambiguity in the existing revision of PRC-005-1 R1.2 which requires a “summary” of maintenance and testing procedures, yet does not describe specifically what is required. It is our

expierence that registered entities and auditors historically have had differences of opinion about what constitutes a “summary”.
No
Exelon requests that the conditions under which the required short circuit (SC) study are to be performed should be defined. What future reinforcements should be assumed in the SC model, since the result will depend on these assumptions? In R2, 10% or greater deviation in Fault Current may not be adequate to perform Short Circuit (SC) Study. It should be clearly stated what threshold is adequate to perform SC study successfully, and the SDT should provide some examples how the ‘six-month” time frame is considered a “reasonable amount “of time to perform the SC study.
No
In the current draft of PRC-027-1, Requirement 3.1 mandates that for any of the listed network changes, entities must communicate “the details”, (i.e., design information to all entities that share the interconnection). Of the network changes/additions listed in the draft, however, some may result in little or no changes to existing protection system coordination settings, thereby having no impact to Protection Systems of other entities. For example, consider a project by a TO to replace a BES circuit breaker at an Interconnected Facility. Assume that breaker failure protection for that circuit breaker will also be upgraded, but that the settings and all protection functions for the new relay remains unchanged from the old system. According to the language of Requirement 3.1, the TO would be required to transmit design information to other entities associated with the interconnected facility even though the project would have no impact to the other entities. This represents one example of a frequently performed project in which design information is not presently shared between entities at an Interconnected Facility. Mandatory compliance with this requirement, as written, could represent a significant burden to the industry by requiring unnecessary communication of design details to other entities, in addition to the added compliance documentation activity, and having no impact to protection systems of the recipients. Exelon suggests that the SDT clarify Requirement 3.1 such that that if a change to an Interconnected Facility is not expected to result in a change to the desired sequence of Protection System operations , the compliance activities required by R3.1 should be waived
Yes
Comments: Although not stated explicitly, this question seems to be asking about R4, Part R4.2. Exelon agrees that concurrence should be reached prior to the in service date for Protection System changes that result from the equipment changes at an Interconnected Facility as described in R3, Part3.1.
No
This question differs from what is required in the language in the draft standard. In Requirement R4.1, the 90 days allowed is for entities to “confirm agreement” with the summary. If an entity must only respond at the end of 90 days, the response could be that they disagree. In this case, discrepancies must be resolved at the cost of more time. Regardless, allowing 90 days for an entity to respond before an entity can proceed with design could cause serious delays to engineering and design processes. However, until we know what is required by a Protection System study, Exelon cannot offer a suggestion for a suitable timeframe for R4.1. SDT should specifically justify the proposed 90-day time frame. Since, a 90-day time frame may not be sufficient to compile all the required design data and results for Protection System Study (PSS) and to verify the Protection Systems are coordinated within the applicable entities.

1. This list does not appear to sufficiently address BES transformers (e.g., autotransformers). 2. There is concern that R3.1 may introduce either an administrative burden to identify and track every change, including those that would not reasonably impact Protection System coordination, or compliance jeopardy if those changes are not identified and tracked. a. For example, the second bullet under R3.1 refers to changes to line spacing. Assume that, during restoration following a Fault, a damaged insulator on one pole or tower is replaced with an insulator one inch longer. Technically, this changes the line spacing. It is doubtful that the SDT intended that this or a similar but less trivial scenario would trigger a Protection System Study; however, the language may introduce compliance jeopardy. Perhaps a similar metric as used in R2.3 could be applied to the second, third, fourth, and fifth bullets. For example, perhaps a 5% change in interconnecting Element impedance from a baseline could trigger a Protection System Study; this approach could be used in lieu of the second and fifth bullets. It seems that R2.3 would address the third and fourth bullets if the short circuit study were conducted before the change was implemented. b. Additionally, the language in the first bullet under R3.1 may introduce compliance jeopardy. For instance, it is possible for an entity to adjust a current and/or voltage transformer ratio and compensate with one or more relay settings such that the primary settings do not change. In many of these cases, there will be no impact on Protection System coordination. While active communication among entities is advised, the potential for fines in this type of scenario does not seem to be appropriate. The emphasis on the first bullet under R3.1 should be on Protection System scheme (e.g., distance, overcurrent, DCB, POTT, differential), primary settings (including time delays), independence/redundancy, and technology (primarily for communications systems).
Yes
Yes
Yes
Is it the expectation of the SDT that Protection System coordination issues may be identified when Protection System Studies are performed pursuant to R1.1.1? If such issues are identified, is it the intention of the SDT that these issues would constitute violations of PRC-027-1, provided that the process described in PRC-027-1 for remedying these issues is followed? Transmision Owners depend on each other for accurate short circuit models. As proposed, PRC-027-1 does not appear to clearly address sharing of short circuit modeling information among Transmission Owners when incremental changes are made within a Transmission Owner's system. For example, incremental changes in adjacent Transmission Owners' systems may result in a 5% change in Fault current at an Interconnected Facility when the changes are considered separately, but when the changes are considered together, the Fault current might change by 10%. While the +/- 10 % change in an Interconnected Facility's Fault current value as a trigger appears to be reasonable, the proposed standard offers no guidance or requirements concerning the accuracy of an entity's short circuit model or the methods used to determine Element impedances. This issue is most pronounced for zero-sequence impedance, and to a lesser extent negative-sequence impedance, since these parameters are used infrequently in system planning studies. It seems that some standardized approach for determining impedance parameters may need to be developed, whether in this standard or in another standard, provided that some latitude is afforded entities based upon sound engineering judgment. In R2.2, why is it not sufficient to simply include the following in the parentheses: "single line to ground and 3-phase for the bus(s) under consideration"? "The formulas in R2 use V for current. For clarity's sake, current should be denoted using the letter I." Under R3.2, if all applicable entities agree to a schedule, was it the intention of the SDT that the agreed-upon schedule could be longer than 30 calendar days? M8 requires that an entity have evidence that other entities received information pursuant to R3.3.1 and R3.3.2. What if, despite due diligence, one or more entities do not acknowledge receipt? Since notification pursuant to R3.3 is after the fact, to be compliant, an entity

depends upon one or more other entities to acknowledge receipt, but there does not appear to be a regulatory requirement for them to acknowledge receipt in a timely manner, only a requirement to confirm that the changes are acceptable within 30 days of receipt pursuant to R4.3. Consequently, if Entity A notifies Entity B of changes pursuant to R3.3 in 15 calendar days, Entity B would have until 45 calendar days following the change to respond. However, by this time, Entity A might not have documentation that it met its requirements under R3.3. Another challenge with R3.3 and R4.3 is that the language seems to assume that both entities will agree to the changes. While this should usually be the case, there may be instances in which the entity receiving notice may not find the changes acceptable. Additionally, the language in R4.3 may influence the entity receiving the notice to deem the changes as being acceptable, even if they are not, in order to meet the 30 calendar day timeframe. Tacoma Power thanks the SDT for including Figure 4 in the Application Guidelines. In Figure 5 of the Application Guidelines, why would it be necessary to check for coordination issues with Protection System settings associated with Breakers A, B, C, and D? Is this language intended to address reverse elements that are independent of communications systems? Is it intended to include bus differential, which would be the scheme commonly applied? Or, is there some other reason? To what extent can this standard be enforced within a Transmission Owner's system? For example, in Figure 1 of the Application Guidelines, in addition to verifying that there are no coordination issues between Protection System settings associated with Breaker A and, say, Breaker F, does the SDT intend that this standard could be construed to grant regulatory authority to audit that a Protection System Study was completed to verify that there are no coordination issues between Protection System settings associated with Breaker F and other breakers within Transmission Owner S's system? While Protection System settings associated with Breakers A and F may be coordinated, Breaker F may not be coordinated with other Protection System settings within Transmission Owner S's system such that Protection System settings associated with Breaker A might also not be coordinated for some Faults within Transmission Owner S's system. It is believed that this type of situation should be rare and that the scope of this proposed standard should be limited to audit and enforcement of Protection Systems at the Interconnected Facilities, as depicted in Figures 1, 2, 3, and 5. Assume that there is documentation supporting coordination of Protection Systems at Interconnected Facilities. However, during a Fault, a Mis-operation occurs, and the cause of the Mis-operation is attributed to mis-coordination, despite good faith on the part of the entities to coordinate Protection Systems. Is it the intention of the SDT that this Mis-operation would be construed as a violation of PRC-027-1? For example, although they are generally addressed to some degree in Protection System Studies, but often implicitly through margins, factors of safety, etc., phenomena such as CT saturation or DC offset are not always directly analyzed in Protection System Studies and could lead to mis-coordination even if Protection System settings appear to be coordinated in documentation. It is not clear what responsibility the TO has if it models a generator's short circuit capability incorrectly. The proposed changes to PRC-001 (proposed version 3) are supported. As a reminder to the SDT, Protection System design and application is part science and part art, and it may be difficult to thoroughly audit and enforce the latter. Tacoma Power appreciates the opportunity to comment on the proposed standard and thanks you for your consideration of our comments.

Tri-State G & T
Yes
No
We agree with this description and the entities, however the standard’s applicability is not written as described in the question. We think that “that require coordination for isolating generation and Transmission Faults” should be added to Section 4.2, Facility Applicability.
Yes
Yes
Yes
No
We believe that there are many instances of changes that can made to Protection Systems as required in Requirement 3, Part 3.1 that don’t require coordination between entities but that might be interpreted that the change “modifies the conditions used in the coordination of Protection Systems.” Examples are load encroachment settings, communication port settings, etc. We think language needs to be added with regard to “… modifications that impact the coordination of Protection Systems between entities, of: …” in the first bullet, if confirmation from the other entity is required.
No
We think 60 days is more appropriate. For the receiving party, 30 days may be too short, and for the sending party 90 days may be too long.
Yes
We think there needs to be a time frame associated with the calculation of the percent deviation after the fault duties are calculated. One way to accomplish that would be to eliminate 2.1 and add a 24 month requirement to 2.2., which would require the performance of a short circuit study anyway.
Individual
John Seelke
Public Service Enterprise Group
Yes
Yes
Within RTOs and ISOs, entities such as PJM and NYISO perform such evaluations as part of their transmission planning process. See PJM Manual 14-B, Appendix G, section G.7 which states: “PJM performs short circuit analysis as part of the annual Regional Transmission Expansion Plan (RTEP) baseline assessment. This analysis includes a study of the entire PJM system based on its current configuration and equipment.” Therefore, Transmission Planners should be considered as an applicable entity for R2 as discussed in #9 below
Yes
We do not believe this requirement has been justified for the several reasons listed below. In addition, the “Protection System Study” definition is too vague as to what it should include. We suggest a separate appendix that lists the items that this study should address. We also suggest that the SDT develop several baseline and change case Protection System Study examples, using a common format. These should be incorporated into an appendix within the standard. a. The format and overall purpose of the baseline study has not been provided. It is highly unlikely that a sufficient Protection System Study has been completed or is available for a majority of the Interconnected Facilities since 6/18/2007 within North America. This is due in part to either no modifications being performed at these facilities or lack of data retention (a study was performed but since it was not a requirement, documentation is not available). To require entities to now perform such studies would be a sizeable undertaking and create a tremendous burden to all entities with little benefit to the entities and the reliability of the BES. For older Interconnected Facilities where no changes have been

made in several decades, no benefit to the facility or the BES would come from perform such a study. b. The only time a Protection System Study should be performed is when a driver is in place that will require a possible relay setting changes. These drivers should be spelled out specifically. For example, if there is substation project work that requires relay setting changes, if the relays are being replaced, if a “tie line” is being re-conductored, etc. The requirement to perform a study should also apply to those “interface” relaying schemes that would normally require periodic review. The requirement for a periodic review will be driven by something other than a system configuration change. This may include schemes that have current operated relaying where the setting of the relay is dependent of fault current level. c. The complexity of such a study is uncertain. In most cases, the “interface” relaying between two TO’s or a TO and a GO is very straightforward. In the case of the “interface” between a TO and a GO, the relaying may simply be a transformer differential scheme. In the case of a tie line between two TOs, if the relaying is strictly impedance based, then there is no need to perform a baseline study. In other cases, the study may be more complex. The study may also have to incorporate Protection System devices beyond the Interconnected Facility (e.g. BOP protection for generators, adjacent line or bus protection for transmission facilities). This would increase the amount of time and complexity required to perform the study. How would the SDT define the appropriate protection coordination boundaries for an Interconnected Facility?
No
We disagree with this requirement for several reasons. a. A change in short circuit Fault current, in many cases, does not require relays to be reset. The requirement to perform a Protection System Study for this reason alone will likely provide no benefit when the relay performance is not dependent on short circuit current level. If the relay performance is directly dependent on short circuit level, then a % change in short circuit level may be appropriate. This distinction should be spelled out in R2. b. It is common for relays to be set at 30-50% of the Fault current or 150%-200% of the full load current. A change of +/- 10% in Fault current would have little to no impact on the existing settings and coordination.
No
a. R3 should be rewritten as follows: “Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the following to each Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility:” b. Part 3.1 should be modified as follows: “For any change or additions listed below, provide a project schedule and the reason for the project, whether to an existing or new Interconnected Facility or to other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities:” c. Part 3.2 does not read well and is not supported by the explanation in the text box. It references 1.1.1, 1.1.2, and 1.1.3, but none of these parts allow an Interconnection Facility owner to request information from another owner to perform the Protection System Study. We can understand why Interconnection Facility owners need to cooperate in the performance of such studies. This thought belongs in R1. We suggest a new 1.2 (with the existing 1.2 renumbered to 1.3) as follows: “Each Interconnected Facility owner shall provide data requested by another owner and which is needed to perform the study in 1.1, either in accordance with an agreed-upon schedule, or within 90 days of receiving the request.” We believe 30 days is too short to require a response.
a. In R4 overall, we concur that agreement does need to be reached before changes can be implemented; however, if there is a disagreement that cannot be resolved by the parties within the time frames specified, a dispute resolution process should be invoked. Otherwise, if an owner disagrees with another owner’s results, it has no option but to agree or face a violation of the standard for failing to do so. b. The specific requirement in the question is in part 4.2, not R4. The list of items in R3.1 appeared reasonable. But R4.2 requires agreement to be reached “prior to the in-service date” under R4.2. Allowing agreement to be reached prior to the in-service date could allow one party to unreasonably hold up the schedule. It should be stated as follows: “Within 90 days after receiving the planned changes at the Interconnection Facility, the affected Interconnection Facility owners shall either agree with the changes, or propose alternative changes, stating why such changes are desirable. Failure to provide a response will constitute agreement with the planned changes by the non-responding Interconnecting Facility owner.”
See our response to #6 above, paragraph a.
Did not evaluate.
We have the following additional comments: a. FORMATTING: Remove the bullets in 3.1 and replace

with subparts 3.1.1, 3.1.2, etc. b. With regard to R2, we suggest that the Transmission Planner be required to perform the studies described therein, not the TO. Furthermore, there should be a requirement similar to that suggested in our response to #5, paragraph c, that each TP provide data needed by another TP needed to perform the required study. It should also address how potentially different results for the same Interconnected Facility by the several TPs should be dealt with.

Yes
Yes
No
I disagree with the requirement for a protection system study. From the draft standard: "The SDT has no evidence there is widespread miscoordination between Interconnected Facilities". There are approximately 18,000 generators in the US. Requiring each to perform a system study would result in costs running into the hundreds of millions of dollars. This will result in lower BES reliability as entities transfer funds from other reliability efforts to comply with this standard.
No
No
The phrase "Changes to generator unit(s), including replacements, re-ratings, and impedances" is too vague. Audit teams could read any change as a trigger. Suggested change: "following the replacement or re-rating of a generator, or following any change to a generator which results in a change in impedance".
Yes
No
Smaller entities do not have the staff resources to respond, and must bid, contract, and receive a report. Further, they must also go through a process to allocate the funds. 180 days at a minimum, but ideally a longer period should be in place to allow for the budget process.
No
There is no generator size limit set for this standard. It should exclude generators below a threshold value. Suggest generators with an aggregate nameplate value below 500 MVA connecting through a single step-up transformer.

We recommend that the SDT delete the last part of the purpose “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003 R1.3.7 already requires the entity to “demonstrate that System performance meets its Table 1 for Category C contingencies” (TPL-001, -002 also have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1.
No

Yes
Yes
(1) In R2 2.1 we request the SDT add "under normal conditions" or "under maximum system conditions" so that it states "Perform a short circuit study to determine the present Fault current values under normal conditions, not less than once every 24 months. " (2) We request the SDT clarify which Interconnection Facility fault current values are to be compared. If the intent is to keep this general so the entities have the flexibility to compare those fault current values that the entities judge appropriate, please state. Otherwise we suggest adding "Specifically find fault current values flowing into each terminal of the Interconnected Facility for independently applied single line to ground and 3-phase short circuits at its other terminal(s)." (3) We request the SDT change R2 2.2 wording to "Calculate the percent [delete – deviation] change between the Fault current values (single line to ground and 3-phase [delete - for the bus(s) or Element(s)] flowing into each terminal of the Interconnected Facility under consideration) used in the most recent Protection System Study…". This along with our recommended change to R2 2.1 clarifies the short circuit values that are to be compared. (4) We request the SDT change R2 2.1 to "not less than once every 5 years" for consistency with TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. Our experience is that PRC-027-1 R3 will trigger almost all Protection System Studies anyhow.
No
We recommend the following changes to Requirement 3- (1) Include 'static wire' in the second bullet, or more simply state as 'line impedance changes.' (2) Include 'bus arrangement changes' in the third bullet. (3) Change the fourth bullet to include 'Additions, retirements, or changes…' to strive for consistency for generation and transmission.
Yes
Yes
No
We recommend to the SDT that a consistent set of VSL timeframes across all requirements. The 10 day limits are too tight and as stated in the R1.1.1 rationale this urgency is not warranted. Most entities will have numerous Interconnection Facilities so applying these VSL to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general: (a) Lower VSL should be 30 days late. (b) Moderate VSL should be more than 30 days, less than a year. (c) High VSL should be more than a year but done. (d) Severe VSL should be more than a year and not done.
(1) We support and agree with the SERC Protection & Control Subcommittee comments. (2) We commend the SDT on their high quality initial draft of PRC-027-1. (3) We recommend that the SDT delete 'operating' from the Interconnected Facilities definition because their different functional or corporate entities sufficiently capture all of them. We also suggest defining the singular Interconnection Facility, rather than the plural. (4) The SDT needs to improve the application guidance examples by stating what constitutes the Interconnection Facility. The first example clearly enumerates the short circuit locations and values to be compared between the most recent Protection Study and the R2 2.1 value. (5) Application Guidelines Example / Figure 3: The Note should be clarified, or the example should be removed. In terms of regulatory requirements, Breaker-A and B should coordinate with Breaker-C. However, Breaker-C and the Generator relaying does not need to coordinate with Breakers at Station-1 or Station-2 unless the generator meets the requirements of a BES element (75MW or greater). For small generators, protection on the generator to detect faults on the transmission system is for generation protection, not BES protection; as the fault currents would be too small to cause damage to the Transmission System. Generator protection is already covered in Example / Figure #2. (6) Please restate Effective Date more clearly, we suggest "PRC-027-1 shall become effective on the first day of the first calendar quarter [delete-that is] three months following [delete-beyond the date that this standard is approved by] applicable regulatory approvals [delete-authorities],…" to be consistent with the wording of other standards (e.g. PRC-005-2.) (7) Since short

circuit data base models are required to perform the Protection System Study, NERC regions should have a consistent schedule for revising models. Please encourage regions to synchronize their regional modeling calendars to enable entities to have consistent models, especially near region borders, for efficient execution of PRC-027-1 (8) we recommend that the SDT add proposed NERC Standard TPL-001-2 to your list on page 5 regarding the Other Aspects of coordination. It requires short circuit studies in R2.8 for the purpose of determining if the short circuit interrupting requirements are within the interrupting capabilities of circuit breakers. (9) We strongly recommend that the SDT use the term ‘change’ rather than ‘deviation’ throughout for consistency and because the latter term is defined as being different from the norm. The new fault current value is now the norm, not abnormal or statistically different. R1 – 1.1.2 and 1.1.3 use ‘change’, but ‘deviation’ is then used about a dozen times thereafter in the document. (10) There is a concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process. (a) The overall process would be less burdensome by changing the R2 2.1 to “not less than once every 5 calendar years” which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3. (b) The overall process would be less burdensome by deleting R3 3.3 because such Protection System changes are already captured by R3 3.1 and 3.2. (c) Omitting ‘project schedule’ from R3 would streamline data exchange. (d) R3-3.1 and 3.3.1 should only be required IF the changes effect the tripping or coordinated functions. Digital relays include numerous settings besides these functions; and these other settings should not trigger a data exchange or study. (e) Streamline the process by measuring dates an entity sends information and receives final agreement. It is burdensome for the sending entity to also track and retain evidence showing another entity received information. Specifically change M2, M5, M6, M7, and M8 to measure the date sent. The other entity’s agreement in M9 shows that the overall process met overall time requirements and that the entities coordinated. If an entity demonstrates such a study is not required in R1, M1 should require the other entity to agree. (f) The application guidelines are generally clear and certainly clarify responsibility. We recommend somehow including their methodology in the requirements because it streamlines the exchanged data and clarifies the process in this complex and potentially voluminous undertaking.

No
We do not believe the phrase "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" is needed and may be confusing to the reader.
No
However, it should be clear the the DP facilities in scope are only those associated with potentially impacting a BES facility.
No
Requirement 1, Part 1.1.1 – Although we agree with the timeframe, the phrase “within 36 calendar months after the effective date . . . . subsequent to June 18, 2007” should not be listed as a requirement but rather as part of the Implementation Plan.
Yes
No
Requirement 3, Part 3.1 - We believe that some entities registered as both a TO and a GO may face Standards of Conduct issues if a TO is required to provided the “bulleted” data specified within the Part 3.1.
No answer or comment at this time.
No answer or comment at this time.
No answer or comment at this time.
FE offers the following additional comments: ♣ PRC-001-2 R1 – This requirement is vague and causes

difficulties in consisten interpretations between entities and auditors. We ask the drafting team to revise the wording to clarify the expectations, such as including the types of protections system limitations they should be aware of. Enhancements to this requirement were also suggested in the “NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination” which is attached to the SAR of this project. In their assessment of R1 of PRC-001, the SPCTF said “This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. .. It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.” We ask the SDT to review this assessment and make changes to PRC-001 and PRC-027 to assure the reliability goal of PRC-001 R1 is met. ♣ With the approval of PRC-027-1, Requirements R3 and R4 will be retired from PRC-001-1 (Requirements R2 & R3 from PRC-001-2, approved as part of the Real-time Operations Project 2007-03) PRC-001-3 will have the same effective date as PRC-027-1. However, in the redlined version of PRC-001-3, the effective date is designated as “the first day of the calendar quarter twelve months following applicable regulatory approval”. This is not what is specified in the Implementation Plan.

No
Reference the ‘required to isolate Faults ‘. In some cases the design of the protection system may take more Elements out than the faulted element, such as a transformer differential that trips a transmission bus and then opens a HS Bank disconnect. For this reason we would prefer the term ‘as designed’ be used. We feel that it is important to identify the Protection Systems that are to be evaluated; perhaps a clear reference to the NERC Technical reference document?
No
No
60 months would be more reasonable for those that have a large number of generators and/or interconnections. Perhaps a tiered approach: 36 months for those with less than 50, 60 months for those with more than 50 but must have 50% done within 36 months?
Yes
When calculating the “+/- 10 % Fault current threshold”, the use of bus fault values vs the line contribution values should be clarified.
No
Reference the bullet on Line items; the issue of mutual coupling and/or overhead grd wire replacement or changes should be included. Perhaps change to any change that impacts the positive, or zero sequence impedance.
No
If there is a requirement to agree, what happens if there is no agreement. There must be a resolution process.
No
Within “90 calendar days after receipt, confirm agreement” vs “90 day time frame for responding to a request”. Acknowledgement of the receipt and review of a change should be the limit here - agreement with the settings should not be required.
1. The separation of PRC-001-1 in three directions is appreciated. This move was a move in the right direction in our opinion. 2. Whereas the SPCTF may believe that the existing PRC-001-1 was too vague and was not measureable, we believe that the initial draft of PRC-027-1 is overly specificative. Contained within the four listed requirements are actually 11 requirements with 11 different time critical counters that are not to be violated. It is our opinion that equally effective reliability improvement results can be achieved with a standard that is of the form of something in between these two extremes. We propose to eliminate the multiple calendar based time framed requirements

and simplify the eleven requirements into four simply stated requirements. The four requirements, simply, could be: 1) For each Interconnect Facility (IF), perform a Protection System coordination study/review every X years or sooner if triggered by Y. (Y = available fault current change % [r-iii below], system configuration change or other protection system change [r-ii below]); 2) IF owners must notify other IF owners of changes that may affect the other IF owner's Protection System coordination study. (list items likely to affect coordination-this list includes everything in the draft standard R3); 3) TOs are to notify other IF owners if available fault current changes significantly %; 4) IF owners must share & acknowledge receipt and review of their IF Protection System coordination study with other IF owners of that IF. 3. On figure 5 (p. 27 of the draft standard), it seems unreasonable to require that the GO coordinate their protection with that associated for breakers E, F, and G, which are three breakers away from the generator. 4. There is an error on p 5 of the Technical Justification document under Requirement R3. In the first sentence, it is R1, not R3, that requires the IF owners to evaluate the impact to their Protection Systems due to proposed changes by others.

It would probably be good to avoid using the term “coordination” as it can be considered as having two meanings, either the “coordinating” of the exchange of the data or the “coordinating” of the actual protective devices. Coordination should be taken out of the title and the purpose. “To Coordinate Protection Systems” could be changed to “To communicate and exchange Protective System data…” in the Purpose. The title could be changed to “Protection System Interconnected Facility Performance during faults”
No
Yes
Yes
No
In R3, 3.3.1, change the wording to address “changes” instead of “corrections” for “errors.” Many changes are made that are not the result of errors. The purpose here should be to communicate changes, and people shouldn’t have to debate whether or not to make an “improvement” (not because of an error or misoperation) because it may be construed as a correction of an error.
Yes
Yes
No
The 10 day VSLs are too restrictive in R1.1.1. VSL times should be similar for all requirements. Suggest dates should be as follows: Lower – 30 days late, Moderate – more than 30 days, less than a year, High – more than a year, but completed, Severe – more than a year or not done.
The documenting, notification and replies required in this standard will put a significant strain on the time of settings personnel. While we agree that this coordination of data is very important, any simplification of the processes would help ensure that protection system staff has the time to do other critical protective system work, in addition to interconnection studies. Possible suggestions would be change R2 2.1 to a longer time period, since most re-coordinations are due to changes covered in R3. “Not less than once every third year,” would fall in well with the audit schedule. Not less than once every fifth year would match TPL-001-2 draft 5. Also, you could conceivably not have R3 3.3, since those are covered by the statements in 3.1 and 3.2

Yes
Comments: SNPD agree with the purpose of the standard; however we disagree with the execution of this purpose. This standard only addresses a very narrow reliability issue. Does the SDT believe this narrow concern needs all the documentation called for in the standard? At a minimum, a Protection System Study, proof that you checked for a +/- 10% Fault current change regularly, and proof that you have communicated with other registered entities on these issues? And this will be for every interconnection. We feels this is regulatory overkill and not indicative of a results based standard.
No
No
Comments: There is no need to have a Protection System Study available for review for every Interconnected Facility. The study is useful only as an intermediate product that leads to relay settings and as a basis for both entities to agree that their planned settings will coordinate. The results based objective is that the registered entities communicate and coordinate together. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard has been met.
No
Comments: SNPD does not agree with this requirement. The selection of a +/- 10% threshold is entirely arbitrary. For instance, some entities will set Z1 to 80%, leaving a 20% margin for error. Some entities will set it at 90%. The SDT should allow entities to decide for themselves when a review is needed. As we stated before, the results based objective is to communicate and coordinate. Not to prove whether the fault current at a certain bus is +/- XX% greater than it was at some time in the past. Furthermore, the SDT itself states there is no proof that failure to coordinate protection systems is causing reliability issues. If entities allow their systems to become uncoordinated, we would expect it to come to light as a Misoperation and be handled under PRC-004. We do not agree it is the TO's responsibility to maintain a short circuit model for other entities. What responsibility does the TO take on if it models a generator's short circuit capability incorrectly? This is a very real concern among transmission protection engineers when attempting to model large wind farms with their proprietary models.
Yes
Comments: SNPD agrees with the list in R3.1. We feel that R2, R3.2 and R3.3 are unnecessary. Instead, the list in R3.1 should act as a trigger requiring both entities to document communication agreeing that coordination exists prior to putting the changes into effect. No communication under R3.3 should be required if the changes restore the system to its original state – replacing a failed relay like for like.
Comments: SNPD agrees that the entities should agree prior to any changes being implemented. The only date of interest, in our opinion, is the in-service date of any proposed changes. If agreement is reached prior to the field changes being made, then that is all that matters.
No
Comments: SNPD does not agree. R4.2 should apply here. R4.1 and R4.3 should be eliminated. If one entity proposes making settings changes, then agreement must be reached prior to implementing the changes. We feel all these timelines are unnecessarily burdensome to remember and quite arbitrary. If one entity feels it cannot get another entity to respond or to reach agreement on coordination, they can always ask their RE for assistance in maintaining the reliability of the system. Since all these activities occurred long before the mandatory standards existed and are covered under the present PRC-001, we do not feel the REs will be swamped with calls if R4.1 and R4.3 are eliminated.
We note that the formulas in R2 use V for current. For clarity's sake, we believe current should be denoted using the letter I

Ingleside Cogeneration LP, (Occidental Chemical Corporation)
Yes
Ingleside Cogeneration LP agrees that PRC-027-1 should be tightly focused on Fault isolation only.

There are other PRC standards which govern the coordination of UFLS, SPS, phase-distance, and other relay types.
Yes
It would seem like Transmission Planners and Planning Coordinators would have a natural interest in modifications made to relay systems. Their simulations must show that BES performance under various contingencies meets certain criteria. Any information discovered in the course of the Protection System Studies would be of interest to them as well.
No
This requirement assumes that a material percentage of the many thousands of interconnecting relay systems has a problem. There is no evidence of this; and in fact, the Rationale text box for R1 states that the converse is true. This makes sense, as the inter-operation of Fault isolation Protection Systems is a fundamental and well-understood concept – which may not be the case with the more complex relay types. In our opinion, the two-year TO assessment will be sufficient to catch an issue and drive improvements afterwards. Therefore requirement R1.1.1 should be deleted. In addition, we do not agree with the "on or subsequent to June 18, 2007" time frame, since these studies are completed when a facility is built, and/or when a facility is significantly changed, which could quite possibly be prior to 2007. If studies were completed before June 18, 2007, and nothing significant has changed, the study meets the PRC-027 requirement, and/or the TO assessment does not indicate a need, there is no purpose served by repeating the study.
Yes
Ingleside Cogeneration LP agrees that a 10% delta in Fault current is material and would warrant further study. However, we are not sure how these studies would correlate to those managed by Planning Coordinators and Transmission Planners. It seems like these entities would have to be involved in any studies that may result in a change in relay settings or a Protection System upgrade.
No
Ingleside Cogeneration LP believes that the coordination process developed by the project team is redundant with the one established in FAC-002-1. If there is a material change made to a Facility, the process should be captured in a single reliability standard.
No
In general, Ingleside Cogeneration LP believes that a material unplanned change must be communicated to neighboring Facility Owners. However, this should not include an emergency replacement in kind due to a failure. This is a repair only which does not change the characteristics of the relay or the associated BES components – and therefore has no impact on interconnected owners.
Yes
It would seem that M9 should be reworded slightly so that it is clear that the compliance burden is placed on the party sending the confirmation. It seems like it should read "demonstrating the confirmation was sent within the respective time frames" instead of "demonstrating the confirmation was achieved within the respective time frames." In other words, Requirement 4 compliance is solely for the confirming party to show evidence, not the submitting party.

The title should state the same as the purpose. Example: "Protection System Coordination of Interconnected Facilities". The purpose is to make each entity communicate protection system and/or facility changes in order to make coordination changes as needed.
No
Yes
No

Using "V" to denote fault current values may help the non-engineer reading the document, but "I" is the common nomenclature for current in the utility industry. The equation in R2.2 should use "I" in place of "V". There is a risk in using calculated fault currents of the most recent PSS and not existing relay settings. If the entity uses 10% margin in settings it will be too late to make settings changes. Should the margin be based on existing fault calculations and existing relay settings basis?
No
The parenthetical comment in R3 should be deleted. R3.1 lists the items that would trigger the need for notification between entities. Once notified of modifications, the entities will communicate documentation needs. R3.2: In the case of major BES equipment failure, there is a more pressing need to notify an interfacing entity that there has been change that could affect fault magnitudes. The 30 calendar days may be too long for such occurances and 2 business days would be more in consideration. R3.3.1 may interfer with PRC-004-# time schedules for misoperation followups and investigations. R3.3.2: Refer to comment above regarding R3.2.

No
The previous version, we think correctly, did not include DP's in the applicability. Since the revised definition of the BES is currently awaiting FERC approval, the applicability of this standard to the Distribution Provider function is not appropriate. The relevant entities should be limited to TO and GO only.

No
In some cases there may be many Interconnected Facilities between two or more owners. It cannot be expected that owners will be able to support performing multiple studies in parallel, at the same time. It would be best to eliminate the specified timeframe, and allow the owners the latitude to determine the timeframe based on priorities decided by them. Also, replace the phrases in R1.1.2 and in R1.1.3, "… unless the entity can demonstrate such a study is not required", with "unless the entities involved agree that a study is not required". If the interconnected entities agree that a study is not required, there should be no requirement to document the reasons why a study is not required. Likewise, revise M1 to include as acceptable evidence "documentation that the relevant entities have agreed that a study is not required."
Yes
No
1. R3 should have the phrase "shall notify…" in the requirement, not simply "shall provide …the details". This should be a requirement for entities to provide a notification to other entities that some changes are being planned which may affect Protection System coordination. 2. The wording in R3.1 is unclear as to the intended scope of the qualifying phrase, "when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities." It should be made clear that ONLY those changes which affect coordination need to be communicated to other entities, whether at new or existing Interconnected Facilities or other facilities. If this is the case, then some of the comments below may not apply. 3. Also in R3.1, the bullets for "changes" in transmission systems and generators should be modified by the word "significant". Likewise, a "replacement" of an Element, or relay, or other device, may not require any change in relay settings, so the wording should be modified by "replacements which require protection setting changes". The bullet for changes to generators should also remove the "re-ratings" term, since a re-rating of a generator typically affects output power, but does not change the impedance. Indeed, there may be many minor changes which fall in the current R3.1 list which may have little or no effect on fault coordination, and therefore should not trigger a requirement for a notification or a study. Also, changes to CT or VT ratios do not necessarily result in a change in primary quantities, so these references should be removed. 4. R3.2 should be revised to require an entity making significant changes to provide the data to the other affected entities, without the need for the other entities to request it. 5. The R3.3 requirement (3.3.1 and 3.3.2) to notify other entities within 30 days for changes made following a Misoperation or failure is too restrictive. A timeframe of 60 days would be more appropriate. Also, as above, these requirements should only be applicable when the changes made have a "significant effect on coordination." A requirement to make notifications for changes unrelated to Interconnected Facility coordination will not serve the objective of increased reliability, and only increases unnecessary compliance documentation. 6. M7 (last phrase) should be revised to "…or absent such an agreement, within 30 calendar days of a request."
No
The requirement to reach agreement on Protection System changes prior to the project in-service date is not realistic and should be removed. While the entity that is initiating a project has a responsibility under R3 to notify other entities in order to perform a study, there is no required timeframe for these notifications to occur. Unless the initiating entity has a requirement to provide data under R3 in a timeframe sufficiently ahead of the in-service date, this is a requirement that may be impossible to achieve.
Yes
The SDT is to be commended for their efforts in what is a very challenging standard to develop. A Protection System Study by definition must assure that Protection Systems are "coordinated" at an Interconnected Facility. However, this standard does not establish any ownership for achieving a complete study. The interconnected entities are only capable of studying the portion of the system that they own. So, each entity performs their portion of the study and communicates it to the other entities. Thus, there is a lack of clarity in the standard about how the complete study gets done and is documented. With the possible exception of the Transmission Owner, no entity alone has the complete system model that is essential for documenting the complete coordination study. There is

also ambiguity on what a complete study looks like, and is subject to interpretation. It is unclear how the supplementary documents previously developed for PRC-001 apply to this standard. In the absence of such guidance, how will consistency be achieved for coordination of Protection Systems on the various types of Interconnection Facilities ? It is suggested that Requirement R4.3 is extraneous and should be removed. If these changes are sufficient to trigger a study, then the timeframe for agreement is already specified in R4.1. We propose that the standard be revised to allow the entities to re-affirm the results of a previous study, when appropriate, rather than needing to perform another study. For example, perhaps the fault current has increased, but the coordination interval between devices is not appreciably changed. The SDT notes in several places in the draft standard (pg 6, 16) that there is no evidence of widespread miscoordination between Interconnected Facilities, nor any evidence of misoperations caused by lack of coordination. This suggests that if this standard is needed, that it should be simpler, less prescriptive, and have greater recognition of the motivation for mutual coordination that already exists. It can be argued that the tasks and time frames required in the draft standard should be left to the entities to determine.

It is suggested that “. . . the system performance specified within requirements established in other approved NERC Reliability Standards” be specified so that what needs to be met is clear.
No
No
Why aren’t studies performed prior to June 18, 2007 considered acceptable if they’re still valid as long as no significant fault current or system changes have occurred?
No

Recommend that the “trigger” be a system change (line, transformer, generator) that results in an impedance change.
Yes
No
Recommend that if protection system changes due to emergencies need not be agreed upon before installation, then this should be stated more directly in the standard.
No
It appears that the “initiator” has 90 days after completing the study to provide the information while the other entity has 90 days to review and respond to the request. Suggest that a longer response time frame be considered since the “responder” may need significant time to review changes.
No
The proposed VSL for R4 appears to imply that the “receiving” entity has no other choice but to confirm agreement. If the “receiving” entity has concerns with the study or changes, both parties should be responsible for resolving the issues.
It is suggested that the standard include other relevant information that could be needed for a protection system study such as critical clearing times determined from stability studies. In Figure 3, what Protection System Studies would be required if the Distribution Provider does not have a Protection System designed to protect BES transmission system elements? Also, please clarify if the transformers in Figures 3 and 4 are BES elements. Also, further clarification, including some examples, would be beneficial to explain what does and what does not constitute “Protection Systems installed to protect Transmission System Elements” by a Distribution Provider.

LES is concerned with the significant amount of data and information an entity would be required to share as part of R3. As an example, if a CT ratio on a secondary relay with no pilot tripping is changed, but does not change the intended response of that relay, then there is no reason to share that information simply for the sake of sharing it. Entities should be allowed some amount of discretion regarding the information to be shared amongst other entities.
LES recommends additional clarity be added to explain how an entity would coordinate the efforts of the many different protection schemes - for example, pilot tripping, primary, secondary, ground overcurrent, breaker failure, LOP supervised, etc. - to determine only Elements required to isolate Faults are removed from service. Does an entity consider only its fastest scheme, slowest scheme, or all of them? Additionally, is an entity to consider contingencies such as primary or secondary relay out of service, loss of communications, etc.? What about backup tripping? Until the above is addressed, an entity will have a difficult time discerning what exactly needs to be studied. Please take into consideration that system protection is a complicated subject and each entity has its own philosophies on how to do it. Entities should be allowed to use their individual engineering judgment when designing their systems and ensuring it will work to their own standards as well as in compliance with the NERC standards. LES is concerned that there may be potential for mis-coordination between PRC-027-1 and PRC-004-2a. If a misoperation is defined as tripping too much out of service during an event, does the entity become instantly non-compliant with PRC-027-1 since it should have been studied not to do so? Any correlation between these two standards should be considered and clearly defined. LES recommends the 24 month timeframe specified in R2.1 be extended to 60 months.

Historically, fault currents tend to increase gradually over time; therefore, an entity may never see a 10% increase between studies, but will most likely see a 10% increase over a larger timeframe at which point they would never be required to perform a study.

No
The NERC Protection System definition includes more elements than would need to be coordinated at interconnecting facilities (e.g. batteries, chargers). Please consider revising to include only the protection elements that would need to be coordinated to remove Elements from service to isolate Faults.
No
It is unclear how the requirements of this standard apply to entities that fulfill multiple functional roles. For example, an entity is registered as both a Generator Owner and Transmission Owner. In the case where a GO and TO are the same entity is it required to show the same type of coordination?
No
It is agreed that the there needs to be a time period for Protection System Studies to be performed after the standard takes affect. However, the length of time is a concern due to the industries existing resources. It would be preferred that the time period be lengthened to 60 months.
Yes
Yes
No
How is it to be handled if two entities do not agree to the same approach?
Yes
Yes
R2, 2.1 “Perform a short circuit study to determine thepresent Fault current values, not less than once every24 months.” is excessive. Yes, short circuit databases are updated annually or even more frequently at times based on system changes. However, to require a full short circuit study every 24 months is too frequent. Changes on the system don’t necessarily warrant a full short circuit study, but maybe a study for the affected area. This is adding an unnecessary burden to the industry.

The language “…remove from service only those Elements required to isolate Faults…” is problematic. Taken literally; only the faulted Element may be isolated, and any adjoining buswork or lines (separate Elements) must remain energized; even the result is no change in the loss of load or capacity. We suggest ““To coordinate existing Protection Systems…” to ensure that this is not interpreted as a construction standard requiring additional Protection Systems.
No
Yes
Yes
No
R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination

studies and this seems appropriate. We believe that R3 should focus more on DPs and GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward.
No
R4.1 as written apparently requires receiving entities to always agree with the initial study, even if they see flaws that would lead to miscoordinating Protection Systems. Suggest that “confirm” be replaced with “reach.”
Yes
No
We note that for R1.1.2 VSLs ratchet up very quickly despite the SDT contention in “guidelines and Technical Basis” that they have no evidence of widespread miscoordination between Interconnected Facilities and that miscoordination is not the predominate cause of reported Misoperations. The 10-20-30 day ratchet just seems arbitrary.
The comment group agrees with the WECC Position Paper that the standard as written requires excessive and burdensome documentation that is not needed to demonstrate coordination.

Protection Systems installed prior to June 18, 2007 should not be required to redo a study because a system study should have been performed prior to installation based on the interconnected configuration at that time. The interconnected systems will change over time and redoing studies will raise more questions on assigning responsibility for changes beyond the control of the protection system owner. For protection systems installed prior to June 2007, TOs should only be required to show a study was performed and coordinated with appropriate interconnected entities.
No
Every TO should not be required to perform a short-circuit study every 24 months if there were no significant changes to that TO's BES facilities. Changes in adjoining interconnected BES systems could change short-circuit duties for an adjoining TO's system. The TO whose BES changes should be responsible for performing short-circuit duties on all adjoining systems as part of Requirement R3. In addition, FAC-002-1 requires TOs to coordinate with TPs and PAs in the assessments of proposed new facilities, including evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission through steady-state, short-circuit, and dynamics studies.
Yes
Yes
No
More time than 90 days may be needed to reach agreement for complex system changes or because of conflicting study priorities. Allow more flexibility for the parties to agree to a time, not to exceed, e.g. 180 days.
Yes
The standard requires more documentation than is necessary and providing a copy of each Protection System Study is burdensome and would not result in better performance. It should be adequate to document that studies were performed and that affected entities have agreed to the results.

No
No, Severe VSL for lateness should only apply to R4.
This standard, as written, requires an inordinate amount of documentation that this not in line with current fault study and protection coordination tools. When combined with the timelines, this will require a complete rework of the existing processes used for protection coordination and an additional full time protection engineer. We have no history of misoperations on interconnecting lines or of backup protection on such lines to justify any additional effort to document coordination. R1 leaves open to interpretation what constitutes coordination, with many unanswered questions. What is an acceptable coordination margin? How many contingencies need to be considered? Does loss of communication need to be considered? For the evidence, would an exception report showing no coordination intervals are violated be acceptable for the “summary results of each Protection System Study”? Will the responsibilities outlined in the Application Guidelines be included as part of the final standard? These may not be in line with current practices. How will this requirement be audited across utilities with different coordination practices? R2 requires significant cooperation between interconnecting utilities, with each keeping track of what fault currents are being used by the other. This is not in line with the use of joint system models, allowing more frequently updated fault currents to be used. Currently, the individual system models are updated by some utilities daily then they are reconciled at least annually. Protection System Studies can be run any time in between model reconciliation, with all local changes accounted for. R3.1 does not provide guidance on the timing of notification for changes; the measure M6 indicates this is for future changes, but the requirement does not. Protection engineers are rarely notified in advance of transmission line changes resulting from such things a road widenings and pole replacements. Providing this information to neighboring utilities in advance will require significant changes to line design processes. Thresholds must be established to rule out minor transmission line changes that do not significantly impact the line impedance (and thus the fault current); perhaps a 10% change in impedance would be more appropriate than the general “changes to line lengths and/or conductor size or spacing”. This requirement should also include changes to facility ratings to ensure PRC-023 compliance. R4 requires a significant change to work practices to support capital construction schedules and allow interconnecting utilities 30 days to review changes. The schedule laid out does not account for disagreements that lead to back-and-forth prior to achieving agreement. This requirement grants power to neighboring utilities to halt construction activities which could, in turn, create compliance violation of other Reliability standards.

No
ATC is not aware of additional functional entities that should be included.
No
ATC does not agree with the time frame proposed. The existing requirements in PRC-001 do not require protection system studies with Distribution Providers. As such, even though studies have been completed there may be no package (documentation) to support an audit. This requirement assumes that, if there is no existing fault study, one needs to be completed. If there have been no changes in short circuit or protective schemes, allow for completion of the studies based upon prioritization using voltage class and loading level.
Yes
ATC does agree with the premise of the a 10% change but feels that the SDT needs to provide a clear definition of which fault current must change 10% to trigger the notification requirements and initiation of a protection study. Fault current on an interconnecting line may change very little even though bus fault contributions from other lines may have increased considerably, affecting in feed current and relay settings.
No
ATC does not agree with the list as written and recommends the following changes: ATC suggests that Requirement 3.1 bullet 2, be revised as follows: Changes to line lengths and/or conductor size or spacing that result in significant impedance changes. As an example, an interconnected line may need to relocate a pole because of a road move. This may alter slightly the length or spacing of the line but does not result in a change to the impedance. If no impedance change occurred, no relay settings need to be changed and there should be no additional coordination. ATC suggests that Requirement 3.1 bullet 3, be revised as follows: Additions, removals, or replacements of transmission system Element(s) that is significant. An Element may be replaced with an equivalent device that does not require a relay setting change. If no relay settings need to be changed, there should be no additional coordination.
Yes
No
ATC does not agree with the 90 day time frame. ATC also has the following recommendation: Requirement 4.2 states that Interconnected Facility Owners confirm that coordination is agreed to prior to placing equipment in-service. ATC believes that R4.2 is adequate to cover coordination. Therefore, the SDT should strike R4.1 and R4.3.
No
The VSLs, in general, are much more severe than the risk to the BES and should be rewritten to more accurately reflect the risk. For example: if a BES Element is replaced “like for like” with no material impact to the associated settings and a failure to notify by more than 30 days occurs, the issue is assigned a Severe VSL yet there was no effective change to BES reliability.
In general, ATC agrees with the need to modify PRC-001. However, PRC-027 as written expands the scope of PRC-001 by including Distribution Providers (DP). The SDT, on both page 6 and 16 states that there is “no evidence of widespread miscoordination between Interconnected Facilities…” They further state on page 16 that “Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperation.” Based on the above statements, ATC questions the need for the level of prescription in the standard. ATC asks the SDT to update the numbering for measures to match the requirement numbering. Reliability Standard TPL-001-2, which has been approved by NERC BOT, requires short circuit analysis. ATC believes that PRC-027-R2.1 is duplicative.

Yes
No
From a reliability perspective, the Applicability Section of PRC-027-1 should not include the Distribution Provider because the TO is responsible of coordination of the protection with the DP.
No
Agreed that a change in fault current is a method to trigger a coordination study, but a 15% threshold would be more efficient (+/- 15 %). Clarify where the fault is to be applied and where the deviation is to be observed. One possibility is to apply the fault at a bus at one end of the tie and then determine the deviation in the current in each element connected to that bus.
No
DP must be excluded from R3. See the response to Question 2.
Yes
What happens when consensus is not reached between two parties? The TO should have the responsibility for coordination.
Yes
For studies of an entire system or all of its interconnections, those persons doing the study should only be responsible for reviewing the study results for those interconnections in which they participate. The wording in the text demands that the results be agreed with. The text should be reworded to require a response (not necessarily agreement) within 90 days and only pertain to the portion of the study applicable to interconnections participated in.
Yes
1. Referring to the Example Process on page 22, it should not be the responsibility of Entity B to propose revisions. It should be the responsibility of the Entity in the better position to propose a revision to propose the revision. There needs to be flexibility as to who is obliged to come up with a revision. 2. Regarding Fig. 2 and Fig. 5 in the Application Guidelines, it is important that the expertise of each entity involved in an interconnection be used to ensure that there are no coordination issues.

For example, Generator Owners and Transmission Owners. 3. Application Guidelines Fig. 3 requires the TO to verify that the DP's and the GO's protection systems coordinate with the TO's, even though the GO doesn’t connect directly to the TO. It should be the DP that checks coordination of the GO with the DP for faults on the transmission side of the DP's substation transformer, and the TO that checks coordination of the DP's transmission protection with the TO. If all of the transmission protection is back at the GO (in other words the DP has installed no transmission protection at its sub) then to do as this app guide suggests the TO will require an accurate short circuit model of the DP's system between the GO and the TO. It would require that the DP keep the TO continuously appraised of changes to the DP's system that impact the short circuit representation. Considering the proliferation of distributed generation being interconnected to distribution systems the burden should be on the DP not on the TO supplying the DP to verify coordination. The scope of the text "....generator protection systems...." should be narrowed so a TO or DP is not responsible for the coordination of devices it doesn’t own, maintain or set.

Suggestion: Remove “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” since there are other standards that are or will be in place otherwise it sounds like the other standards must have evidence included for this standard documentation as well. Perhaps this standard is not required if the other performance standards are adhered to or have portions of this draft standard included in them.
No
This applicability needs clarification. How does this standard relate to the definition of BES? Does including Distribution Providers mean an entity that does not own a transmission protection system is included under this standard? There needs to be clear understanding that radial feeds on load serving transformers such as 115/69kV or 115/34.5kV transformers and low voltage feeders are not included in this standard. Perhaps NERC needs a program to evaluate/identify all functional entities and determine if they should be registered and thus applicable and not have utilities try to determine the status of other utilities or functional entities. Clarify if the Transmission and Generator owner are the same utility how sharing of information is documented or confirm that this relationship means the documentation is not applicable in this standard.
No
To mitigate compliance risks for various types of data formats for existing studies and studies older than June 2007 this standard will likely require utilities to go back and update all data so that it meets the requirements and description of evidence in the application guidelines when the requirements become enforceable. This could likely take longer than 3 years. I would recommend more time such as 6-10 years (time depends on the number of applicable system ties as well)
No
Monitoring for a 10% change in faults could trigger studies that are not needed and it is not necessarily a good indicator settings updates are needed. It would be more practical to require a

review of settings on a set interval (5 years) or as required by R3.
No
Section 3.3 should clarify if the corrections change the coordination then other entities should be notified.
No
Recommend the drafting team should consider several scenarios to help determine issues that will arise with putting into practice this standard with the time lines included. Some scenarios I can think of are: 1. who is liable or fineable if a required approval reply for a protection study is not made in a timely manner to a Transmission owner. It is imperative not to hold a utility responsible for another entities lack of timely responses. Theses issues will create murky situations when the Transmission owner does not have control over external entities ability to respond to notifications of changes within specified times. 2. If a Distribution Provider is not registered is the Transmission owner responsible for getting a reply or approval of a protection study?
No
This requirement does not allow for various scenarios or conditions in the process of doing business. For example, multiple phased work or longer lead time projects where designs may change. It would be better that there be verification that studies were performed prior to in-service dates rather than tracking detailed time lines which could likely be complex and difficult to judge for audit start and end dates.
No
The time lines monitored down to 10, 20 or 30 days appear to be impractical in terms of monitoring for facility owners and in terms of auditing by compliance entities. This diverts the focus or sharing the data in a timely manner prior to project in service dates.
On page 6 and 16 there are statements such as “no evidence there is widespread miscoordination between Interconnected Facilities…” and on page 16 “Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” Clarify what the need is for this standard? This proposed standard significantly increases the record keeping requirements and subsequent resources needed for each Facility owner but does not appear to have a justification. I find the numerous time lines will create significant confusion and very complex data retention practices that will be difficult to track and difficult to audit. It appears the focus is more on time lines and the likely result is the content of the shared information will likely suffer due to the burden of tracking communications between entities. This draft standard includes time lines ranging from “prior to in service date, 30 days, 60 days, 90 days, 6 months, 2 years and 3 years”. I suggest fewer and longer time lines with the focus on if the sharing of information took place and not on when did it take place. The SDT statement below should be generalized to the standard as a whole: “The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable “prior to the in-service date,” Clarify the size of generation for Distribution Providers that would make this standard applicable for all involved entities. I would expect that the BES phase II definition or registry criteria would be referenced.

No
The purpose should specifically state whether or not this standard applies to BES Elements or all Elements. In consideration of other PRC reliability standards, this standard uses language that implies applicability to all Elements. Under the NERC Standard Development Process, standards are only to be applied to BES equipment, unless the applicability language specifically states a broader application. This standard implies it but does not specifically state it. The standard should be modified to clear up any confusion.
No
However, using the broad term "Protection Systems", this SDT is broadening the scope of the

standard beyond the BES. Due to the recent direction in Project 2007-17 for PRC-005-2, Protection Systems has been expanded to include systems beyond the definition of the BES. This project should limit the applicability for the DP to "transmission Protection Systems" as identified in PRC-004 and 005-1.
No
This requirement if left as is, would create a potential double jeopardy situation if a violation occurs. Under FAC-002, entities already have the obligations to communicate and coordinate the integration of new, replacement, or upgrades on existing facilities. We view this requirement to be a duplication of that standard and creates a double jeopardy situation if a violation were deemed to have occurred.
No

WILL SMITH
Yes
The last part of the purpose, "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" is vague and open-ended. The NSRF recommends that the SDT refer to the TPL standards if the intent is to limit responsibility for correct coordination to studied system contingencies
No
The standard includes the definition of Interconnected Facilities as BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities. It is unclear how the requirements of the standard would apply if a registered entity would fulfill more than one functional entity role. For example if a registered entity was both a Generator Owner and Transmission Owner would the requirements of the standard apply to the interconnection of the generator and transmission facilities? It is recommended that the standard be modified to provide clarity for this situation.
No
If an entity has a Protection System Study performed prior to June 18, 2007 that meets the requirements for the study specified in PRC-027-1 and there have been no changes to trigger a new study as specified in PRC-027-1 (that have occurred) the study should be acceptable for compliance with the standard. It is suggested that the requirement R1, sub-requirement R1.1 be revised by removing the phrase "that was performed on or subsequent to June 18, 2007." The NSRF questions if 36 months is ample enough time for large company to get all studies done within 36 months. Unless R1.1 is revised to mean all studies regardless to when it was performed.
The NSRF recommends that a clear definition of what fault current must change 10 % to trigger the notification requirements and initiation of a protection study. Fault current on an interconnecting line may change very little even though bus fault contributions from other lines may have increased considerably, affecting in-feed current and relay settings. It would be easier to implement a time-based periodic review of settings every 5 – 8 years (or sooner if required by conditions in Requirement R3). R2 is redundant and could subject entities to double jeopardy in conjunction with the new TPL standards which will require annual short circuit studies and NERC studies should not be duplicated to avoid double jeopardy. At a minimum, the 24 month requirement should be changed to at least every 2 calendar years. This would align with the annual requirement for the TPL standards. The new TPL standards are in limbo with FERC's rejection to footnote b.
Yes

No
The NSRF agrees in general but questions how to handle situation where neighboring utility are unable or unwilling to meet required timetable? Recommend the SDT explain the process for conflict resolution. Requirement 4.2 seems to mandate agreement with proposed changes which seems to go beyond the scope of the standard which is stated as “to coordinate Protection Systems”. It is suggested that this requirement be rewritten to require agreement that proper coordination will be maintained when the changes are implemented. In a similar way requirement 4.3 should be rewritten.
Yes
Yes
Recommend that the wording of R2 need be modified to allow a grace period for implementation, as was done in R1. As written, R2 requires an immediate short circuit study, even if no protection system study is required by R1.1.1. The SDT, on both page 6 and 16 states that there is “no evidence there is widespread mis-coordination between Interconnected Facilities…” They further state on page 16 that “Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” Why, then, is this standard even needed? It adds an onerous burden of record keeping on each Facility owner without justification for doing so. Since these are still zero defect standards, should exceptions be included for required operational replacements due to events (e.g. such as storms or immediate equipment replacement). When the lights are out and a technician replaces a CT or VT with a slightly different ratio but compensates by altering the relay settings, there is no way to perform an instant system protection study when the equipment change out was required to support system reliability. The NSRF understands that a “planned” changed be studied before hand, but how will this be viewed when a change is needed that is “unplanned”? Please clarify

No
PRC-027 appears to have been written exclusively for vertically integrated power companies, and there is no justification for making the proposed standard applicable to independent GOs. The only role an independent GO fulfills in isolating faults is to trip the breaker if the generator or GSU has a problem; everything involving sequencing is in the Transmssion Owner’s (TOs) or Distribution Providers (DPs) system. Independent GOs are owned by separate legal entities than the applicable TO or Distribution Provider [DP] to which they are interconnected. Such GOs do not have the capability to perform the type of TO/DP system studies that appear to be contemplated by the SDT. The actions required of independent GOs should be to perform Protection System maintenance and supply data to other applicable entities, per existing standards PRC-005-1 and PRC-001-1.1, respectively.
No
Applicability to GOs should be limited as stated above in question #1.
No
As noted in the response to question #1, TOs and DPs have the data and the capability needed to perform the studies that appear to be contemplated by the SDT.
No

No
See comment in question #1 above.

The cutoff date of 6/18/07 for grandfathering of studies may be appropriate for TOs and DPs in light of changes over time to their systems, but the studies that originally established GO relay settings would still be valid where the equipment has stayed the same. For the reasons discussed above, there should be no applicability of PRC-027 to independent GOs, and no changes to PRC-001-1.1 because the applicable requirements.

a) Recommend under Purpose, deleting: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003R1.3.7 already requires the entity to “demonstrate that system performance meets its Table 1 for Category C contingencies” (TPL-001, -002 have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1. b) The term “coordination” should be removed from the new standard Title and Purpose. Recommend changing Title to “Protection System Interconnected Facility Performance during Faults”. Also recommended is to change the Purpose to read “To communicate and exchange Protection System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those Elements required to isolate Faults.” c) In PRC 027, using the term coordination should only be referenced when referring to the technical aspects of the relay coordination within a requirement when applicable. (In the current PRC 001 standard the meaning of the term “coordination” has, and still is, interpreted in two ways. One interpretation is viewed from the technical aspect as “relay coordination” and the second is viewed from an inter-communication aspect as “coordination of information” between entities).
No
Yes
Yes
a) In R2 2.2, replace the term “deviation” with “change.” (Note: For this calculation, all that is required is to calculate percent change. For example, Webster’s dictionary definition of “deviation” is: 1) a variation that deviates from the standard or norm; "the deviation from the mean” 2) the difference between an observed value and the expected value of a variable or function.) b) In R2 2.2, replace the term “present” with “new” and the term “most recent” with “previous”. Also reflect this terminology change in the %Change equation. (The use of the terms “present” and “most recent” can be perceived to be the same.) c) It is also recommended that “V” for value be replaced by “I” for current. d) In R2 2.1, please add “new”, delete “present” and add either “under normal conditions” or “maximum system conditions” so that it states “Perform a new short circuit study to determine the Fault current values under normal conditions, not less than once every 24 months.
No
a) Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout this standard already address notification requirements. b) In R3 3.3.1, change requirement to read: “Changes are made to a Protection System as a result of findings during misoperation investigations, commissioning, or maintenance activities.”(The current wording implies that all findings are due to errors. The reference to errors should be removed and the emphasis of this requirement needs to be placed on “changes” made to Protection Systems when it becomes apparent that a change is required which impacts coordination of relays.)
Yes
Yes

No
We recommend a consistent set of VSL timeframes across all requirements. The 10 day limits are too tight and as stated in the R1.1.1 rationale, this urgency is not warranted. Most entities will have numerous Interconnection Facilities, so applying these VSL to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general: • Lower VSL should be 30 days late. • Moderate VSL should be more than 30 days, less than a year. • High VSL should be more than a year but done. • Severe VSL should be more than a year and not done.
a)Throughout the 1st draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.2, R2-2.3, R4-4.1, R4-4.2, R4-4.3-4.3.1 and R4-4.3-4.3.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. For example: R1-1.1.2 reads - “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.” For Requirement R1-1.1.2, recommend omitting the reference to R2 and reword so that the requirement is specific. Recommend changing to read: “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility unless the entity can demonstrate such a study is not required”. b) The standard uses different formats for identifying deadlines. Sometimes “days” are used and sometime “months” are used. It is suggested that a common format be used. c) Please note that there appears to be an inconsistency in the 24 month requirement of R2.2.1 and the ongoing work in TPL-001-2 draft 5 R2 2.6.1, which allows short circuit studies to be five calendar years old. PRC-027-1 R3 will trigger a Protection System Study if there are proximate changes in the meantime. d) Throughout the 1st draft of this standard, there are references to a variety of time horizons (calendar days, calendar months) and within individual requirements where time schedules are involved, the wording of the requirement is not consistent when calendar days or months are referenced. For example: R1-1.1-1.1.1 references the time schedule at the beginning of the requirement whereas R1-1.2 references the time schedule at t the end of the requirement. Recommend using a standard wording format and list the time horizons in the beginning of the requirement in all requirements that have time requirements involved. For Requirement R1-1.2, recommend changing to read: “Within 90 calendar days after the completion of the Protection System Study, provide to each affected Interconnected Facility owner a summary of the results of each Protection System Study performed (including at a minimum the Protection System(s) reviewed and any proposed revisions).” e) There is a concern with the various time requirements for studies, notification, and replying.Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process. i) The overall process would be less burdensome by changing the R2 2.1 to “not less than once every 5 calendar years” which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above).Our experience is that the vast majority of Protection System Studies are triggered by R3. ii) The overall process would be less burdensome by deleting R3 3.3 because such Protection System changes are already captured by R3 3.1 and 3.2. iii) Omitting “project schedule” from R3 would streamline data exchange. f) Delete “operating” from the Interconnected Facilities definition because different functional or corporate entities sufficiently capture all of them. We also suggest defining the singular Interconnection Facility, rather than the plural. “The comments expressed herein represent a consensus of the views of the above named members of the Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”

Althought the timeframe appears reasonable, the more basic question about the necessity of the documentation requirements needs to be reconsidered.
No comment
No
Do not agree with blanket inclusion of replacement of the generator step-up transformer(s) on this list.
No
Each entity has its own philosophy and standards for Protection System design. In providing agreement to a third party design, a question of liability is also opened up. R4 should be changed from requiring agreement to requiring notification. There is enough incentive for entities to resolve material disagreements on Protection System design without the need for regulatory intervention. Regulatory involvement should only take place when business conditions call for it. Otherwise the result is higher production costs with no reliability benefit.
No
Do not agree with the need for documentation of "agreement with a Protection System Study" between entities. See Question 6 response.

It is unclear whether the proposed standard intends to reach 10% or greater deviations that accumulate over the course of a more extended period of time (i.e., greater than 2 years), or whether an entity can seek to perform multiple studies within a compressed period of time in such a way that it can ensure that a 10% deviation will not be reached from study to study, as illustrated below: • Study performed in Year 1 shows a 5% deviation • Study performed 12 months later (in Year 2) shows a 5% deviation • Study performed 12 months later (in Year 3) shows a 5% deviation [Cumulative deviation of 15% within 3 years, but only a 5% deviation from study to study]
Yes
Yes
No
EPE believes the timelines are not adequate when coordinating protection system studies involving sequential interdependence among parties for interconnected facilities. Timing of study data should correlate with any written agreements or procedures agreed to between the various parties. EPE also believes the documentation requirements within this draft Standard slow down the process, therefore increasing the time needed to complete and communicate the study data. Additionally, the proposed Standard fails to address two important and likely types of situations: (a) the situation in which an interconnected entity fails to respond to study results or to a planned change at the Interconnected Facility, or (b) the situation in which disagreements between the entities are not resolved within the proposed Standard's time clock.
Group
Colorado Springs Utilities
Jennifer Eckels
Yes
There are cases of weak system interconnected facilities where proper coordination may not be

achievable economically, except by severing the interconnect. Allowances should be made for these cases to prevent the severing of weak systems to meet this standard.
No
The wording of the text suggests that Interconnected Facilities include coordination and documentation of Transmission to Distribution interfaces. Since these are usually contained in different functional or corporate entities it suggests much more documentation, and needs clarified.
Yes
No
In order to avoid burdensome paperwork of traditional fault study values and existing fault study values, common thresholds should be determined for initiating a review. Common thresholds can be common device ratings, or agreed upon levels at interconnects. As in Facility ratings, each owner should have device ratings for device capacities and can include short circuit ratings, which if exceeded can initiate a review.
No
Specific project schedules can potentially cause violation of other requirements. A proposed change of conductor spacing, which can be interpreted as a change of one transmission structure requires notification to other entities, which we feel is excessive. Re-rating of generators rarely changes the protection, impedances or coordination involved. It is common to re-rate units depending on external factors to the generator which also provides excessive reviews and project schedule notifications. This section also implies notifications must be made after like and kind replacements of equipment found during misoperation investigations, but not those found during testing. On larger systems this requirement would be difficult unless notifications were made more than twice a month, which would require a large tracking system of who, what, and when information is sent to interconnected utilities.
No
This requirement seems to create a paper work burden that will add cost and lengthen the process of any and all transmission changes, unless there is some size significance added to the requirement under which a reduced process is involved. The maximum amount of paper work to complete must be assumed, unless there are specific limits set to restrict an overreach in how the regulation is applied.
No
Due to construction schedule requirements a 30 day approach should be taken.
No
If the requirements are not reasonable, the VRFs and VSLs are also not reasonable.
The wording of the text under Applicability suggests that Interconnected Facilities include coordination and documentation of Transmission to Distribution interfaces. Since these are often located in different functional or corporate entities we feel this would require more documentation, and therefore needs clarified. There are no specifications on what constitutes a significant change to a Protection System; is it a CT ratio change, a relay replacement, or anything to the whole system? For example, would a single structure replacement require notification as a line spacing change? The wording sounds good but lacks specifics that would make this a workable standard.

Is the intent of the coordination that is expected limited only to those protection systems related to intertie facilities between facilities owners ? Or is the intent of the proposed standard to require coordination of protection systems to take into account outage and/or operating conditions between facilities owners beyond the immediate intertie facilities? In other words is this coordination requirement expected to be applied to relays that may not be directly involved in protection of intertie equipment?
Yes

Depending on the intent of the requirements as questioned in the comment to question #1, it may be necessary to include planners to provide data for contingent and varying operating conditions to coordinate relays beyond those dedicated to intertie facilities.
Yes
Yes

The SDT recognizes that Requirement R1 falls outside the scope of Poject 2007-06 and proposes that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. Left unaddressed, entities may be reluctant to vote to approve the PRC-001-2 changes. Changes made to a standard can cause unforeseen or unintended consequences that cannot be addressed because of limitations in the scope of the project. The SDT has no ability to address the matter without getting a change in scope of the project. This is a concern that applies to ALL standards changes as the industry seeks to revise and improve the NERC standards. A change in the Rules of Procedure or the Standards Development Procedures must be in place to recognize and deal with such occurrences. The SDT is also concerned that these proposed requirements are not conducive to NERC's stated goal of making the reliability standards more "results or performance oriented". Although many of the actions embodied in the proposed requirements should be performed, they are administrative in nature and do not in and of themselves provide results that will impact reliability. The industry needs to discuss and come to agreement on what reliability standards should look like in order to meet the NERC stated goal. The SRC also believes these requirements are not applicable for entities operating in the ERCOT Interconnection.

The language "...remove from service only those Elements required to isolate Faults..." is problematic. Taken literally; only the faulted Element may be isolated, and any adjoining buswork or lines (separate Elements) must remain energized; even the result is no change in the loss of load or capacity. We suggest ""To coordinate existing Protection Systems..." to ensure that this is not interpreted as a construction standard requiring additional Protection Systems.
No
Yes
Yes
No
Comments: R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination studies and this seems appropriate. We believe that R3 should focus more on DPs and GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward.
No
Comments: R4.1 as written apparently requires receiving entities to always agree with the initial

study, even if they see flaws that would lead to miscoordinating Protection Systems. Suggest that "confirm" be replaced with "reach."
Yes
No
Comments: We note that for R1.1.2 VSLs ratchet up very quickly despite the SDT contention in "guidelines and Technical Basis" that they have no evidence of widespread miscoordination between Interconnected Facilities and that miscoordination is not the predominate cause of reported Misoperations. The 10-20-30 day ratchet just seems arbitrary.
Comments: The comment group agrees with the WECC Position Paper that the standard as written requires excessive and burdensome documentation that is not needed to demonstrate coordination.

No
The proposed term for Interconnected Facilities, shown on page 2 of 27 of PRC-027-1 Draft #1, is defined as "BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities." CenterPoint Energy believes Interconnected Facilities should be defined in reference to NERC registration and recommends changing the definition to "BES Facilities that are electrically joined by one or more Element(s) and are owned by different registered entities."
No
(a) The proposed term for Protection System Study, shown on page 2 of 27 of PRC-027-1 Draft #1, is defined as "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults." CenterPoint Energy recommends Protection System Study instead be defined as "A study that demonstrates Protection Systems operate as desired for clearing postulated short circuit Fault events." (b) CenterPoint Energy believes a 36 month implementation to have a documented Protection System Study completed for each Interconnected Facility is overly burdensome, unless certain Interconnected Facilities are exempted. CenterPoint Energy recommends exempting Interconnected Facilities that are serving only load and that are connected by no more than two transmission line Elements that are operating between 100 kV to 200 kV. Many of these Interconnected Facilities have fault-proven, time-proven protection system set points. Additionally, Draft #1, on page 5 of 27, notes that protection system misoperations related to coordination issues are addressed by PRC-004.
Yes
No
(a) Requirement 3 includes providing schedule information and project details to generation entities. There may be established market rules that provide for what information can be shared with competitive entities. (b) Requirements 3.1 and 3.3, with examples of what system and equipment changes require coordination, appear overly broad. Such requirements should only be "if applicable". R3.1, for example, specifies changes in line length. Certain changes of line length are immaterial to protection system set points. R3.3 requires coordination for the replacement of failed equipment. Replacing equipment "like function-for-like function" should be excluded from this requirement.
Group

a) The term “coordination” should be removed from the new standard Title and Purpose. Recommend changing Title to: “Interconnected Facility Protection System Performance During Faults”. Also recommend changing the Purpose to read: "To communicate and exchange Protection System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those elements required to isolate faults." b) Recommend under Purpose, deleting: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The purpose without this clause is clear, concise, and consistent with the rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003 R1.3.7 already requires the entity to “demonstrate that System performance meets its Table 1 for Category C contingencies” (TPL-001, -002 have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1. c) In PRC 027, the term "coordination" should only be referenced when referring to the technical aspects of the relay coordination within a Requirement when applicable. (In the current PRC 001 standard the meaning of the term “coordination” has and still is interpreted in two ways. One interpretation is viewed from the technical aspect as “relay coordination” and the second is viewed from an inter-communication aspect as “coordination of information” between entities).
No
In some instances end-use customers, such as a large industrial load, take service delivery through an Interconnected Facility. It is not clear that the draft standard covers coordination between a TO and an end-use customer (not registered as a TO, GO or DP) who takes service via a BES Interconnected Facility.
No
"Protection System Study" is a new term being introduced with this standard. Since industry documentation of protection system coordination reviews are conceivably available from both before and after June 18, 2007, precluding coordination reviews performed prior to June 18, 2007 from acceptable compliance evidence could greatly increase the workload of protection system engineers during the proposed 36 month time period. Note that there is a possibility of overlap with the "Order 754 request for data" response period. The rationale statement for R1, Part 1.1.1, indicates that the effective date of PRC-001-1 was the basis for selecting June 18, 2007. PRC-001-1 primarily addresses new protective systems and changes (R3 & R5) and coordination with neighboring GOP, TOP and BA entities (R4). We suggest changing the wording of Part 1.1.1 to the following: “Within 36 calendar months after the effective date of this standard, if no valid Protection System Study for that Interconnected Facility exists.”
No
The 10% change is too narrow for protection system studies. Accuracies of PT, CT, wiring, and modeling all add together and therefore the threshold for a new protection system study should be 15%. a) In R2, Part 2.2, replace the term “deviation” with “change.” (Note: For this calculation all thats required is to calculate percent change. ie.Webster’s dictionary definition of “deviation” is 1) A variation that deviates from the standard or norm; "the deviation from the mean”. 2. The difference between an observed value and the expected value of a variable or function.) b) In R2, Part 2.2, replace the term “present” with “new” and the term “most recent” with “previous”. Also reflect this terminology change in the % Change equation.(the use of the terms “present” and “most recent” can be perceived to be the same.) c) It is also recommended that “V” for value be replaced by “I” for current. d) In R2, Part 2.1, please add “new”, delete “present” and add either “under normal conditions” or “maximum system conditions” so that it states “Perform a new short circuit study to determine the fault current values under normal conditions, not less than once every 24 months."
No
a) Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout this standard already address notification requirements. b) In R3,Part 3.3.1, change Requirement to read: “Changes are made to a Protection System as a result of findings during Misoperation investigations, commissioning, or maintenance activities.” (The current wording implies that all findings are due to errors. The reference to errors should be removed and the

emphasis of this Requirement needs to be placed on “changes” made to Protection Systems when it becomes apparent that a change is required which impacts coordination of relays.)
Yes
No
There may be instances where extenuating circumstances delay agreement beyond 90 days. For long lead time or complex protection scheme projects requiring more interaction between protective relaying engineers, exceeding the 90 day period could be acceptable to the entities involved. Evidence of mutual agreement on an extension beyond 90 days should be acceptable.
No
We recommend a consistent set of VSL timeframes across all requirements. The 10 day limits are unreasonable and, as stated in the R1.1.1 rationale, this urgency is not warranted. Most entities will have numerous Interconnection Facilities, so applying these VSLs to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general: • Lower VSL should be 60 days late. • Moderate VSL should be more than 60 days, less than a year. • High VSL should be more than a year but done. • Severe VSL should be more than a year and not done.
a)Throughout the 1st draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.2, R2-2.3, R4-4.1, R4-4.2, R4-4.3-4.3.1 and R4-4.3-4.3.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. For example: R1, Part 1.1.2 reads - “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.” For Requirement R1, Part 1.1.2, we recommend omitting the reference to R2 and reword so that the requirement is specific. Recommend changing to read: “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility unless the entity can demonstrate such a study is not required”. b) The standard uses different formats for identifying deadlines. Sometimes “days” are used and sometime “months” are used. It is suggested that a common format be used. c) Please note that there appears to be an inconsistency in the 24 month requirement of R 2.2.1 and the ongoing work in TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. PRC-027-1 R3 will trigger a Protection System Study if there are proximate changes in the meantime. d) Throughout the 1st draft of this standard, there are references to a variety of time horizons (calendar days, calendar months) and within individual Requirements where time schedules are involved, the wording of the Requirement is not consistent when calendar days or months are referenced. For example: R1-1.1-1.1.1 references the time schedule at the beginning of the Requirement whereas R1-1.2 references the time schedule at the end of the Requirement. Recommend using a standard wording format and list the time horizons in the beginning of the Requirement in all Requirements that have time requirements involved. For Requirement R1-1.2, we recommend changing to read: “Within 90 calendar days after the completion of the Protection System Study: Provide, to each affected Interconnected Facility owner, a summary of the results of each Protection System Study performed (including at a minimum the Protection System(s) reviewed and any proposed revisions).” e) There is a concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process. i) The overall process would be less burdensome by changing R2, Part 2.1 to “not less than once every 5 calendar years” which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3. ii) The overall process would be less burdensome by deleting R3, Part 3.3 because such Protection System changes are already captured by R3, Parts 3.1 and 3.2. iii) Omitting ‘project schedule’ from R3 would streamline data exchange. f) Delete ‘operating’ from the Interconnected Facilities definition because “different functional or corporate entities” sufficiently captures all of them. We also suggest defining the singular Interconnection Facility, rather than the plural.

Yes
Yes
We agree that there should be a process for ensuring that the industry continuously evaluates the system and ensures that the relay settings are coordinated and adjusted to meet the dynamically changing grid. However, we disagree that the studies should be conducted by the owners of the facilities. We feel these studied should be conducted by the Transmission Planner or Planning Authority and the cost of the studies should be allocated equally to all users of the grid. Currently, a study is performed when a new facility is added or an existing facility is modified. Typically, the study is conducted by the Transmission Planner as identified in FAC-002 and paid for by the facility that is being modified or is being added. It makes since that these facilities pay for the studies as they are the ones modifying the overall grid and benefit from the modification. In this case the cost should not be bared by an existing facility. The drafting team states that an owner should perform a study when the fault current changes by 10% or greater at their Interconnected Facility. The team may not have taken into account the potential that these changes are not related to that particular facility but rather from a change in the overall dynamics of the grid. For example, an influx of renewable resources (both behind and in front of the meters), retirement of generation, changes to transmission, or changes in load pockets. In addition, it excludes any new facilities added since 2007 from sharing the cost of changes to the grid. The cost for studies conducted for changes to the existing grid should be allocated to all interconnected facilities and should be performed by the Transmission Planner. As defined in the Rules of Procedure, section 500, the Transmission Planner is “the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the PA area.” The Planning Authority is the entity that maintains the information required for the studies and is the entity that could perform the studies at the lowest cost. The cost for performing the studies should be allocated to all entitles doing business on the grid and the cost should be reviewed in a rate case and allocated appropriately. MOD-010 and MOD-012 already provides a requirement to provide the characteristics for system studies to the RRO for updating the models that would be used to conduct the studies. These Standards, however, have a gap in that they do not include Distribution Provider as indicated in the proposed PRC-027 Standard. We recommend the drafting team revise MOD-010 and MOD-012 to retrieve all necessary information to update the RRO model and that the Transmission Planner be tasked with performing the necessary studies.

No
Yes
However R1 is confusing by having two sub-requirements R1.1 and R1.2, two measures M1 and M2, and VSLs consisting of various combinations of non-compliance with sub-requirements. We think it could be made clearer by separating R1.2 out as a separate requirement with its own measure and

VSLs. We have made a similar comment on Question 8 that other requirements, measures and VSLs in this standard could be made clearer by breaking them apart. Also, Requirement R1.2 states “each affected Interconnected Facility owner” without describing how the owner may be affected.
Yes
However it’s unclear what Fault duty is being referred to. Is it the total Fault current at the bus, or Fault current that flows down the line or to the generator? It should also be clarified that Fault duty is the normal case (i.e. with all sources and all lines in-service).
No
Revise second bullet under R3.1 as follows: “Changes to line impedance”. Add another bullet under R3.1 as follows: “Changes to breaker failure scheme operating times”. Also, we don’t agree with the R3.1 Rationale that specifying a single time frame is inappropriate. A time frame similar to R3.2 should be specified. We suggest the following revised lead-in paragraph to R3.1: “According to an agreed-upon schedule or absent such an agreement, 180 calendar days prior to implementing any change or additions listed below; either at an Interconnected Facility or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities”.
Yes
We support the necessity for agreement, but there can be differences in philosophies that make reaching agreement difficult. How are disagreements to be handled? As the requirement is currently worded, the entity receiving the study has no alternative but to agree within the specified timeframes.
Yes
No
The requirements in this standard do not have solely one activity. Also, requirements R1, R2, and R4 do not have an activity or goal stated (other than is stated in the subparts). The requirements in this standard all have sub-requirements, multiple measures and VSLs consisting of various combinations of non-compliance with sub-requirements. We think the standard could be made clearer by separating sub-requirements out as separate requirements with their own measure and VSLs.
The order of the Requirements in PRC-027-1 should be put in chronological order to align with the Example Process outlined on page 22. PRC-001-1: It’s not clear that balloting for Project 2007-06 also includes PRC-001-3. General comment - The vague language of R1 does not make it practicable for the responsible entities to implement the requirement. The Purpose is limited to coordination/relationship with the applicable entities. The Purpose is vague as to whether it applies to the Bulk Electric System. Requirement R1 does not clearly state a reliability outcome/benefit. It is not aimed to achieve one objective. The phrase “shall be familiar with the purpose and limitations of protection system schemes,” is vague and not measurable. What does it mean to be “familiar” with in this context? Could this requirement be stated in a way that is measurable? The outcome is not obvious because of vague terminology. What will be the outcome of entities being “familiar purpose and limitations of protection system schemes?” The term “familiar” is too general to address a single activity. Although it can be inferred that familiarity with the purpose and limitations helps ensure reliability, what single reliability goal will be accomplished? There is no measure specified for R1 (according to the Model: each requirement must have one or more associate measures used to objectively evaluate compliance with the requirement). What type of evidence could be used so the entities are compliant with the requirement? The Data Retention language mirrors the recommended default language. However, because there are no measures, which are “used as a guide in identifying which responsible entity must keep the evidence and for how long,” where do the “3 years” come from? There is no supporting document or reference to a supporting document for justification of VRFs for PRC-001-3; although, there is one for PRC-027-1 (which does not mention PRC-001-3). No explanation is given for the “High” or “Severe” VRF for R1. Generally, how is the VSL said to be “Severe” if there are no measures for R1? Effective Date – There needs to be an explanation for the time lapse of more than 3 months between approval date and the effective date of the standard. Additional clarity is needed regarding performance requirements and how an entity would demonstrate compliance with R1. Requirement R1 doesn’t support the Purpose statement of the standard.

Don’t necessarily agree with the statement: “Protection Systems remove from service only those Elements required to isolate Faults..." This statement can be problematic since backup functions such as remote Zone 3 distance elements cannot be overlapped reliably yet are necessary for N-2 and beyond contingencies. Also, in some case it may be desirable to allow for intentional overlap or mis-coordination depending on the circumstances. These issues need to be resolved in the proposed standard or the standard eliminated.
No
No
No
We have concerns over what NERC considers to be a "Protection System Study". Needs to be defined more clearly.
No
What are the details to be provided? Should only be for significant changes.
No
See general comments below (#9).
General: Western disagrees with NERC standards becoming too specific on technical issues such as protective relay coordination. Protection Engineers are highly skilled and trained in system coordination and should be left to determine the proper course of action without the hindrance of PRC-027-1 requirements. There is a reason why, historically, protection system coordination has been termed "the Art and Science of Protective Relaying." The proposed standard also mentions that "Protection Systems remove from service only those Elements required to isolate Faults..." This statement can be problematic since backup functions such as remote Zone 3 distance elements cannot be overlapped reliably yet are necessary for N-2 and beyond contingencies. Also, in some case it may be desirable to allow for intentional overlap or mis-coordination depending on the circumstances. These issues need to be resolved in the proposed standard or the standard eliminated. Specific issues: - We have concerns over what NERC considers to be a "Protection System Study". Needs clearer definition. - Swap requirement positions R1 and R3. I.e. make R1 be R3 and R3 be R1. - R2.2: Provide equation. And, use “I” instead of “V” when referring to current. - R2.2: What values are being referred to for deviation calculation? (i.e. ground current, phase current, positive sequence, etc.) - R2.2: Clarify the fault current contribution or provide a table specifying the details - R3.1: Last bullet, suggest making the statement “Replacement of the transformer(s)” to cover all transformers. - R3.2: How does the neighboring entity know when to request? - R3: What are the details to be provided? Should only be for significant changes. - Concerned about dates and timelines associated with this standard. Often schedules and tasks change during design, checkout and commissioning. R1.1.3 and R3 need to be clarified. Western feels that this standard will create more questions than it answers. The standard, as written, is not clear or concise and would surely lead to CAN's and FAQ's.

The proposed Requirement R4 is not an acceptable method of confirming agreement among parties. Requirement 4.1 requires an entity to agree with the proposed changes within 90 calendar days. What if the entity thinks the proposed changes are wrong? Other standards that require entity A to provide information to entity B provide that entity B will provide written comments to entity A within a specified period of time. 4.1 should state the following: “Within 90 calendar days after receipt, provide written comments (if any) regarding the summary results of a Protection System Study, as described in Requirement R1, Part 1.2.” Requirement 4.2 will require an entity needing to implement a planned change to delay the in-service date until affected entities agree with the proposal. This sets up a potential stand-off with no method of resolution. In other standards where parties provide comments the entity is required to respond to those comments within a specified period of time. However, 4.2 as worded would stop the implementation until the other parties all agree. The owner of the facility needs to have ultimate and sole control for implementing these changes and the current 4.2 would stop a project dead in its tracks until the other parties all agreed. Proceeding without this agreement would result in a standard violation and imparts power upon entities over facilities they do not own. 4.2 should state the following: “Within 30 calendar days after receipt of any written comments received per Requirement 4.1 and prior to the in-service date of any planned change at the Interconnected Facility, respond to such written comments.”

AECI objects with the line of questioning here, because it does not fully address all aspects of Requirement R1. While AECI appreciates the 36 month time-frame, we did receive internal comment back from our planning engineers Relay Operations Sub-Committee: 1) Concerning our Regional Entity’s Short Circuit Data Working Group, the current status is such that a unilateral AECI SC study would be technically difficult. 2) Further, significant modeling development will be necessary in order for entities to comply with this requirement through a regional study formation, ie 3 yrs is a definite push on the timeline on the Initial pass. 3) Finally, the information to be reported from a Protection System Study R1.1, and particularly the information to be communicated to other entities R1.2, may be too vague. This primary concern is for personnel being inundated by the sheer volume of data that can now be performed in relation to such studies. AECI would appreciate the SDT providing further Industry Guidance as to what would constitute a clear and concise set of information, to be transmitted or received from corresponding parties.
Yes
A 10% threshold seems simple, but the SDT may or may not wish to clarify the formula to be applied because any of the following is a valid interpretation: 1) abs(Vscs – Vpss)/Vscs, 2) abs(Vscs – Vpss)/Vpss, 3) abs(Vscs – Vpss)/0.5(Vscs + Vpss), 4) abs(Vscs –Vpss)/Max(Vscs,Vpss), or 5) abs(Vscs-Vpss)/Min(Vscs,Vpss). Also see SERC PCS Comments.
No
AECI believes the industry would be better served by placing this list of items into a Guidance

document, and rephrasing R3 to include only “field-changes known to modify the conditions used in coordination settings of Protection Systems.” Although some of the listed items are direct-impact, as currently drafted, any field-equipment changes are potentially in scope, regardless of proximity to the Interconnected Facility(s) of interest. With exception of R3.1 Bullet #1, the R2.3 10% is a better metric and the other Guidance bullets and wording we proposed above, should be added into R2.3.
No
PRC-027-1 R4.2 change: Replace: “that Protection Systems(s) changes” With: “each related Protection Systems(s) change” Rationale: AECI sympathizes with the need for agreement, and believes that to be the necessary goal. However, this requirement indicates all-or-none for notified Protection System Change(s). Entities may agree on most all communicated changes, and yet a more complicated change, particularly outside of Zone 1, may require some interim compromise, or that one particular (backward-looking) be excluded until agreement is reached. Full agreement, prior to placing facilities into service, might otherwise become a method for forcing a poor compromise on protective settings.
Yes
These facilities take time and budget to build or implement, and so 3-months prior to field-changes seems reasonable.
No
See SERC PCS Comments.
See SERC Comments Also pertaining to PRC-027-1 Page 2, Terms:, "Interconnected Facilities" definition, proposed change: Replace: “functional, operating, or corporate entities” With: “functional or operating entities” Rationale: In certain cases, independent Corporate entity is irrelevant to the planning and operations of these systems. As written, the underlying 6 G&Ts of AECI’s JRO could technically and unnecessarily be subjected to this standard for AECI's internal Facilities, and not just Interconnected Facilities between AECI and other non-JRO entities, although AECI's JROs functionally coordinate relay settings much as a large IOU’s regional departments would.

Please strike “while meeting the system performance specified within requirements established in other approved NERC reliability standards.” It provides no additional explanation for the purpose and these “other approved NERC reliability standards” apply regardless of this standard. In generally, it is not necessary to reference other NERC standards within a standard and, in fact, should be avoided as a standard should stand alone.
Yes
No
(1) Conceptually, we agree with the intent of the standard and this requirement as it is presented in the application guidelines. However, more refinement is needed to make this requirement implement what is explained in the application guidelines. For instance, nowhere in Requirement R1 is it stated clearly that the responsible entity is only responsible for performing Protection System Studies (PSS) for only those breakers it owns and are protecting the Interconnection Facility. This is pretty clear in the application guidelines. (2) While we do not disagree with the time frame, we question if it should be part of the requirement. It makes more sense to include the time frame for initial compliance of a requirement in the implementation plan. In that way, the initial compliance time frame does not persist in the standard long after it is no longer needed. It is common to utilize the implementation plan to describe initial compliance dates. Furthermore, FERC approves implementation plans as part of the standards package so there is no issue with whether the implementation plan are enforceable. (3) We disagree with limiting PSS that can meet this requirement to only those that occurred after June 18, 2007 as defined in Part 1.1.1. While NERC cannot compel evidence from a date before the standards became enforceable, there is no reason that a TO, GO, or DP could not choose to utilize a PSS from before this date as evidence. (4) We think the use of PSS in Part. 1.1 is partly redundant to the definition. The definition indicates PSS is a study that demonstrates Protection Systems operate in desired sequence for clearing Faults. Part 1.1 states that the TO, GO, and DP shall perform the PSS

“to verify Protection Systems remove from service only those Elements required to isolate Faults” are removed from service. Isn’t the statement in Part 1.1 “to verify Protection Systems remove from service only those Elements required to isolate Faults” equivalent to the demonstrating that Protection Systems operate in the desired sequence for clearing faults as defined in the PSS? (5) We disagree with including the Distribution Provider in this requirement. The primary reason that a Distribution Provider owns Protection Systems that protect Interconnected Facilities is that it is often cheaper to install a fault interrupting device and its associated Protection Systems on the distribution side. These Protection Systems are typically installed per the Transmission Owner facility connection requirements which are established per FAC-001. The Transmission Owner usually still performs the PSS and short circuit study and the Distribution Provider uses settings specified by the Transmission Owner. The fact that FAC-001 applies only to the TO and allows the TO establish such facility connection requirements that applies to the DP further supports this claim. (6) The definition of Interconnection Facility is confusing and needs further refinement. First, we are not sure what the purpose of including “that are electrically joined by one or more Element(s)” is. If it is not electrically joined, it cannot be a Facility. It would not be part of the BES which is a basic requirement of the Facility definition. Second, it is not clear if this is intended to cover only jointly owned Facilities or not. We do not think that is the intention but the clause “are owned by different functional, operating or corporate entities” cause this confuses. Third, ownership cannot be defined by functional or operating entities. A corporate entity may be registered as a TO and GO. Which part of the definition applies for the interconnection between the transmission system and generator: Functional Entities or Corporate Entities? Furthermore, a functional entity or operating entity does not really describe a legal entity capable of ownership. The definition of Interconnected Facility should be a Facility that ties together two different sets of Facilities together where the Protection System coordination would be performed by different companies. This would appear to be consistent with the explanation of the standards in the application guidelines. For example, a Facility connecting two different TO transmission systems together where the TOs are owned by separate corporate entities would be an Interconnected Facility. A generation interconnection Facility would only be considered an Interconnection Facility if the GO and TO were separate corporate entities. If they were the same corporate entity, coordination would already occur and the generation interconnection Facility should not be considered an Interconnected Facility.
No
(1) While we do not have an issue with the +/- 10% Fault current threshold, we question if the TO should be responsible for calculating the percent deviation for all Protection Systems for all Interconnected Facilities. Rather the TO should be responsible for calculating Fault currents on its transmission system and should be required to calculate the percent deviation for only those breakers and associated Protection Systems it owns and are protecting an Interconnected Facility and that it has performed the Protection System Study (PSS). The TO should communicate the Fault current to the owners of other Protection Systems protecting the Interconnected Facilities for them to calculate the percent deviation. (2) The main part of the requirement needs to be modified to further clarify for which Interconnected Facilities the TO is conducting short studies. As it is written now, each TO has to perform these short circuit studies for each Interconnected Facility. This literally means a TO has to perform short circuit studies for Interconnected Facilities for which it has no information or is even remotely responsible. For example, a literal reading would mean a TO in the Eastern Interconnection would have to perform a short circuit study for an Interconnected Facility in the Western Interconnection. Obviously, this is not the drafting team’s intention but the language does need refinement.
No
(1) In general, we are supportive of the list and requirement because it helps to clarify what changes are intended in Part 1.1.3 in Requirement R1. However, we have identified two specific issues with the list. First, we question if this requirement is at least partly duplicative with FAC-001-0 R2.1.2 which requires the TO to have procedures for notification of new or modified equipment. Second, the third bullet regarding additions, removals, and replacements of transmission system Elements is too broad. This literally means that if a TO replaces a bus section with similar equipment, this requirement to notify of changes is triggered which then triggers a Protection System Study or documentation that one is not required per Requirement R1 Part 1.1.3. Ultimately, we believe the changes that need to be identified are those that actually affect the Protection Systems for the Interconnected Facilities or those that change the Fault current on the Interconnected Facilities. (2)

The 30 day requirement should be struck from Part 3.2. If a schedule is not identified by any party, it must not be pressing and an artificial deadline should not be created. (3) The language of the main requirement needs to be further refined. A literal reading would require the TO, GO, and DP to provide details about Interconnected Facilities that they neither own nor operate or to which they are even connected. Obviously, the literal meaning is not intended. The requirement needs to be refined to clarify that the TO, GO, and DP only need to provide the details for Facilities they own. (4) For Part 3.3.2, we suggest clarifying that this requirement does not apply if the equipment is replaced with like equipment and settings. We also suggest that that some sort of exemption is written into this part for extreme weather events that allows more time for notifications.
Yes
Yes, we agree. The application guidelines were particularly helpful in explaining how the Requirements R3 and R4 work together.
No
We assume this question refers to Part 4.1. While we do not see any issues with the 90 day requirement, Part 4.1 needs to be modified to reflect what a responsible entity must do if they do not agree. As written any other response than agreement is a violation. Thus, if a TO indicates it disagrees with the results of the Protection System Study (PSS) within 90 days, it technically is in violation of the requirement. The application guidelines explain that absent agreement the revisions should be proposed. We agree with this approach but the requirement simply does not say this. It should.
No
(1) The time horizon for R2 should only be Long-term Planning. The study has to be completed every 24 months and while notification in Part 2.3 has to occur within 30 days it is only after that the study to satisfy the 24 month time period is complete. (2) Requirement R3 should include Long-term Planning. Transmission system expansions would be covered under Part 3.1. (3) The VSLs for Requirement R1 are gradated based on the number of days late the requirement is met for Part 1.1 but not Part 1.2. It seems Part 1.2 should have similar gradated VSLs. (4) For Requirement R4, we suggest the VSL for Part 4.2 should clearly state that any changes made during extreme operating circumstances (i.e. extreme weather) are excluded. This is essentially a question on what is meant by “planned”. Are changes made to restore service in a hurricane or tornado damaged area a few days after the devastation planned? We think they are not but see how auditors could view the changes as planned particular if any level of study was required.
(1) Please restate section 4.2. It states that it applies to Protection Systems installed at Interconnected Facilities. “Installed at” is not really the intention. It should be Protection Systems installed to protect Interconnected Facilities. While they most likely would be at the Facility, they do not have to be. For example, a 500 kV transmission line is a Facility. Protection Systems will not be “Installed at” the line but rather at the substations. (2) If PRC-001-3 R1 is going to be retained, it needs to be further refined. First, it inappropriately uses the term area when referring to a GOP. While the BA and TOP do have Balancing Authority Areas and Transmission Operator Areas, no equivalent exists with the GOP. The GOP simply operates generating units not areas. Second, the requirement confuses the role of the GO and GOP. In the functional model, it is the GO that is responsible for installing, setting and coordinating generation protection systems not the GOP. Thus, it is not clear what role the drafting team envisions for the GOP being familiar” with the purpose and limitation of protection system schemes applied in its area”. Third, the requirement is written too broadly for the BA. Because the requirement compels the BA to be familiar “with the purpose and limitation of protection system schemes applied in its area” this could literally require the BA to understand many protection schemes for which it has no direct or even indirect responsibility. For instance, distance and differential protection schemes are contained within the metered boundaries of a BA Area. This requirement would compel the BA to be familiar with them even though this knowledge would have zero impact on its decision making or responsibilities. This does not align with the responsibilities assigned to the BA in the functional model. The BA being included in this requirement is likely a vestige of the version 0 standards and should be corrected. When version 0 standards were translated from the policies, BA and TOP were simply substituted for control area regardless of the role the control area was playing in the requirement. (3) The NERC function model defines one role of the Transmission Planner as “define system protection and control needs”. Should the Transmission Planner have a role in this standard? For instance, should the TP actually perform the short circuit studies? (4) The application guidelines and examples are very helpful in understanding the intent of

the drafting team. However, we recommend revising the example regarding Figure 3. It would appear to assume a distribution level generator is part of the BES and subject to NERC standards. While it is possible for a generator on the distribution system to be part of the BES (i.e. if it is a Blackstart Resource), inclusion of such a generator would be unusual and an exception to the normal BES 100 kV threshold. If the generator is not part of the BES, there would be no Generation Owner registered to perform the coordination. Industry is likely to be sensitive to such an example. Removing the generator will still allow the example to communicate that a breaker and associated Protection System on the high side (100 kV or higher) of a distribution or step-down transformer would still have to be coordinated.

We feel that this is a very difficult standard to interpret consistently as written. We think a negative vote is warranted since it is confusing and unclear for our situation. Following are specific comments to support our negative vote. In regard to the Process Flow Chart on page 21 - We assume this Process Flow Chart is intended as an illustrative clarification of the standard, not a supplement to the wording. The chart claims to be a “complete representation of the process” and as such should match identically or it should be eliminated as it causes confusion. It is our interpretation that the chart does not match the standard’s wording. One example if you start with an R3 emergency replacement you end up with two conflicting results. Under 4.3.2 you have 30 days to confirm that the changes are acceptable. Under 1.1.3 you have to do a protection study so you are given 90 days per section 1.2. This entire chart should be verified to ensure that it matches the written standard and does not result in conflicting requirements. We suggest adding the sub-requirement labels to each flow chart item for easier reference to that section of the standard. In regard to Figure 3 on page 25 - The figure appears to represent the connection of a large NERC qualified generator. Does this figure also apply to a looped source distribution system or should that follow figure 4? We would like to see a definitive example that clarifies what to do for the situation where you have a looped source distribution system. In regard to Figure 4 on page 26 - the figure implies that A & B can be set to overtrip C (as no study is required) which would interrupt the BES for distribution faults. This appears to be contrary to what is intended by this standard.

While 36 months is allowed for studying all interconnections, what time is allowed for mitigation of identified setting or hardware change? If an issue is discovered, then an additional 12-24 months mitigation time should be allowed.
No
It would seem that NERC Standards efforts, such as PRC-027 should focus on areas that have a record of poor performance and a contributor to misoperations. The area of tie line protection addressed in PRC-027 is not an area of poor performance, see page 4 of the attachment “….Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard

PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations". Areas that are less problematic should be addressed by NERC with less intrusive methods such as Industry Alerts, general cautionary statements or a standard with less detailed documentation requirements. Thus, PRC-027, as drafted, will unnecessarily require additional focus and resources be placed in an area that has not been a problem for the reliability of the BES. Alternatively, PRC-027 should be drafted much less prescriptively from a technical standpoint, and allow for more discretion on how to conduct the study and how to coordinate the results. The prescriptive nature of many of the technical requirements PRC-027 is so narrow that it may counterproductive. A results-based approach here should focus more on conduct a study and coordinating the results, rather than dictating how the technical requirements of how study is to be completed.

No
Oncor takes the position that the word "only" in the Purpose is too subjective and allows for multiple interpretations. Oncor believes that in order to provide clarity, Oncor suggest that the Purpose be modified as follows: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.
No
No
Given the "agreement" requirements defined in Requirement R4 and the uncertainty of its interpretation, many of the recent protection system studies may have to be performed again. Therefore, a more appropriate timeframe would be 5 years to have all applicable Protection System Studies completed.
Yes
Oncor takes the position that the 10% fault current threshold criteria is the only criteria needed;
Yes
No
Oncor believes agreements must be reached; however, there needs to be some definitions in the Standard to define the exact meaning of the term "agreement". In addition, the sub requirements 4.3.1 and 4.3.2 calls for confirmation of the Protection System changes are acceptable pursuant to notification received in Requirement 3, within 30 days, however the sub requirements provide no mechanism for resolution in the event the changes are not acceptable to the receiving entity within 30 days of receipt. Oncor suggest that these two sub requirements be removed. There is sufficient checks and balances under 4.2 to provide coverage for any disagreement between entities without the need to self-report under the 4.3.1 and 4.3.2 if an agreement cannot be reached within 30 days of receipt.
Yes
No
Until 'agreement' definitions or further clarity as to what is an "agreement", can be added the Standard, Oncor does not believe that VRFs and VSLs can be established for this standard.
Based on a thorough review of the proposed Standard, Oncor has identified several questions or

comments which need to be addressed in the Standard to ensure the Requirements are clear. • R4.1: please provide clarification of which entity would be out of compliance if the 90 day requirement is not met - initiating entity or receiving entity or both • M9: What does "confirmation" mean as explained in Measure M9? • R4: please incorporate a definition of “agreement” • R4.2: please incorporate some examples for "evidence of agreement"? o There are two types of agreement that are needed; the first being an "agreement" with the overall projected relaying scheme (i.e. agreement with preliminary conceptual design detailing proposed protection scheme changes). This is prior to any equipment being purchased. The second agreement, which could be identified as more of a concurrence, is agreement that both relay systems coordinate from a protection standpoint (i.e. concurrence with relay setting changes). The relay setting process and concurrences occur later in the project closer to the in-service dates. In addition, the sub requirements 4.3.1 and 4.3.2 calls for confirmation of the Protection System changes are acceptable pursuant to notification received in Requirement 3, within 30 days, however the sub requirements provide no mechanism for resolution in the event the changes are not acceptable to the receiving entity within 30 days of receipt. Oncor suggest that these two sub requirements be removed. There is sufficient checks and balances under 4.2 to provide coverage for any disagreement between entities without the need to self-report under the 4.3.1 and 4.3.2 if an agreement cannot be reached within 30 days of receipt. • R3.1: please provide further clarification of the statement "modifies the conditions used". It would seem that most system changes would modify the conditions used even though for many of those changes, coordination would not be impacted. Oncor takes the position that the phrase provides ambiguity and subjectivity that would difficult to measure or audit.

Yes
No
Yes
Yes
No
R3.3 in its entirety should be removed considering that all conditions covered by R3.3 are already covered by R3.1 which states: “New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios” If a correction or replacement of a protection system element is made per R3.3, this is the same thing as a modification covered under R3.1. It is noted that R4 would need to be reworded to accommodate unplanned and emergency protection system changes.
Yes
Yes
R4.1 only mentions R1. R4.2 should be reworded to make it clear that entities have 90 days to respond to proposed protection system changes received per R3.1. The concern is that with no specified time the responding entity can delay the initiating entity’s schedule even if the protection system changes were shared well in advance of the in service date.
Yes
Group
Kansas City Power & Light
Tim Hinken
No

The reliability objective of this standard should be to insure that there is an agreement between two interconnected entities of relay protection schemes and relay protection settings for the interconnected facilities. This is achieved if there is documentation stating that the Interconnected operating companies have reached agreement on protection schemes and protective relay settings. This standard should only require documentation that neighboring owners are talking and agreeing with one another in relation to protection and control. The present purpose makes it appear that you are in violation of the standard any time the system has a misoperation because of relay setting regardless of whether both parties have agreed on the settings used but the measures tend to measure agreement with the other entity. This is the reason that the present purpose needs to be rewritten the auditors may interpret the purpose to indicate any misoperation due to setting issues is a violation.
No
The applicability should also include Transmission Operators and Generator Operators as it is possible for jointly held facilities to be owned by several parties and operated by another party and relay protection responsibilities could be with the Operator of the facility. It should be clarified the proposed Standard is applicable to Distribution Providers that provide protection for BES Elements.
No
The protective systems were coordinated when installed. If the power system has not undergone any significant change, then line impedances and fault current levels are the same and the original settings are still valid. So, no new study is required based on the passage of time. A new study is needed only if there have been significant system changes as outlined under question 5 and requirement R3. Requirement 1.1 states each entity must perform a system protection coordination study, however, the coordination efforts will be joint efforts between the entities and sharing of pertinent information such that an effective study can be performed. The proposed Standard should make it clear the study effort can be a joint study between the entities involved and that independent studies are not necessarily intended by each entity.
No
Primary protection of most transmission lines is impedance based. Sensitive ground over current systems are used for communications assisted tripping and time ground over current systems are typically used as backup protection. Some line protection is differential based. Some entities also apply instantaneous ground over current relaying for faults at some fraction of the protected line. Increases in fault current do not affect impedance based relaying. Communications assisted sensitive ground elements are set well below available fault current levels and increases in fault current levels will not hinder proper operation. Differential based systems would also not be harmed by fault current increases unless fault currents increase enough to result in ct saturation. Since time ground over current relays are usually used as backup protection they are typically set only to operate if the primary relaying protection has failed. These relays are typically set to coordinate based on time delays for ground faults on the protected line. Because the overcurrent curves are based on a log scale the increase in current magnitude does not correlate to the same percentage in time. Instantaneous ground over current elements are most susceptible to misoperations caused by increases in fault current, however these elements should be initially set to protect only the first 50 to 70% of the protected line based on the fault current at the remote end. With this in mind a fault current increase of 10% is not significant by itself to require a setting review and it is very difficult to see how a 10% decrease can affect the coordination unless over current elements are the primary protection elements or over currents elements can prevent the operation of the other protection functions. If the SDT is adamant about having a periodic review of fault current levels then the time should be extended to 5 years and the fault current level should be increased to 20% on the protected line.
No
Bullet item #3 is too broad. The NERC Glossary definition for Element is, “Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.”. For example, a disconnect switch would be considered an Element, but a change of this component would not warrant a change to relay protection. Recommend modifying bullet item #3 to, “Additions, removals, or replacements of transmission system Element(s) that have an impact on relay protection systems or component(s)”

Yes
No
These can be matters of extreme complexity in design, implementation and operation. Stipulating that 90 days (Requirement 4.1) and 30 days (Requirement 4.3) is sufficient time to come to an agreement is presumptuous and is not necessary. Requirements 4.1 and 4.3 should stipulate that entities in receipt of proposed changes to relay protection system(s) or component(s) be evaluated and responded to by the entity in receipt. The response could be agreement or non-agreement with concerns or objections noted in the response.
No
The 10 day increments represent a 5% error and considering this is a six month requirement. The 10 day increment represents 4 – 6 working days across 2 weekends and including a holiday. Recommend the increments be increased to allow at least 10 working days which would be at least 15 calendar day increments. VSL for R2, part 2.1 – The 10 day increments represent a 1% error and considering this is a 24 month requirement. Recommend the increments be increased to 30 days to make more sense with the 24 month period.
Requirement 1.1 of R1 states, “Perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults as follows:”. The purpose of this standard should not be to remove from service only those Elements required to isolate Faults, therefore 1.1 above should state, “Perform a Protection System Study for each Interconnected Facility as follows:”. Requirement 1.1.2 of R1 states, “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.” Since this Requirement is an action as a result of requirement R2 and as noted in the response to question 6 above, R2 should be deleted. If the SDT is adamant about having a periodic review of fault current levels then the fault current level should be increased to 20% on the protected line. A 10% fault current change is not significant enough to require a new protection system study. Requirements R4.3 and R3.3 are actions as a result of a misoperation and because there is already a standard (PRC-004) that deals with misoperations these two requirements should not be covered in this standard if changes need to be made due to misoperations they should be made in the misoperation standard (PRC-004). This standard is not intended to replace the Misoperation Standard and any requirements addressing misoperations gives FERC, NERC and the Audit Teams the wrong impression of the intent of this standard. All Protection System Studies are dependent on accurate system models. Individual Entities should not be responsible for development and maintenance of an accurate Regional model or model to be used between Regions. Individual Entities should only be responsible for providing the information on their system to the Regional Entity so that an accurate model can be maintained by the RC. I propose that this standard be applicable to the Region and require the Region to maintain an accurate model that includes zero sequence impedance and is useful for Protection System Studies. This system model also needs to be accurate between Regions for Protection System Studies that span between Regions. This will require that the standard also be applicable to NERC RRO and require RRO to oversee the process of maintaining an accurate national model or equivalents that can be used between Regions. Anything less than this is placing an unfair burden and unrealistic expectation on the TO to produce and maintain an accurate model for interconnecting Protection System Studies. A dispute resolution mechanism also needs to be required to provide for instances where entities cannot come to a mutual agreement. Recommend a requirement be included for entities to request applicable RC(s) to arbitrate to bring resolution to a matter.
Individual
Jian Zhang
TransAlta Centralia Generation LLC
No
The Interconnected Facilities definition is not clear.
Yes
The applicability should include other functional entities which should provide power system study data.

1) Applicability 4.2 Facilities should be Protection System installed at Interconnected Facilities that required coordination. 2) R2- For the Inteconnected Facilies only for the purpose of the generator interconnection, only the Transmission Owner providing the generator interconnection should be required to perform the tasks as mentioned in R2, not the other entity (generator) even though it is registered as the Transmssion Owner. 3) R2 2.1 perform a short circuit study to determine the present fault current values, not less than once every 24 months. 24 months is too often. Suggest to change to “once every 60 months unless there is major equipment change on the system”.
Individual
Pablo Oñate
El Paso Electric
Yes
No
Yes
It is unclear whether the proposed standard intends to reach 10% or greater deviations that accumulate over the course of a more extended period of time (i.e., greater than 2 years), or whether an entity can seek to perform multiple studies within a compressed period of time in such a way that it can ensure that a 10% deviation will not be reached from study to study, as illustrated below: • Study performed in Year 1 shows a 5% deviation • Study performed 12 months later (in Year 2) shows a 5% deviation • Study performed 12 months later (in Year 3) shows a 5% deviation [Cumulative deviation of 15% within 3 years, but only a 5% deviation from study to study]
Yes
Yes
No
EPE believes the timelines are not adequate when coordinating protection system studies involving sequential interdependence among parties for interconnected facilities . Timing of study data should correlate with any written agreements or procedures agreed to between the various parties. EPE also believes the documentation requirements within this draft Standard slow down the process, therefore increasing the time needed to complete and communicate the study data. The proposed Standard fails to address two important and likely types of situations: (a) the situation in which an interconnected entity fails to respond with study results or to a planned change at the Interconnected Facility, or (b) the situation in which disagreements between the entities are not resolved within the proposed Standard’s time clock.

Dominion Resources Services, Inc.
Mike Garton

Question 1

In the current PRC-001-1 standard the meaning of the term “coordination” has and still is interpreted in two ways. One interpretation is viewed from the technical aspect as “relay coordination” and the second is viewed from an inter-communication aspect as “coordination of information” between entities. The term “coordination” should be removed from the new standard Title and Purpose. Recommend changing **Title** to: “Protection System Interconnected Facility Performance During Faults”. Also, recommended is to change the **Purpose** to read: “To communicate and exchange Protection System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those Elements required to isolate Faults.” In PRC- 027-1, use the term coordination only when referring to the technical aspects of the relay coordination within a Requirement when applicable.

Under **Purpose**, delete: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1.

Question 4

a). In R2-2.2 Replace the term “deviation” with “change”. {(Note: For this calculation all that is required is to calculate percent change. i.e. Webster’s dictionary definition of “deviation” is 1) A variation that deviates from the standard or norm; "the deviation from the mean”. 2. The difference between an observed value and the expected value of a variable or function. This is not a statistical calculation.) }

b). In R2-2.2, Replace the term “present” with “new” and the term “most recent” with “previous”.

c). Change the % Deviation Equation to % Change. Reflect as stated above in the equation legend (the use of the terms “present” and “most recent” can be perceived to be the same).

d) Replace “V” (Value) with “I” (Current) in the % Change Equation. “V” is frequently used to represent Voltage and this could lead to confusion.

e). In M5 Replace the term “deviation” with “change”

f). In R2-2.1 please add “new”, delete “present” and add either “under normal conditions” or “maximum system conditions” so that it

states “Perform a *new* short circuit study to determine the Fault current values *under normal conditions*, not less than once every

24 months.

Question 5 (NO)

a). Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout the draft already address notification requirements. By using the term project scheduling this implies that detailed project information needs to be included in the information exchange. The standard should not dictate the information exchange details required and should allow the entities to determine what information is required in the exchange in order to achieve protection coordination in the appropriate timeframe.

b). In R3 reword to read: <u>"Each Functional Entity shall provide to other Functional Entities connected to an Interconnected Facility, the details of the Protection System as follows:" (It</u> is not necessary to include (e.g. Examples) since references to these are already listed in R3-3.1.)

c). In R3-3.1 reword to read: <u>"When adding new or modifying existing Interconnected Facilities or when making changes to other facilities where the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities"</u>

d). Bullets: 1st bullet -Recommend changing reference to "protective Function settings" to <u>"protection settings"./</u> 2nd bullet – Reword to read: <u>"Line impedance changes" /</u> 3rd bullet – Remove the word "system"

e). In R3-3.3.1 change Requirement to read: "Changes found during Misoperation, commissioning, or maintenance activities

that modify the conditions used in the coordination of Protection Systems. "

Question 7

Reword R4., 4.3 to read: <u>"Within 30 calendar days after receiving notification of:"</u>

Question 8 (NO)

a). Dominion recommends a consistent set of VSL timeframes across all requirements. The 10 day limits are too tight and as stated in the R1.1.1 rationale this urgency is not warranted. Most entities will have numerous Interconnection Facilities so applying these VSL to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general:

- Lower VSL should be 30 days late.
- Moderate VSL should be more than 30 days, less than a year.
- High VSL should be more than a year but done.
- Severe VSL should be more than a year and not done.

Question 9

a). Dominion is concerned that a YES vote will also endorse the revision, also part of this project, to PRC-001-3, would then be reduced to only one requirement that is not measurable and does not contribute to the purpose of the standard. The Measure for the requirement has also been removed. The PRC-001 standard should be retired or mapped to another standard.

b). The proposed definition of Protection System Study is vague and introduces subjective terms such as “demonstrates” and “desired sequences”. Recommend the following definition: “<u>A study that determines the proper selection of settings for existing or proposed protective relays in order to properly isolate Elements.”</u>

c). Throughout the 1st draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.2, R2-2.3, R4-4.1, R4-4.2, R4-4.3-4.3.1 and R4-4.3-4.3.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. For example: R1-1.1.2 reads - **“Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.”** For Requirement R1-1.1.2 - Omit the reference to R2 and reword so that the requirement is specific. Recommend changing to read: <u>“Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility unless the entity can demonstrate such a study is not required”</u>.

- Change R1-1.1.3 wording to read <u>“When proposing or being notified of a change that modifies the conditions used in the coordination of Protection Systems at the Interconnected Facility unless the entity can demonstrate such a study is not required.”</u>
- R2-2.2, delete reference to R2. Delete “pursuant to Requirement R2, 2.1”.
- Change R4-4.1 to read: <u>“Within 90 calendar days of receiving summary results of a new Protection System Study, confirm agreement with the summary results.”</u>
- Change R4-4.2 to read: <u>“Prior to the installation of a proposed change that modifies the existing conditions used in the coordination of Protection Systems of the Interconnected Facilities, confirm the affected Interconnected Facility owner(s) agree with the Protection System(s) change.”</u>
- Change R4-4.3.1 to read: <u>“Changes made to a Protection System as a result of findings during Misoperation investigations, commissioning, or maintenance activities, confirm the Protection System(s) changes are acceptable.”</u>
- Change R4-4.3.2 to read: <u>“Emergency replacements are made due to failures of Protection System components confirm the Protection System(s) changes are acceptable.”</u>

d) Throughout the 1st draft of this standard, there are references to a variety of time horizons (calendar days, calendar months) and within individual Requirements where time schedules are involved, the wording of the Requirement is not consistent when calendar days or months are referenced. For example: R1-1.1-1.1.1 references the time schedule at the beginning of the Requirement whereas R1-1.2 references the time schedule at the end of the Requirement. Recommend using a standard wording format and list the time horizons in the beginning of the Requirement in all Requirements that have time requirements involved. For Requirement R1-1.2, Change wording to read: **<u>"Within 90 calendar days after the completion of the Protection System Study, provide to each affected Interconnected Facility owner a summary of the results of each Protection System Study performed (including at a minimum the Protection System(s) reviewed and any proposed revisions)."</u>**

- Change R2- 2.3 wording to read: <u>Within 30 calendar days after identifying that the calculation performed between the previous Protection System Study and the new study indicates a change in Fault current of 10% or greater, notify each Interconnected Facility owner, at which the 10% or greater change applies.</u>
- Chang R3-3.2 wording to read: <u>"Within 30 calendar days of receiving a request for information in the absence of an agreed-upon schedule or according to an agreed-upon schedule with a Transmission Owner, Generator Owner, or Distribution Provider."</u>

e). Throughout this 1st draft of the standard, there are references that illustrate documentation requirements that are inconsistent. <u>Recommend all be written as "(hard copy or electronic file formats)".</u>

f). Please note that there appears to be an inconsistency in the 24 month requirement of R 2.2.1 and the ongoing work in TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. PRC-027-1 R3 will trigger a Protection System Study if there are proximate changes in the meantime.

g). There are several requirements stipulated throughout the draft standard creating the concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process.

1). The overall process would be less burdensome by changing the R2 2.1 to "not less than once every 5 calendar years" which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3.

2). The overall process would be less burdensome by deleting R3 3.3 because such Protection System changes are already captured by R3 3.1 and 3.2.

3). Omitting 'project schedule' from R3 would streamline data exchange.

h). There is confusion on the connections at the end of the flow chart. Please provide clarification.

END

Consideration of Comments

Project 2007-06 System Protection Coordination

The System Protection Coordination Drafting Team thanks all commenter's who submitted comments on the 1st draft of the standard for Protection System Coordination for Performance During Faults. These standards were posted for a 45-day public comment period from May 21, 2012 through July 5, 2012. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 76 sets of comments, including comments from approximately 198 different people from approximately 139 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/System_Protection_Project_2007-06.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received

Definitions

The drafting team added the following sentence to the standard to specify that the definitions will not be added to the NERC Glossary of Terms. "The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the Glossary of Terms:"

The drafting team modified the previous definition of Interconnected Facilities to 'Interconnected Element' defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."

Purpose

The drafting team modified the purpose statement based on comments related to two main issues: (1) the inclusion of the phrase '…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards', and (2) the inclusion of the phrase '… remove

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

from service only those Elements...'. The purpose now reads: To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.

Applicability

The Applicability was modified as follows:

4.2 Facilities: Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.

Requirements

The time frame for Requirement R1, Part 1.1.1 was increased to forty-eight calendar months to allow entities with large numbers of Interconnected Elements enough time to complete the Protection System Studies. Additionally, changes were made to not exclude studies performed prior to June 18, 2007. Requirement R1, Part 1.1.1 now reads: (Part 1.1 Perform a Protection System Study)…"Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists."

The drafting team modified Requirement R1, Part 1.1.2 to be consistent with the Fault location referenced in Requirement R2, Parts 2.1 and 2.2 such that it now reads: "Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required."

The drafting team modified Requirement R1, Part 1.1.3 for clarity. It now reads: "According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required."

The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."

The drafting team reworded Requirement R2 to read as follows: "For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall:"

The drafting team modified Requirement R2, Part 2.1 to provide clarity as to where the Fault should be applied. Requirement R2, Part 2.1.1 now reads: At least once every 24 months: "Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."

The equation stated in Requirement R2, Part 2.1.2 was modified to replace "V" with "I".

The drafting team modified Requirement R2, Part 2.2 to provide clarity and to change "notify" to "provide" such that it now reads: "Within 30 calendar days after identification where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in Fault current of 10% or greater, provide each owner of the Protection System associated with the Interconnected Element the updated Fault current values (Iscs)."

The drafting team modified Requirement R3 for clarity and moved the examples into Measure M5 such that it now reads: "Acceptable evidence may include, but is not limited, a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) in hard copy or electronic file formats as identified in the bulleted list for Requirement R3, Part 3.1 was provided to each responsible entity connected to the same Interconnected Element."

The drafting team modified Requirement R3, Part 3.1 for consistency with changes to other requirements, the addition of the examples, combining the second and third bullets, and clarity. It now reads: "Details for any change or additions listed below; either at an existing or new Facility associated with the Interconnected Element; or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

- New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to a transmission system Element that change any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

The drafting team modified Requirement R3, Part 3.2 for clarity. It now reads: "Requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 calendar days of receiving a request or according to an agreed-upon schedule."

The drafting team combined the Requirement R3 Part 3.3 subparts 3.3.1 and 3.3.2 into the main body of the Requirement R3, part 3.3 which now reads: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."

The drafting team removed the term “confirm agreement” from Requirement R4, Part 4.1 and revised it to read: “Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.”

The drafting team revised Requirement R4, Part 4.2 to read: “Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.”

The drafting team removed Requirement R4, Part 4.3.

Measures

The drafting team modified all the measures to be consistent with the revised requirements.

Evidence Retention

The drafting team modified the language for consistency.

VSLs and Time Horizon

The drafting team made no changes to the VRFs; however, the following changes were made to the VSLs:

- For Requirement R1, Part 1.1.2, the time period for tardiness in the ‘Lower’ VSL was lengthened from 10 days to 30 days.

The drafting team added Long-term Planning to the Time Horizon for Requirement R3.

Guidelines and Technical Basis

Complementary changes were made to the Guidelines and Technical Basis corresponding to all changes to the standard.

The drafting team added the following to the description of a Protection System Study in the “Guidelines and Technical Basis”: “System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions.”

The drafting team revised the description relating to Figure 3 in the “Guidelines and Technical Basis” to clarify that only the Distribution Provider’s Protection Systems installed to protect for Faults on Transmission System Elements are a part of the Applicability of this standard. The drafting team modified Figure 3 to indicate that the source could be a generator or a network system.

The drafting team modified the text associated with each Figure to identify the Interconnected Elements.

The drafting team modified the process flow chart to be consistent with the requirements.

Unresolved Minority Views

- Several commenters felt that the Transmission Planner, Planning Authority, Transmission Operator and/or Generator Operator should be included because those entities were identified as providing the Protection System Studies and/or system modeling services for the owners. An example response to these comments was as follows: The SDT believes that the owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others.
- Several commenters disagreed with the Distribution Provider being included. The SDT responses indicated that the inclusion of Distribution Providers was appropriate if the Distribution Provider owned Protection Systems that require coordination with other owners for isolating generation and Transmission Faults.
- A few commenters disagreed with the 10% deviation trigger. The drafting team recognizes there are variations of margins used throughout the industry; however, believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.
- A few commenters had concerns with the 30-day time frame in Parts 3.2 and 3.3 while other commenters wanted them eliminated. The drafting team explained that they believed the 30-day time frame is appropriate and declined to make the change.
- Some commenters wanted to remove reference to schedules in the requirements. The drafting team reinforced that they believe the sharing of project schedules is a necessary communication between entities.
- A few commenters expressed concerns that there is redundancy between this draft standard and several FAC standards. The drafting team stated their belief that these concerns were not applicable.
- Several commenters expressed a desire to see the standard drafting team develop and include a conflict resolution process for situations where mutual agreement cannot be reached. The drafting team responded with the following: The drafting team believes that any conflict resolution should be handled through normal company practices. Note that the drafting team changed from agreement to confirm acceptance.
- Some commenters wanted the drafting team to further modify PRC-001-2 by adding a Measure for Requirement R1 or retire the standard. This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, “The drafting team recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to

an existing standard or development of a new standard". Note: PRC-001-1 Requirement 1 never had an associated measure.

- Some commenters expressed concern over the number of time frames associated with the coordination process and the burden of documentation. The drafting team believes the assigned time frames and documentation are appropriate and necessary and declined to make any changes.
- A few commenters wanted time frames to be established for Requirement R1, Part 1.1.3. The drafting team reiterated that there is not a single time frame that would be appropriate for every project and chose not to modify the standard.

Index to Questions, Comments, and Responses

1. The SDT established the following Purpose for this standard: “To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.” Do you agree with this Purpose? If not, please provide specific suggestions for changes to the purpose in the comment area. 18
2. The SDT assigned the Applicability of PRC-027-1 to Transmission Owners, Generator Owners and Distribution Providers that own the Protection Systems applied at the Interconnected Facilities that require coordination for isolating generation and Transmission Faults. Are you aware of other functional entities that should be included in the Applicability? If so, please provide specific suggestions in the comment area and the reason for including those functional entities. 43
3. In Requirement R1, the SDT allowed a responsible entity 36 months to have a documented Protection System Study completed for each Interconnected Facility if the responsible entity does not already have a Protection System Study for that Interconnected Facility performed on or subsequent to June 18, 2007 (the effective date of PRC-001-1). Do you agree with this time frame? If not, please provide specific suggestions for change in the comment area. 59
4. In Requirement R2, the SDT established a +/- 10 % change in an Interconnected Facility’s Fault current value as a criterion for notifying interconnected entities to give the interconnected entity a “heads up” that a review of the existing documented Protection System Study may be warranted. Do you agree with the +/- 10 % Fault current threshold for initiating this review? If not, please provide an alternative means along with a technical justification for determining a threshold. 88
5. In Requirement R3, the SDT included a list of proposed changes that impact the coordination of Protection Systems and would initiate a need to inform other entities. Do you agree that this is an appropriate and inclusive list? If not, please provide specific suggestions for additions or deletions with your reasoning(s) in the comment area. 116
6. In Requirement R4, the SDT required that agreement must be reached prior to implementation of proposed Protection System changes except under the conditions identified in Requirement 3, Part 3.3. Do you agree with this need? If not, please specify reasons in the comment area. 146
7. In Requirement R4, the SDT established a 90 day time frame for responding to a request for agreement with a Protection System Study. Do you agree with this time frame? If not, please provide specific suggestions with your reasoning(s) in the comment area. 165
8. The team included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments? If not, please provide specific suggestions for change. 183

9. If you have any other comments that you have NOT provided in response to the above questions, please provide them here. (Please do not repeat comments that you provided elsewhere.) 196

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The SDT established the following Purpose for this standard: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards." Do you agree with this Purpose? If not, please provide specific suggestions for changes to the purpose in the comment area.**

Summary Consideration:

The responses were equally split between yes and no. Many negative comments related to the inclusion of the phrase '… while meeting the system performance specified within requirements established in other approved NERC Reliability Standards'. Several comments related to the phrase '… remove from service only those Elements ...' due to the fact that some designs include multiple elements within a single protection zone such as bank/bus differential schemes. Suggestions included eliminating 'only' or to add 'as designed'. The Purpose has been modified as follows which addresses the large majority of the negative comments.

Purpose: To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear faults.

Organization	Yes or No	Question 1 Comment
Dominion	No	1. Dominion supports the stated purpose up to the comma. The qualifying language after the comma is ambiguous and not supported in the Requirements of this standard. 2. In the current PRC-001-1 standard the meaning of the term "coordination" has and still is interpreted in two ways. One interpretation is viewed from the technical aspect as "relay coordination" and the second is viewed from an inter-communication aspect as "coordination of information" between entities. The term "coordination" should be removed from the new standard Title and Purpose. a. Recommend changing **Title** to: <u>"Protection System Interconnected Facility Performance During Faults".</u> Also, recommended is to change the **Purpose** to read<u>: "To communicate and exchange Protection</u>

Organization	Yes or No	Question 1 Comment
		System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those Elements required to isolate Faults." In PRC- 027-1, use the term coordination only when referring to the technical aspects of the relay coordination within a Requirement when applicable. b. Under **Purpose**, delete: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet 'the system performance specified within requirements established in other approved NERC Reliability Standards' and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1.
Response: Thank you for your comment. **Based on yours and others comments, the drafting team removed the phrase: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."** **a. The drafting team agrees that the use of the term "coordination" in PRC-001 did result in multiple meanings and potential confusion. The drafting team believes the use of "coordination" in this standard clearly relates to the technical aspects of relay coordination and respectfully declines to make the suggested changes.** **b. Based on yours and others comments, the drafting team removed the phrase: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."**		
Southwest Power Pool NERC Reliability Standards Development Team	No	We would ask that the team revise the second part of the purpose to lead in with "In accordance with the system performance specified within requirements established in other approved NERC Reliability Standards" If

Organization	Yes or No	Question 1 Comment
		left as is it reads like you are required to do both the first and second parts of the purpose. This proposed language requires the initial goal of this standard and references that it will do so under the system performance specified in NERC standards.
Response: Thank you for your comment. **Based on yours and others comments, the drafting team removed the phrase: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."**		
Pepco Holdings Inc. & Affiliates	No	1) The language in the Statement of Purpose needs to be reworded. The phrase "remove from service only those elements required to isolate faults" may restrict certain protection practices in widespread use today, where coordination on tapped distribution facilities is achieved via auto-reclosing rather than via coordinated time delays. For example, a BES line (protected by a high speed DCB or POTT pilot scheme) is tapped by a distribution provider as demonstrated in Figure 3 of the Application Guidelines. Very often for distribution taps like these, rather than requiring the distribution provider to establish a costly transmission class pilot scheme terminal at breaker C with communication links to A & B, it is common to let the pilot scheme reach into (but not thru) the transformer at C. For faults in the transformer the high speed transformer relays will operate to trip and lockout breaker C. However, the pilot scheme at A & B will also trip simultaneously. Breaker C will lockout and A & B will auto-reclose to restore the line. Coordination is achieved via auto-reclosing. For faults on the line, A & B will trip via the pilot scheme, and if generation happens to be running either C will trip, or the generator will trip depending on scheme design. Reclosing at A & B would be delayed and / or voltage supervised to ensure generation has been removed prior to auto-reclosing. In the above scenarios since the line tripped for a fault in the transformer, or the generator tripped for a

Organization	Yes or No	Question 1 Comment
		fault on the line, it would violate the requirement to "remove from service only those elements required to isolate faults". The language used in the proposed definition of Protection System Study is slightly better, using the phrase "demonstrates ... Protection Systems operate in the desired sequence for clearing faults". 2) The problem here is who determines what is the "desired sequence"? Would a scheme, which is purposely designed as described above and acknowledged by the Transmission Planner and Transmission Operator, be considered to operate in the "desired sequence" for clearing faults? 3) The language in the standard needs to be re-visited to enable these types of protection interfaces with distribution providers having limited generation resources connected downstream. Also, if system reliability was truly an issue for this example, the interconnection should not have been a simple tap on the line, but rather a ring bus should have been established at the interconnection point.

Response: Thank you for your comment.

1. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The Purpose states the reason for the standard and is the basis for everything else in the standard, but the Purpose is not a requirement and is not mandatory or enforceable. The individual requirements support the goal or Purpose of the standard.**
2. **Determining the "desired sequence" is the purpose of the Protection System Study agreed to by all parties involved.**
3. **The drafting team believes Distribution Providers that own Protection Systems installed for the primary function of detecting Faults on BES Elements should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners. To add clarity to this issue, the drafting team revised Applicability Section 4.2 as follows: Protection Systems installed at Interconnected Stations for the primary function of detecting Faults on BES Elements. Additionally, the drafting team changed the term "Interconnected Facilities" to Interconnected Elements" defined as follows: "An Element that electrically joins separate Functional Entities, including**

Organization	Yes or No	Question 1 Comment
those Functional Entities that are a part of the same Registered Entity".		
Hydro One	No	1. The goal of this standard is to address co-ordination of protection systems between neighboring entities. To achieve this goal, the efforts should focus on the co-ordination of protections between entities as outlined and described in the NERC SPCS paper "Power Plant and Transmission System Protection Co-ordination - Technical Reference Document (TRD)," dated July 2010. This standard should include the review/study of all protections requiring coordination not the ones dealing with faults only as identified in the above TRD. There should be one comprehensive study/report not spread out into 7-8 standards. If so, there are still protection elements that require coordination that have not been addressed such as: open-phase, loss-of-field, over-excitation, out-of-step, and negative sequence normal unbalance, etc. We don't see how a standard for Protection system co-ordination can rely on other standards to achieve the goal of co-coordinating protections for both Faults and other conditions that challenge co-ordination. 2. The Purpose should be: "To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate from abnormal system conditions, while meeting the system performance specified within requirements established in NERC TPL Reliability Standards."If the above suggestions are not taken into consideration and the SDT decides to keep the requirements in the current form, the statement"...while meeting the system performance specified within requirements established in other approved NERC Reliability Standards." should be changed to include exact reference to standards or at least group of standards the SDT is referring to.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. 1. **As noted in the Background information section, the drafting team believes that other aspects of coordination are or should be covered by other standards and it is appropriate for this standard to be limited to the stated Purpose.** 2. **Based on yours and others comments, the drafting team removed the phrase: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."**		
Imperial Irrigation District (IID)	No	The SDT proposed Purpose is confusing. IID proposes the following Purpose language: "To coordinate Protection Systems for Interconnected Facilities, such that during faults, those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."
Response: Thank you for your comment. **The drafting team does not see the confusion in the present language and respectfully declines to make the suggested change. The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults".**		
Bonneville Power Administration	No	The purpose of PRC-001-1 was "To ensure system protection is coordinated among operating entities." With the rewrite of PRC-001 to PRC-027, the standard drafting team has expanded the purpose to specify that only elements required to isolate faults are removed from service and that system performance established in other NERC standards is met. The two additions to the purpose of PRC-027 should be removed for the reasons described below. 1) The statement in the purpose, "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards", only serves to unnecessarily complicate the purpose statement. BPA recognizes that the NERC standard does not

Organization	Yes or No	Question 1 Comment
		void the requirements of other NERC standards; therefore, there is no need to state in the purpose that other NERC standards must be met. 2) The statement in the purpose, “such that those Protection Systems remove from service only those Elements required to isolate faults”, drastically expands the scope of PRC-027 over PRC-001. With this new purpose, BPA believes this puts NERC in the position of micromanaging how protection systems are applied. Although most protection schemes are intended to remove only the faulted element, it is not necessarily a problem if additional elements are removed, and there might even be reasons to remove additional elements. In some cases it might be significantly less expensive to design a scheme that allows the removal of additional elements. Protection engineers need to have the flexibility to apply protection schemes that meet the requirements of the project at hand. Creating standards with absolute requirements on how protection schemes are applied and set will eliminate the flexibility necessary to implement effective and efficient protection schemes. The Standard Drafting Team (SDT) does not have the ability to foresee all possible protection scenarios, and to create a standard whose purpose is to remove from service only those elements required to isolate faults will create unnecessary expense and difficulty. BPA strongly recommends that the statement “such that those Protection Systems remove from service only those Elements required to isolate faults” be removed from the purpose and that the standard be modified to eliminate this requirement.
Response: Thank you for your comment. **1. Based on yours and others comments, the drafting team removed the phrase: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.”** **2. The drafting team modified the Purpose, it now reads: “To coordinate Protection Systems for Interconnected Elements, such**		

Organization	Yes or No	Question 1 Comment
that the least number of power system Elements are isolated to clear Faults". The Purpose states the reason for the standard and is the basis for everything else in the standard, but the Purpose is not a requirement and is not mandatory or enforceable. The individual requirements support the goal or Purpose of the standard.		
FirstEnergy	No	We do not believe the phrase "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" is needed and may be confusing to the reader.
Response: Thank you for your comment. **Based on yours and others comments, the drafting team removed the phrase: "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards."**		
Santee Cooper	No	It would probably be good to avoid using the term "coordination" as it can be considered as having two meanings, either the "coordinating" of the exchange of the data or the "coordinating" of the actual protective devices. Coordination should be taken out of the title and the purpose. "To Coordinate Protection Systems" could be changed to "To communicate and exchange Protective System data..." in the Purpose. The title could be changed to "Protection System Interconnected Facility Performance during faults"
Response: Thank you for your comment. **The drafting team agrees that the use of the term 'coordination' in PRC-001 did result in multiple meanings and potential confusion. The drafting team believes that the use of the term in this standard is clear and has not removed the term from the Title nor Purpose.**		
Detroit Edison	No	It is suggested that ". . . the system performance specified within requirements established in other approved NERC Reliability Standards" be specified so that what needs to be met is clear.
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		

Organization	Yes or No	Question 1 Comment
Western Small Entity Comment Group	No	The language "...remove from service only those Elements required to isolate Faults..." is problematic. Taken literally; only the faulted Element may be isolated, and any adjoining buswork or lines (separate Elements) must remain energized; even the result is no change in the loss of load or capacity. We suggest ""To coordinate existing Protection Systems..." to ensure that this is not interpreted as a construction standard requiring additional Protection Systems.
Response: Thank you for your comment. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The Purpose states the reason for the standard and is the basis for everything else in the standard, but the Purpose is not a requirement and is not mandatory or enforceable. The individual requirements support the goal or Purpose of the standard.**		
PPL Corporation NERC Registered Affiliates	No	PRC-027 appears to have been written exclusively for vertically integrated power companies, and there is no justification for making the proposed standard applicable to independent GOs. The only role an independent GO fulfills in isolating faults is to trip the breaker if the generator or GSU has a problem; everything involving sequencing is in the Transmission Owner's (TOs) or Distribution Providers (DPs) system. Independent GOs are owned by separate legal entities than the applicable TO or Distribution Provider [DP] to which they are interconnected. Such GOs do not have the capability to perform the type of TO/DP system studies that appear to be contemplated by the SDT. The actions required of independent GOs should be to perform Protection System maintenance and supply data to other applicable entities, per existing standards PRC-005-1 and PRC-001-1.1, respectively.
Response: Thank you for your comment. **The drafting team believes that the Owner of the Protection System is responsible for ensuring its Protection Systems are coordinated with others. It is acknowledged that in many cases, the majority of the work associated with this task will fall on**		

Organization	Yes or No	Question 1 Comment
the Transmission Owner; however, the coordination of some Protection Systems owned by Generator Owners installed for the purpose of detecting Faults on Interconnected Elements of the BES should be included.		
SERC Protection and Control Subcommittee	No	a) Recommend under Purpose, deleting: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003R1.3.7 already requires the entity to “demonstrate that system performance meets its Table 1 for Category C contingencies” (TPL-001, -002 have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1. b) The term “coordination” should be removed from the new standard Title and Purpose. Recommend changing Title to “Protection System Interconnected Facility Performance during Faults”. Also recommended is to change the Purpose to read “To communicate and exchange Protection System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those Elements required to isolate Faults.” In PRC 027, using the term coordination should only be referenced when referring to the technical aspects of the relay coordination within a requirement when applicable. (In the current PRC 001 standard the meaning of the term “coordination” has, and still is, interpreted in two ways. One interpretation is viewed from the technical aspect as “relay coordination” and the second is viewed from an inter-communication aspect as “coordination of information” between

Organization	Yes or No	Question 1 Comment
		entities).
Response: Thank you for your comment. a. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".** b. **The drafting team agrees that the use of the term 'coordination' in PRC-001 did result in multiple meanings and potential confusion. The SDT believes that the use of the term in this standard is clear and has not removed the term from the Title nor Purpose.**		
ISO RTO Council SRC	No	Is the intent of the coordination that is expected limited only to those protection systems related to intertie facilities between facilities owners? Or is the intent of the proposed standard to require coordination of protection systems to take into account outage and/or operating conditions between facilities owners beyond the immediate intertie facilities? In other words is this coordination requirement expected to be applied to relays that may not be directly involved in protection of intertie equipment?
Response: Thank you for your comment. **The intent of this standard is focused on those Protection Systems directly associated with the Facility Interconnections. However, as noted in R.3.1 it is recognized that there may be changes or additions either at an existing or new Facility associated with the Interconnected Element, or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).**		
Tennessee Valley Authority	No	a) The term "coordination" should be removed from the new standard Title and Purpose. Recommend changing Title to: "Interconnected Facility Protection System Performance During Faults". Also recommend changing the Purpose to read: "To communicate and exchange Protection System Studies for Interconnected Facilities such that the Protection Systems can be properly coordinated to remove from service only those elements required

Organization	Yes or No	Question 1 Comment
		to isolate faults." b) Recommend under Purpose, deleting: “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” as it is superfluous and could cause duplicative or conflicting work. The purpose without this clause is clear, concise, and consistent with the rest of the 1st draft of this standard. The resulting coordinated Protection System must meet ‘the system performance specified within requirements established in other approved NERC Reliability Standards’ and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003 R1.3.7 already requires the entity to “demonstrate that System performance meets its Table 1 for Category C contingencies” (TPL-001, -002 have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1. c) In PRC 027, the term "coordination" should only be referenced when referring to the technical aspects of the relay coordination within a Requirement when applicable. (In the current PRC 001 standard the meaning of the term “coordination” has and still is interpreted in two ways. One interpretation is viewed from the technical aspect as “relay coordination” and the second is viewed from an inter-communication aspect as “coordination of information” between entities).

Response: Thank you for your comment.

a. **The drafting team agrees that the use of the term ‘coordination’ in PRC-001 did result in multiple meanings and potential confusion. The drafting team believes that the use of the term in this standard is clear and has not removed the term from the Title nor Purpose.**

b. **Based on all the comments received, the drafting team has removed the phrase “…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards”.**

Organization	Yes or No	Question 1 Comment
Associated Electric Cooperative, Inc., JRO00088	No	See comments posted by SERC PCS
Response: See response to SERC Protection and Control Subcommittee.		
ACES Power Marketing Standards Collaborators	No	Please strike "while meeting the system performance specified within requirements established in other approved NERC reliability standards." It provides no additional explanation for the purpose and these "other approved NERC reliability standards" apply regardless of this standard. In generally, it is not necessary to reference other NERC standards within a standard and, in fact, should be avoided as a standard should stand alone.
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		
Kansas City Power & Light	No	1. The reliability objective of this standard should be to insure that there is an agreement between two interconnected entities of relay protection schemes and relay protection settings for the interconnected facilities. This is achieved if there is documentation stating that the Interconnected operating companies have reached agreement on protection schemes and protective relay settings. This standard should only require documentation that neighboring owners are talking and agreeing with one another in relation to protection and control. 2. The present purpose makes it appear that you are in violation of the standard any time the system has a misoperation because of relay setting regardless of whether both parties have agreed on the settings used but the measures tend to measure agreement with the other entity. This is the reason that the present purpose needs to be

Organization	Yes or No	Question 1 Comment
		rewritten the auditors may interpret the purpose to indicate any misoperation due to setting issues is a violation.
Response: Thank you for your comment. 1. **The drafting team believes the standard does exactly what you stated. The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The Purpose states the reason for the standard and is the basis for everything else in the standard, but the Purpose is not a requirement and is not mandatory or enforceable. The individual requirements support the goal or Purpose of the standard.** 2. **The drafting team disagrees with the misoperation issue you describe. Misoperations can occur even when Protection Systems are fully coordinated and agreed upon.**		
Southern Company	No	1) Reference the 'required to isolate Faults '. In some cases the design of the protection system may take more Elements out than the faulted element, such as a transformer differential that trips a transmission bus and then opens a HS Bank disconnect. For this reason we would prefer the term 'as designed' be used. 2) We feel that it is important to identify the Protection Systems that are to be evaluated; perhaps a clear reference to the NERC Technical reference document?
Response: Thank you for your comment. 1. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults".** 2. **The Protection Systems that must be evaluated are those that are identified in the Applicability section of this standard.**		
Western Area Power Administration	No	Don't necessarily agree with the statement: "Protection Systems remove from service only those Elements required to isolate Faults..." This statement can be problematic since backup functions such as remote

Organization	Yes or No	Question 1 Comment
		Zone 3 distance elements cannot be overlapped reliably yet are necessary for N-2 and beyond contingencies. Also, in some case it may be desirable to allow for intentional overlap or mis-coordination depending on the circumstances. These issues need to be resolved in the proposed standard or the standard eliminated.
Response: Thank you for your comments. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults".**		
Independent Electricity System Operator	No	We agree with the first part of the purpose statement, but do not find it necessary to include the second part since "meeting the system performance specified within requirements established in other approved NERC Reliability Standards" is universally true for all standards. No one single standard can assure reliability on its own; multiple standards must be complied with to meet one or more reliability objectives and performance targets. We suggest to remove the part "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		
American Electric Power	No	AEP recommends the removal of the language, "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards". AEP recommends as an alternative to the removal of the language, modification of the language to reference the TOP standards that should be adhered to in conjunction with PRC-027.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		
Texas Reliability Entity	No	We support this reliability objective, but feel that it may fall short of fulfilling all of the required Protection System coordination needs, resulting in a gap in the Standards. The major issue that we see in Protection System coordination is with coordination studies conducted WITHIN an individual entity, not between two or more entities. Using the Misoperation data as an indication, for CY2011, out of 202 total Misoperations in the ERCOT region, 46% were due to "Incorrect settings/logic design", however, less than 2% of the Misoperations occurred on Interconnected Facilities between different entities. This suggests the main problem with Protection System coordination is internal to an entity, not between two different entities. This Standard, as well as PRC-001, are somewhat silent as to what internal coordination should be considered "Good Utility Practice", even though there have been instances where internal coordination was not done.
Response: Thank you for your comment. **The previous PRC-001 only applied to coordination between TOPs, GOPs and BAs. The drafting team has chosen not to include internal facilities for two main reasons: the extreme documentation burden that would be involved for minimal benefit as most of this work is done by the same organization, and the drafting team believes that the entities' internal facilities are completely in their control and are the responsibility of the entity. Failure to properly design and implement internal Protection Systems would be an internal lack of procedures and/or a human performance issue which are both outside the scope of this standard. Additionally, PRC-004 requires that entities have corrective actions plans for identified Misoperations which would prevent similar Misoperations.**		
LCRA Transmission Services Corporation	No	Reword the Purpose to state as follows: "To allow for the coordination of Protection Systems at Interconnected Facilities to prevent equipment damage while maintaining proper selectivity during Faults." This phrasing is

Organization	Yes or No	Question 1 Comment
		more consistent with NERC Reliability Standard language where adherence with other reliability standards is not explicitly stated.
Response: Thank you for your comment. **The drafting team believes that restricting the purpose to "preventing equipment damage" does not meet the intended reliability objective.**		
Exelon	No	1. The current Purpose for PRC-027-1 should more clearly and concisely state the purpose of the standard by relating the purpose of the standard to the definition of Protection System Study (the key element of the proposed PRC-027). 2. The statement, "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards", is likely to be subject to interpretation by registered entities and auditors alike and cause confusion. The specific Standards should be referenced in a footnote, or the reference should be removed. [For the purposes of this comment and the suggested revision, Exelon removed the reference since we believe this is the best option].Exelon suggests the following revised Purpose "To ensure Protection Systems at Interconnected Facilities operate in the desired sequence to isolate a fault." In our experience, the term "coordinate" (or "coordination") caused confusion in PRC-001-1 and therefore Exelon proposes that the term be omitted. 3. In PRC-001-1, the term "coordination" was unofficially accepted as either the correspondence or communication between entities (i.e., via email, memo, fax, etc.), or as the time response relationship associated with backup protection elements. Thus, to avoid this confusion and to match to the proposed Protection System Study definition, Exelon removed it from our suggested Purpose statement above. If the SDT believes that the term "coordination" should

Organization	Yes or No	Question 1 Comment
		remain, it should be clearly defined. Given the Protection System Study definition, a suggested definition for coordination would be "operation of Protection Systems in the desired sequence to isolate a fault".
Response: Thank you for your comment. 1. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The drafting team believes that the Purpose does not need to address its relation to the Protection System Study in order to accurately reflect the goal of the standard.** 2. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".** 3. **The drafting team agrees that the use of the term "coordination" in PRC-001 did result in multiple meanings and potential confusion. The drafting team believes that the use of the term in this standard is clear and has not removed the term from the Title nor Purpose.**		
Ameren	No	We recommend that the SDT delete the last part of the purpose "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" as it is superfluous and could cause duplicative or conflicting work. The Purpose without this clause is clear, concise, and consistent with rest of the 1st draft of this standard. The resulting coordinated Protection System must meet 'the system performance specified within requirements established in other approved NERC Reliability Standards' and is addressed when the entity complies with those standards. A Compliance Enforcement Entity (CEA) could interpret this clause to require the entity to repeat such work in a Protection System Study within PRC-027-1. For example, TPL-003 R1.3.7 already requires the entity to "demonstrate that System performance meets its Table 1 for Category C contingencies" (TPL-001, -002 also have similar requirements). Entities perform such work for TPL, and need not repeat it for PRC-027-1.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		
Georgia Transmission Corporation	No	The title should state the same as the purpose. Example: "Protection System Coordination of Interconnected Facilities". The purpose is to make each entity communicate protection system and/or facility changes in order to make coordination changes as needed.
Response: Thank you for your comment. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The drafting team believes the Title and Purpose, as separate components of the standard, are not obligated to be the same.**		
Dairyland Power Cooperative	No	The NERC Protection System definition includes more elements than would need to be coordinated at interconnecting facilities (e.g. batteries, chargers). Please consider revising to include only the protection elements that would need to be coordinated to remove Elements from service to isolate Faults.
Response: Thank you for your comment. **The drafting team modified the Purpose, it now reads: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults". The drafting team does not see that specific Protection System elements referenced (Batteries and chargers) would be considered in doing a Protection System Study; therefore, your suggested changes have not been made.**		
NPPD	No	Suggestion: Remove "while meeting the system performance specified within requirements established in other approved NERC Reliability Standards" since there are other standards that are or will be in place otherwise it sounds like the other standards must have evidence included

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 1 Comment</th></tr>
<tr><td></td><td></td><td>for this standard documentation as well. Perhaps this standard is not required if the other performance standards are adhered to or have portions of this draft standard included in them.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.
Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".</td></tr>
<tr><td>Utility Services</td><td>No</td><td>The purpose should specifically state whether or not this standard applies to BES Elements or all Elements. In consideration of other PRC reliability standards, this standard uses language that implies applicability to all Elements. Under the NERC Standard Development Process, standards are only to be applied to BES equipment, unless the applicability language specifically states a broader application. This standard implies it but does not specifically state it. The standard should be modified to clear up any confusion.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.
The definition of Interconnect Facilities has been modified as follows: Interconnected Elements: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity". The Applicability section has been modified as follows: Facilities: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements".</td></tr>
<tr><td>Trans Bay Cable</td><td>No</td><td>The language "...remove from service only those Elements required to isolate Faults..." is problematic. Taken literally; only the faulted Element may be isolated, and any adjoining buswork or lines (separate Elements) must remain energized; even the result is no change in the loss of load or capacity. We suggest ""To coordinate existing Protection Systems..." to ensure that this is not interpreted as a construction standard requiring additional Protection Systems.</td></tr>

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comment. **The drafting team modified the Purpose, it now reads: “To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults”.**		
Oncor Electric Delivery Company LLC	No	Oncor takes the position that the word "only" in the Purpose is too subjective and allows for multiple interpretations. Oncor believes that in order to provide clarity, Oncor suggest that the Purpose be modified as follows:"To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.
Response: Thank you for your comment. **The drafting team modified the Purpose, it now reads: “To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults”.**		
TransAlta Centralia Generation LLC	No	The Interconnected Facilities definition is not clear.
Response: Thank you for your comment. **The term “Interconnected Facilities” has been changed to “Interconnected Element” and reads as follows: “An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity”. More details related to why it is not clear are needed prior to addressing your comment.**		
ExxonMobil Research & Engineering	No	
MRO NSRF	Yes	The last part of the purpose, “while meeting the system performance specified within requirements established in other approved NERC Reliability Standards” is vague and open-ended. The NSRF recommends that the SDT refer to the TPL standards if the intent is to limit responsibility for correct

Organization	Yes or No	Question 1 Comment
		coordination to studied system contingencies
Response: Thank you for your comment. **Based on all the comments received, the drafting team has removed the phrase "…while meeting the system performance specified within requirements established in other approved NERC Reliability Standards".**		
Colorado Springs Utilities	Yes	There are cases of weak system interconnected facilities where proper coordination may not be achievable economically, except by severing the interconnect. Allowances should be made for these cases to prevent the severing of weak systems to meet this standard.
Response: Thank you for your comment. **The drafting team does not understand the scenario that is described. If this occurs in circumstances not accounted for in normal Protection System Studies, such as n-2 and above situations, it is not an issue.**		
Sacramento Municipal Utility District	Yes	We agree with the purpose of the standard. We disagree with the execution of this purpose. This standard only addresses a very narrow reliability issue. Does the SDT really believe that this narrow concern needs all the documentation called for in the standard? At a minimum, a Protection System Study, proof that you checked for a +/- 10% Fault current change regularly, and proof that you have communicated with other registered entities on these issues? And this will be for every interconnection. We believes this is regulatory overkill and not indicative of a results based standard.
Response: Thank you for your comment. **The drafting team believes the documentation identified in the requirements is necessary to support the purpose.**		
Public Utility District No. 1 of Snohomish County	Yes	1. We agree with the purpose of the standard. We disagree with the execution of this purpose. This standard only addresses a very

Organization	Yes or No	Question 1 Comment
		narrow reliability issue. Does the SDT really believe that this narrow concern needs all the documentation called for in the standard? At a minimum, a Protection System Study, proof that you checked for a +/- 10% Fault current change regularly, and proof that you have communicated with other registered entities on these issues? And this will be for every interconnection. We believes this is regulatory overkill and not indicative of a results based standard.
Response: Thank you for your comment. **The drafting team believes the documentation identified in the requirements is necessary to support the purpose.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	Yes	Ingleside Cogeneration LP agrees that PRC-027-1 should be tightly focused on Fault isolation only. There are other PRC standards which govern the coordination of UFLS, SPS, phase-distance, and other relay types.
Response: Thank you for your support.

2. **The SDT assigned the Applicability of PRC-027-1 to Transmission Owners, Generator Owners and Distribution Providers that own the Protection Systems applied at the Interconnected Facilities that require coordination for isolating generation and Transmission Faults. Are you aware of other functional entities that should be included in the Applicability? If so, please provide specific suggestions in the comment area and the reason for including those functional entities.**

Summary Consideration:

A large majority of the commenters did not identify any additional entities that should be added to the Applicability.

Various commenters felt that the Transmission Planner, Planning Authority, Transmission Operator and/or Generator Operator should be included. The basis for these requests was the fact that in some cases those entities were identified as providing the Protection System Studies and/or system modeling services for the Owners. An example response to these comments was as follows: The drafting team believes that the Owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others.

Several commenters disagreed with the Distribution Provider being included. The drafting team responses indicated that the inclusion of Distribution Providers was appropriate. The drafting team responded that they believe the Distribution Providers that own "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements" should be included in the Applicability of this standard because those Protection Systems must be coordinated with the Protection Systems of other Facility owners.

A few commenters asked for clarification as to whether the standard applied to entities that had multiple registrations (i.e. as a TO and GO). An example response to these questions was as follows: If Entity A is registered as a Transmission Owner and a Generator Owner then all aspects of this standard would apply to the Interconnected Facilities between Entity A- Transmission Owner and Entity A-Generator Owner. The drafting team will review the language in order to ensure clarity related to this.

The Applicability was slightly modified as a result of these comments and others as follows: 4.2 Facilities: Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.

Organization	Yes or No	Question 2 Comment
FirstEnergy	No	However, it should be clear the DP facilities in scope are only those associated with potentially impacting a BES facility.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. **The drafting team believes Distribution Providers that own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners.** **To add clarity to this issue, the drafting team revised Applicability Section 4.2 as follows: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements". Additionally, the drafting team changed the term "Interconnected Facilities" to "Interconnected Element" defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity".**		
Northeast Power Coordinating Council	No	From a reliability perspective, the Applicability Section of PRC-027-1 should not include the Distribution Provider because the TO is responsible of coordination of the protection with the DP.
Response: Thank you for your comment. **The drafting team believes that the owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others. It is acknowledged that some cases the scenario described may exist; however, if the Transmission Owner is providing such a service it would be by agreement, and does not change the fact the Distribution Provider has the responsibility.**		
MRO NSRF	No	The standard includes the definition of Interconnected Facilities as BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities. It is unclear how the requirements of the standard would apply if a registered entity would fulfill more than one functional entity role. For example if a registered entity was both a Generator Owner and Transmission Owner would the requirements of the standard apply to the interconnection of the generator and transmission facilities? It is recommended that the standard be modified to provide clarity for this situation.
Response: Thank you for your comment.		

Organization	Yes or No	Question 2 Comment
The drafting team's intent is that if Entity A is registered as a Transmission Owner and a Generator Owner then all aspects of this standard would apply to the Interconnected Facilities between Entity A- Transmission Owner and Entity A- Generator Owner. **Additionally, the drafting team changed the term "Interconnected Facilities" to Interconnected Element" defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity".**		
PPL Corporation NERC Registered Affiliates	No	Applicability to GOs should be limited as stated above in question #1.
Response: Thank you for your comment. **As noted in the response to #1: The drafting team believes that the Owner of the Protection System is responsible for ensuring its Protection Systems are coordinated with others. It is acknowledged that in many cases, the majority of the work associated with this task will fall on the Transmission Owner; however, the coordination of some Protection Systems owned by Generator Owners installed for the purpose of detecting Faults on Interconnected Elements of the BES should be included.**		
Colorado Springs Utilities	No	The wording of the text suggests that Interconnected Facilities include coordination and documentation of Transmission to Distribution interfaces. Since these are usually contained in different functional or corporate entities it suggests much more documentation, and needs clarified.
Response: Thank you for your comment. **The only Transmission to Distribution interfaces included in this standard are those where the Distribution Providers own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES. Consequently, these facilities are the only ones that would require documentation.**		
Tennessee Valley Authority	No	In some instances end-use customers, such as a large industrial load, take service delivery through an Interconnected Facility. It is not clear that the draft standard covers coordination between a TO and an end-use customer (not registered as a TO, GO or DP) who takes service via a BES Interconnected Facility.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. **The drafting team changed the term "Interconnected Facilities" to Interconnected Element" defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity". The standard only applies to Interconnected Element(s) between registered Transmission Owners, Generator Owners, and Distribution Providers. . To add clarity to this issue, the drafting team revised Applicability Section 4.2 as follows: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements".**		
Kansas City Power & Light	No	1. The applicability should also include Transmission Operators and Generator Operators as it is possible for jointly held facilities to be owned by several parties and operated by another party and relay protection responsibilities could be with the Operator of the facility. 2. It should be clarified the proposed Standard is applicable to Distribution Providers that provide protection for BES Elements.
Response: Thank you for your comment. **1. The drafting team believes that the Owner of the facility is responsible for ensuring that its Protection Systems are coordinated with others. It is acknowledged that in some cases the scenario described may exist; however, if the TOP or GOP is providing such a service it would be by agreement with the Owner, and does not change the fact the Owner has the responsibility.** **2. To add clarity to this issue, the drafting team revised Applicability Section 4.2 as follows: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements". Additionally, the drafting team changed the term "Interconnected Facilities" to "Interconnected Element" defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity".**		
LCRA Transmission Services Corporation	No	We agree that applicability of the overall standard should be limited to the Transmission Owners, Generator Owners and Distribution Providers; however, requirements for conducting the Protection System Coordination Study should only

Organization	Yes or No	Question 2 Comment
		apply to the Transmission Owners, Generator Owners and Distribution Providers that have ownership of the protective relay portion of the Protection System. Requirement R1 should read as follows:"Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System that owns a Protection System shall:"
Response: Thank you for your comment. **The drafting team believes that the Applicability section addresses this. Typically the protective relay may be the only component of the Protection System that requires review; however, that is not always the case.**		
Tri-State G & T	No	We agree with this description and the entities, however the standard's applicability is not written as described in the question. We think that "that require coordination for isolating generation and Transmission Faults" should be added to Section 4.2, Facility Applicability.
Response: Thank you for your comment. **Based on yours and others comments, the drafting team modified the Applicability section 4.2 Facilities as follows: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements".**		
Wisconsin Electric Power Company	No	The previous version, we think correctly, did not include DP's in the applicability. Since the revised definition of the BES is currently awaiting FERC approval, the applicability of this standard to the Distribution Provider function is not appropriate. The relevant entities should be limited to TO and GO only.
Response: Thank you for your comment. **The drafting team believes Distribution Providers that own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners.**		

Organization	Yes or No	Question 2 Comment
Dairyland Power Cooperative	No	It is unclear how the requirements of this standard apply to entities that fulfill multiple functional roles. For example, an entity is registered as both a Generator Owner and Transmission Owner. In the case where a GO and TO are the same entity is it required to show the same type of coordination?
Response: Thank you for your comment. **Yes. The drafting team's intent is that if Entity A is registered as a Transmission Owner and a Generator Owner then all aspects of this standard would apply to the Interconnected Element(s) between Entity A- Transmission Owner and Entity A- Generator Owner.**		
American Transmission Company	No	ATC is not aware of additional functional entities that should be included.
Response: Thank you for your support.		
NPPD	No	1. This applicability needs clarification. How does this standard relate to the definition of BES? 2. Does including Distribution Providers mean an entity that does not own a transmission protection system is included under this standard? 3. There needs to be clear understanding that radial feeds on load serving transformers such as 115/69kV or 115/34.5kV transformers and low voltage feeders are not included in this standard. 4. Perhaps NERC needs a program to evaluate/identify all functional entities and determine if they should be registered and thus applicable and not have utilities try to determine the status of other utilities or functional entities. 5. Clarify if the Transmission and Generator owner are the same utility how sharing of information is documented or confirm that this relationship means the documentation is not applicable in this standard.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. **1. The drafting team revised the Applicability of this Standard to provide more clarity, it now reads: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements"** **2. No. The drafting team believes Distribution Providers that do not own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES are not included in the Applicability of this standard.** **3. As noted in the revised Applicability section, only Facilities that have "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements" are subject to the requirements of this Standard. In general, radial feeds on load serving transformers such as 115/69kV or 115/34.5kV transformers and low voltage feeders do not have such Protection Systems applied. Please see Figure 4 in the Application Guidelines section of the draft standard PRC-027-1.** **4. This subject is outside the scope of this drafting team; however, your comment will be forwarded to NERC staff.** **5. How to meet the documentation requirements would be up to the entity to determine. The drafting team's intent is that if Entity A is registered as a Transmission Owner and a Generator Owner then all aspects of this standard would apply to the Interconnected Element(s) between Entity A- Transmission Owner and Entity A- Generator Owner.**		
Utility Services	No	However, using the broad term "Protection Systems", this SDT is broadening the scope of the standard beyond the BES. Due to the recent direction in Project 2007-17 for PRC-005-2, Protection Systems has been expanded to include systems beyond the definition of the BES. This project should limit the applicability for the DP to "transmission Protection Systems" as identified in PRC-004 and 005-1.
Response: Thank you for your comment. **The drafting team revised the Applicability of this Standard to address your and others' comments, it now reads: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements".**		
CenterPoint Energy	No	The proposed term for Interconnected Facilities, shown on page 2 of 27 of PRC-027-1

Organization	Yes or No	Question 2 Comment
		Draft #1, is defined as “BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities.” CenterPoint Energy believes Interconnected Facilities should be defined in reference to NERC registration and recommends changing the definition to “BES Facilities that are electrically joined by one or more Element(s) and are owned by different registered entities.”
Response: Thank you for your comment. **The drafting team considered this option; however, the drafting team felt that ‘registered entities’ would potentially mislead some entities that have different functional registrations, to think that the Standard does not apply to them. The term Interconnected Facilities has been changed to Interconnected Element as follows: “An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity”.**

Hydro One	Yes	1. This is related to our comments from Question 1. We believe that the Planning Coordinators (PC) shall be included. PCs are accountable to conduct studies to determine critical clearing times, stable and unstable power swings, etc., to determine coordination. Transmission and Generator Owners do not have access to such information or the

Organization	Yes or No	Question 2 Comment
		tools/experience to conduct such studies. In addition to this there is a possibility that the entity in charge of day-to-day operation of the Interconnection Facilities (likely registered as TOP only) doesn't own the facility and consequently is not registered as a TO. In this case, such facility or the facilities would be out of scope of this standard. We believe that the SDT should refine the Applicability section to encompass the above mentioned cases. 2. From a reliability point of view, we think that this standard should not be applicable to Distribution Providers because the TO is mostly responsible of coordination of the protection with the DP.
Response: Thank you for your comment. **1. The drafting team believes that the Owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others. It is acknowledged that some cases the scenario described may exist; however, if PC is providing such a service it would be by agreement with the Owner, and does not change the fact the Owner has the responsibility.** **2. The drafting team believes Distribution Providers that own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners.**		
ISO RTO Council SRC	Yes	Depending on the intent of the requirements as questioned in the comment to question #1, it may be necessary to include planners to provide data for contingent and varying operating conditions to coordinate relays beyond those dedicated to intertie facilities.
Response: Thank you for your comment. **The drafting team believes that the Owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others. It is acknowledged that some cases the scenario described may exist; however, the fact that the planners may be providing some data necessary to complete the evaluation it does not warrant including them in the Applicability.**		

Organization	Yes or No	Question 2 Comment
GP Strategies	Yes	1. We agree that there should be a process for ensuring that the industry continuously evaluates the system and ensures that the relay settings are coordinated and adjusted to meet the dynamically changing grid. However, we disagree that the studies should be conducted by the owners of the facilities. We feel these studied should be conducted by the Transmission Planner or Planning Authority and the cost of the studies should be allocated equally to all users of the grid. Currently, a study is performed when a new facility is added or an existing facility is modified. Typically, the study is conducted by the Transmission Planner as identified in FAC-002 and paid for by the facility that is being modified or is being added. It makes since that these facilities pay for the studies as they are the ones modifying the overall grid and benefit from the modification. In this case the cost should not be barred by an existing facility. 2. The drafting team states that an owner should perform a study when the fault current changes by 10% or greater at their Interconnected Facility. The team may not have taken into account the potential that these changes are not related to that particular facility but rather from a change in the overall dynamics of the grid. For example, an influx of renewable resources (both behind and in front of the meters), retirement of generation, changes to transmission, or changes in load pockets. In addition, it excludes any new facilities added since 2007 from sharing the cost of changes to the grid. The cost for studies conducted for changes to the existing grid should be allocated to all interconnected facilities and should be performed by the Transmission Planner. As defined in the Rules of Procedure, section 500, the Transmission Planner is "the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the PA area." The Planning Authority is the entity that maintains the information required for the studies and is the entity that could perform the studies at the lowest cost. The cost for performing the studies should be allocated to all entitles doing business on the grid and the cost should be reviewed in a rate case and allocated appropriately.MOD-010 and MOD-012 already provides a requirement

Organization	Yes or No	Question 2 Comment
		to provide the characteristics for system studies to the RRO for updating the models that would be used to conduct the studies. 3. These Standards, however, have a gap in that they do not include Distribution Provider as indicated in the proposed PRC-027 Standard. We recommend the drafting team revise MOD-010 and MOD-012 to retrieve all necessary information to update the RRO model and that the Transmission Planner be tasked with performing the necessary studies.
Response: Thank you for your comment. **1. The studies conducted by the Transmission Planner or Planning Authority related to FAC-002 are not necessarily directly related to the protection system study identified by this standard. The drafting team believes that the Owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others. It is acknowledged that some cases the scenario described may exist; however, if the Transmission Planner or Planning Authority is providing such a service it would be by agreement with the Owner, and does not change the fact the Owner has the responsibility. It is also noted that Protection System Studies are not generally conducted by the Transmission Planner or Planning Authority.** **2. The observation that changes to the grid not directly associated with the Interconnected Element(s) is exactly the driver for the inclusion of a regular review of fault currents at the Interconnected Element(s). If such changes result in a 10% change in the conditions that were used in the last Protection System Study, the need for a new study must be evaluated; however, it does not require a study be done.** **3. Modifications of the noted standards are outside the scope of this drafting team.**		
Idaho Power Company	Yes	Yes, Transmission Operators may own protection systems but not the interconnected element due to cost sharing agreements among Entities, for example. The applicability should be expanded to cover the Entity responsible for operation of the protection system element and interconnection.
Response: Thank you for your comment. **Based on the Functional Model, the drafting team does not see how the Transmission Operator would own Protection Systems without also being registered as a Transmission Owner. If such a scenario does exist, it is assumed that it would be by agreement**		

Organization	Yes or No	Question 2 Comment
with the Owner, and does not change the fact that the Owner has the responsibility.		
Exelon	Yes	Agree, all entities should be included if they are responsible for engineering of protection systems protecting BES elements at Interconnected Facilities.
Response: Thank you for your comment. **It is unclear to the drafting team which additional entities are being suggested for inclusion.**		
Public Service Enterprise Group	Yes	Within RTOs and ISOs, entities such as PJM and NYISO perform such evaluations as part of their transmission planning process. See PJM Manual 14-B, Appendix G, section G.7 which states: "PJM performs short circuit analysis as part of the annual Regional Transmission Expansion Plan (RTEP) baseline assessment. This analysis includes a study of the entire PJM system based on its current configuration and equipment." Therefore, Transmission Planners should be considered as an applicable entity for R2 as discussed in #9 below
Response: Thank you for your comment. **The drafting team believes that the Owner of the facility is responsible for ensuring that their Protection Systems are coordinated with others. It is acknowledged that some cases the scenario described may exist; however, if the RTO or ISO is providing such a service it would be by agreement with the Owner, and does not change the fact the Owner has the responsibility.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	Yes	It would seem like Transmission Planners and Planning Coordinators would have a natural interest in modifications made to relay systems. Their simulations must show that BES performance under various contingencies meets certain criteria. Any information discovered in the course of the Protection System Studies would be of interest to them as well.
Response: Thank you for your comment. **The drafting team agrees; however, the Protection System data that may need to be provided by the owner to the Transmission Planners and Planning Coordinators is covered by other Standards.**		

Organization	Yes or No	Question 2 Comment
TransAlta Centralia Generation LLC	Yes	The applicability should include other functional entities which should provide power system study data.
Response: Thank you for your comment. **It is unclear to the drafting team which additional entities are being suggested for inclusion.**		
Liberty Electric Power LLC	Yes	
NV Energy	Yes	
ACES Power Marketing Standards Collaborators	Yes	

3. **In Requirement R1, the SDT allowed a responsible entity 36 months to have a documented Protection System Study completed for each Interconnected Facility if the responsible entity does not already have a Protection System Study for that Interconnected Facility performed on or subsequent to June 18, 2007 (the effective date of PRC-001-1). Do you agree with this time frame? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration:

Many commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Elements enough time to complete the Protection System Studies, and that there is no evidence there is widespread miscoordination between Interconnected Stations; therefore, the drafting team changed the time frame to forty-eight months.

Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2.

Several commenters stated that the definition of Interconnected Facility is confusing. The drafting team changed the term to Interconnected Element defined as follows: “An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity”.

Several commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: “Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).”

Organization	Yes or No	Question 3 Comment
Pepco Holdings Inc. & Affiliates	No	1. Each owner should already possess information demonstrating that their protective devices are set to “coordinate” with adjacent protection systems. However, the documentation that presently exists may not be in the form of a formal “coordination study” in a format suitable for audit purposes. Some guidance should be provided indicating what form of documentation is expected,

Organization	Yes or No	Question 3 Comment
		especially by the TO. For instance, on transmission tie lines between different TO's coordination of zone distance elements is fairly straightforward and can be accomplished without a traditional "coordination study". Also settings on pilot schemes need to be exchanged in order to allow for proper operation, but this is also not what is considered a traditional "coordination study". On the other hand, coordination between GO's and TO's is even more complicated. Without some direction as to what specific documentation is required it is difficult to estimate how many existing interconnection points would have to be re-visited in order to produce the required auditable documentation. 2. Some specific examples of what specific type of documentation is required would be helpful. To be safe, most likely all interconnection points would be revisited to ensure adequate compliance documentation. Also, for each revised Protection Study produced (per R1.1) a formal review (R1.2) and approval (R4.1) would be required. 3. As such, with the large number of interconnection points on the system a 60 month time frame would be more appropriate. The SDT acknowledged that they had no evidence that there is widespread miscoordination between Interconnected Facilities when establishing the arbitrary 36 month requirement.

Response: Thank you for your comment.

1. **Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2.**

2. **Several commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."**

Organization	Yes or No	Question 3 Comment
3. Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists.		
Hydro One	No	1. Hydro One would like to suggest that 60 months would be a more realistic span of time needed in order to formally complete a documented study, or derive a time frame based on the number of interconnections that an entity must conduct studies for. Whether the systems are co-ordinated or not, the work needs to be carried out and documented. In the case of Hydro One there are almost 300 individual generator connections that belong to other entities many of whom do not have onsite protection experts. Most of these connections do not have a formal documented protection co-ordination study. 2. Statements in R1.1.2 and 1.1.3: "unless the entity can demonstrate such a study is not required." and its corresponding measure: " or documentation demonstrating why a study is not required for changes described in Parts 1.1.2 and 1.1.3" are vague and don't give much guidance on what would be the appropriate evidence in this case. 3. Suggest adding examples of documents that can be used to demonstrate compliance.
Response: Thank you for your comment. **1. Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Elements. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element**		

Organization	Yes or No	Question 3 Comment
exists" 2. Based on your comment, the drafting team revised Requirement 1, Parts 1.1.2 and 1.1.3 to include the phrase: "or technically justify why such a study is not required". As stated in the Rationale box for Part 1.1.2, one example of a technical justification would be: "when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current". 3. Several commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."		
Bonneville Power Administration	No	1. This question assumes that the requirement to perform a protection system study is acceptable, and the question focuses only on the timeframe allowed. In BPA's opinion, the requirement to have a protection system study is objectionable and cause for disapproval of the standard. Therefore, the timeframe is irrelevant. 2. In addition, the standard fails to make clear just what a protection system study is, either in the definition, the requirements, or the guidelines that follow. BPA believes that R1 is ambiguous and unacceptable.
Response: Thank you for your comment. 1. The drafting team believes that documentation is necessary in order to have a record that the coordination study was completed, communicated to the appropriate Entities and agreed upon. 2. The drafting team made various changes including those to the definition, requirements, and guidelines to clarify what a Protection System Study is. Other commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system		

Organization	Yes or No	Question 3 Comment
Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."		
FirstEnergy	No	Requirement 1, Part 1.1.1 - Although we agree with the timeframe, the phrase "within 36 calendar months after the effective date . . . . subsequent to June 18, 2007" should not be listed as a requirement but rather as part of the Implementation Plan.
Response: Thank you for your comment. **Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."**		
Detroit Edison	No	Why aren't studies performed prior to June 18, 2007 considered acceptable if they're still valid as long as no significant fault current or system changes have occurred?
Response: Thank you for your comment. **Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2. which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."**		
MRO NSRF	No	1. If an entity has a Protection System Study performed prior to June 18, 2007 that

Organization	Yes or No	Question 3 Comment
		meets the requirements for the study specified in PRC-027-1 and there have been no changes to trigger a new study as specified in PRC-027-1 (that have occurred) the study should be acceptable for compliance with the standard. It is suggested that the requirement R1, sub-requirement R1.1 be revised by removing the phrase "that was performed on or subsequent to June 18, 2007." 2. The NSRF questions if 36 months is ample enough time for large company to get all studies done within 36 months. Unless R1.1 is revised to mean all studies regardless to when it was performed.
Response: Thank you for your comment. 1. **Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."** 2. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".**		
PPL Corporation NERC Registered Affiliates	No	As noted in the response to question #1, TOs and DPs have the data and the capability needed to perform the studies that appear to be contemplated by the SDT.
Response: Thank you for your comment.		

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 3 Comment</th></tr>
<tr><td colspan="3">The drafting team agrees.</td></tr>
<tr><td>Tennessee Valley Authority</td><td>No</td><td>1. "Protection System Study" is a new term being introduced with this standard. Since industry documentation of protection system coordination reviews are conceivably available from both before and after June 18, 2007, precluding coordination reviews performed prior to June 18, 2007 from acceptable compliance evidence could greatly increase the workload of protection system engineers during the proposed 36 month time period. Note that there is a possibility of overlap with the "Order 754 request for data" response period. The rationale statement for R1, Part 1.1.1, indicates that the effective date of PRC-001-1 was the basis for selecting June 18, 2007. PRC-001-1 primarily addresses new protective systems and changes (R3 & R5) and coordination with neighboring GOP, TOP and BA entities (R4). We suggest changing the wording of Part 1.1.1 to the following: “Within 36 calendar months after the effective date of this standard, if no valid Protection System Study for that Interconnected Facility exists.”</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.
1. Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2 which now reads: “Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).</td></tr>
<tr><td>ACES Power Marketing Standards Collaborators</td><td>No</td><td>(1) Conceptually, we agree with the intent of the standard and this requirement as it is presented in the application guidelines. However, more refinement is needed to make this requirement implement what is explained in the application guidelines. For instance, nowhere in Requirement R1 is it stated clearly that the responsible</td></tr>
</table>

Organization	Yes or No	Question 3 Comment
		entity is only responsible for performing Protection System Studies (PSS) for only those breakers it owns and are protecting the Interconnection Facility. This is pretty clear in the application guidelines. (2) While we do not disagree with the time frame, we question if it should be part of the requirement. It makes more sense to include the time frame for initial compliance of a requirement in the implementation plan. In that way, the initial compliance time frame does not persist in the standard long after it is no longer needed. It is common to utilize the implementation plan to describe initial compliance dates. Furthermore, FERC approves implementation plans as part of the standards package so there is no issue with whether the implementation plan is enforceable. (3) We disagree with limiting PSS that can meet this requirement to only those that occurred after June 18, 2007 as defined in Part 1.1.1. While NERC cannot compel evidence from a date before the standards became enforceable, there is no reason that a TO, GO, or DP could not choose to utilize a PSS from before this date as evidence. (4) We think the use of PSS in Part. 1.1 is partly redundant to the definition. The definition indicates PSS is a study that demonstrates Protection Systems operate in desired sequence for clearing Faults. Part 1.1 states that the TO, GO, and DP shall perform the PSS "to verify Protection Systems remove from service only those Elements required to isolate Faults" are removed from service. Isn't the statement in Part 1.1 "to verify Protection Systems remove from service only those Elements required to isolate Faults" equivalent to the demonstrating that Protection Systems operate in the desired sequence for clearing faults as defined in the PSS? (5) We disagree with including the Distribution Provider in this requirement. The primary reason that a Distribution Provider owns Protection Systems that protect Interconnected Facilities is that it is often cheaper to install a fault interrupting device and its associated Protection Systems on the distribution side. These Protection Systems are typically installed per the Transmission Owner facility connection

Organization	Yes or No	Question 3 Comment
		requirements which are established per FAC-001. The Transmission Owner usually still performs the PSS and short circuit study and the Distribution Provider uses settings specified by the Transmission Owner. The fact that FAC-001 applies only to the TO and allows the TO establish such facility connection requirements that applies to the DP further supports this claim. (6) The definition of Interconnection Facility is confusing and needs further refinement. First, we are not sure what the purpose of including “that are electrically joined by one or more Element(s)” is. If it is not electrically joined, it cannot be a Facility. It would not be part of the BES which is a basic requirement of the Facility definition. Second, it is not clear if this is intended to cover only jointly owned Facilities or not. We do not think that is the intention but the clause “are owned by different functional, operating or corporate entities” cause this confuses. Third, ownership cannot be defined by functional or operating entities. A corporate entity may be registered as a TO and GO. Which part of the definition applies for the interconnection between the transmission system and generator: Functional Entities or Corporate Entities? Furthermore, a functional entity or operating entity does not really describe a legal entity capable of ownership. The definition of Interconnected Facility should be a Facility that ties together two different sets of Facilities together where the Protection System coordination would be performed by different companies. This would appear to be consistent with the explanation of the standards in the application guidelines. For example, a Facility connecting two different TO transmission systems together where the TOs are owned by separate corporate entities would be an Interconnected Facility. A generation interconnection Facility would only be considered an Interconnection Facility if the GO and TO were separate corporate entities. If they were the same corporate entity, coordination would already occur and the generation interconnection Facility should not be considered an Interconnected Facility.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
1. **The drafting team believes that the Entity is responsible for conducting the PSS as described in the application guidelines.** 2. **Making the time frame part of the Requirements was the choice of the drafting team.** 3. **Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2.** 4. **Several commenters stated that the definition of Interconnected Facility is confusing. The drafting team changed the term to Interconnected Element defined as follows: Interconnected Elements: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity".** 5. **The Applicability of this standard includes Protection Systems installed for the primary function of detecting Faults on BES Elements irrespective of what functional entity owns them. Protection Systems not installed for the primary function of detecting Faults on BES Elements are not included in the Applicability.** 6. **Several commenters stated that the definition of Interconnected Facility is confusing. The drafting team changed the term to Interconnected Elements defined as follows: Interconnected Elements: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity".**		
Kansas City Power & Light	No	The protective systems were coordinated when installed. If the power system has not undergone any significant change, then line impedances and fault current levels are the same and the original settings are still valid. So, no new study is required based on the passage of time. A new study is needed only if there have been significant system changes as outlined under question 5 and requirement R3.Requirement 1.1 states each entity must perform a system protection coordination study, however, the coordination efforts will be joint efforts between the entities and sharing of pertinent information such that an effective study can be performed. The proposed Standard should make it clear the study effort can be a joint study between the entities involved and that independent studies are not necessarily intended by each entity.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
The drafting team acknowledges that the identified Protection System Studies can be a joint effort but believes they do not have to be. The drafting team agrees with the concept of joint studies as long as all involved entities have the required documentation.		
Southern Company	No	60 months would be more reasonable for those that have a large number of generators and/or interconnections. Perhaps a tiered approach: 36 months for those with less than 50, 60 months for those with more than 50 but must have 50% done within 36 months?
Response: Thank you for your comment. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".**		
Salt River Project	No	The requirement to provide a copy of each Protection System Study is an administrative burden that does not reflect the intent of Results Based Standards. Changing the requirement to maintain evidence that Protection System Studies are coordinated and affected entities have agreed to the results of the Studies is adequate.
Response: Thank you for your comment. **The drafting team is not requiring a Protection System Study; only a summary of the results of the Protection System Study performed is required to be provided to the other entities.**		
Pacific Gas and Electric Company	No	PG&E we believes that the 6 calendar month time frame in requirement R1.1.2 is too short and should be extended to 12 calendar months
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
The drafting team believes because fault current reviews are conducted every 2 years, the expectation is that the number of instances where the fault current changes by 10 % will be limited. We therefore believe that the 6 month time frame is appropriate and decline to make the suggested change.		
American Electric Power	No	1. 36 months is not adequate for unique Protection System Studies to be conducted for the TO, GO, and DP. The interface and coordination requirements as written will require close communication with a vast number of interconnected facilities. In addition the generation landscape changes over the next few years with the large number of generation retirements and additions will continually change the short circuit model. AEP believes that these contributing factors will lead to time requirements above the proposed 36 months currently in the standard. AEP would require a minimum of 60 months to complete this work as the AEP system exists today. An added complication that will impact this time requirement is the approval of FERC Order 1000, which could result in additional interfacing TO's inside AEP's footprint. In addition, NERC's rationale for R1 states that "the SDT has no evidence there is widespread miscoordination between Interconnected Facilities that warrants a shorter time frame." If this is the case, then there should be no issue with extending this timeframe. 2. Using the word "demonstrates" within the definition for Protection System Study could be interpreted as requiring an actual, operational test rather than a simulation study. We recommend changing the definition to "a study that demonstrates that the existing or proposed Protection System design will enables the Protection System to operate in the desired sequence for clearing Faults." 3. Is using the defined term "Protection System" appropriate? Does it possible bring things into scope (CTs, PTs, Station batteries) which should not?
Response: Thank you for your comment. **1. Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations**		

Organization	Yes or No	Question 3 Comment
enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists". 2. The definition of Protection System Study refers to "a study that demonstrates"; consequently, the drafting team believes the word "demonstrates" is appropriate in the context it is used. 3. As stated, the Protection System does include CTs and VTs which are part of the considerations used when determining the settings of a protective relay. The information needed to be transmitted to another Entity would include this equipment.		
Sacramento Municipal Utility District	No	There is no need to have a Protection System Study available for review for every Interconnected Facility. The study is useful only as an intermediate product that leads to relay settings and as a basis for both entities to agree that their planned settings will coordinate. The results based objective is that the registered entities communicate and coordinate together. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard has been met.
Response: Thank you for your comment. **The standard requires a Protection System Study be performed but only requires a summary be provided to the other entity. The standard provides for documentation of the agreement which may be a simple statement as you indicate.**		
Idaho Power Company	No	1. No, Should a Protection System Study under R1 result in triggering of the other Requirements in the Standard, more time may be needed. 2. An Entity could easily find themselves responding to multiple inquiries from Interconnectors while performing their own Studies. Additional time should be allowed to address the results of the Protection System Studies triggered during this implementation timeframe.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. **1. The Requirement R1 time frame only addresses performing a Protection System Study; this time frame is not inclusive of other changes that may result from the Protection System Study and are covered by Requirements R3 and R4.** **2. The time frame for Requirement R1 has been increased to forty-eight months and the drafting team believes this time is sufficient to perform all required studies.**		
Exelon	No	Exelon cannot agree to the time frame proposed without understanding the scope of work involved in the required protection system study. 1. The current definition of Protection System Study (PSS) is not clear enough to avoid confusion. To better define the "study" as referenced in PRC-027-1 and to ensure that applicable entities know what they're required to do, the definition of PSS needs to clarify the elements of the protection system and power system conditions the study is run similar to how required Transmission Planning studies are defined. With this in mind, Exelon suggests the following definition for "Protection System Study": A study that demonstrates that existing or proposed Protection Systems operate in the desired sequence for clearing a fault. The study is conducted with a single power system element out of service and all Protection System elements in service, and with all power system elements in service and a failure of a single protective relay, communication system, ac current input, ac voltage input, or DC control circuit (these can be further defined using the information and Table from Order 754). 2. Exelon suggests that "summary results of a protection system study" should also be defined with clear parameters established. Unless the specific particulars are established, Exelon predicts that there will be confusion as auditors attempt to decide whether or not a piece of evidence will qualify as a "summary" of a Protection System Study. This is similar to the ambiguity in the existing revision of PRC-005-1 R1.2 which requires a "summary" of maintenance and testing procedures, yet does not describe specifically what is required. It is our experience that registered entities and auditors historically have had differences

Organization	Yes or No	Question 3 Comment
		of opinion about what constitutes a “summary”.
Response: Thank you for your comments. 1. Based on your comments and others, the drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: “Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).” Additionally, language has been included in the Guidelines and technical Basis section of the standard to indicate “System conditions used in Protection System Studies include maximum generation and transmission system at normal operating conditions and under single contingency conditions.” 2. Several commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: “Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).”		
Liberty Electric Power LLC	No	I disagree with the requirement for a protection system study. From the draft standard: "The SDT has no evidence there is widespread miscoordination between Interconnected Facilities". There are approximately 18,000 generators in the US. Requiring each to perform a system study would result in costs running into the hundreds of millions of dollars. This will result in lower BES reliability as entities transfer funds from other reliability efforts to comply with this standard.
Response: Thank you for your comment. **The drafting team believes the requirements of this standard will enhance the reliability of the BES.**		
Public Utility District No. 1 of	No	Comments: There is no need to have a Protection System Study available for review

Organization	Yes or No	Question 3 Comment
Snohomish County		for every Interconnected Facility. The study is useful only as an intermediate product that leads to relay settings and as a basis for both entities to agree that their planned settings will coordinate. The results based objective is that the registered entities communicate and coordinate together. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard has been met.
Response: Thank you for your comment. **The standard requires a Protection System Study be performed but only requires a summary be provided to the other entity. The standard provides for documentation of the agreement which may be a simple statement as you indicate.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	No	1. This requirement assumes that a material percentage of the many thousands of interconnecting relay systems have a problem. There is no evidence of this; and in fact, the Rationale text box for R1 states that the converse is true. This makes sense, as the inter-operation of Fault isolation Protection Systems is a fundamental and well-understood concept - which may not be the case with the more complex relay types. In our opinion, the two-year TO assessment will be sufficient to catch an issue and drive improvements afterwards. Therefore requirement R1.1.1 should be deleted. 2. In addition, we do not agree with the "on or subsequent to June 18, 2007" time frame, since these studies are completed when a facility is built, and/or when a facility is significantly changed, which could quite possibly be prior to 2007. If studies were completed before June 18, 2007, and nothing significant has changed, the study meets the PRC-027 requirement, and/or the TO assessment does not indicate a need, there is no purpose served by repeating the study.
Response: Thank you for your comment. **1. For entities that do not have a Protection System Study as specified in Requirement R1 will need to conduct a study to create a baseline for use in the two year TO assessment as outlined in Requirement R2.**		

Organization	Yes or No	Question 3 Comment
2. Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2.		
Wisconsin Electric Power Company	No	1. In some cases there may be many Interconnected Facilities between two or more owners. It cannot be expected that owners will be able to support performing multiple studies in parallel, at the same time. It would be best to eliminate the specified timeframe, and allow the owners the latitude to determine the timeframe based on priorities decided by them. 2. Also, replace the phrases in R1.1.2 and in R1.1.3, "... unless the entity can demonstrate such a study is not required", with "unless the entities involved agree that a study is not required". If the interconnected entities agree that a study is not required, there should be no requirement to document the reasons why a study is not required. Likewise, revise M1 to include as acceptable evidence "documentation that the relevant entities have agreed that a study is not required."
Response: Thank you for your comment. **1. The time frame for Requirement R1 has been increased to forty-eight months and the drafting team believes this time is sufficient to perform all required studies.** **2. The drafting team revised Requirement 1, Parts 1.1.2 and 1.1.3 to include the phrase: "or technically justify why such a study is not required". As stated in the Rationale box for Part 1.1.2, one example of a technical justification would be: "when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current". Documentation is needed to verify that an agreement was reached.**		
NV Energy	No	With such a long time frame for conducting this subject study, one cannot assure that the protection systems are coordinated, and there could be an impending mis-coordination that goes uncorrected. Suggest 12 or 24 months.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".		
Dairyland Power Cooperative	No	It is agreed that the there needs to be a time period for Protection System Studies to be performed after the standard takes affect. However, the length of time is a concern due to the industries existing resources. It would be preferred that the time period be lengthened to 60 months.
Response: Thank you for your comment. **Many of the commenters suggested that 36 months was not enough time – suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".**		
Platte River Power Authority	No	There is no need to have a Protection System Study available for review of every Interconnected Facility. The results based objective is that the registered entities communicate and coordinate. a simple statement by both entities that they have communicated and coordinated is sufficient.
Response: Thank you for your comment. **The standard requires a Protection System Study be performed but only requires a summary be provided to the other entity. The standard provides for documentation of the agreement which may be a simple statement as you indicate.**		
MWDSC	No	1. Protection Systems installed prior to June 18, 2007 should not be required to redo

Organization	Yes or No	Question 3 Comment
		a study because a system study should have been performed prior to installation based on the interconnected configuration at that time. The interconnected systems will change over time and redoing studies will raise more questions on assigning responsibility for changes beyond the control of the protection system owner. 2. For protection systems installed prior to June 2007, TOs should only be required to show a study was performed and coordinated with appropriate interconnected entities.
Response: Thank you for your comment. **1. Several commenters questioned why Protection System Studies performed prior to 6/18/07 would not be acceptable. The drafting team modified Requirement R1, Part 1.1.1 to make these studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."** **2. A valid Protection System Study will require the same documentation, regardless of the date of completion.**		
American Transmission Company	No	1. ATC does not agree with the time frame proposed. 2. The existing requirements in PRC-001 do not require protection system studies with Distribution Providers. As such, even though studies have been completed there may be no package (documentation) to support an audit. This requirement assumes that, if there is no existing fault study, one needs to be completed. If there have been no changes in short circuit or protective schemes, allow for completion of the studies based upon prioritization using voltage class and loading level.
Response: Thank you for your comment.		

Organization	Yes or No	Question 3 Comment
1. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists"** 2. **The drafting team modified Requirement R1, Part 1.1.1 to make studies acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2 which now reads: "Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)."**		
NPPD	No	To mitigate compliance risks for various types of data formats for existing studies and studies older than June 2007 this standard will likely require utilities to go back and update all data so that it meets the requirements and description of evidence in the application guidelines when the requirements become enforceable. This could likely take longer than 3 years. I would recommend more time such as 6-10 years (time depends on the number of applicable system ties as well)
Response: Thank you for your comment. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".**		
CenterPoint Energy	No	(a) The proposed term for Protection System Study, shown on page 2 of 27 of PRC-027-1 Draft #1, is defined as "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults." CenterPoint

Organization	Yes or No	Question 3 Comment
		Energy recommends Protection System Study instead be defined as “A study that demonstrates Protection Systems operate as desired for clearing postulated short circuit Fault events.” (b) CenterPoint Energy believes a 36 month implementation to have a documented Protection System Study completed for each Interconnected Facility is overly burdensome, unless certain Interconnected Facilities are exempted. CenterPoint Energy recommends exempting Interconnected Facilities that are serving only load and that are connected by no more than two transmission line Elements that are operating between 100 kV to 200 kV. Many of these Interconnected Facilities have fault-proven, time-proven protection system set points. Additionally, Draft #1, on page 5 of 27, notes that protection system misoperations related to coordination issues are addressed by PRC-004.
Response: Thank you for your comment. a. **The definition of Protection System Study refers to “a study that demonstrates”; consequently, the drafting team believes the word ‘demonstrates’ is appropriate in the context it is used.** b. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: “Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists”.**		
NextEra Energy Inc	No	While 36 months is allowed for studying all interconnections, what time is allowed for mitigation of identified setting or hardware change? If an issue is discovered, then an additional 12-24 months mitigation time should be allowed.
Response: Thank you for your comment. **The Requirement R1 time frame only addresses performing a Protection System Study; this time frame is not inclusive of other**		

Organization	Yes or No	Question 3 Comment
changes that may result from the Protection System Study and are covered by Requirements R3 and R4.		
Oncor Electric Delivery Company LLC	No	Given the “agreement” requirements defined in Requirement R4 and the uncertainty of its interpretation, many of the recent protection system studies may have to be performed again. Therefore, a more appropriate timeframe would be 5 years to have all applicable Protection System Studies completed.
Response: Thank you for your comment. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: “Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists”.**		
Western Area Power Administration	No	
ExxonMobil Research & Engineering	No	
National Grid USA / Niagara Mohawk	Yes	As a TO our experience has been that many GOs do not reply to requests for information. If the 36 month window cannot be met by a TO because information requests are ignored what recourse does the TO have to avoid a penalty for non-compliance?
Response: Thank you for your comment. **Requirement R3, Part 3.2 specifies that the “Requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 calendar days of receiving a request or according to an agreed-upon schedule.” In your example, the GO would be in violation of this standard.**		

Organization	Yes or No	Question 3 Comment
Associated Electric Cooperative, Inc., JRO00088	Yes	AECI objects with the line of questioning here, because it does not fully address all aspects of Requirement R1. While AECI appreciates the 36 month time-frame, we did receive internal comment back from our planning engineers Relay Operations Sub-Committee: 1) Concerning our Regional Entity's Short Circuit Data Working Group, the current status is such that a unilateral AECI SC study would be technically difficult. 2) Further, significant modeling development will be necessary in order for entities to comply with this requirement through a regional study formation, i.e. 3 yrs is a definite push on the timeline on the Initial pass. 3) Finally, the information to be reported from a Protection System Study R1.1, and particularly the information to be communicated to other entities R1.2, may be too vague. This primary concern is for personnel being inundated by the sheer volume of data that can now be performed in relation to such studies. AECI would appreciate the SDT providing further Industry Guidance as to what would constitute a clear and concise set of information, to be transmitted or received from corresponding parties.

Response: Thank you for your comment.

1. **The drafting team believes that a short-circuit study is required to meet the requirements of this standard and acknowledges that this is a collaborative effort.**
2. **Many of the commenters suggested that 36 months was not enough time - suggested time frames varied widely up to 10 years. The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists".**
3. **Requirement R1.2 has been modified to include additional details for the summary of results as follows: "or technically justify why such a study is not required".**

Organization	Yes or No	Question 3 Comment
Flathead Electric Cooperative, Inc.	Yes	This seems like an adequate time, but it is unclear that smaller transmission dependent utilities really need to do this to maintain reliability and if their ratepayers would see any reliability benefit.
Response: Thank you for your comment. **This standard is applicable to Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements.**		
LCRA Transmission Services Corporation	Yes	Requirement R1 should read as follows:"Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System shall: "Requirement R1.1.2 should read as follows: Within 6 calendar months after determining or being notified of a change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.
Response: Thank you for your comment. **1. In the case where different portions of the Protection System are owned by different entities, then the Protection System Study must be a collaborative effort.** **2. The drafting team revised Requirement 1, Part 1.1.2 to include the phrase: "or technically justify why such a study is not required".**		
Xcel Energy	Yes	The standard does not specify M2 violation reporting responsibility or assignment of violation due to non-responsiveness of the interconnected entity. Clarification needs to be made as to what is considered acceptable evidence that the affected entity received the study results under measure M2. Would a registered mail confirming receipt at an address be considered acceptable evidence; if not what type of document service would be considered acceptable?

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. **Registered mail confirming receipt at an address would be considered acceptable evidence. Additional acceptable evidence would be letters, or emails acknowledging receipt.**		
Public Service Enterprise Group	Yes	We do not believe this requirement has been justified for the several reasons listed below. In addition, the "Protection System Study" definition is too vague as to what it should include. We suggest a separate appendix that lists the items that this study should address. We also suggest that the SDT develop several baseline and change case Protection System Study examples, using a common format. These should be incorporated into an appendix within the standard. a. The format and overall purpose of the baseline study has not been provided. It is highly unlikely that a sufficient Protection System Study has been completed or is available for a majority of the Interconnected Facilities since 6/18/2007 within North America. This is due in part to either no modifications being performed at these facilities or lack of data retention (a study was performed but since it was not a requirement, documentation is not available). To require entities to now perform such studies would be a sizeable undertaking and create a tremendous burden to all entities with little benefit to the entities and the reliability of the BES. For older Interconnected Facilities where no changes have been made in several decades, no benefit to the facility or the BES would come from perform such a study. b. The only time a Protection System Study should be performed is when a driver is in place that will require a possible relay setting changes. These drivers should be spelled out specifically. For example, if there is substation project work that requires relay setting changes, if the relays are being replaced, if a "tie line" is being re-conductored, etc. The requirement to perform a study should also apply to those "interface" relaying schemes that would normally require periodic review. The requirement for a periodic review will be driven by something other than a system configuration change. This may include schemes that have current operated relaying

Organization	Yes or No	Question 3 Comment
		where the setting of the relay is dependent of fault current level. c. The complexity of such a study is uncertain. In most cases, the “interface” relaying between two TO’s or a TO and a GO is very straightforward. In the case of the “interface” between a TO and a GO, the relaying may simply be a transformer differential scheme. In the case of a tie line between two TOs, if the relaying is strictly impedance based, then there is no need to perform a baseline study. In other cases, the study may be more complex. The study may also have to incorporate Protection System devices beyond the Interconnected Facility (e.g. BOP protection for generators, adjacent line or bus protection for transmission facilities). This would increase the amount of time and complexity required to perform the study. How would the SDT define the appropriate protection coordination boundaries for an Interconnected Facility?

Response: Thank you for your comment.

a. **Several commenters asked what documentation was required for a Protection System Study. The drafting team modified the minimum attributes of a Protection System Study summary identified in Requirement R1, Part 1.2 which now reads: “Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).” Entities that do not have a Protection System Study as specified in Requirement R1 will need to conduct a study to verify Protection System coordination and to create a baseline for use in the two year TO assessment as outlined in Requirement R2.**

b. **Requirements R2 and R3 provide the triggering points that indicate when a new study is necessary.**

c. **The drafting team acknowledges that the complexity of the Protection Systems applied will determine the scope of a Protection System Study and in some cases may not be required; however, this does not preclude the need for a baseline study. Application Guidelines provide examples of the protection boundaries.**

Organization	Yes or No	Question 3 Comment
mason	Yes	Although the timeframe appears reasonable, the more basic question about the necessity of the documentation requirements needs to be reconsidered.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment. The drafting team believes that documentation is necessary in order to have a record that the coordination study was completed, communicated to the appropriate Entities and agreed upon.		
Duke Energy	Yes	However R1 is confusing by having two sub-requirements R1.1 and R1.2, two measures M1 and M2, and VSLs consisting of various combinations of non-compliance with sub-requirements. We think it could be made clearer by separating R1.2 out as a separate requirement with its own measure and VSLs. We have made a similar comment on Question 8 that other requirements, measures and VSLs in this standard could be made clearer by breaking them apart. Also, Requirement R1.2 states “each affected Interconnected Facility owner” without describing how the owner may be affected.
Response: Thank you for your comment. **The drafting team used the format recommended by NERC staff.**

4. In Requirement R2, the SDT established a +/- 10 % change in an Interconnected Facility's Fault current value as a criterion for notifying interconnected entities to give the interconnected entity a "heads up" that a review of the existing documented Protection System Study may be warranted. Do you agree with the +/- 10 % Fault current threshold for initiating this review? If not, please provide an alternative means along with a technical justification for determining a threshold.

Summary Consideration:

A majority of the commenters agreed with the 10% deviation trigger. Of those that disagreed and provided an option, they suggested a range of 15-20%. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows timely notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.

Multiple commenters expressed confusion as to where the fault needed to be applied, what branch(s) needed to be monitored, and what system conditions needed to be considered. Some expressed that the fault should be applied at the bus so that batch studies could be run to automate the short circuit study. The drafting team modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."

Based on comments, the drafting team reworded Requirement R2 to provide clarity. The requirement now reads: "For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall:"

Several commenters suggested modifying the equation to replace "V" with "I". The drafting team made the change.

Organization	Yes or No	Question 4 Comment
Pepco Holdings Inc. & Affiliates	No	The 10% threshold would be acceptable providing the following changes were made to Requirements R2.1 and R2.2:R2.1 – 1. Re-word Requirement R2.1 to read: "Perform a short circuit study to determine the present maximum available fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities, not less than once every 24 months. 2. R2.2 - Re-word Requirement R2.2 to read: "Calculate the percent deviation

Organization	Yes or No	Question 4 Comment
		between the maximum available Fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation...” The existing wording requires one to “calculate the percent deviation between the fault current values ... for the bus(s) or Elements(s) under consideration”. 3. Including the phrase “or Element(s) under consideration” increases the complexity of the periodic fault screening requirement significantly. Instead of performing a relatively easy bus fault summary routine (available in most batch short circuit programs) individual branch current in various coordination pairs must be examined. Take for example the system shown in Figure 1 in the Application Guidelines. Instead of just screening the available bus fault current at the point of interconnection (the ownership boundary between the two entities), fault current in each “element under consideration” used in the Protection study must be calculated. This would mean determining fault current flows through breakers A, B, C, D, E, F, G, & H) under various fault scenarios and comparing them to those used in the previous coordination study. This is far from a simple task and not conducive to a “batch” screening tool. The intended purpose of R2.2 is to catch external system changes that have over time led to gradual increases in fault current that may require the Protection System Study to be re-examined. A simple year to year bus fault comparison would serve this purpose. System changes at, or immediately adjacent to, the interconnection point, which could lead to a re-distribution of fault currents through the effected element(s), would be caught elsewhere under R3.1 “Additions, removals, or replacements of transmission Elements”.

Response: Thank you for your comments.

1. **Per your suggestions and others, the drafting team has modified Requirement 2.1 to read “Perform a short-circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus,**

Organization	Yes or No	Question 4 Comment
not less than once every 24 months.” 2. The drafting team believes the existing wording was sufficient and did not make your suggested change. 3. The drafting team did remove the word “or Element(s)” as you suggested.		
Hydro One	No	Hydro One agrees with the need of a defined fault current threshold. However, we’d like to suggest a 20% threshold instead as most protection settings, if coordinated properly, must coordinate with system normal and under credible minimum system conditions, therefore, it is our opinion that a 10 % change should generally not affect coordination.
Response: Thank you for your comment. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10 % margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.		
Bonneville Power Administration	No	This question assumes that the requirement to perform a mandatory short-circuit study every 24 months is acceptable, and the question focuses only on the percent change of the study results that will require notification. BPA believes that a short-circuit study should not be required and the percent change that triggers notification is irrelevant.
Response: Thank you for your comment. The drafting team believes that a periodic Fault current study is necessary to identify incremental changes in Fault current over time that could lead to relay miscoordination. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.		
Detroit Edison	No	Recommend that the “trigger” be a system change (line, transformer, generator) that

Organization	Yes or No	Question 4 Comment
		results in an impedance change.
Response: Thank you for your comment. **Requirement R3 of this standard allows for system changes to trigger a study as you suggest. However, the drafting team believes that a periodic Fault current study is necessary to identify incremental changes in Fault current over time that could lead to relay miscoordination.**		
Northeast Power Coordinating Council	No	1. Agreed that a change in fault current is a method to trigger a coordination study, but a 15% threshold would be more efficient (+/- 15 %). 2. Clarify where the fault is to be applied and where the deviation is to be observed. One possibility is to apply the fault at a bus at one end of the tie and then determine the deviation in the current in each element connected to that bus.
Response: Thank you for your comments. **1. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10 % margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.** **2. Per your suggestions and others, the drafting team has modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."**		
PPL Corporation NERC Registered Affiliates	No	See comment in question #1 above.
Response: Thank you for your comment. **Please see the SDT's response to your comments in question #1.**		
Colorado Springs Utilities	No	In order to avoid burdensome paperwork of traditional fault study values and existing

Organization	Yes or No	Question 4 Comment
		fault study values, common thresholds should be determined for initiating a review. Common thresholds can be common device ratings, or agreed upon levels at interconnects. As in Facility ratings, each owner should have device ratings for device capacities and can include short circuit ratings, which if exceeded can initiate a review.
Response: Thank you for your comment. **The drafting team agrees with your comment about establishing a common threshold but it is related to Protection System coordination rather than device ratings. The threshold we arrived at is a 10 % deviation of the Fault current values used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1.**		
Tennessee Valley Authority	No	1. The 10% change is too narrow for protection system studies. Accuracies of PT, CT, wiring, and modeling all add together and therefore the threshold for a new protection system study should be 15%.a) 2. In R2, Part 2.2, replace the term “deviation” with “change.” (Note: For this calculation all that’s required is to calculate percent change. i.e. Webster’s dictionary definition of “deviation” is 1) A variation that deviates from the standard or norm; "the deviation from the mean”. 2. The difference between an observed value and the expected value of a variable or function.) 3. In R2, Part 2.2, replace the term “present” with “new” and the term “most recent” with “previous”. Also reflect this terminology change in the % Change equation.(the use of the terms “present” and “most recent” can be perceived to be the same.) 4. It is also recommended that “V” for value be replaced by “I” for current. d) In R2, Part 2.1, please add “new”, delete “present” and add either “under normal conditions” or “maximum system conditions” so that it states “Perform a new short circuit study to determine the fault current values under normal conditions, not less than once every 24 months."

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comments. 1. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10 % margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.** 2. **The drafting team believes that the term "deviation" is properly used in R2 Part 2.2 and is synonymous with the term "change".** 3. **The drafting team believes that the terms "present" and "new" are properly used in R2 Part 2.2 and are synonymous with your recommended changes.** 4. **Per your suggestions and others, the drafting team has modified the equation to replace "V" with "I". The drafting team modified Requirement 2.1 to read "Perform a short-circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus, not less than once every 24 months."**		
ACES Power Marketing Standards Collaborators	No	(1) While we do not have an issue with the +/- 10% Fault current threshold, we question if the TO should be responsible for calculating the percent deviation for all Protection Systems for all Interconnected Facilities. Rather the TO should be responsible for calculating Fault currents on its transmission system and should be required to calculate the percent deviation for only those breakers and associated Protection Systems it owns and are protecting an Interconnected Facility and that it has performed the Protection System Study (PSS). The TO should communicate the Fault current to the owners of other Protection Systems protecting the Interconnected Facilities for them to calculate the percent deviation. (2) The main part of the requirement needs to be modified to further clarify for which Interconnected Facilities the TO is conducting short studies. As it is written now, each TO has to perform these short circuit studies for each Interconnected Facility. This literally means a TO has to perform short circuit studies for Interconnected Facilities for which it has no information or is even remotely responsible. For example, a literal reading would mean a TO in the Eastern Interconnection would have to perform a short circuit study for an Interconnected

Organization	Yes or No	Question 4 Comment
		Facility in the Western Interconnection. Obviously, this is not the drafting team's intention but the language does need refinement.

Response: Thank you for your comments.

1. **The drafting team changed the text in Requirement R2 to read: "For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall".**
2. **The drafting team changed the text in Requirement R2 to read: "For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall".**

Organization	Yes or No	Question 4 Comment
Kansas City Power & Light	No	a. Primary protection of most transmission lines is impedance based. Sensitive ground over current systems are used for communications assisted tripping and time ground over current systems are typically used as backup protection. Some line protection is differential based. Some entities also apply instantaneous ground over current relaying for faults at some fraction of the protected line. Increases in fault current do not affect impedance based relaying. Communications assisted sensitive ground elements are set well below available fault current levels and increases in fault current levels will not hinder proper operation. Differential based systems would also not be harmed by fault current increases unless fault currents increase enough to result in ct saturation. Since time ground over current relays are usually used as backup protection they are typically set only to operate if the primary relaying protection has failed. These relays are typically set to coordinate based on time delays for ground faults on the protected line. Because the overcurrent curves are based on a log scale the increase in current magnitude does not correlate to the same percentage in time. Instantaneous ground over current elements are most susceptible to misoperations caused by increases in fault current, however these elements should be initially set to protect only the first 50 to 70% of the protected line based on the fault current at the remote end. With this in mind a fault current increase of 10% is not significant by itself to require

Organization	Yes or No	Question 4 Comment
		a setting review and it is very difficult to see how a 10% decrease can affect the coordination unless over current elements are the primary protection elements or over currents elements can prevent the operation of the other protection functions. If the SDT is adamant about having a periodic review of fault current levels then the time should be extended to 5 years b. and the fault current level should be increased to 20% on the protected line.
Response: Thank you for your comments. a. **Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation. The drafting team believes studies associated with changes that would affect the coordination in less time would be triggered by other requirements in this standard.** b. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10 % margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.**		
Operational Compliance	No	1. We agree with the 10% value, but not with the actual wording in the Standard. The Standard reads "2.3 Where the calculation performed....indicates a deviation in Fault current of 10% or greater". It is not clear whether this means 10% Fault current deviation above or below, both or just above. 2. We also suggest that specific defined trigger events prompt a Fault current review for affected Interconnection Facilities, instead of fault current reviews being required every 24 months for every Interconnection Facility.
Response: Thank you for your comments. 1. **The drafting team changed the formula to take the absolute value of the calculated percent deviation to make it clear that the**		

Organization	Yes or No	Question 4 Comment
percent change is plus or minus 10 %. **2. Requirement 3 provides the specific defined trigger events as you suggest, however, the drafting team believes that a periodic Fault current study is still necessary to identify incremental changes in Fault current over time that could lead to relay miscoordination.**		
Pacific Gas and Electric Company	No	The requirement to run the fault study to determine if there is any 10% change is only required once every 24 months per requirement R2.1. But if you run a batch study and find a bunch of 10% changes, you only have 6 months to do all the coordination studies. We think a 12 month window for performing the coordination studies is more appropriate.
Response: Thank you for your comment. **The drafting team believes that complying with Requirement R3 will minimize the situation you describe.**		
Western Area Power Administration	No	We have concerns over what NERC considers to be a "Protection System Study". Needs to be defined more clearly.
Response: Thank you for your comment. **The drafting team modified the description of the term "Protection System Study" in the Technical Guidelines section of the standard.**		
Independent Electricity System Operator	No	We do not agree or disagree with the 10% deviation threshold. In the Technical Justification document, the SDT indicates that "The SDT investigated various inputs that would trigger a review of the existing Protection System Studies, and determined through the experience of the SDT members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary." Lacking statistical or detailed studied results, this basis is as good as any. However, there does not appear to be any assessment made on the potential

Organization	Yes or No	Question 4 Comment
		BES reliability risks when the Fault current deviates by less than 10%. Many Protection Systems' settings are linked to Fault current level and as such, deviation as low as a few percent may render a Protection relay not operating as intended. We suggest the STD to assess the risk of not conducting a verification study for the Protection Systems when Fault current deviates from past values at a lower range to either confirm that a 10% deviation would be a safe trigger, or revise it according to the findings of the risk assessment. (NTD: we may also suggest that a Protection System Study should be required for every BES modification that is in the electrical proximity of the Interconnected Facility and is expected to modify the Fault current levels.)
Response: Thank you for your comment. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10 % margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. Entities are not precluded from notifying other entities at levels of Fault currents lower than 10 %. The drafting team did not make any of the suggested changes. Further, Requirement 3 should capture Fault current changes caused by BES additions.**		
Sacramento Municipal Utility District	No	1. We do not agree with this requirement. The selection of a +/- 10% threshold is entirely arbitrary. For instance, some entities will set Z1 to 80%, leaving a 20% margin for error. Some entities will set it at 90%. The SDT should allow entities to decide for themselves when a review is needed. 2. As we stated before, the results based objective is to communicate and coordinate. Not to prove whether the fault current at a certain bus is +/- XX% greater than it was at some time in the past. Furthermore, the SDT itself states there is no proof that failure to coordinate protection systems is causing reliability issues. If entities allow their systems to become uncoordinated, we would expect it to come to light as a Misoperation and be handled under PRC-004. We do not agree it is the TO's responsibility to maintain a short circuit model for other entities. What responsibility does the TO take on if it models a generator's short

Organization	Yes or No	Question 4 Comment
		circuit capability incorrectly? This is a very real concern among transmission protection engineers when attempting to model large wind farms with their proprietary models.
Response: Thank you for your comments. 1. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. Entities are not precluded from notifying other entities at levels of Fault currents lower than 10%.** 2. **The expectation is that the Transmission Owner will be reviewing short circuit values on the Transmission Owner's facilities only. When the Transmission Owner identifies a 10% deviation at a location where there are Interconnected Elements, the Transmission Owner would notify the other entity(s). The Transmission Owner is identified as the entity responsible for performing the Fault current studies because they maintain the data necessary to perform the studies.**		
ReliabilityFirst	No	It may be appropriate to trigger a coordination review based on multiple criteria. For instance, perhaps coordination should be verified at the interconnection at least once every 7 years, as well as whenever the available fault current at the point of interconnection changes by more than 10%. There may be other better indicators when coordination should be checked as well such as a percentage change in system impedances at the interconnecting buses. RFC also questions whether there is a justification for choosing the 10% criteria (rather than say 5%)
Response: Thank you for your comment. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. Further, Requirement 3 should capture Fault current changes caused by BES additions; therefore, the drafting team believes a periodic study as you suggest is not warranted.**		
Idaho Power Company	No	No, We are unsure whether a 10% trigger level is appropriate in this context as the location of the fault is not specified in this Requirement. Faults used to properly set a

Organization	Yes or No	Question 4 Comment
		protective relay will be made at multiple locations and with various source conditions. The Requirement should be more specific in order to achieve consistent coordination among entities.
Response: Thank you for your comment. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The 10% trigger will potentially initiate a Protection System Study which could involve evaluating Faults at multiple locations and with various source conditions.**		
LCRA Transmission Services Corporation	No	1. A 10% change in fault current is not an appropriate criterion or "trigger" for relay coordination review. It does not meet the standard's purpose to ensure speed and selectivity requirements associated with protection system coordination. Requirement R2 should read as follows: "For each Interconnected Facility, each Transmission Owner that has ownership of the protective relay portion of the Protection System shall: " 2. Requirement R2.2:LCRA TSC recommends not including this requirement. Requirement R2.3: Should the SDT decide to include requirement R2.2, then rephrase R2.3 as follows:"Where the calculation performed, pursuant to Requirement R2, Part 2.2, indicates a deviation in Fault current of 10% or greater, notify each non-transmission owner of the Interconnected Facility, at which the 10% or greater deviation applies, within 30 calendar days after identification. As an alternative requirement to R2.2 and R2.3, LCRA TSC recommends the following language to R2.1, 2.2 and 2.3:2.1. Perform a short circuit study to determine the present Fault current values, not less than annually. 2.2. Pursuant to Requirement R2, Part 2.1, provide summary results to each directly impacted non-Transmission Owner entity at the Interconnected Facility, within 30 calendar days after completion of the short circuit study. 2.3 Delete

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comments. 1. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin.** 2. **The drafting team believes the requirement is appropriate as written.**		
Exelon	No	1. Exelon requests that the conditions under which the required short circuit (SC) study are to be performed should be defined. What future reinforcements should be assumed in the SC model, since the result will depend on these assumptions? 2. In R2, 10% or greater deviation in Fault Current may not be adequate to perform Short Circuit (SC) Study. It should be clearly stated what threshold is adequate to perform SC study successfully, and 3. the SDT should provide some examples how the 'six-month" time frame is considered a "reasonable amount "of time to perform the SC study.
Response: Thank you for your comments. 1. **The drafting team revised Requirement R2, Part 2.1 to indicate that the maximum available Fault current values are to be calculated. It is intended that current system models are to be used when performing the 24 month calculations, not future models.** 2. **The drafting team maintains that the 10% threshold is adequately sensitive and should be conducted every twenty-four months.** 3. **The drafting team believes that 6 months is adequate time to perform a Protection System Study triggered by a 10% deviation in current magnitudes at an interconnection. These Protection Systems should have been previously checked and documented under a Protection System Study and any settings changes should be minor.**		
Massachusetts Municipal Wholesale Electric Company	No	MMWEC endorses the comments submitted by NPCC.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comment. **See the response provided to NPCC's comments.**		
Public Service Enterprise Group	No	We disagree with this requirement for several reasons. a. A change in short circuit Fault current, in many cases, does not require relays to be reset. The requirement to perform a Protection System Study for this reason alone will likely provide no benefit when the relay performance is not dependent on short circuit current level. If the relay performance is directly dependent on short circuit level, then a % change in short circuit level may be appropriate. This distinction should be spelled out in R2. b. It is common for relays to be set at 30-50% of the Fault current or 150%-200% of the full load current. A change of +/- 10% in Fault current would have little to no impact on the existing settings and coordination.
Response: Thank you for your comments. **a. Requirement R1, Part 1.1.2 allows you to offer a justification as to why a Protection System Study is not needed even if Fault duty increases by 10%.** **b. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin.**		
Public Utility District No. 1 of Snohomish County	No	Comments: 1) SNPD does not agree with this requirement. The selection of a +/- 10% threshold is entirely arbitrary. For instance, some entities will set Z1 to 80%, leaving a 20% margin for error. Some entities will set it at 90%. The SDT should allow entities to decide for themselves when a review is needed. 2) As we stated before, the results based objective is to communicate and

Organization	Yes or No	Question 4 Comment
		coordinate. Not to prove whether the fault current at a certain bus is +/- XX% greater than it was at some time in the past. Furthermore, the SDT itself states there is no proof that failure to coordinate protection systems is causing reliability issues. If entities allow their systems to become uncoordinated, we would expect it to come to light as a Misoperation and be handled under PRC-004. We do not agree it is the TO's responsibility to maintain a short circuit model for other entities. What responsibility does the TO take on if it models a generator's short circuit capability incorrectly? This is a very real concern among transmission protection engineers when attempting to model large wind farms with their proprietary models.
Response: Thank you for your comments. 1. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. Entities are not precluded from notifying other entities at levels of Fault currents lower than 10%.** 2. **The expectation is that the Transmission Owner will be reviewing short circuit values on the Transmission Owner's facilities only. When the Transmission Owner identifies a 10% deviation at a location where there are Interconnected Elements, the Transmission Owner would notify the other entity(s). The Transmission Owner is identified as the entity responsible for performing the Fault current studies because they maintain the data necessary to perform the studies.**		
Georgia Transmission Corporation	No	1) Using "V" to denote fault current values may help the non-engineer reading the document, but "I" is the common nomenclature for current in the utility industry. The equation in R2.2 should use "I" in place of "V". 2) There is a risk in using calculated fault currents of the most recent PSS and not existing relay settings. If the entity uses 10% margin in settings it will be too late to make settings changes. Should the margin be based on existing fault calculations and existing relay settings basis?
Response: Thank you for your comments.		

Organization	Yes or No	Question 4 Comment
1. The drafting team made the suggested change replacing "V" with "I" in the equation. 2. The drafting team does not understand the scenario you describe.		
Platte River Power Authority	No	The selection of a +/- 10% change in an Interconnected Facilty's Fault current value is arbitrary. The results based objective is to communicate and coordinate.
Response: Thank you for your comment. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin.**		
MWDSC	No	1. Every TO should not be required to perform a short-circuit study every 24 months if there were no significant changes to that TO's BES facilities. Changes in adjoining interconnected BES systems could change short-circuit duties for an adjoining TO's system. The TO whose BES changes should be responsible for performing short-circuit duties on all adjoining systems as part of Requirement R3. 2. In addition, FAC-002-1 requires TOs to coordinate with TPs and PAs in the assessments of proposed new facilities, including evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission through steady-state, short-circuit, and dynamics studies.
Response: Thank you for your comments. **1. The drafting team believes that a periodic Fault current study is necessary to identify incremental changes in Fault current over time that could lead to relay miscoordination. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes. Further, Requirement 3 should capture Fault current changes caused by BES additions.** **2. The statements you make about FAC-002-1 are correct, however, Requirement R1.4 of that standard requires the**		

Organization	Yes or No	Question 4 Comment
Transmission Owner to evaluate system performance under short circuit and other conditions in accordance with the TPL-001-0, TPL-002-0 and TPL-003-0 planning standards. The "coordination" reference in FAC-002-1 is synonymous with "cooperation". No reference to Short Circuit Studies for the purpose of verifying protective relay coordination is made in FAC-002-1. The drafting team believes that Short Circuit Studies as proposed in PRC-027 adequately accomplish the purpose of the standard.		
NPPD	No	Monitoring for a 10% change in faults could trigger studies that are not needed and it is not necessarily a good indicator settings updates are needed. It would be more practical to require a review of settings on a set interval (5 years) or as required by R3.
Response: Thank you for your comments. **The drafting team believes that a periodic Fault current study is necessary to identify incremental changes in Fault current over time that could lead to relay miscoordination. The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin.**		
NextEra Energy Inc	No	It would seem that NERC Standards efforts, such as PRC-027 should focus on areas that have a record of poor performance and a contributor to misoperations. The area of tie line protection addressed in PRC-027 is not an area of poor performance, see page 4 of the attachment "....Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations". Areas that are less problematic should be addressed by NERC with less intrusive methods such as Industry Alerts, general cautionary statements or a standard with less detailed documentation requirements. Thus, PRC-027, as drafted, will unnecessarily require additional focus and resources be placed in an area that has not been a problem for the reliability of the BES. Alternatively, PRC-027 should be drafted much less prescriptively from a technical standpoint, and allow for more discretion on how to conduct the study and how to coordinate the results. The prescriptive nature of many of the technical

Organization	Yes or No	Question 4 Comment
		requirements PRC-027 is so narrow that it may counterproductive. A results-based approach here should focus more on conduct a study and coordinating the results, rather than dictating how the technical requirements of how study is to be completed.
Response: Thank you for your comments. **PRC-027-1 is replacing Requirements R2 and R3 of PRC-001-2. The drafting team is developing a standard based on a SAR accepted by the Standards Committee and is addressing directives issued by FERC in Order 693.**		
ExxonMobil Research & Engineering	No	
Liberty Electric Power LLC	No	
National Grid USA / Niagara Mohawk	Yes	Please clarify where the fault is to be placed and where the deviation is to be observed. One possibility is to place the fault at a bus at one end of the tie and then determine the deviation in the current in each element connected to said bus.
Response: Thank you for your comment. **Per your suggestions and others, the drafting team has modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."**		
SERC Protection and Control Subcommittee	Yes	a) In R2 2.2, replace the term "deviation" with "change." (Note: For this calculation, all that is required is to calculate percent change. For example, Webster's dictionary definition of "deviation" is: 1) a variation that deviates from the standard or norm; "the deviation from the mean" 2) the difference between an observed value and the expected value of a variable or function.) b) In R2 2.2, replace the term "present" with "new" and the term "most recent" with

Organization	Yes or No	Question 4 Comment
		"previous". Also reflect this terminology change in the %Change equation. (The use of the terms "present" and "most recent" can be perceived to be the same.) c) It is also recommended that "V" for value be replaced by "I" for current. d) In R2 2.1, please add "new", delete "present" and add either "under normal conditions" or "maximum system conditions" so that it states "Perform a new short circuit study to determine the Fault current values under normal conditions, not less than once every 24 months.
Response: Thank you for your comments. **a. The drafting team believes that the term "deviation" is properly used in R2 Part 2.2 and is synonymous with the term "change".** **b. The drafting team believes that the terms "present" and "new" are properly used in R2 Part 2.2 and are synonymous with your recommended changes.** **c. Per your suggestion, the drafting team has modified the equation to replace "V" with "I".** **d. The drafting team modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."**		
Associated Electric Cooperative, Inc., JRO00088	Yes	1. A 10% threshold seems simple, but the SDT may or may not wish to clarify the formula to be applied because any of the following is a valid interpretation: 1) abs(Vscs - Vpss)/Vscs, 2) abs(Vscs - Vpss)/Vpss, 3) abs(Vscs - Vpss)/0.5(Vscs + Vpss), 4) abs(Vscs -Vpss)/Max(Vscs,Vpss), or 5) abs(Vscs-Vpss)/Min(Vscs,Vpss). 2. Also see SERC PCS Comments.
Response: Thank you for your comments. **1. Initially, the posted standard was missing the equation but the document was reposted with the equation included. The drafting team modified the equation to include the absolute value.**		

Organization	Yes or No	Question 4 Comment
2. Please see the drafting team's responses to the SERC PCS comments.		
Southern Company	Yes	When calculating the "+/- 10 % Fault current threshold", the use of bus fault values vs the line contribution values should be clarified.
Response: Thank you for your comment. **The drafting team modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."**		
Texas Reliability Entity	Yes	1. Using a +/- 10% change is a good threshold, with the understanding that if a change in fault current value of less than 10% results in a need to change relay settings, then Requirement R3.1 will cover the coordination between entities in that case. 2. Additional comment: For R2.1, Does the SDT also want to consider other system studies in addition to short circuit studies (e.g. critical clearing time studies at generation facilities needed for breaker failure coordination, equipment rating studies, or stability studies)?
Response: Thank you for your comments. **1. Your understanding about R3.1 covering the scenario you describe is correct.** **2. The drafting team doesn't believe that the other studies you mention should be considered in this standard.**		
Xcel Energy	Yes	Similar comments on measure M5 as contained in item 3 above on measure M2.This provision should become effective 36 months after the effective date of the standard.
Response: Thank you for your comments. **The drafting team believes that the description of the evidence in the Measure is acceptable. The drafting team further believes**		

Organization	Yes or No	Question 4 Comment
that the 24 month time frame to perform a short circuit study is adequate.		
Ameren	Yes	(1) In R2 2.1 we request the SDT add “under normal conditions” or “under maximum system conditions” so that it states “Perform a short circuit study to determine the present Fault current values under normal conditions, not less than once every 24 months. “ (2) We request the SDT clarify which Interconnection Facility fault current values are to be compared. If the intent is to keep this general so the entities have the flexibility to compare those fault current values that the entities judge appropriate, please state. Otherwise we suggest adding “Specifically find fault current values flowing into each terminal of the Interconnected Facility for independently applied single line to ground and 3-phase short circuits at its other terminal(s).” (3) We request the SDT change R2 2.2 wording to “Calculate the percent [delete - deviation] change between the Fault current values (single line to ground and 3-phase [delete - for the bus(s) or Element(s)] flowing into each terminal of the Interconnected Facility under consideration) used in the most recent Protection System Study...”. This along with our recommended change to R2 2.1 clarifies the short circuit values that are to be compared. (4) We request the SDT change R2 2.1 to “not less than once every 5 years” for consistency with TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. Our experience is that PRC-027-1 R3 will trigger almost all Protection System Studies anyhow.

Response: Thank you for your comments.

1. **The drafting team modified Requirement 2.1 to read “At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1.”**
2. **The drafting team modified Requirement 2.1 to read “At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus**

Organization	Yes or No	Question 4 Comment
where a Protection System Study is available per Requirement R1.” **3. The drafting team believes that the term “deviation” is properly used in R2 2.2 and is synonymous with the term “change”. We also believe that the changes made to R2.1 clarify where the fault is to be applied and monitored.** **4. The reliability intent and purpose of the two standards is different. The drafting team agrees with you that Requirement R3 should capture Fault current changes caused by other BES additions.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	Yes	Ingleside Cogeneration LP agrees that a 10% delta in Fault current is material and would warrant further study. However, we are not sure how these studies would correlate to those managed by Planning Coordinators and Transmission Planners. It seems like these entities would have to be involved in any studies that may result in a change in relay settings or a Protection System upgrade.
Response: Thank you for your comment. **The drafting team does not believe the Planning Coordinators or Transmission Planners need to be involved in Protection System Studies associated with verifying protective relay coordination.**		
American Transmission Company	Yes	ATC does agree with the premise of the a 10% change but believes that the SDT needs to provide a clear definition of which fault current must change 10% to trigger the notification requirements and initiation of a protection study. Fault current on an interconnecting line may change very little even though bus fault contributions from other lines may have increased considerably, affecting in feed current and relay settings.
Response: Thank you for your comment. **The drafting team modified Requirement 2.1 to read “At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1.”**		

Organization	Yes or No	Question 4 Comment
Duke Energy	Yes	However it's unclear what Fault duty is being referred to. Is it the total Fault current at the bus, or Fault current that flows down the line or to the generator? It should also be clarified that Fault duty is the normal case (i.e. with all sources and all lines in-service).
Response: Thank you for your comment. **The drafting team modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."**		
Oncor Electric Delivery Company LLC	Yes	Oncor takes the position that the 10% fault current threshold criteria is the only criteria needed;
Response: Thank you for your comment.		
Dominion	Yes	a) In R2-2.2 Replace the term "deviation" with "change". {(Note: For this calculation all that is required is to calculate percent change. i.e. Webster's dictionary definition of "deviation" is 1) A variation that deviates from the standard or norm; "the deviation from the mean". 2. The difference between an observed value and the expected value of a variable or function. This is not a statistical calculation.) } b) In R2-2.2, Replace the term "present" with "new" and the term "most recent" with "previous". c) Change the % Deviation Equation to % Change. Reflect as stated above in the equation legend (the use of the terms "present" and "most recent" can be perceived to be the same). d) Replace "V" (Value) with "I" (Current) in the % Change Equation. "V" is frequently used to represent Voltage and this could lead to confusion. e) In M5 Replace the term "deviation" with "change".

Organization	Yes or No	Question 4 Comment
		f) In R2-2.1 please add “new”, delete “present” and add either “under normal conditions” or “maximum system conditions” so that it states “Perform a new short circuit study to determine the Fault current values under normal conditions, not less than once every 24 months.
Response: Thank you for your comments. a. **The drafting team believes that the term “deviation” is properly used in R2 Part 2.2 and is synonymous with the term “change”.** b. **The drafting team believes that the terms “present” and “new” are properly used in R2 Part 2.2 and are synonymous with your recommended changes.** c. **See response to “a”.** d. **Per your suggestions and others, the drafting team has modified the equation to replace “V” with “I”.** e. **See response to “a”.** f. **The drafting team modified Requirement 2.1 to read “At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1.”**

mason		No comment

5. **In Requirement R3, the SDT included a list of proposed changes that impact the coordination of Protection Systems and would initiate a need to inform other entities. Do you agree that this is an appropriate and inclusive list? If not, please provide specific suggestions for additions or deletions with your reasoning(s) in the comment area.**

Summary Consideration:

Several commenters suggested minor wording changes to the list included in Requirement R3, Part 3.1. The drafting team considered all of the suggestions and made changes including combining the second and third bullets to read as follows 'Changes to a transmission system Element that change any sequence or mutual coupling impedance'. Also, the fourth and fifth bullets were modified to indicate that impedance changes are what need to be communicated.

A few commenters had concerns with the 30 day time frame in Parts 3.2 and 3.3 while other commenters wanted them eliminated. The drafting team explained that they believed the 30-day time frame is appropriate and declined to make the change, and further explained the purposes for the Parts and retained them with minor wording changes.

Some commenters wanted to remove reference to schedules in the requirements. The drafting team reinforced that they believe the sharing of project schedules is a necessary communication between entities.

Some commenters did not like the use of the word "error" in Requirement 3, it was restated as follows: Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

A few commenters expressed concerns that there is redundancy between this draft standard and several FAC standards. The drafting team stated their belief that these concerns were not applicable.

Organization	Yes or No	Question 5 Comment
Southwest Power Pool NERC Reliability Standards Development Team	No	In R3 we would suggest that re-rating could be use as a temporary procedure which is addressed in the TOP standards and if the drafting team needs to include these types of re-ratings that they be more specific to exclude the temporary re-ratings. Changes to generator unit(s), including replacements, Output change that causes a change in the protection system, and impedances

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment **The drafting team believes that if a temporary or permanent re-rating modifies the conditions used in the coordination of Protection Systems of the Interconnected Stations, then any associated protective relay setting changes must be provided to the other entities.**		
Pepco Holdings Inc. & Affiliates	No	The 10% threshold would be acceptable providing the following changes were made to Requirements R2.1 and R2.2:R2.1 – 1. Re-word Requirement R2.1 to read: "Perform a short circuit study to determine the present maximum available fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities, not less than once every 24 months. 2. R2.2 - Re-word Requirement R2.2 to read: "Calculate the percent deviation between the maximum available Fault current values (single line to ground and 3-phase) at the point of interconnection for the Interconnected Facilities used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1, using the following equation..."The existing wording requires one to "calculate the percent deviation between the fault current values ... for the bus(s) or Elements(s) under consideration". 3. Including the phrase "or Element(s) under consideration" increases the complexity of the periodic fault screening requirement significantly. Instead of performing a relatively easy bus fault summary routine (available in most batch short circuit programs) individual branch current in various coordination pairs must be examined. Take for example the system shown in Figure 1 in the Application Guidelines. Instead of just screening the available bus fault current at the point of interconnection (the ownership boundary between the two entities), fault current in each "element under consideration" used in the Protection study must be calculated. This would mean determining fault current flows through breakers A, B, C, D, E, F, G, & H) under various fault scenarios and

Organization	Yes or No	Question 5 Comment
		comparing them to those used in the previous coordination study. This is far from a simple task and not conducive to a "batch" screening tool. The intended purpose of R2.2 is to catch external system changes that have over time led to gradual increases in fault current that may require the Protection System Study to be re-examined. A simple year to year bus fault comparison would serve this purpose. System changes at, or immediately adjacent to, the interconnection point, which could lead to a re-distribution of fault currents through the effected element(s), would be caught elsewhere under R3.1 "Additions, removals, or replacements of transmission Elements".
Response: Thank you for your comments. **1. Per your suggestions and others, the drafting team has modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."** **2. The drafting team believes the existing wording was sufficient and did not make your suggested change.** **3. The drafting team did remove the word "or Element(s)" as you suggested.**		
Hydro One	No	While we agree with the principle of exchanging information, R3.1 is confusing "...or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities." We believe that this statement is too inclusive. It implies that changes in facilities other than the Interconnected Facility need to be communicated and is too open for interpretation. Suggest the scope be better defined and limited only to changes at the Interconnected Facility.
Response: Thank you for your comment **The drafting team revised the term "Interconnected Facilities" to "Interconnected Element". The drafting team believes changes at other Facilities that modify the conditions used in the coordination of Protection Systems of the Interconnected Elements need to be communicated because they could lead to coordination issues. An example of this is a new substation installed near**		

Organization	Yes or No	Question 5 Comment
Interconnected Elements that could require a change in impedance relay settings for overreaching zones.		
Luminant	No	Luminant agrees with R3.1 and 3.2. Luminant suggests that the language in this requirement be revised so it is clear what is to be provided between the parties.
Response: Thank you for your comment. **Requirement R3, Parts 3.1, 3.2, and 3.3 each refer back to the main Requirement R3. The drafting team revised Requirement R3, Part 3.2 to clarify that it pertains to responses for Protection System coordination information.**		
Bonneville Power Administration	No	BPA believes that it is not practical to list all of the possible changes that could impact the coordination of protection systems. Any such list will likely lead to unnecessary notification in most cases, while failing to recognize unusual situations that could cause miscoordination. BPA is in favor of a simplified approach where notification is provided to the owner of the remote terminal(s) whenever a change is made to the protection scheme at one terminal.
Response: Thank you for your comment. **The drafting team appreciates your concern but believes changes to a protection scheme are not the only system changes than can lead to miscoordination.**		
FirstEnergy	No	Requirement 3, Part 3.1 - We believe that some entities registered as both a TO and a GO may face Standards of Conduct issues if a TO is required to provided the “bulleted” data specified within the Part 3.1.
Response: Thank you for your comment. **The drafting team does not believe that the requested exchange of information would violate the Standards of Conduct for an entity registered as both a GO and a TO.**		
Santee Cooper	No	In R3, 3.3.1, change the wording to address “changes” instead of “corrections” for “errors.” Many changes are made that are not the result of errors. The purpose here

Organization	Yes or No	Question 5 Comment
		should be to communicate changes, and people shouldn't have to debate whether or not to make an "improvement" (not because of an error or misoperation) because it may be construed as a correction of an error.
Response: Thank you for your comment **Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Western Small Entity Comment Group	No	R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination studies and this seems appropriate. We believe that R3 should focus more on DPs and GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward.
Response: Thank you for your comment. **Requirement R2 requires the Transmission Owners to perform the Fault current studies because they have the necessary information to perform the studies. Requirement R1 requires all applicable entities to perform Protection System Studies. Requirement R3 requires all applicable entities to exchange the information necessary for Protection System coordination.**		
Northeast Power Coordinating Council	No	DP must be excluded from R3. See the response to Question 2.
Response: Thank you for your comment **The drafting team believes that the Owner of the Protection System is responsible for sharing information to ensure its Protection Systems are coordinated with others.**		
PPL Corporation NERC Registered Affiliates	No	See comment in question #1 above.
Response: Thank you for your comment.		

Organization	Yes or No	Question 5 Comment
The drafting team revised the term "Interconnected Facilities" to "Interconnected Element". The drafting team believes that coordination is required at all Interconnected Elements between Transmission Owners and Generator Owners regardless of whether the entity is an independent Generator Owner. It is acknowledged that in many cases, the majority of the work associated with this task will fall on the Transmission Owner; however, the coordination of some Protection Systems applied on generators must be verified by the Generator Owner.		
SERC Protection and Control Subcommittee	No	a) Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout this standard already address notification requirements. b) In R3 3.3.1, change requirement to read: "Changes are made to a Protection System as a result of findings during misoperation investigations, commissioning, or maintenance activities."(The current wording implies that all findings are due to errors. The reference to errors should be removed and the emphasis of this requirement needs to be placed on "changes" made to Protection Systems when it becomes apparent that a change is required which impacts coordination of relays.)
Response: Thank you for your comment. **a. The drafting team believes it is necessary to share the pertinent scheduling information that could affect the other party.** **b. Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Colorado Springs Utilities	No	Specific project schedules can potentially cause violation of other requirements. 1. A proposed change of conductor spacing, which can be interpreted as a change of one transmission structure requires notification to other entities, which we feel is excessive. 2. Re-rating of generators rarely changes the protection, impedances or coordination involved. It is common to re-rate units depending on external factors to the

Organization	Yes or No	Question 5 Comment
		generator which also provides excessive reviews and project schedule notifications. 3. This section also implies notifications must be made after like and kind replacements of equipment found during misoperation investigations, but not those found during testing. On larger systems this requirement would be difficult unless notifications were made more than twice a month, which would require a large tracking system of who, what, and when information is sent to interconnected utilities.
Response: Thank you for your comment **1. The drafting team has modified the bullet in 3.1 to read "Changes to a transmission system Element that changes any sequence or mutual coupling impedance'; therefore, the noted change in spacing that does not change the impendence used in the system model would not need to be communicated.** **2. The drafting team believes that, regardless of the probability of a change affecting Protection Systems; it must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained.** **3. The drafting team believes that testing is included in commissioning and maintenance activities. The drafting team believes that relay replacement information needs to be provided to the interconnecting entity and that 30 calendar days is sufficient and adequate to provide the notice.**		
Tennessee Valley Authority	No	a) Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout this standard already address notification requirements. b) In R3,Part 3.3.1, change Requirement to read: "Changes are made to a Protection System as a result of findings during Misoperation investigations, commissioning, or maintenance activities." (The current wording implies that all findings are due to errors. The reference to errors should be removed and the emphasis of this Requirement needs to be placed on "changes" made to Protection Systems when it becomes apparent that a change is required which impacts coordination of relays.)

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. a. **The drafting team believes it is necessary to share the pertinent scheduling information that could affect the other party.** b. **Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Associated Electric Cooperative, Inc., JRO00088	No	1. AECI believes the industry would be better served by placing this list of items into a Guidance document, and rephrasing R3 to include only "field-changes known to modify the conditions used in coordination settings of Protection Systems." Although some of the listed items are direct-impact, as currently drafted, any field-equipment changes are potentially in scope, regardless of proximity to the Interconnected Facility(s) of interest. 2. With exception of R3.1 Bullet #1, the R2.3 10% is a better metric and the other Guidance bullets and wording we proposed above, should be added into R2.3.
Response: Thank you for your comment 1. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** 2. **The drafting team respectfully disagrees and declines to make your suggested changes.**		
ACES Power Marketing Standards Collaborators	No	In general, we are supportive of the list and requirement because it helps to clarify what changes are intended in Part 1.1.3 in Requirement R1. However, we have identified two specific issues with the list. (1) First, we question if this requirement is at least partly duplicative with FAC-001-0 R2.1.2 which requires the TO to have procedures for notification of new or modified equipment.

Organization	Yes or No	Question 5 Comment
		(2) Second, the third bullet regarding additions, removals, and replacements of transmission system Elements is too broad. This literally means that if a TO replaces a bus section with similar equipment, this requirement to notify of changes is triggered which then triggers a Protection System Study or documentation that one is not required per Requirement R1 Part 1.1.3. Ultimately, we believe the changes that need to be identified are those that actually affect the Protection Systems for the Interconnected Facilities or those that change the Fault current on the Interconnected Facilities. (3) The 30 day requirement should be struck from Part 3.2. If a schedule is not identified by any party, it must not be pressing and an artificial deadline should not be created. (4) The language of the main requirement needs to be further refined. A literal reading would require the TO, GO, and DP to provide details about Interconnected Facilities that they neither own nor operate or to which they are even connected. Obviously, the literal meaning is not intended. The requirement needs to be refined to clarify that the TO, GO, and DP only need to provide the details for Facilities they own. (5) For Part 3.3.2, we suggest clarifying that this requirement does not apply if the equipment is replaced with like equipment and settings. (6) We also suggest that that some sort of exemption is written into this part for extreme weather events that allows more time for notifications.

Response: Thank you for your comment

1. **While FAC-001 Part R2.1.2 does require the Transmission Owner to have a procedure, the drafting team believes the two requirements are not duplicative. PRC-027-1 Requirement R3 requires the communication of Protection System information between owners of Interconnected Elements.**
2. **Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be**

Organization	Yes or No	Question 5 Comment
communicated. **3. The drafting team believes that 30 days is a sufficient time to reply to a request for information; however, the requirement provides flexibility to negotiate an extended schedule.** **4. The drafting team revised Requirement R3 for clarification, indicating that the owner shall provide details to only Responsible Entities connected to the same Interconnected Element.** **5. Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."** **6. The drafting team believes that 30 calendar days is sufficient and adequate to provide the notice and declines to make a change.**		
Kansas City Power & Light	No	Bullet item #3 is too broad. The NERC Glossary definition for Element is, "Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.". For example, a disconnect switch would be considered an Element, but a change of this component would not warrant a change to relay protection. Recommend modifying bullet item #3 to, "Additions, removals, or replacements of transmission system Element(s) that have an impact on relay protection systems or component(s)"
Response: Thank you for your comment. **Based on your and other comments, the drafting team revised Requirement R3 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.**		
Southern Company	No	Reference the bullet on Line items; the issue of mutual coupling and/or overhead grd wire replacement or changes should be included. Perhaps change to any change that impacts the positive, or zero sequence impedance.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. **Based on your and other comments, the drafting team revised Requirement R3 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.**		
Western Area Power Administration	No	1. What are the details to be provided? 2. Should only be for significant changes.
Response: Thank you for your comment **1. The drafting team believes that the examples of the provided information are clear but leave flexibility between the two parties.** **2. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.**		
Flathead Electric Cooperative, Inc.	No	Comments: R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination studies and this seems appropriate. We believe that R3 should focus more on DPs and GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward
Response: Thank you for your comment **Requirement R2 requires the Transmission Owners to perform the Fault current studies because they have the necessary information to perform the studies. Requirement R1 requires all applicable entities to perform Protection System Studies. Requirement R3 requires all applicable entities to exchange the information necessary for Protection System coordination.**		
Manitoba Hydro	No	(1) It is not clear what this list should include. Should the protection changes on the interconnected facilities only be included? Or should it include the protection

Organization	Yes or No	Question 5 Comment
		changes on the adjacent elements? (2) Also, for the changes of power system elements, should those connected directly to the interconnecting bus be included or it should also include changes beyond that?
Response: Thank you for your comment **1. The drafting team believes Protection System changes at other Facilities that modify the conditions used in the coordination of Protection Systems of the Interconnected Elements need to be communicated because they could lead to coordination issues.** **2. The drafting team believes changes at other Facilities that modify the conditions used in the coordination of Protection Systems of the Interconnected Elements need to be communicated because they could lead to coordination issues. An example of this is a new substation installed near Interconnected Elements that could require a change in impedance relay settings for overreaching zones.**		
LCRA Transmission Services Corporation	No	(1) Requirement R3 should read: Each Transmission Owner, Generator Owner, and Distribution Provider that has ownership of the protective relay portion of the Protection System shall provide to each directly impacted Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility, the details (e.g., project schedule, protective relaying scheme types and settings) as follows: (2) The first bullet of requirement R3.1 should read: New installation, replacement with different types, or modification of: protective relays or protective function settings that result in a direct impact on protection system coordination to an entity at that Interconnected Facility. (3) The second bullet of requirement R3.1 should read: Changes to positive or zero sequence line impedance by more than 5 percent
Response: Thank you for your comment **1. The drafting team believes that the Applicability section appropriately describes which entities and for which installations**		

Organization	Yes or No	Question 5 Comment
require exchange of data. **2. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available. (3) Based on your comment and others, the second bullet of Requirement R3, Part 3.1 was modified (and combined with the third bullet). However, the drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.**		
Exelon	No	In the current draft of PRC-027-1, Requirement 3.1 mandates that for any of the listed network changes, entities must communicate "the details", (i.e., design information to all entities that share the interconnection). Of the network changes/additions listed in the draft, however, some may result in little or no changes to existing protection system coordination settings, thereby having no impact to Protection Systems of other entities. For example, consider a project by a TO to replace a BES circuit breaker at an Interconnected Facility. Assume that breaker failure protection for that circuit breaker will also be upgraded, but that the settings and all protection functions for the new relay remains unchanged from the old system. According to the language of Requirement 3.1, the TO would be required to transmit design information to other entities associated with the interconnected facility even though the project would have no impact to the other entities. This represents one example of a frequently performed project in which design information is not presently shared between entities at an Interconnected Facility. Mandatory compliance with this requirement, as written, could represent a significant burden to the industry by requiring unnecessary communication of design details to other entities, in addition to the added compliance documentation activity, and having no impact to protection systems of the recipients. Exelon suggests that the SDT clarify Requirement 3.1 such that that if a change to an Interconnected

Organization	Yes or No	Question 5 Comment
		Facility is not expected to result in a change to the desired sequence of Protection System operations , the compliance activities required by R3.1 should be waived
Response: Thank you for your comment. **Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.** **In your specific example, the drafting team believes that, if the proposed breaker failure protection change does not modify the impedances used in the calculation of fault currents, then the information does not need to be exchanged.**		
Tacoma Power	No	1. This list does not appear to sufficiently address BES transformers (e.g., autotransformers). 2. There is concern that R3.1 may introduce either an administrative burden to identify and track every change, including those that would not reasonably impact Protection System coordination, or compliance jeopardy if those changes are not identified and tracked. a. For example, the second bullet under R3.1 refers to changes to line spacing. Assume that, during restoration following a Fault, a damaged insulator on one pole or tower is replaced with an insulator one inch longer. Technically, this changes the line spacing. It is doubtful that the SDT intended that this or a similar but less trivial scenario would trigger a Protection System Study; however, the language may introduce compliance jeopardy. Perhaps a similar metric as used in R2.3 could be applied to the second, third, fourth, and fifth bullets. For example, perhaps a 5% change in interconnecting Element impedance from a baseline could trigger a Protection System Study; this approach could be used in lieu of the second and fifth bullets. It seems that R2.3 would address the third and fourth bullets if the short circuit study were conducted before the change was implemented. b. Additionally, the language in the first bullet under R3.1 may introduce compliance jeopardy. For instance, it is possible for an entity to adjust a current and/or voltage

Organization	Yes or No	Question 5 Comment
		transformer ratio and compensate with one or more relay settings such that the primary settings do not change. In many of these cases, there will be no impact on Protection System coordination. While active communication among entities is advised, the potential for fines in this type of scenario does not seem to be appropriate. The emphasis on the first bullet under R3.1 should be on Protection System scheme (e.g., distance, overcurrent, DCB, POTT, differential), primary settings (including time delays), independence/redundancy, and technology (primarily for communications systems).
Response: Thank you for your comment **1. The drafting team believes that BES transformers are addressed in the original third bullet, which is now combined into the second bullet, of Requirement R3, Part 3.1.** **2a. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** **In your specific example, the drafting team believes that the type of damage replacement that you suggested is so small that it would not modify the impedances used in the calculation of fault currents and would therefore not need to be communicated to the interconnecting entity. Part 3.1 does not trigger a Protection System Study.** **2b. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the type of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.**		
Public Service Enterprise Group	No	a. R3 should be rewritten as follows: "Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the following to each Transmission Owner, Generator Owner, and Distribution Provider connected to each Interconnected Facility:" b. Part 3.1 should be modified as follows: "For any change or additions listed below,

Organization	Yes or No	Question 5 Comment
		provide a project schedule and the reason for the project, whether to an existing or new Interconnected Facility or to other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities:" c. Part 3.2 does not read well and is not supported by the explanation in the text box. It references 1.1.1, 1.1.2, and 1.1.3, but none of these parts allow an Interconnection Facility owner to request information from another owner to perform the Protection System Study. We can understand why Interconnection Facility owners need to cooperate in the performance of such studies. This thought belongs in R1. We suggest a new 1.2 (with the existing 1.2 renumbered to 1.3) as follows: "Each Interconnected Facility owner shall provide data requested by another owner and which is needed to perform the study in 1.1, either in accordance with an agreed-upon schedule, or within 90 days of receiving the request." We believe 30 days is too short to require a response.
Response: Thank you for your comment **a. Requirement R3 was reworded to enhance clarity.** **b. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** **c. The drafting team believes that nothing in the requirements precludes an entity from asking for necessary data, and requirements are needed to ensure that requested data is provided. The drafting team believes that 30 calendar days is sufficient and adequate to provide the response, and declines to make a change.**		
Liberty Electric Power LLC	No	The phrase "Changes to generator unit(s), including replacements, re-ratings, and impedances" is too vague. Audit teams could read any change as a trigger. Suggested change: "following the replacement or re-rating of a generator, or following any change to a generator which results in a change in impedance".

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. **The drafting team has made your suggested change.**		
Ameren	No	We recommend the following changes to Requirement 3- (1) Include 'static wire' in the second bullet, or more simply state as 'line impedance changes.' (2) Include 'bus arrangement changes' in the third bullet. (3) Change the fourth bullet to include 'Additions, retirements, or changes...' to strive for consistency for generation and transmission.
Response: Thank you for your comment **1. Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.** **2. The drafting team believes that "bus arrangement changes" would be included in the revised second bullet of Requirement 3, Part 3.1.** **3. The drafting team believes the existing language is clear with regard to generation and respectfully declines to make the change.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	No	Ingleside Cogeneration LP believes that the coordination process developed by the project team is redundant with the one established in FAC-002-1. If there is a material change made to a Facility, the process should be captured in a single reliability standard.
Response: Thank you for your comment. **FAC-002-1 does not address Protection System coordination and the drafting team does not believe the two standards are redundant. As described in the "Description of the Current Draft," PRC-027 is replacing PRC-001, Requirements R3 and R4.**		

Organization	Yes or No	Question 5 Comment
Georgia Transmission Corporation	No	1. The parenthetical comment in R3 should be deleted. R3.1 lists the items that would trigger the need for notification between entities. Once notified of modifications, the entities will communicate documentation needs. 2. R3.2: In the case of major BES equipment failure, there is a more pressing need to notify an interfacing entity that there has been change that could affect fault magnitudes. The 30 calendar days may be too long for such occurrences and 2 business days would be more in consideration. 3. R3.3.1 may interfere with PRC-004-# time schedules for misoperation follow-ups and investigations. 4. R3.3.2: Refer to comment above regarding R3.2.
Response: Thank you for your comment 1. **The drafting team believes that the parenthetical expression is beneficial to Requirement 3, but it was moved to Part 3.1 for clarity.** 2. **Requirement 3, Part 3.2 regards responding to a request for information required to perform a Protection System Study, not for notification of an unplanned change in the BES configuration.** 3. **The drafting team believes that the notifications of Requirement 3, Part 3.3 will not impact schedules for any future version of PRC-004 because the notifications take place after the corrective action has been implemented.** 4. **Requirement 3, Part 3.2 regards the failure of Protection System components and their replacement, not BES Elements that can change the fault duty.**		
Wisconsin Electric Power Company	No	1. R3 should have the phrase “shall notify...” in the requirement, not simply “shall provide ...the details”. This should be a requirement for entities to provide a notification to other entities that some changes are being planned which may affect Protection System coordination. 2. The wording in R3.1 is unclear as to the intended scope of the qualifying phrase, “when the proposed change modifies the conditions used in the coordination of

Organization	Yes or No	Question 5 Comment
		Protection Systems of the Interconnected Facilities." It should be made clear that ONLY those changes which affect coordination need to be communicated to other entities, whether at new or existing Interconnected Facilities or other facilities. If this is the case, then some of the comments below may not apply. 3. Also in R3.1, the bullets for "changes" in transmission systems and generators should be modified by the word "significant". Likewise, a "replacement" of an Element, or relay, or other device, may not require any change in relay settings, so the wording should be modified by "replacements which require protection setting changes". The bullet for changes to generators should also remove the "re-ratings" term, since a re-rating of a generator typically affects output power, but does not change the impedance. Indeed, there may be many minor changes which fall in the current R3.1 list which may have little or no effect on fault coordination, and therefore should not trigger a requirement for a notification or a study. Also, changes to CT or VT ratios do not necessarily result in a change in primary quantities, so these references should be removed. 4. R3.2 should be revised to require an entity making significant changes to provide the data to the other affected entities, without the need for the other entities to request it. 5. The R3.3 requirement (3.3.1 and 3.3.2) to notify other entities within 30 days for changes made following a Misoperation or failure is too restrictive. A timeframe of 60 days would be more appropriate. Also, as above, these requirements should only be applicable when the changes made have a "significant effect on coordination." A requirement to make notifications for changes unrelated to Interconnected Facility coordination will not serve the objective of increased reliability, and only increases unnecessary compliance documentation. 6. M7 (last phrase) should be revised to "...or absent such an agreement, within 30 calendar days of a request."
Response: Thank you for your comment		

Organization	Yes or No	Question 5 Comment
1. **The drafting team believes that providing the details of the changes is more beneficial than just notifying of a proposed change.** 2. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** 3. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** 4. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** 5. **The drafting team believes that 30 days is a sufficient time to reply to provide the information on the changes.** 6. **Based on your comment, Measure M6 (old M7) was modified to read, "Acceptable evidence for R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or absent such an agreement, within 30 calendar days of a request."**		
Lincoln Electric System	No	LES is concerned with the significant amount of data and information an entity would be required to share as part of R3. As an example, if a CT ratio on a secondary relay with no pilot tripping is changed, but does not change the intended response of that relay, then there is no reason to share that information simply for the sake of sharing it. Entities should be allowed some amount of discretion regarding the information to be shared amongst other entities.
Response: Thank you for your comment **The drafting team believes that communication between interconnecting entities is important for any change that modifies the**

information previously used to comply with Requirement R2, regardless of the type of change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.		
Portland General Electric Company	No	No, Add facility ratings and define transmission line impedance tolerance (see question 9 response)
Response: Thank you for your comment. **The drafting team believes that FAC-009 already requires the sharing of Facility Ratings and their inclusion into the Protection System coordination standard is unnecessary. Your concern relating to PRC-023 is valid and may need to be addressed in FAC-009 or PRC-023.** **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.**		
American Transmission Company	No	ATC does not agree with the list as written and recommends the following changes: (1) ATC suggests that Requirement 3.1 bullet 2, be revised as follows: Changes to line lengths and/or conductor size or spacing that result in significant impedance changes. As an example, an interconnected line may need to relocate a pole because of a road move. This may alter slightly the length or spacing of the line but does not result in a change to the impedance. If no impedance change occurred, no relay settings need to be changed and there should be no additional coordination. (2) ATC suggests that Requirement 3.1 bullet 3, be revised as follows: Additions, removals, or replacements of transmission system Element(s) that is significant. An Element may be replaced with an equivalent device that does not require a relay setting change. If no relay settings need to be changed, there should be no additional coordination.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 5 Comment</th></tr>
<tr><td colspan="3">Response: Thank you for your comment
1. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.
In your specific example, since the impedance did not change the drafting team believes you would not need to inform each Responsible Entity connected to the same Interconnected Element.
2. Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.</td></tr>
<tr><td>NPPD</td><td>No</td><td>Section 3.3 should clarify if the corrections change the coordination then other entities should be notified.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment
Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: “Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.”</td></tr>
<tr><td>Utility Services</td><td>No</td><td>This requirement if left as is, would create a potential double jeopardy situation if a violation occurs. Under FAC-002, entities already have the obligations to communicate and coordinate the integration of new, replacement, or upgrades on existing facilities. We view this requirement to be a duplication of that standard and creates a double jeopardy situation if a violation were deemed to have occurred.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment
FAC-002-1 does not address Protection System coordination and the drafting team does not believe the two standards are redundant. As described in the “Description of the Current Draft,” PRC-027 is replacing PRC-001, Requirements R3 and R4.</td></tr>

Organization	Yes or No	Question 5 Comment
mason	No	Do not agree with blanket inclusion of replacement of the generator step-up transformer(s) on this list.
Response: Thank you for your comment. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available. It is the experience of the drafting team that modeling information will change with the replacement of a transformer.**		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency (IMEA) recommends language be included in R3 (and elsewhere if needed) to clarify the R3.1 "generator unit(s)" is not applicable to a 20 MVA or less unit or behind-the-meter generation.
Response: Thank you for your comment **This is an issue that reaches beyond the scope of this standard and may need to be addressed through a Request for Interpretation. However, the Applicability section indicates that an entity that is registered as a Generator Owner and has Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements will need to comply with this standard.**		
Trans Bay Cable	No	Comments: R3 seems confusing and redundant. R2 designates TOs as the responsible party for coordination studies and this seems appropriate. We believe that R3 should focus more on DPs and GOs complying with requests from TOs. A clear line of delineation from TO request seems more straightforward.
Response: Thank you for your comment **Requirement R2 requires the Transmission Owners to perform the Fault current studies because they have the necessary information to perform the studies. Requirement R1 requires all applicable entities to perform Protection System Studies. Requirement R3 requires all applicable entities to exchange the information necessary for Protection System coordination.**		

Organization	Yes or No	Question 5 Comment
CenterPoint Energy	No	(a) Requirement 3 includes providing schedule information and project details to generation entities. There may be established market rules that provide for what information can be shared with competitive entities. (b) Requirements 3.1 and 3.3, with examples of what system and equipment changes require coordination, appear overly broad. Such requirements should only be "if applicable". R3.1, for example, specifies changes in line length. Certain changes of line length are immaterial to protection system set points. (c) R3.3 requires coordination for the replacement of failed equipment. Replacing equipment "like function-for-like function" should be excluded from this requirement.
Response: Thank you for your comment a. **The drafting team does not believe that the requested exchange of information would violate the Standards of Conduct for an entity registered as both a GO and a TO.** b. **The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available.** **In your specific example, the drafting team believes that the entities involved can agree whether the change is significant enough to warrant an immediate review of the Protection System or whether the change could just be added to the simulation model for review as a part of the fault current assessment specified in Requirement R2.** c. **Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Duke Energy	No	(1) Revise second bullet under R3.1 as follows: "Changes to line impedance". (2) Add another bullet under R3.1 as follows: "Changes to breaker failure scheme

Organization	Yes or No	Question 5 Comment
		operating times”. (3) Also, we don’t agree with the R3.1 Rationale that specifying a single time frame is inappropriate. A time frame similar to R3.2 should be specified. We suggest the following revised lead-in paragraph to R3.1: “According to an agreed-upon schedule or absent such an agreement, 180 calendar days prior to implementing any change or additions listed below; either at an Interconnected Facility or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities”.
Response: Thank you for your comment 1. **Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated.** 2. **The drafting team believes that breaker failure scheme timers are already included from the first bullet.** 3. **The drafting team respectfully disagrees and declines to make your suggested changes.**		
South Carolina Electric and Gas	No	R3.3 in its entirety should be removed considering that all conditions covered by R3.3 are already covered by R3.1 which states: “New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios” If a correction or replacement of a protection system element is made per R3.3, this is the same thing as a modification covered under R3.1. It is noted that R4 would need to be reworded to accommodate unplanned and emergency protection system changes.
Response: Thank you for your comment **The purpose of Requirement R3, Part 3.3 is to allow retroactive notification when changes are made during events such as commissioning or component failure.**		

Organization	Yes or No	Question 5 Comment
ExxonMobil Research & Engineering	No	
Sacramento Municipal Utility District	Yes	(1) We agree with the list in R3.1. (2) We feel that R2, R3.2 and R3.3 are unnecessary. Instead, the list in R3.1 should act as a trigger requiring both entities to document communication agreeing that coordination exists prior to putting the changes into effect. No communication under R3.3 should be required if the changes restore the system to its original state - replacing a failed relay like for like.
Response: Thank you for your comment **1. Thank you for your support.** **2. Requirement 3, Part 3.2 is associated with providing information required to perform Protection System Studies, which may be required outside of a change in 3.1. Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Public Utility District No. 1 of Snohomish County	Yes	(1) Comments: SNPD agrees with the list in R3.1. (2) We feel that R2, R3.2 and R3.3 are unnecessary. Instead, the list in R3.1 should act as a trigger requiring both entities to document communication agreeing that coordination exists prior to putting the changes into effect. No communication under R3.3 should be required if the changes restore the system to its original state - replacing a failed relay like for like.
Response: Thank you for your comment **1. Thank you for your support.** **2. 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."		
Dominion (this vote was changed to No, per Connie Lowe's email with updated comment submission)	No	a). Any reference to project scheduling should be removed from this standard since time frame requirements listed throughout the draft already address notification requirements. By using the term project scheduling this implies that detailed project information needs to be included in the information exchange. The standard should not dictate the information exchange details required and should allow the entities to determine what information is required in the exchange in order to achieve protection coordination in the appropriate timeframe. b). In R3 reword to read: "Each Functional Entity shall provide to other Functional Entities connected to an Interconnected Facility, the details of the Protection System as follows:" (It is not necessary to include (e.g. Examples) since references to these are already listed in R3-3.1.) c). In R3-3.1 reword to read: "When adding new or modifying existing Interconnected Facilities or when making changes to other facilities where the proposed change modifies the conditions used in the coordination of Protection Systems of the Interconnected Facilities" d). Bullets: 1st bullet -Recommend changing reference to "protective Function settings" to "protection settings"./ 2nd bullet – Reword to read: "Line impedance changes" / 3rd bullet – Remove the word "system" e). In R3-3.3.1 change Requirement to read: "Changes found during Misoperation, commissioning, or maintenance activities that modify the conditions used in the coordination of Protection Systems. "
Response: Thank you for your comment		

Organization	Yes or No	Question 5 Comment
a. The drafting team believes it is necessary to share the pertinent scheduling information that could affect the other party. b. The drafting team believes the current wording more correctly states the requirement. c. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2, regardless of the magnitude of the change. This will ensure that the cumulative effect of multiple small changes will be included in the calculations to develop fault currents and ensure that the information to perform Protection System Studies is available. d. The drafting team believes the first bullet accurately portrays the requirement's needs. e. Based on your and other comments, the drafting team revised Requirement R3, Part 3.1 by combining the second and third bullets and modifying the language to state that only changes that affect the sequence or mutual coupling impedance must be communicated. f. The drafting team combined the 3rd bullet of Requirement R3, Part 3.1 with the 2nd bullet but the drafting team did not believe that "system" needed to be removed. g. Based on your and other comments, the drafting team revised Requirement R3, Part 3.3.to read: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."

6. In Requirement R4, the SDT required that agreement must be reached prior to implementation of proposed Protection System changes except under the conditions identified in Requirement 3, Part 3.3. Do you agree with this need? If not, please specify reasons in the comment area.

Summary Consideration:

A majority of commenters concurred with the need for entities to confirm agreement of Protection System coordination prior to implementing changes. Several commenters expressed a desire to see the standard drafting team develop and include a conflict resolution process for situations where mutual agreement cannot be reached. The drafting team responded with the following: The drafting team believes that any conflict resolution should be handled through normal company practices.

Several commenters expressed concern that Requirement 4 seemed to mandate agreement without provision for the entity receiving study results to express disagreement and suggest modifications or compromise. Also some commenters disagreed with the time frames associated with Requirement 4, suggesting lengthening them and/or including a provision for an otherwise agreed-upon schedule. Others suggested the "prior to implementation" was appropriate without specifying any particular time period. Based on comments, the drafting team revised Requirement R4, Parts 4.1 and 4.2, and removed Part 4.3. The responses are as follows: Based on comments, the drafting team revised Requirement R4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." Also based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."

Some commenters suggested the requirement refer to entities confirming "acceptance" rather than confirming "agreement". Others suggested the requirement refer to agreeing that coordination is achieved or maintained prior to implementing changes, rather than requiring agreement with the changes themselves. Based on these comments, the drafting team revised Requirements R4, Parts 4.1 and 4.2 as noted above.

Pepco Holdings Inc. & Affiliates	No	1) Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D

Organization	Yes or No	Question 6 Comment
		subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? 2) Requirement R4.3 requires confirmation of agreement within 30 days of being notified of corrections made due to as found setting errors or emergency replacements of Protection System components. Again, what if the changes are not acceptable to the other party? Which entity is found not compliant, the one who proactively made the changes or the one who won't confirm agreement? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. 3) It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the "Protection System Study" and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing some outlet for a dispute resolution process seems unfair to either party. As such, we suggest Requirement R4 be removed entirely or extensively re-written to address the concerns outlined above.

Response: Thank you for your comments.

Response: Thank you for your comment. **Please see the drafting team response to your comment in Question 1.**		
Colorado Springs Utilities	No	This requirement seems to create a paper work burden that will add cost and lengthen the process of any and all transmission changes, unless there is some size significance added to the requirement under which a reduced process is involved. The maximum amount of paper work to complete must be assumed, unless there are specific limits set to restrict an overreach in how the regulation is applied.
Response: Thank you for your comment. **The drafting team believes the scope of a particular project will dictate the work necessary to coordinate the Protection Systems involved, and to document the coordination process.**		
Associated Electric Cooperative, Inc., JRO00088	No	PRC-027-1 R4.2 change: Replace: “that Protection Systems(s) changes” With: “each related Protection Systems(s) change “Rationale: AECI sympathizes with the need for agreement, and believes that to be the necessary goal. However, this requirement indicates all-or-none for notified Protection System Change(s). Entities may agree on most all communicated changes, and yet a more complicated change, particularly outside of Zone 1, may require some interim compromise, or that one particular (backward-looking) be excluded until agreement is reached. Full agreement, prior to placing facilities into service, might otherwise become a method for forcing a poor compromise on protective settings.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: “Prior to implementing any planned change(s)**		

Organization	Yes or No	Question 6 Comment
associated with Requirement R3, Part 3.1, confirm the owner(s) of the Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."		
Southern Company	No	If there is a requirement to agree, what happens if there is no agreement. There must be a resolution process.
Response: Thank you for your comment. **The drafting team believes that any conflict resolution should be handled through normal company practices.**		
Independent Electricity System Operator	No	We agree with the need to provide an agreement to the study results and to confirm acceptability of the proposed changes (other than those conditions identified in Requirement 3, Part 3.3), but R4 is unclear in a number of aspects, as follows: 1. 4.1 There is no requirement or provision for the receiving entities to express disagreement, with rationale, and R4 does not require resolving the differences. Both need to be added. 2. 4.2 Based on the language in Part 4.1, we assume R4 applies to the receiving entities. Hence we interpret 4.2 to require the receiving entities to confirm with the sending (or the initiating) entities of their agreement with the proposed changes. In that vein, the wording in 4.1 "confirm the affected Interconnected Facility owners" is unclear as to who needs to confirm with whom. Suggest to reword 4.1 to:"Prior to the in-service date of any planned change at the Interconnected Facility, confirm with the Interconnected Facility owners that initiated the changes that agreement with the Protection System(s) changes as described in Requirement R3, Part 3.1. was reached." 3. 4.3 requires that the receiving entities confirm with the initiating entities of the changes made under Part 3.3, for which prior agreements are not necessary or perhaps possible. However, there is no requirement or provision for the receiving entities to express a disagreement, with rationale, and suggest alternative setting

Organization	Yes or No	Question 6 Comment
		changes, or resolve the differences. This needs to be provided.

American Electric Power	No	The 90 Day window will not be sufficient during the initial R1 time frame. AEP suggests 180 days during the R1 compliance window.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
City of Austin dba Austin Energy	No	Austin Energy (AE) agrees with the need to coordinate Protection System changes; however, AE believes R4.2 is not sufficiently clear. As written, one could interpret it to mean that a Facility owner must obtain consent on the changes listed under R3.1, not just the Protection System changes (such as relay settings). AE does not believe it appropriate to require a Facility owner to gain consent on the actual change to the Facility itself (such as changes to line lengths/conductor size or replacement of transmission system Element(s), generator units or generator step-up transformer).The Guidelines and Technical Basis (p 20 of PRC-027-1 Draft #1) states, "The purpose of this requirement is to assure the effects

Organization	Yes or No	Question 6 Comment
		that planned changes have on Protection Systems at Interconnected Facilities have been considered by all affected entities." AE agrees with this concept and believes the SDT sufficiently covers it through R1.1.3 and R4.1. AE recommends striking R4.2 from the Standard.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s)associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**		
LCRA Transmission Services Corporation	No	Each Transmission Owner, Generator Owner, and Distribution Provider shall: 4.1. Within 90 calendar days after receipt, confirm acceptance with the summary results of a Protection System Coordination Study, as described in Requirement R1, Part 1.2. 4.2. Prior to the in-service date of any planned change at the Interconnected Facility, confirm the affected Interconnected Facility owners accept the Protection System(s) changes, as described in Requirement R3, Part 3.1
Response: Thank you for your comment. **1. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."** **2. Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of the Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**		
Tri-State G & T	No	We believe that there are many instances of changes that can made to Protection Systems as required in Requirement 3, Part 3.1 that don't require coordination between entities but that might be interpreted that the change "modifies the

Organization	Yes or No	Question 6 Comment
		conditions used in the coordination of Protection Systems." Examples are load encroachment settings, communication port settings, etc. We think language needs to be added with regard to "... modifications that impact the coordination of Protection Systems between entities, of: ..." in the first bullet, if confirmation from the other entity is required.
Response: Thank you for your comment. **The drafting team believes that any change(s) noted in Requirement R3, Part 3.1 at the Interconnected Element needs to be communicated with the other entity.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)	No	In general, Ingleside Cogeneration LP believes that a material unplanned change must be communicated to neighboring Facility Owners. However, this should not include an emergency replacement in kind due to a failure. This is a repair only which does not change the characteristics of the relay or the associated BES components - and therefore has no impact on interconnected owners.
Response: Thank you for your comment. **The drafting team believes this information must be communicated.**		
Wisconsin Electric Power Company	No	The requirement to reach agreement on Protection System changes prior to the project in-service date is not realistic and should be removed. While the entity that is initiating a project has a responsibility under R3 to notify other entities in order to perform a study, there is no required timeframe for these notifications to occur. Unless the initiating entity has a requirement to provide data under R3 in a timeframe sufficiently ahead of the in-service date, this is a requirement that may be impossible to achieve.
Response: Thank you for your comment. **The drafting team believes that proposed modifications to Interconnected Elements, as described in Requirement R3, Part 3.1,**		

Organization	Yes or No	Question 6 Comment
must be communicated and agreed to prior to the in-service date. This would include communication of project schedules developed relative to a project's scope. However, the drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated for a particular project. Further, the drafting team believes the entity initiating the project has incentive to consider provision of, and response to Protection System coordination issues be considered within the project schedule. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of the Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**		
Dairyland Power Cooperative	No	How is it to be handled if two entities do not agree to the same approach?
Response: Thank you for your comment. **The drafting team believes that any conflict resolution should be handled through normal company practices.**		
Portland General Electric Company	No	No, see question 9 response
NPPD	No	Recommend the drafting team should consider several scenarios to help determine issues that will arise with putting into practice this standard with the time lines included. Some scenarios I can think of are: 1. who is liable or fineable if a required approval reply for a protection study is not made in a timely manner to a Transmission owner. It is imperative not to hold a utility responsible for another entities lack of timely responses. These issues will create murky situations when the Transmission owner does not have control over external entities ability to respond to notifications of changes within specified times. 2. If a Distribution Provider is not registered is the Transmission owner responsible for getting a reply or approval of a protection study?
Response: Thank you for your comments.		

Organization	Yes or No	Question 6 Comment
1. **The drafting team cannot make compliance judgments. Additionally, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."** 2. **The standard is only applicable to the registered entities listed in the Applicability section of the standard.**		
Utility Services	No	See comment to Question 5.
mason	No	Each entity has its own philosophy and standards for Protection System design. In providing agreement to a third party design, a question of liability is also opened up. R4 should be changed from requiring agreement to requiring notification. There is enough incentive for entities to resolve material disagreements on Protection System design without the need for regulatory intervention. Regulatory involvement should only take place when business conditions call for it. Otherwise the result is higher production costs with no reliability benefit.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Trans Bay Cable	No	Comments: R4.1 as written apparently requires receiving entities to always agree with the initial study, even if they see flaws that would lead to miscoordinating Protection Systems. Suggest that "confirm" be replaced with "reach."
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Clark Public Utilities	No	1. The proposed Requirement R4 is not an acceptable method of confirming

Organization	Yes or No	Question 6 Comment
		agreement among parties. Requirement 4.1 requires an entity to agree with the proposed changes within 90 calendar days. What if the entity thinks the proposed changes are wrong? Other standards that require entity A to provide information to entity B provide that entity B will provide written comments to entity A within a specified period of time. 4.1 should state the following: "Within 90 calendar days after receipt, provide written comments (if any) regarding the summary results of a Protection System Study, as described in Requirement R1, Part 1.2." 2. Requirement 4.2 will require an entity needing to implement a planned change to delay the in-service date until affected entities agree with the proposal. This sets up a potential stand-off with no method of resolution. In other standards where parties provide comments the entity is required to respond to those comments within a specified period of time. However, 4.2 as worded would stop the implementation until the other parties all agree. The owner of the facility needs to have ultimate and sole control for implementing these changes and the current 4.2 would stop a project dead in its tracks until the other parties all agreed. Proceeding without this agreement would result in a standard violation and imparts power upon entities over facilities they do not own. 4.2 should state the following: "Within 30 calendar days after receipt of any written comments received per Requirement 4.1 and prior to the in-service date of any planned change at the Interconnected Facility, respond to such written comments."

Response: Thank you for your comment.

1. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**
2. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**

Organization	Yes or No	Question 6 Comment
Oncor Electric Delivery Company LLC	No	Oncor believes agreements must be reached; however, there needs to be some definitions in the Standard to define the exact meaning of the term “agreement”. In addition, the sub requirements 4.3.1 and 4.3.2 calls for confirmation of the Protection System changes are acceptable pursuant to notification received in Requirement 3, within 30 days, however the sub requirements provide no mechanism for resolution in the event the changes are not acceptable to the receiving entity within 30 days of receipt. Oncor suggest that these two sub requirements be removed. There are sufficient checks and balances under 4.2 to provide coverage for any disagreement between entities without the need to self-report under the 4.3.1 and 4.3.2 if an agreement cannot be reached within 30 days of receipt.
Response: Thank you for your comment. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**		
ExxonMobil Research & Engineering	No	
Northeast Power Coordinating Council	Yes	What happens when consensus is not reached between two parties? The TO should have the responsibility for coordination.
Response: Thank you for your comment. **The drafting team believes that any conflict resolution should be handled through normal company practices.**		
ACES Power Marketing Standards Collaborators	Yes	Yes, we agree. The application guidelines were particularly helpful in explaining how the Requirements R3 and R4 work together.
Response: Thank you for your comment.		

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 6 Comment</th></tr>
<tr><td>Operational Compliance</td><td>Yes</td><td>We suggest that R4.1, R4.3.1 and R4.3.2 all have a time period of 90 days.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.

Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.</td></tr>
<tr><td>Sacramento Municipal Utility District</td><td>Yes</td><td>We agree that the entities should agree prior to any changes being implemented. The only date of interest, in our opinion, is the in-service date of any proposed changes. If agreement is reached prior to the field changes being made, then that is all that matters.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.

Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: “Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.”</td></tr>
<tr><td>Xcel Energy</td><td>Yes</td><td>1. Conceivably, there could be non-reliability based reasons why an entity might not provide concurrence. An alternate avenue should be considered as allowable, such as the requesting entity working through the RC to obtain response from a non-responsive entity.

2. Similar comments on measure M9 as contained in item 3 above on measure M2.

3. Measure M9 does not account for non-acceptance under R4.3 or R4.1 as restudy or expanded studies may be required and result in a M9 violation.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.

1. The drafting team believes that any conflict resolution should be handled through normal company practices.

2. Acceptable evidence that response was provided could be registered mail confirming receipt at an address. Additional acceptable evidence would be letters, or emails acknowledging receipt.</td></tr>

Public Service Enterprise		a. In R4 overall, we concur that agreement does need to be reached before changes

Organization	Yes or No	Question 6 Comment
Group		can be implemented; however, if there is a disagreement that cannot be resolved by the parties within the time frames specified, a dispute resolution process should be invoked. Otherwise, if an owner disagrees with another owner's results, it has no option but to agree or face a violation of the standard for failing to do so. b. The specific requirement in the question is in part 4.2, not R4. The list of items in R3.1 appeared reasonable. But R4.2 requires agreement to be reached "prior to the in-service date" under R4.2. Allowing agreement to be reached prior to the in-service date could allow one party to unreasonably hold up the schedule. It should be stated as follows: "Within 90 days after receiving the planned changes at the Interconnection Facility, the affected Interconnection Facility owners shall either agree with the changes, or propose alternative changes, stating why such changes are desirable. Failure to provide a response will constitute agreement with the planned changes by the non-responding Interconnecting Facility owner."
Response: Thank you for your comment. **a. The drafting team believes that any conflict resolution should be handled through normal company practices.** **b. Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**		
Public Utility District No. 1 of Snohomish County		Comments: SNPD agrees that the entities should agree prior to any changes being implemented. The only date of interest, in our opinion, is the in-service date of any proposed changes. If agreement is reached prior to the field changes being made, then that is all that matters.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**		

7. **In Requirement R4, the SDT established a 90 day time frame for responding to a request for agreement with a Protection System Study. Do you agree with this time frame? If not, please provide specific suggestions with your reasoning(s) in the comment area.**

Summary Consideration:

The responses were equally split between agreeing and not agreeing with the 90 day time frame. Some comments wanted a longer time frame due to resource issues while others preferred a shorter time frame to prevent potential project delays. The drafting team decided not to make any changes to the time frame and responded as such: The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Element(s) to review the summary results of a Protection System Study.

There were several comments which suggested changes to the requirements. The responses included one or more of the following:

- Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."
- Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."
- Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.

Several responses involved the need for a resolution process in cases that agreement could not be reached. The drafting team responded to these comments as follows: "The drafting team believes that any conflict resolution should be handled through normal company practices".

Organization	Yes or No	Question 7 Comment
Pepco Holdings Inc. & Affiliates	No	We suggest Requirement R4 be removed entirely or extensively re-written to address the concerns outlined in our response to Question 6.
Response: Thank you for your comment.		

Organization	Yes or No	Question 7 Comment
Based on comments, the drafting team did extensively rewrite Requirement R4 including removing Requirement R4, Part 4.3.		
Luminant	No	Luminant recommends that the time frame should be "according to an agreed-upon documented schedule between Transmission Owner, Generation Owner, or Distribution Provider. Luminant would recommend the removal of the 90 day requirement. 90 days may not fit all circumstances. It should be left between the parties to determine the timeline of the project and reaching agreement. This is what should be documented to ensure coordination of activities between the affected parties.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Imperial Irrigation District (IID)	No	120 calendar days are suggested instead of 90 because verification of Protection System Study needs to be performed before an agreement can be made and it is time consuming.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Bonneville Power Administration	No	BPA believes that requiring an agreement from all parties could prevent the implementation of emergency changes.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comment. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**		
Detroit Edison	No	It appears that the "initiator" has 90 days after completing the study to provide the information while the other entity has 90 days to review and respond to the request. Suggest that a longer response time frame be considered since the "responder" may need significant time to review changes.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
PPL Corporation NERC Registered Affiliates	No	See comment in question #1 above.
Colorado Springs Utilities	No	Due to construction schedule requirements a 30 day approach should be taken.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Tennessee Valley Authority	No	There may be instances where extenuating circumstances delay agreement beyond 90 days. For long lead time or complex protection scheme projects requiring more

Organization	Yes or No	Question 7 Comment
		interaction between protective relaying engineers, exceeding the 90 day period could be acceptable to the entities involved. Evidence of mutual agreement on an extension beyond 90 days should be acceptable.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
ACES Power Marketing Standards Collaborators	No	We assume this question refers to Part 4.1. While we do not see any issues with the 90 day requirement, Part 4.1 needs to be modified to reflect what a responsible entity must do if they do not agree. As written any other response than agreement is a violation. Thus, if a TO indicates it disagrees with the results of the Protection System Study (PSS) within 90 days, it technically is in violation of the requirement. The application guidelines explain that absent agreement the revisions should be proposed. We agree with this approach but the requirement simply does not say this. It should.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Kansas City Power & Light	No	These can be matters of extreme complexity in design, implementation and operation. Stipulating that 90 days (Requirement 4.1) and 30 days (Requirement 4.3) is sufficient time to come to an agreement is presumptuous and is not necessary. Requirements 4.1 and 4.3 should stipulate that entities in receipt of proposed

Organization	Yes or No	Question 7 Comment
		changes to relay protection system(s) or component(s) be evaluated and responded to by the entity in receipt. The response could be agreement or non-agreement with concerns or objections noted in the response.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." The drafting team also combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**		
Southern Company	No	Within "90 calendar days after receipt, confirm agreement" vs. "90 day time frame for responding to a request". Acknowledgement of the receipt and review of a change should be the limit here - agreement with the settings should not be required.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Salt River Project	No	This is too long; 60 days should be adequate
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		

Organization	Yes or No	Question 7 Comment
Pacific Gas and Electric Company	No	12 month time frame may be required to resolve the technical issues that typically prevent agreement
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Western Area Power Administration	No	See general comments below (#9).
American Electric Power	No	AEP has suggested adjusting the time requirements, as stated in Question 3 and 7. These time requirements should be included and the VSLs should be scaled accordingly.
Response: Thank you for your comment. **The drafting team believes 90 calendar days is a reasonable time for the owners of existing Interconnected Facilities to review the summary results of a Protection System Study. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Sacramento Municipal Utility District	No	No, we do not agree. R4.2 should apply here. R4.1 and R4.3 should be eliminated. If one entity proposes making settings changes, then agreement must be reached prior to implementing the changes. We feel all these timelines are unnecessarily burdensome to remember and quite arbitrary. If one entity believes it cannot get another entity to respond or to reach agreement on coordination, they can always ask their RE for assistance in maintaining the reliability of the system. Since all these activities occurred long before the mandatory standards existed and are covered

Organization	Yes or No	Question 7 Comment
		under the present PRC-001, we do not feel the REs will be swamped with calls if R4.1 and R4.3 are eliminated.
Response: Thank you for your comment. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3. Also based on comments, the drafting team revised Requirement 4, Part 4.1 to read: “Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.” Also based on comments, the drafting team revised Requirement R4, Part 4.2 to read: “Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.”**		
City of Austin dba Austin Energy	No	Austin Energy (AE) believes that 90 days is sufficient for responding to summary results of a Protection System Study, but it is not always sufficient for completing the iterative discussions that often take place to resolve questions and potential concerns. The Guidelines and Technical Basis (p19 of PRC-027-1 Draft #1) states, “R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to confirm agreement with the summary results of a Protection System Study ...; or absent such agreement, propose revisions to achieve acceptable results.” AE asks the SDT to include this “absent such agreement” concept in R4.1 and extend the timeline to accommodate such revisions to one that is mutually agreed upon by the impacted parties.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: “Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.”**		
Manitoba Hydro	No	This 90 day time frame may be too long, since an agreement is required from the

Organization	Yes or No	Question 7 Comment
		interconnecting parties before the proposed protection changes can be implemented.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Exelon	No	This question differs from what is required in the language in the draft standard. In Requirement R4.1, the 90 days allowed is for entities to "confirm agreement" with the summary. If an entity must only respond at the end of 90 days, the response could be that they disagree. In this case, discrepancies must be resolved at the cost of more time. Regardless, allowing 90 days for an entity to respond before an entity can proceed with design could cause serious delays to engineering and design processes. However, until we know what is required by a Protection System study, Exelon cannot offer a suggestion for a suitable timeframe for R4.1. SDT should specifically justify the proposed 90-day time frame. Since, a 90-day time frame may not be sufficient to compile all the required design data and results for Protection System Study (PSS) and to verify the Protection Systems are coordinated within the applicable entities.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Tri-State G & T	No	We think 60 days is more appropriate. For the receiving party, 30 days may be too short, and for the sending party 90 days may be too long.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Liberty Electric Power LLC	No	Smaller entities do not have the staff resources to respond, and must bid, contract, and receive a report. Further, they must also go through a process to allocate the funds. 180 days at a minimum, but ideally a longer period should be in place to allow for the budget process.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Public Utility District No. 1 of Snohomish County	No	Comments: SNPD does not agree. R4.2 should apply here. R4.1 and R4.3 should be eliminated. If one entity proposes making settings changes, then agreement must be reached prior to implementing the changes. We feel all these timelines are unnecessarily burdensome to remember and quite arbitrary. If one entity believes it cannot get another entity to respond or to reach agreement on coordination, they can always ask their RE for assistance in maintaining the reliability of the system. Since all these activities occurred long before the mandatory standards existed and are covered under the present PRC-001, we do not feel the REs will be swamped with calls if R4.1 and R4.3 are eliminated.
Response: Thank you for your comment. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3. Also based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after**

receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." Also based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."		
Platte River Power Authority	No	We believe the agreement must be reached prior to implementing the changes. This requirement is burdensome on the entity for record keeping and does not add reliability to the BPS.
Response: Thank you for your comment. **Based on comments, the drafting team did extensively rewrite Requirement R4 including removing Requirement R4, Part 4.3.**		
MWDSC	No	More time than 90 days may be needed to reach agreement for complex system changes or because of conflicting study priorities. Allow more flexibility for the parties to agree to a time, not to exceed, e.g. 180 days.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Portland General Electric Company	No	No, It depends upon what constitutes a Protection System Study (see question 9 response
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1,**		

Organization	Yes or No	Question 7 Comment
Part 1.2, and respond as to whether further action is required.”		
American Transmission Company	No	1) ATC does not agree with the 90 day time frame. 2) ATC also has the following recommendation: Requirement 4.2 states that Interconnected Facility Owners confirm that coordination is agreed to prior to placing equipment in-service. ATC believes that R4.2 is adequate to cover coordination. Therefore, the SDT should strike R4.1 and R4.3.
Response: Thank you for your comment. **1. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: “Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.”** **2. Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3. Also based on comments, the drafting team revised Requirement R4, Part 4.2 to read: “Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.”**		
NPPD	No	This requirement does not allow for various scenarios or conditions in the process of doing business. For example, multiple phased work or longer lead time projects where designs may change. It would be better that there be verification that studies were performed prior to in-service dates rather than tracking detailed time lines which could likely be complex and difficult to judge for audit start and end dates.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: “Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.”**		

Organization	Yes or No	Question 7 Comment
mason	No	Do not agree with the need for documentation of "agreement with a Protection System Study" between entities. See Question 6 response.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
El Paso Electric Company	No	1) EPE believes the timelines are not adequate when coordinating protection system studies involving sequential interdependence among parties for interconnected facilities. Timing of study data should correlate with any written agreements or procedures agreed to between the various parties. EPE also believes the documentation requirements within this draft Standard slow down the process, therefore increasing the time needed to complete and communicate the study data. 2) Additionally, the proposed Standard fails to address two important and likely types of situations: (a) the situation in which an interconnected entity fails to respond to study results or to a planned change at the Interconnected Facility, or (b) the situation in which disagreements between the entities are not resolved within the proposed Standard's time clock.
Response: Thank you for your comment. **1. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		

Organization	Yes or No	Question 7 Comment
2. The drafting team believes that any conflict resolution should be handled through normal company practices.		
El Paso Electric	No	1) EPE believes the timelines are not adequate when coordinating protection system studies involving sequential interdependence among parties for interconnected facilities. Timing of study data should correlate with any written agreements or procedures agreed to between the various parties. 2) EPE also believes the documentation requirements within this draft Standard slow down the process, therefore increasing the time needed to complete and communicate the study data. The proposed Standard fails to address two important and likely types of situations: (a) the situation in which an interconnected entity fails to respond with study results or to a planned change at the Interconnected Facility, or (b) the situation in which disagreements between the entities are not resolved within the proposed Standard's time clock.
Response: Thank you for your comment. 1. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."** 2. **The drafting team believes that any conflict resolution should be handled through normal company practices.**		
ExxonMobil Research & Engineering	No	
Utility Services	No	
National Grid USA / Niagara Mohawk	Yes	1) In the event that someone hands you a study of their entire system or of all their interconnections you should only be responsible for reviewing study results for those interconnections in which you are a participant.

Organization	Yes or No	Question 7 Comment
		2) Furthermore, what if you don't agree with the study results you've been handed? The text as written literally commands you to agree with them! The text should be reworded to require a response (not necessarily agreement) within 90 days and relative only to the portion of the study applicable to interconnections you participate in.
Response: Thank you for your comment. **1. The drafting team believes the purpose and applicability sections of the standard support your conclusion.** **2. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Northeast Power Coordinating Council	Yes	For studies of an entire system or all of its interconnections, those persons doing the study should only be responsible for reviewing the study results for those interconnections in which they participate. The wording in the text demands that the results be agreed with. The text should be reworded to require a response (not necessarily agreement) within 90 days and only pertain to the portion of the study applicable to interconnections participated in.
Response: Thank you for your comment. **The drafting team believes the purpose and applicability sections of the standard support your conclusion. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Associated Electric Cooperative, Inc., JRO00088	Yes	These facilities take time and budget to build or implement, and so 3-months prior to field-changes seems reasonable.
Response: Thank you for your comment.		

Organization	Yes or No	Question 7 Comment
Idaho Power Company	Yes	Yes, There appears to be no mechanism in the Requirement addressing if coordination changes are not acceptable. This should be addressed as 90 days could easily be exceeded in this scenario.
Response: Thank you for your comment. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
South Carolina Electric and Gas	Yes	1) R4.1 only mentions R1. 2) R4.2 should be reworded to make it clear that entities have 90 days to respond to proposed protection system changes received per R3.1. The concern is that with no specified time the responding entity can delay the initiating entity's schedule even if the protection system changes were shared well in advance of the in service date.
Response: Thank you for your comment. **1. Requirement R4, Part 4.1 is intended to only reference Requirement R1.** **2. The drafting team acknowledges your concern and believes the concern you raise would need to be handled through normal company practices.**		
Dominion	Yes	Reword R4., 4.3 to read: <u>"Within 30 calendar days after receiving notification of:"</u>
Response: Thank you for your comment. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**

8. **The team included VRFs, VSLs, and Time Horizons with this posting. Do you agree with the assignments? If not, please provide specific suggestions for change.**

Summary Consideration:

In general, most commenters agreed with the VRF assignments and about half of the commenters agreed with the VSLs assignments. Those commenters that disagreed with several of the assigned VSLs stated that they were too stringent, or escalated too rapidly. Several commenters wanted consistency regarding the time frames established for tardiness.

The drafting team responded that they had assigned the VRFs and written the VSLs in accordance with the guidance established by NERC and FERC, and that the VSLs were assigned based upon the significance of the individual requirement parts to the overall coordination process. The drafting team made no changes to the VRFs; however, the following changes were made to the VSLs:

- For Requirement R1, Part 1.1.2, the time period for tardiness in the 'Lower' VSL was lengthened from 10 days to 30 days.

One commenter suggested adding Long-term Planning to the Time Horizon for Requirement R3. The drafting team agreed and made the suggested change.

Organization	Yes or No	Question 8 Comment
Luminant	No	Based on the comments on Q6, the VSL would need to be modified. Q7 and 9, the VSLs would change accordingly to accommodate an agreed-upon time frame for acceptable relay coordination and a method for resolving issues surrounding obtaining an acceptable coordination where differences occur.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise the VSL for Requirement R1, Part 1.1.2.**		

Organization	Yes or No	Question 8 Comment
Bonneville Power Administration	No	BPA believes that in general, the VRFs and VSL's are too high.
Response: Thank you for your comment. **The drafting team assigned the VRFs in accordance with the NERC criteria and FERC guidelines for establishing VRFs, and believes the assigned risk factors are appropriate.**		
Santee Cooper	No	The 10 day VSLs are too restrictive in R1.1.1. VSL times should be similar for all requirements. Suggest dates should be as follows: Lower - 30 days late, Moderate - more than 30 days, less than a year, High - more than a year, but completed, Severe - more than a year or not done.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise the VSL for Requirement R1, Part 1.1.2.**		
Detroit Edison	No	The proposed VSL for R4 appears to imply that the "receiving" entity has no other choice but to confirm agreement. If the "receiving" entity has concerns with the study or changes, both parties should be responsible for resolving the issues.
Response: Thank you for your comment. **The drafting team believes your comment pertains to Requirement R4 and not the VSL. Requirement R4 does require the receiving entity to confirm agreement within a set time frame. The VSL defines the degree of non-compliance with the requirement.**		

Organization	Yes or No	Question 8 Comment
Western Small Entity Comment Group	No	We note that for R1.1.2 VSLs ratchet up very quickly despite the SDT contention in “guidelines and Technical Basis” that they have no evidence of widespread miscoordination between Interconnected Facilities and that miscoordination is not the predominate cause of reported Misoperations. The 10-20-30 day ratchet just seems arbitrary.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team’s intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise the VSL for Requirement R1, Part 1.1.2.**		
PPL Corporation NERC Registered Affiliates	No	See comment in question #1 above.
SERC Protection and Control Subcommittee	No	We recommend a consistent set of VSL timeframes across all requirements. The 10 day limits are too tight and as stated in the R1.1.1 rationale, this urgency is not warranted. Most entities will have numerous Interconnection Facilities, so applying these VSL to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general: o Lower VSL should be 30 days late. o Moderate VSL should be more than 30 days, less than a year. o High VSL should be more than a year but done. o Severe VSL should be more than a year and not done.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs; and believes the VSL for Requirement 1, Part 1.1.1 is correctly assigned. The drafting team modified Requirement 1, Part 1.1.1 to 48 months from 36**		

Organization	Yes or No	Question 8 Comment
months. The VSLs are written specific to an individual requirement and define the degree to which compliance with the requirement was not achieved; consequently, a consistent set of VSL time frames across all requirements may not be appropriate. The drafting team strives for consistency in assignment of VSLs throughout the standard.		
Colorado Springs Utilities	No	If the requirements are not reasonable, the VRFs and VSLs are also not reasonable.
Response: Thank you for your comment.		
Tennessee Valley Authority	No	We recommend a consistent set of VSL timeframes across all requirements. The 10 day limits are unreasonable and, as stated in the R1.1.1 rationale, this urgency is not warranted. Most entities will have numerous Interconnection Facilities, so applying these VSLs to each one could quickly stack up violations for being a few days tardy in the midst of this imposed heavy workload. In general: o Lower VSL should be 60 days late. o Moderate VSL should be more than 60 days, less than a year. o High VSL should be more than a year but done. o Severe VSL should be more than a year and not done.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise the VSL for Requirement R1, Part 1.1.2.**		
Associated Electric Cooperative, Inc., JRO00088	No	See SERC PCS Comments.
ACES Power Marketing Standards Collaborators	No	(1) The time horizon for R2 should only be Long-term Planning. The study has to be completed every 24 months and while notification in Part 2.3 has to occur within 30

Organization	Yes or No	Question 8 Comment
		days it is only after that the study to satisfy the 24 month time period is complete. (2) Requirement R3 should include Long-term Planning. Transmission system expansions would be covered under Part 3.1. (3) The VSLs for Requirement R1 are gradated based on the number of days late the requirement is met for Part 1.1 but not Part 1.2. It seems Part 1.2 should have similar gradated VSLs. (4) For Requirement R4, we suggest the VSL for Part 4.2 should clearly state that any changes made during extreme operating circumstances (i.e. extreme weather) are excluded. This is essentially a question on what is meant by “planned”. Are changes made to restore service in a hurricane or tornado damaged area a few days after the devastation planned? We think they are not but see how auditors could view the changes as planned particular if any level of study was required.

Response: Thank you for your comment.

The Time Horizon is a compliance element and is used as a factor in determining the size of a sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time.

1. **The drafting team respectfully disagrees and believes the time horizons are appropriate and consistent with the criteria for establishing time horizons: Long-term Planning — a planning horizon of one year or longer... Operations Planning — operating and resource plans from day-ahead up to and including seasonal.**
2. **The drafting team agrees and will make the suggested change to Requirement R3.**
3. **Please review the VSLs. Requirement 1, Part 1.2 is already gradated.**
4. **The notification of unplanned changes (for circumstances as you describe) are covered by Requirement 3, Part 3.3. The drafting team has removed the requirement for parties to reach agreement (Requirement R4, Part 4.3).**

Organization	Yes or No	Question 8 Comment
Kansas City Power & Light	No	The 10 day increments represent a 5% error and considering this is a six month requirement. The 10 day increment represents 4 - 6 working days across 2 weekends and including a holiday. Recommend the increments be increased to allow at least 10 working days which would be at least 15 calendar day increments. VSL for R2, part 2.1 - The 10 day increments represent a 1% error and considering this is a 24 month requirement. Recommend the increments be increased to 30 days to make more sense with the 24 month period.
Response: Thank you for your comment. **The drafting team assigned the VSLs in accordance with the NERC guidelines and the FERC Order on VSLs. The drafting team believes the coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner. Each part of the coordination process is critical to success and the exchange of information provides the necessary situational awareness for coordination to occur. The drafting team's intent is to assign the VSLs accordingly based upon the significance of the individual requirement parts. Based on yours and others comments, the drafting team did revise the VSL for Requirement R1, Part 1.1.2.**		
Pacific Gas and Electric Company	No	do not line up with probability and potential severity
Response: Thank you for your comment. **The drafting team assigned the VRFs in accordance with the NERC criteria and FERC guidelines for establishing VRFs, and believes the assigned risk factors are appropriate.**		
Flathead Electric Cooperative, Inc.	No	Comments: We note that for R1.1.2 VSLs ratchet up very quickly despite the SDT contention in "guidelines and Technical Basis" that they have no evidence of widespread miscoordination between Interconnected Facilities and that miscoordination is not the predominate cause of reported Misoperations. 9. **If you have any other comments that you have NOT provided in response to the above questions, please provide them here. (Please do not repeat comments that you provided elsewhere.)**

Summary Consideration:

Some commenters wanted the drafting team to further modify PRC-001-2 by adding a Measure for Requirement R1 or retire the standard. This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, "The drafting team recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".

Some commenters requested the time frame in Requirement 2, Part 2.1 be increased up to 60 months to coincide with studies associated with TPL-001-2 draft 5 Requirement R2, Part 2.6.1. The drafting team responded with the following: "The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard does not require."

Numerous commenters wanted further clarification as to the definition of a Protection System Study and also what is included in a summary result. Other commenters did not want the term Protection System Study added to the NERC Glossary of Terms. The drafting team declined to modify the definition of the Protection System Study but did add the following to the description in the "Guidelines and Technical Basis": "System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions." The drafting team believes that the full description in the Guidelines and Technical Basis is now adequate and appropriate. The drafting team did add language to the standard to specify that the term Protection System Study will not be added to the NERC Glossary of Terms. "The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the Glossary of Terms:"

Some commenters expressed concern over the number of time frames associated with the coordination process and the burden of documentation. The drafting team believes the assigned time frames and documentation are appropriate and necessary and declined to make any changes.

Numerous commenters wanted the description associated with Figure 3 clarified. The drafting team noted that: Figure 3 is independent of whether the facilities are part of the BES. The intent is to identify that the coordination is required where Protection Systems are installed for the purpose of protecting Transmission System Elements. The drafting team added a note of clarification of the phrase

"Protection Systems installed to detect faults on the BES Transmission System." Figure 3 represents a generator connected to a Distribution Provider. The drafting team revised the description relating to Figure 3 in the "Guidelines and Technical Basis" to clarify that only the Distribution Provider's Protection Systems installed to protect for Faults on Transmission System Elements are a part of the Applicability of this standard. The drafting team modified Figure 3 to indicate that the source could be a generator or a network system.

A few commenters suggested the Figures in the Application Guidelines needed clarification on what the Interconnected Facilities were in the Figures. The drafting team modified the text associated with each Figure to identify the Interconnected Elements.

Some commenters expressed concern over the need to provide evidence demonstrating that the information was received by the other entity. The drafting team modified Measures M6, M7 and M8 to indicate the evidence needed is dated documentation that the information was provided during the specified time frames.

Several commenters suggested changes to the process flow chart and the drafting team modified the flow chart to be consistent with the requirements.

A few commenters wanted time frames to be established for Requirement R1, Part 1.1.3. The drafting team reiterated that there in not a single time frame that would be appropriate for every project and chose not to modify the standard.

Several commenters wanted Requirement R4 to be revised because of compliance and agreement concerns. The drafting team revised the requirement for clarity.

Several commenters requested the Applicability Section 4.2 Facilities be modified to clarify the role of Distribution Providers. The drafting team responded that they believe the Distribution Providers that own Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements should be included in the Applicability of this standard because those Protection Systems must be coordinated with the Protection Systems of other Facility owners.

A commenter requested clarification of the Fault current contribution specified in Requirement R2, Part 2. The drafting team modified Requirement R2, Part 2.2 to read "for the interconnecting bus(s) under consideration."

A commenter expressed concern that Requirement R2 mandated that an entity perform a short circuit study even if no Protection System Study existed. The drafting team modified Requirement R2, Part 2.1 to read: "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."

Several commenters suggested various changes be made to the Purpose statement of the standard. Based on these comments, the drafting team modified the Purpose to read: "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults." and also modified Requirement R1, Part 1.1 to reflect the change in the Purpose. It now reads: "Perform a Protection System Study for each Interconnected Element to coordinate Protection Systems, such that the least number of power system Elements are isolated to clear Faults as follows:"

Organization	Yes or No	Question 9 Comment
ACES Power Marketing Standards Collaborators		(1) Please restate section 4.2. It states that it applies to Protection Systems installed at Interconnected Facilities. "Installed at" is not really the intention. It should be Protection Systems installed to protect Interconnected Facilities. While they most likely would be at the Facility, they do not have to be. For example, a 500 kV transmission line is a Facility. Protection Systems will not be "Installed at" the line but rather at the substations. (2) If PRC-001-3 R1 is going to be retained, it needs to be further refined. a) First, it inappropriately uses the term area when referring to a GOP. While the BA and TOP do have Balancing Authority Areas and Transmission Operator Areas, no equivalent exists with the GOP. The GOP simply operates generating units not areas. b) Second, the requirement confuses the role of the GO and GOP. In the functional model, it is the GO that is responsible for installing, setting and coordinating generation protection systems not the GOP. Thus, it is not clear what role the drafting team envisions for the GOP being familiar" with the purpose and limitation of protection system schemes applied in its area". c) Third, the requirement is written too broadly for the BA. Because the requirement compels the BA to be familiar "with the purpose and limitation

Organization	Yes or No	Question 9 Comment
		of protection system schemes applied in its area" this could literally require the BA to understand many protection schemes for which it has no direct or even indirect responsibility. For instance, distance and differential protection schemes are contained within the metered boundaries of a BA Area. This requirement would compel the BA to be familiar with them even though this knowledge would have zero impact on its decision making or responsibilities. This does not align with the responsibilities assigned to the BA in the functional model. The BA being included in this requirement is likely a vestige of the version 0 standards and should be corrected. When version 0 standards were translated from the policies, BA and TOP were simply substituted for control area regardless of the role the control area was playing in the requirement. (3) The NERC function model defines one role of the Transmission Planner as "define system protection and control needs". Should the Transmission Planner have a role in this standard? For instance, should the TP actually perform the short circuit studies? (4) The application guidelines and examples are very helpful in understanding the intent of the drafting team. However, we recommend revising the example regarding Figure 3. It would appear to assume a distribution level generator is part of the BES and subject to NERC standards. While it is possible for a generator on the distribution system to be part of the BES (i.e. if it is a Blackstart Resource), inclusion of such a generator would be unusual and an exception to the normal BES 100 kV threshold. If the generator is not part of the BES, there would be no Generation Owner registered to perform the coordination. Industry is likely to be sensitive to such an example. Removing the generator will still allow the example to communicate that a breaker and associated Protection System on the high side (100 kV or higher) of a distribution or step-down transformer would still have to be coordinated.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comment. 1. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."** 2. **This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, "The drafting team recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".** 3. **Although the Transmission Planner may "define system protection and control needs", it will be the owner that is responsible for determining the implementation and coordination.** 4. **Figure 3 is independent of whether the facilities are part of the BES. The intent is to identify that the coordination is required where Protection Systems are installed for the purpose of protecting Transmission System Elements.**		
Ameren		(1) We support and agree with the SERC Protection & Control Subcommittee comments. (2) We commend the SDT on their high quality initial draft of PRC-027-1. (3) We recommend that the SDT delete 'operating' from the Interconnected Facilities definition because their different functional or corporate entities sufficiently capture all of them. We also suggest defining the singular Interconnection Facility, rather than the plural. (4) The SDT needs to improve the application guidance examples by stating what constitutes the Interconnection Facility. The first example clearly enumerates the short circuit locations and values to be compared between the most recent Protection Study and the R2 2.1 value. (5) Application Guidelines Example / Figure 3: The Note should be clarified, or the example should be removed. In terms of regulatory requirements, Breaker-A and B should coordinate with Breaker-C. However, Breaker-C and the Generator relaying does not need to coordinate with Breakers at Station-1 or Station-2 unless the

Organization	Yes or No	Question 9 Comment
		generator meets the requirements of a BES element (75MW or greater). For small generators, protection on the generator to detect faults on the transmission system is for generation protection, not BES protection; as the fault currents would be too small to cause damage to the Transmission System. Generator protection is already covered in Example / Figure #2. (6) Please restate Effective Date more clearly, we suggest "PRC-027-1 shall become effective on the first day of the first calendar quarter [delete-that is] three months following [delete-beyond the date that this standard is approved by] applicable regulatory approvals [delete-authorities],..." to be consistent with the wording of other standards (e.g. PRC-005-2.) (7) Since short circuit data base models are required to perform the Protection System Study, NERC regions should have a consistent schedule for revising models. Please encourage regions to synchronize their regional modeling calendars to enable entities to have consistent models, especially near region borders, for efficient execution of PRC-027-1 (8) we recommend that the SDT add proposed NERC Standard TPL-001-2 to your list on page 5 regarding the Other Aspects of coordination. It requires short circuit studies in R2.8 for the purpose of determining if the short circuit interrupting requirements are within the interrupting capabilities of circuit breakers. (9) We strongly recommend that the SDT use the term 'change' rather than 'deviation' throughout for consistency and because the latter term is defined as being different from the norm. The new fault current value is now the norm, not abnormal or statistically different. R1 - 1.1.2 and 1.1.3 use 'change', but 'deviation' is then used about a dozen times thereafter in the document. (10) There is a concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process.

Organization	Yes or No	Question 9 Comment
		(a) The overall process would be less burdensome by changing the R2 2.1 to “not less than once every 5 calendar years” which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3.(b) The overall process would be less burdensome by deleting R3 3.3 because such Protection System changes are already captured by R3 3.1 and 3.2. (b) Omitting ‘project schedule’ from R3 would streamline data exchange. (c) R3-3.1 and 3.3.1 should only be required IF the changes effect the tripping or coordinated functions. Digital relays include numerous settings besides these functions; and these other settings should not trigger a data exchange or study. (d) Streamline the process by measuring dates an entity sends information and receives final agreement. It is burdensome for the sending entity to also track and retain evidence showing another entity received information. Specifically change M2, M5, M6, M7, and M8 to measure the date sent. The other entity’s agreement in M9 shows that the overall process met overall time requirements and that the entities coordinated. If an entity demonstrates such a study is not required in R1, M1 should require the other entity to agree. (e) The application guidelines are generally clear and certainly clarify responsibility. We recommend somehow including their methodology in the requirements because it streamlines the exchanged data and clarifies the process in this complex and potentially voluminous undertaking.

Response: Thank you for your comment.

1. **See the response to the SERC Protection & Control Subcommittee comments.**
2. **Thank you for your support.**
3. **Based on comments, the drafting team modified Interconnected Facilities to Interconnected Elements defined as follows,**

Organization	Yes or No	Question 9 Comment
Interconnected Elements: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity. 4. The drafting team has modified the figures to clarify what is the Interconnected Element. 5. Figure 3 is independent of whether the facilities are part of the BES. The intent is to identify that the coordination is required where Protection Systems are installed for the purpose of protecting transmission system elements. The drafting team has modified Figure #3. 6. The language for the Effective Date is the authorized text approved by NERC legal staff. 7. This is outside the scope of the drafting team. 8. The drafting team believes that the referenced requirement in TPL-001-2 is related to interrupting capabilities and is not directly related to Protection System coordination. 9. The drafting team believes that the term "deviation" is properly used in R2 Part 2.2 and is synonymous with the term "change". 10. (a) The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard does not require. (b) The drafting team believes that omitting the "project schedule" from the list of example data submittal will not streamline the data exchange, but the schedule is very likely required to ensure that each entity can allocate resources as necessary. (c) Requirement R3, Part 3.1 states that the information shall be provided "when the proposed change modifies the conditions used in the coordination of Protection Systems…" The drafting team modified Requirement R3, Part 3.3 to eliminate Parts 3.3.1 and 3.3.2, but believes any information previously provided to another entity to ensure Protection System coordination must be provided if any of the information is changed pursuant to Part 3.3. (d) The drafting team believes that confirmation of receipt is an important aspect of information exchange and declines to		

Organization	Yes or No	Question 9 Comment
make the suggested change. **(e) The drafting team believes that the "Guidelines and Technical Basis" is the appropriate place to elaborate on the responsibilities under the standard rather than including the information in the Requirements.**		
TransAlta Centralia Generation LLC		1) Applicability 4.2 Facilities should be Protection System installed at Interconnected Facilities that required coordination. 2) R2- For the Inteconnected Faculties only for the purpose of the generator interconnection, only the Transmission Owner providing the generator interconnection should be required to perform the tasks as mentioned in R2, not the other entity (generator) even though it is registered as the Transmission Owner. 3) R2 2.1 performs a short circuit study to determine the present fault current values, not less than once every 24 months. 24 months is too often. Suggest to change to "once every 60 months unless there is major equipment change on the system".
Response: Thank you for your comment. **1. Based on comments, the drafting team has changed the Application, 4.2 Facilities to "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements."** **2. The drafting team added the following to the Rationale for R2, "(This requirement does not apply to the subject Generator Owner if it is also registered as a Transmission Owner, unless also registered as a Transmission Owner interconnecting to its own generator)" to address your comment.** **3. The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2.**		
Xcel Energy		1) It appears that clarification is needed in the Application guidelines with respect to the Generator Owners, Distribution Providers and Transmission Owners. If they are the same corporate entity, do the examples indicate as such and would coordination be required as specified? (It is presumed YES but not clear...e.g. GO

Organization	Yes or No	Question 9 Comment
		"R" and TO "S" could be the same corporate entity). Figure 5 implies the letters "R", "S", and "T" refers to different corporate entities since there is a Transmission Owner R and a Transmission Owner S along with a Generator Owner T. If these letters do not indicate different corporate entities, then is it the intention of the SDT that all GO and DP facilities that connect directly to the BES be treated as "Interconnected Facilities"?. 2) Additional clarification in the Application Guide (figure 3) is required as it would imply that proof is require that generation on a tapped substation does not pose a risk to the transmission system. 3) The dates and documentation requirements for this standard will require an equivalently complex system or database for tracking in order to prove compliance. From review of the standard it appears that tracking of ~8 dates and associated supporting documents will be required for each interconnection study. Additional implementation time should be included in the standard for proper processes and tools to be in place prior to perform study or re-study work. 4) Most study work would be initiated by R3.2 and typically involve multiple data requests for varying items and with associated responses providing the information. If each email request needs a corresponding response, then much time will be required to match emails topic for topic to meet this measure. The result will be multiple of same measure for study work, increasing tracking time for engineering. (i.e. more tracking time and less engineering time per engineering FTE). If the measure is to be based on first request to last response then this would easier to implement. 5) As existing studies will fall under the measures of this document, with no grandfathering, it is likely existing studies will need to be re-evaluated. As a result, consulting services for competent protection engineering services may become limited and may impact the ability in meeting the 36 month requirement. 6) Larger regional studies with interconnection impacts may be the outcome of

Organization	Yes or No	Question 9 Comment
		more localized studies. Such studies could be recommended as a result of R2 of this document or future year models under R3.1. The time-frames specified in this standard may not be sufficient and no exception method is provided for expanded study work. (i.e.-studies beyond what is would be considered typical for an interconnection study).
Response: Thank you for your comment. 1. **The drafting team has removed the term Interconnected Facilities and replaced it with Interconnected Elements, which is defined as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity." The drafting team believes that the definition includes a Generation Owner and Transmission Owner that are part of the same registration, but would exclude a single Transmission Owner that is responsible for all interconnected terminals.** 2. **Based on comments received, the drafting team has revised the description relating to Figure 3 in the "Guidelines and Technical Basis".** 3. **The drafting team believes that the proposed requirement time frames and effective date allow sufficient time to comply with the standard.** 4. **The drafting team did not change the standard based on this comment.** 5. **The drafting team recognizes that 36 months does not provide entities with large numbers of Interconnected Stations enough time to complete the Protection System Studies, and agrees with those commenters that pointed out that there is no evidence there is widespread miscoordination between Interconnected Stations. R 1.1.1 has been changed to: "Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists"** 6. **Based on comments, the drafting team has modified requirement 4, Part 4.2 to state, "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element agree with any resulting Protection System(s) changes." The drafting team believes that regional studies as a result of Requirement 2 are outside the scope of this standard.**		
Pepco Holdings Inc. & Affiliates		1) The SDT states that "the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14,

Organization	Yes or No	Question 9 Comment
		2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays". However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of "the appropriate use of time delays in relays" in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS's during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue.

Organization	Yes or No	Question 9 Comment
		As such, although we support the overall desire to ensure that protective systems are "properly coordinated"; we see little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. 2) PRC-001 With the vast majority of the requirements from PRC-001-1 being removed, the Title and Purpose of proposed standard PRC-001-3 no longer seem appropriate for the content remaining therein and should be revised. The only remaining requirement in PRC-001-3 states that "Each Transmission Owner, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area. This does not seem to be a Protection System Coordination issue. 3) The definition of Interconnected Facilities should reference Registered Entities rather than functional, operating, or corporate entities. BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities Registered Entities (TOs, GOs, and/or DPs). 4) Is Facility and/or Element the best term(s) to use in the definition? It seems to say Elements that are joined by Elements? If not, should the definition be further revised. NERC Glossary of terms for Element: Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. NERC Glossary of terms for Facility: A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.) 5) Does joint own lines and stations create issues? Should the definition or standard

Organization	Yes or No	Question 9 Comment
		make a distinction between principal owner and financial owners?

Response: Thank you for your comment.

1. **PRC-027-1 is replacing Requirements R2 and R3 of PRC-001-2. The drafting team is developing this standard based on the Standards Committee approved SAR, and is addressing directives issued by FERC in Order 693.**
2. **This subject is outside the scope of this drafting team; however, your comment will be forwarded to NERC staff.**
3. **The drafting team has removed the term "Interconnected Facilities" and replaced it with "Interconnected Elements," which is defined as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."**
4. **The drafting team replaced the term "Interconnected Facilities" with "Interconnected Element."**
5. **The drafting team believes that the individual owners' Protection Systems are well defined, but if there is joint ownership in the Protection Systems, compliance responsibility has been delegated for other standards and this standard has a similar need for delegation of responsibility.**

Organization	Yes or No	Question 9 Comment
Northeast Power Coordinating Council		1. Referring to the Example Process on page 22, it should not be the responsibility of Entity B to propose revisions. It should be the responsibility of the Entity in the better position to propose a revision to propose the revision. There needs to be flexibility as to who is obliged to come up with a revision. 2. Regarding Fig. 2 and Fig. 5 in the Application Guidelines, it is important that the expertise of each entity involved in an interconnection be used to ensure that there are no coordination issues. For example, Generator Owners and Transmission Owners. 3. Application Guidelines Fig. 3 requires the TO to verify that the DP's and the GO's protection systems coordinate with the TO's, even though the GO doesn't connect directly to the TO. It should be the DP that checks coordination of the GO with the DP for faults on the transmission side of the DP's substation transformer, and the TO that checks coordination of the DP's transmission protection with the TO. If all of the transmission protection is back at the GO (in other words the DP has installed no

Organization	Yes or No	Question 9 Comment
		transmission protection at its sub) then to do as this app guide suggests the TO will require an accurate short circuit model of the DP's system between the GO and the TO. It would require that the DP keep the TO continuously appraised of changes to the DP's system that impact the short circuit representation. Considering the proliferation of distributed generation being interconnected to distribution systems the burden should be on the DP not on the TO supplying the DP to verify coordination. The scope of the text "....generator protection systems...." should be narrowed so a TO or DP is not responsible for the coordination of devices it doesn't own, maintain or set.
Response: Thank you for your comment. 1. **The drafting team believes that the Example Process does allow the flexibility that you describe. The collaboration would begin at the point where Entity B responds to Entity A with its proposal.** 2. **The drafting team believes that there is flexibility in the process to allow for the expertise of each entity to be used to coordinate Protection Systems.** 3. **Based on comments received, the drafting team has revised the description relating to Figure 3 in the "Guidelines and Technical Basis" to clarify that only the Distribution Provider's Protection Systems installed to protect for Faults on Transmission System Elements are a part of the Applicability of this standard.**		
Independent Electricity System Operator		1. As a general comment, we do not support defining new terms which have limited applications (e.g. for use in one or very few standard) and which are short and therefore can be equally effectively expressed in the requirement that the term or its intended meaning is used. Adding new terms to the NERC Glossary when not absolutely necessary creates unnecessary maintenance workload and dependency among standards that use the same term, making it far more difficult to revise a standard without addressing the ripple effects. While we do not oppose to defining the term Interconnected Facilities as it serves to clarify and provide the boundary of the Facility, and we see its potential application to other standards, we disagree with defining the term "Protection System Study". The definition contains an objective "operate in the

Organization	Yes or No	Question 9 Comment
		desired sequence for clearing Faults" that should be stipulated in the standard requirements themselves. Further, as suggested below, the requirements that this term is used can be easily revised to convey the meaning of the definition: R1, 1.1 Perform a study for each Interconnected Facility to verify that Protection Systems operate in the desired sequence for clearing Faults and remove from service only those Elements required to isolate Faults as follows:1.1.1 Within 36 calendar months after the effective date of this standard, if no such study for that Interconnected Facility exists that was performed on or subsequent to June 18, 2007R1, 1.2 Provide to each affected Interconnected Facility owner a summary of the results of each study performed pursuant to Part 1.1 of this requirement, (including, at a minimum, the Protection System(s) reviewed, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each study.R2, 2.2 Calculate the percent deviation between the Fault current values (single line to ground and 3-phase for the bus(s) or Element(s) under consideration) used in the most recent study performed under Part 1.1 of R1 and the Fault current values....Vpss = Fault current value used in the most recent studyR4, 4.1 Within 90 calendar days after receipt, confirm agreement with the summary results of a study as described in Requirement R1, Part 1.2.Conforming changes can be made to the associated Measures and VSLs. 2. We do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. If this is a training requirement, it should be transferred to the appropriate PER standards. c. Measures M1 is removed from the standard. This does not conform with the Elements of a Reliability Standard template, specifically those specified in the

Organization	Yes or No	Question 9 Comment
		"Mandatory and Enforceable Sections of a Standard". d. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. However, leaving this not measurable and unnecessary requirement in PRC-001-3 is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT could have proposed a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee's advice/direction for appropriate actions. 3. The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "where such explicit approval is required" in the Effective Dates Section on P. 2, to the following effect:", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities."

Response: Thank you for your comment.

1. **The drafting team believes that defining the term "Protection System Study" is the most efficient way to refer to the necessary reviews and the best way to allow for description of the studies.**
2. **This subject is outside the scope of this drafting team; however, your comment will be forwarded to NERC staff.**
3. **The drafting team believes that the "Effective Dates" language used in the standard and in the Implementation Plan is appropriate and consistent with other reliability standards.**

Organization	Yes or No	Question 9 Comment
Southern Company		1. The separation of PRC-001-1 in three directions is appreciated. This move was a move in the right direction in our opinion. 2. Whereas the SPCTF may believe that the existing PRC-001-1 was too vague and was not measureable, we believe that the initial draft of PRC-027-1 is overly specificative. Contained within the four listed requirements are actually 11 requirements with 11 different time critical counters that are not to be violated. It is our opinion that equally effective reliability improvement results can be achieved with a standard that is of the form of something in between these two extremes. We propose to eliminate the multiple calendar based time framed requirements and simplify the eleven requirements into four simply stated requirements. The four requirements, simply, could be: 1) For each Interconnect Facility (IF), perform a Protection System coordination study/review every X years or sooner if triggered by Y. (Y = available fault current change % [r-iii below], system configuration change or other protection system change [r-ii below]); 2) IF owners must notify other IF owners of changes that may affect the other IF owner's Protection System coordination study. (list items likely to affect coordination-this list includes everything in the draft standard R3); 3) TOs are to notify other IF owners if available fault current changes significantly %; 4) IF owners must share & acknowledge receipt and review of their IF Protection System coordination study with other IF owners of that IF. 3. On figure 5 (p. 27 of the draft standard), it seems unreasonable to require that the GO coordinate their protection with that associated for breakers E, F, and G, which are three breakers away from the generator.

Organization	Yes or No	Question 9 Comment
		4. There is an error on p 5 of the Technical Justification document under Requirement R3. In the first sentence, it is R1, not R3, that requires the IF owners to evaluate the impact to their Protection Systems due to proposed changes by others.
Response: Thank you for your comment. **1. The drafting team thanks you for your support.** **2. The drafting team understands your concerns but believes that the requirements and associated time frames are the best way to ensure that Protection System coordination is achieved in a non-discriminatory fashion.** **3. The drafting team believes that the Generator Owner may have overreaching elements that require coordination with breakers E, F, and G and thus made no changes to the standard based on this comment.** **4. Based on your comment the drafting team modified the sentence to "This requires the registered functional entity initiating any change to provide the details to the other affected entities of the Interconnected Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes."**		
Hydro One		1. This standard has been written on the basis that one of the Entities initiates the process and that both, assuming 2 only, conduct their own independent Protection System Studies; and then at the end of the process they agree, etc. Based on our experience, it is more efficient that both parties work in cooperation to conduct the Protection System Study and that they produce one report document which is then approved by both entities as meeting adequate coordination requirements. The Protection System Studies report shall be dated, and include the fault values at the time of assessment and should be filed as compliance evidence. 2. The SDT states "The SDT has no evidence there is widespread miscoordination between Interconnected Facilities...." This is contrary to the NERC TRD that indicated that there were plenty of co-ordination issues during the 2003 Blackout. Suggest removing this statement as it is contradictory and serves no purpose since the documented Protection System study has to take place regardless. 3. We feel the standard would be more useful to the industry if a list of applicable

Organization	Yes or No	Question 9 Comment
		Protection System elements that require co-ordination is presented in the requirements section in line with the NERC white paper. Much like PRC-023 that identifies specific elements and corresponding numbers, we feel this approach would result in proper Protection System studies being undertaken for elements that are affected by this standard. The SDT claims some elements will be covered in other standards so the scope of elements that need co-ordination needs some clarity. 4. PRC-001-3 lists “first day of the first calendar quarter twelve months following” as the Effective Date. However, the implementation plan states that the effective date is the same as for PRC-027-1 which is “first day of the first calendar quarter that is three months beyond”. Please clarify and ensure consistency. 5. Hydro One is questioning the purpose and existence of PRC-001-3 in its current form. It contains only one requirement that is very vague and not measurable. Suggest that the SDT retires that standard as a part of this project 6. To avoid confusion we ask the SDT to establish 1 to 1 correspondence between the requirements and measure. For example R2 measures should be M2 or M2.1, M2.2 rather than M3 and M4.

Response: Thank you for your comment.

1. **The drafting believes that the standard does not preclude collaboration between the affected entities when performing the Protection System Study.**
2. **The drafting team believes that the coordination issues addressed in the 2003 Blackout report were related to UFLS, UVLS, and generator controls. While there were statements of general philosophy about the need for coordination of transmission line protection, there were no examples of miscoordination. As such, the drafting team has declined to remove the suggested statement from the standard.**
3. **Based on comments, the drafting team modified the Facility Applicability 4.2 to “Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements,” which the team believes clarifies those Protection System Elements that are required to be coordinated under this standard.**
4. **The drafting team has modified the effective dates so they will be consistent. The effective date for PRC-001-3 is now**

Organization	Yes or No	Question 9 Comment
described as "This standard becomes effective coincidently with PRC-027-1." **5. The retirement of PRC-001-3 is beyond the scope of this drafting team; however, your comment will be forwarded to NERC staff.** **6. The drafting team followed the format outlined in the NERC "Standard Processes Manual," effective January 31, 2012.**		
National Grid USA / Niagara Mohawk		1. Regarding the definition of "Interconnected Facilities," when the functional and operating entities are part of the same corporate entity documented correspondence within that same corporate entity seems of little benefit. In fact, it could be the same individual wearing two hats in the same corporate entity who would have to document communications with him/herself. 2. Example process on page 22 should not automatically make it the responsibility of entity B to propose a solution to a problem discovered by entity A quite possibly resulting from system modifications initiated by entity A. Whether entity A or entity B is in a better position to propose a solution depends entirely on the circumstance and there needs to be flexibility as to who is obliged to come up with a fix. 3. Application Guidelines, Fig. 2 and Fig. 5 require the TO to verify "...the generator Protection Systems..." coordinate with the TO's systems. The scope of generator protection systems should be narrowed to just distance relays and overcurrent relays that look out onto the TO's system. If the high side winding of the transformer that interconnects to the TO is ungrounded and zero sequence overvoltage protection is provided for the transmission, then that would be appropriate to include in the scope of TO responsibilities too. The expertise in other types of generator protection likely resides with the GO and not the TO so it would be best if the GO handled the coordination of those other types of protection. 4. Application Guidelines, Fig. 3 requires the TO to verify the DP's and the GO's protection systems coordinate with the TO's. Yet the GO doesn't even connect directly to the TO. It should be the DO that checks coordination of the GO with

Organization	Yes or No	Question 9 Comment
		the DP for faults on the transmission side of the DP's substation transformer (assuming the DP has installed transmission protection at the sub) and the TO that checks coordination of the DP's transmission protection with the TO. If all of the transmission protection is back at the GO (in other words the DP has installed no transmission protection at its sub) then to do as this app guide suggests the TO will require an accurate short circuit model of the DP's system between the GO and the TO. Furthermore it would require that the DP keep the TO continuously appraised of changes to the DP's system that impact the short circuit representation. Considering the proliferation of distributed generation being interconnected to distribution systems the burden should be on the DP not on the TO supplying the DP to verify coordination of what could be a multitude of interconnections to the DP. Furthermore, the scope of the text "....generator protection systems...." should be narrowed so a TO or DP is not responsible for the coordination of devices it doesn't even own, maintain or set. When study work is required to interconnect a GO to an entity, the entity is commonly reimbursed by the GO for study work. Yet this app guide requires a TO to perform study work for the benefit of a GO which does not even directly interconnect with it so how will the TO be reimbursed for it's efforts?

Response: Thank you for your comment.

1. **The drafting team has removed the term Interconnected Facilities and replaced it with Interconnected Elements, which is defined as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity." The drafting team believes that the definition includes a Generation Owner and Transmission Owner that are part of the same registration, but would exclude a single Transmission Owner that is responsible for all interconnected terminals.**
2. **The drafting team believes that the Example Process does allow the flexibility that you describe. The collaboration would begin at the point where Entity B responds to Entity A with its proposal.**
3. **The drafting team believes that there is flexibility in the process to allow for the expertise of each entity to be used to coordinate Protection Systems.**

Organization	Yes or No	Question 9 Comment
4. Based on comments received, the drafting team has revised the description relating to Figure 3 in the "Guidelines and Technical Basis" to clarify that only the Distribution Provider's Protection Systems installed to protect for Faults on Transmission System Elements are a part of the Applicability of this standard.		
Tennessee Valley Authority		a)Throughout the 1st draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.2, R2-2.3, R4-4.1, R4-4.2, R4-4.3-4.3.1 and R4-4.3-4.3.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. For example: R1, Part 1.1.2 reads - "Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required." For Requirement R1, Part 1.1.2, we recommend omitting the reference to R2 and reword so that the requirement is specific. Recommend changing to read: "Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility unless the entity can demonstrate such a study is not required". b) The standard uses different formats for identifying deadlines. Sometimes "days" are used and sometime "months" are used. It is suggested that a common format be used. c) Please note that there appears to be an inconsistency in the 24 month requirement of R 2.2.1 and the ongoing work in TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. PRC-027-1 R3 will trigger a Protection System Study if there are proximate changes in the meantime. d) Throughout the 1st draft of this standard, there are references to a variety of time horizons (calendar days, calendar months) and within individual Requirements where time schedules are involved, the wording of the Requirement is not consistent when calendar days or months are referenced. For example: R1-1.1-1.1.1 references the

Organization	Yes or No	Question 9 Comment
		time schedule at the beginning of the Requirement whereas R1-1.2 references the time schedule at the end of the Requirement. Recommend using a standard wording format and list the time horizons in the beginning of the Requirement in all Requirements that have time requirements involved. For Requirement R1-1.2, we recommend changing to read: "Within 90 calendar days after the completion of the Protection System Study: Provide, to each affected Interconnected Facility owner, a summary of the results of each Protection System Study performed (including at a minimum the Protection System(s) reviewed and any proposed revisions)." e) There is a concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process. i) The overall process would be less burdensome by changing R2, Part 2.1 to "not less than once every 5 calendar years" which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3. ii) The overall process would be less burdensome by deleting R3, Part 3.3 because such Protection System changes are already captured by R3, Parts 3.1 and 3.2. iii) Omitting 'project schedule' from R3 would streamline data exchange. f) Delete 'operating' from the Interconnected Facilities definition because "different functional or corporate entities" sufficiently captures all of them. We also suggest defining the singular Interconnection Facility, rather than the plural.

Response: Thank you for your comment.

a. **The drafting team believes that your proposal does not change the requirement and the reference to the other requirements in this standard is the best way to both maintain consistency and to describe the requirements. The team declined to make the suggested changes.**

Organization	Yes or No	Question 9 Comment
b. The drafting team chose to use "months" for any measurable period longer than 90 calendar days and believes this does not introduce any problem with meeting the requirements. c. The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard does not require. d. The drafting team believes that references to the time horizons are accurately and sufficiently described and declined to make the suggested changes. e. i) The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). Operational Compliance		All of the questions in this survey should elicit a "yes" response to agree with the Standard. Question 2 elicited a "no" response even though we agree with the part of the standard in the question. The questions in this survey should be worded to ask if we agree with the exact wording of the standard. For example, in Question 4 the wording of the question is different than in the Standard regarding deviation.
Response: Thank you for your comment. The drafting team agrees.		

Organization	Yes or No	Question 9 Comment
City of Austin dba Austin Energy		Austin Energy (AE) agrees with PRC-027-1 in concept and is prepared to change our vote to affirmative once the SDT addresses the items in these comments. In addition to those provided as part of the specific questions, AE provides the following comments for consideration: (1) AE requests the SDT to identify a timeframe for R1.1.3. The Guidelines and Technical Basis (p17 of PRC-027-1 Draft #1) states, "The SDT believes that specifying a single time frame for evaluation of the wide variety of conditions that may be associated with a particular change is not appropriate ..." The flowchart on page 21 shows a system change that triggers the need for a new study leading to a box that requires the study be performed within six months. Please remove the conflicting information. (2) AE supports a timeframe that requires a Protection System Study in accordance with a mutually agreed-upon schedule that includes confirmation of agreement with summary results (per R4.1) prior to the in-service date of any planned change. AE suggests the SDT identify this timeframe in R1.1.3 and delete R4.2. (3) AE requests that the SDT change the values in the % Deviation formula (R2.2) from VSCS and VPSS to ISCS and IPSS since V is typically used for voltage. AE also requests the SDT change the variable definitions from "fault current value ..." to "fault current magnitude ..." to clarify that the phase angle is not included.

Response: Thank you for your comment.

1. **The drafting team has modified the flowchart based on comments and to reflect all changes made to the standard.**
2. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."**
3. **Based on comments, the drafting team has modified the equation to replace "V" with "I." The drafting team kept the phasor values of the current in the calculation but included the percent deviation to be the absolute value of the percentage change**

Organization	Yes or No	Question 9 Comment
in the current to remove the angle from the final result.		
Oncor Electric Delivery Company LLC		Based on a thorough review of the proposed Standard, Oncor has identified several questions or comments which need to be addressed in the Standard to ensure the Requirements are clear. 1. R4.1: please provide clarification of which entity would be out of compliance if the 90 day requirement is not met - initiating entity or receiving entity or both 2. M9: What does "confirmation" mean as explained in Measure M9? 3. R4: please incorporate a definition of “agreement” 4. R4.2: please incorporate some examples for "evidence of agreement"? 5. There are two types of agreement that are needed; the first being an "agreement" with the overall projected relaying scheme (i.e. agreement with preliminary conceptual design detailing proposed protection scheme changes). This is prior to any equipment being purchased. The second agreement, which could be identified as more of a concurrence, is agreement that both relay systems coordinate from a protection standpoint (i.e. concurrence with relay setting changes). The relay setting process and concurrences occur later in the project closer to the in-service dates. In addition, the sub requirements 4.3.1 and 4.3.2 calls for confirmation of the Protection System changes are acceptable pursuant to notification received in Requirement 3, within 30 days, however the sub requirements provide no mechanism for resolution in the event the changes are not acceptable to the receiving entity within 30 days of receipt. Oncor suggest that these two sub requirements be removed. There are sufficient checks and balances under 4.2 to provide coverage for any disagreement between entities without the need to self-report under the 4.3.1 and 4.3.2 if an agreement cannot be reached within 30 days of receipt.

Organization	Yes or No	Question 9 Comment
		6. R3.1: please provide further clarification of the statement "modifies the conditions used". It would seem that most system changes would modify the conditions used even though for many of those changes, coordination would not be impacted. Oncor takes the position that the phrase provides ambiguity and subjectivity that would difficult to measure or audit.

Response: Thank you for your comment.

1. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes..**
2. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." Measure M9 was revised to read: "Acceptable evidence for Requirement R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement."**
3. **Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Acceptable evidence for R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement"**
4. **Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm that the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes."Acceptable evidence for R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement."**
5. **Based on comments, Requirement 4, Part 4.3 was removed.**
6. **Based on comments, the drafting team clarified the items in Requirement 3, Part 3.1 to indicate which items the drafting team**

Organization	Yes or No	Question 9 Comment
believes modify the conditions used in the coordination of Protection Systems.		
Luminant		Comment on Requirement R1.2. The time frame listed may not be adequate under all circumstances or situations. Luminant recommends that the language be changed in this requirement as follows: "... Protection System Study performed pursuant to this requirement (including at a minimum, the Protection System(s) reviewed, any issued identified, and any revisions proposed) shall be in accordance to an agreed-upon schedule with a Transmission Owner, Generation Owner, of Distribution Provider." The corresponding measures will also need to be modified if this language is accepted.
Response: Thank you for your comment. **The drafting team believes that 90 days is adequate time to provide the owner(s) of the Protection System(s) associated with the Interconnected Element(s) with the summary of the results of a Protection System Study and declined to change the standard based on this comment.**		
Trans Bay Cable		Comments: The comment group agrees with the WECC Position Paper that the standard as written requires excessive and burdensome documentation that is not needed to demonstrate coordination.
Response: Thank you for your comment. **The drafting team believes that changes affecting Protection Systems must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained.**		
Dominion		a). Dominion is concerned that a YES vote will also endorse the revision, also part of this project, to PRC-001-3, would then be reduced to only one requirement that is not measurable and does not contribute to the purpose of the standard. The Measure for the requirement has also been removed. The PRC-001 standard should be retired or mapped to another standard.

Organization	Yes or No	Question 9 Comment
		b). The proposed definition of Protection System Study is vague and introduces subjective terms such as "demonstrates" and "desired sequences". Recommend the following definition: "A study that determines the proper selection of settings for existing or proposed protective relays in order to properly isolate Elements." c). Throughout the 1st draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.2, R2-2.3, R4-4.1, R4-4.2, R4-4.3-4.3.1 and R4-4.3-4.3.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. For example: R1-1.1.2 reads - **"Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required."** For Requirement R1-1.1.2 - Omit the reference to R2 and reword so that the requirement is specific. Recommend changing to read: "Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility unless the entity can demonstrate such a study is not required". - Change R1-1.1.3 wording to read "When proposing or being notified of a change that modifies the conditions used in the coordination of Protection Systems at the Interconnected Facility unless the entity can demonstrate such a study is not required." - R2-2.2, delete reference to R2. Delete "pursuant to Requirement R2, 2.1". - Change R4-4.1 to read: "Within 90 calendar days of receiving summary results of a new Protection System Study, confirm agreement with the summary results." - Change R4-4.2 to read: "Prior to the installation of a proposed change that

Organization	Yes or No	Question 9 Comment
		modifies the existing conditions used in the coordination of Protection Systems of the Interconnected Facilities, confirm the affected Interconnected Facility owner(s) agree with the Protection System(s) change." - Change R4-4.3.1 to read: "Changes made to a Protection System as a result of findings during Misoperation investigations, commissioning, or maintenance activities, confirm the Protection System(s) changes are acceptable." - Change R4-4.3.2 to read: "Emergency replacements are made due to failures of Protection System components confirm the Protection System(s) changes are acceptable." d) Throughout the 1st draft of this standard, there are references to a variety of time horizons (calendar days, calendar months) and within individual Requirements where time schedules are involved, the wording of the Requirement is not consistent when calendar days or months are referenced. For example: R1-1.1-1.1.1 references the time schedule at the beginning of the Requirement whereas R1-1.2 references the time schedule at the end of the Requirement. Recommend using a standard wording format and list the time horizons in the beginning of the Requirement in all Requirements that have time requirements involved. For Requirement R1-1.2, Change wording to read: **"Within 90 calendar days after the completion of the Protection System Study, provide to each affected Interconnected Facility owner a summary of the results of each Protection System Study performed (including at a minimum the Protection System(s) reviewed and any proposed revisions)."** - Change R2- 2.3 wording to read: Within 30 calendar days after identifying that the calculation performed between the previous Protection System Study and the new study indicates a change in Fault current of 10% or greater, notify each Interconnected Facility owner, at which the 10% or greater change applies.

Organization	Yes or No	Question 9 Comment
		- Chang R3-3.2 wording to read: <u>"Within 30 calendar days of receiving a request for information in the absence of an agreed-upon schedule or according to an agreed-upon schedule with a Transmission Owner, Generator Owner, or Distribution Provider."</u> e). Throughout this 1st draft of the standard, there are references that illustrate documentation requirements that are inconsistent. <u>Recommend all be written as "(hard copy or electronic file formats)".</u> f). Please note that there appears to be an inconsistency in the 24 month requirement of R 2.2.1 and the ongoing work in TPL-001-2 draft 5 R2 2.6.1 which allows short circuit studies to be five calendar years old. PRC-027-1 R3 will trigger a Protection System Study if there are proximate changes in the meantime. g). There are several requirements stipulated throughout the draft standard creating the concern with the various time requirements for studies, notification, and replying. Tracking and documentation requirements will be very burdensome. We request the drafting team consider streamlining the data required in the exchange of studies and the overall process. 1). The overall process would be less burdensome by changing the R2 2.1 to "not less than once every 5 calendar years" which would be consistent with TPL-001-2 draft 5 R2 2.6.1 (see comment 9c above). Our experience is that the vast majority of Protection System Studies are triggered by R3. 2). The overall process would be less burdensome by deleting R3 3.3 because such Protection System changes are already captured by R3 3.1 and 3.2. 3). Omitting 'project schedule' from R3 would streamline data exchange. h). There is confusion on the connections at the end of the flow chart. Please provide clarification.

Organization	Yes or No	Question 9 Comment

Response: Thank you for your comment.

a. **The retirement of PRC-001-3 is beyond the scope of this drafting team; however, your comment will be forwarded to NERC staff.**

b. **The drafting team declines to modify the definition of the Protection System Study but did add the following to the description in the "Guidelines and Technical Basis": "System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions." The drafting team believes that the full description in the Guidelines and Technical Basis is now adequate and appropriate.**

c. **The drafting team believes the reference to the other requirements in this standard is the best way to both maintain consistency and to describe the requirements. The team declined to make the suggested changes.**

d. **The drafting team believes that references to the time frames are sufficient and declined to make the suggested changes.**

e. **The drafting team does not agree that the references "illustrate documentation requirements that are inconsistent." Each measurement in the standard (M1 through M10) has as evidence the statement "dated documentation (hardcopy or electronic file formats)."**

f. **The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard does not require.**

g. **1) The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard**

Organization	Yes or No	Question 9 Comment
does not require. 2) Requirement R3, Part 3.3 was not in the version of the standard that was sent out for comment. Based on consideration of comments the subparts (R3.31 & R3.3.2) have been combined as Requirement R3 Part 3.3. 3) The drafting team believes that omitting the "project schedule" from the list of example data submittal will not streamline the data exchange, but the schedule is very likely required to ensure that each entity can allocate resources as necessary. h. The drafting team has modified the flowchart based on comments and to reflect all changes made to the standard.		
Idaho Power Company		1. During our review it appears that an Entity will need to maintain an exceedingly large list of contacts for all Interconnected Facilities in order to ensure that the appropriate personnel receive and respond appropriately to Protection System coordination requests as Required by this Standard. With the probability of regular turnover occurring (retirements, transfers, etc.) at Interconnected Facilities, it would be helpful for a master list of Interconnected Facility Contacts for Protection Systems be held by a centralized Entity, such as a Reliability Coordinator, in order for an Entity to meet the timeframes specified and facilitate reliability via compliance with this Standard. 2. This Standard will enforce consistent communication between Entities which is necessary for coordination of Protection Systems. It does not however, guide an Entity to set relays that will ensure proper coordination. Having a separate Entity verify coordination is desirable, but differences in experience, expertise, and analysis tools between Entities will not ensure proper coordination if methods of checking are not also part of the Requirements.
Response: Thank you for your comment. 1. Your comments concerning the need for a current listing of "Interconnected Facility Contacts" is very perceptive, but cannot be addressed by the Requirements of the standard. The drafting team believes that ultimately it is the owner's responsibility		

Organization	Yes or No	Question 9 Comment
to maintain this list; however, if you can reach an agreement with the Reliability Coordinator, that may be option. **2. The drafting team agrees with your comment that the "Standard will enforce consistent communication between Entities which is necessary for coordination of Protection Systems" but disagrees with your assertion that "Entities will not ensure proper coordination if methods of checking are not also part of the requirements." The drafting team believes that all interconnected Protection System Owners have the capability of self checking their setting that will ensure coordination without making external checking of Protection Studies a Requirement of this standard.**		
FirstEnergy		FE offers the following additional comments: a. PRC-001-2 R1 - This requirement is vague and causes difficulties in consistent interpretations between entities and auditors. We ask the drafting team to revise the wording to clarify the expectations, such as including the types of protections system limitations they should be aware of. Enhancements to this requirement were also suggested in the "NERC SPCTF Assessment of Standard PRC-001-0 - System Protection Coordination" which is attached to the SAR of this project. In their assessment of R1 of PRC-001, the SPCTF said "This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. .. It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems." We ask the SDT to review this assessment and make changes to PRC-001 and PRC-027 to assure the reliability goal of PRC-001 R1 is met. b. With the approval of PRC-027-1, Requirements R3 and R4 will be retired from PRC-001-1 (Requirements R2 & R3 from PRC-001-2, approved as part of the Real-time Operations Project 2007-03) PRC-001-3 will have the same effective date as PRC-027-1. However, in the redlined version of PRC-001-3, the effective date is designated as "the first day of the calendar quarter twelve months following applicable regulatory approval". This is not what is specified in the

Organization	Yes or No	Question 9 Comment
		Implementation Plan.
Response: Thank you for your comment. a. **The drafting team believes that Requirement R1 falls outside the scope of Project 2007-06 and should remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard.** b. **The drafting team has modified the effective dates so they will be consistent. The effective date for PRC-001-3 is now described as "This standard becomes effective coincidently with PRC-027-1."**		
LCRA Transmission Services Corporation		General Comment: First, as industry comments are considered by the SDT, the standard must continue to take into consideration that the fundamental objective of a protection system is to prevent equipment damage that may occur as a result of a short circuit by ensuring fault isolation. The secondary objective is to maintain the power delivery capability in the rest of the system during a fault. This must not be compromised. Second, setting of protective relays is an art and finding a balance between dependability and security is already a challenge and may be an area of disagreement amongst owners (in some cases entities may end up "agreeing to disagree"). The standard should not take away the protection system owner's responsibility and right to set its own protection systems by requiring "Approval" from other interconnection entities at the Interconnected Facility. Specific Comments: Title of the proposed standard- The title for this standard is misleading since it only applies to locations that contain Interconnected Facilities. LCRA TSC suggests changing the title to "Protection System Coordination for Interconnection Facilities" Terms-Protection System Coordination Study: A study that demonstrates existing or proposed Protection Systems maintain proper selectivity while clearing Faults.
Response: Thank you for your comment.		

Organization	Yes or No	Question 9 Comment
The drafting team agrees that two objectives of a Protection System are to "prevent equipment damage due to faults" and to "maintain the power delivery capability in the rest of the system during a fault." **Based on comments concerning agreement, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."** **The drafting team does not believe the standard title is misleading and therefore did not adopt your recommended title.** **The drafting team does not agree with expanding Protection System Study to "Protection System Coordination Study. Also the drafting team does not agree that "maintain proper selectivity while clearing Faults" adds significant clarity to the current definition of a Protection System Study.**		
Western Area Power Administration		General: Western disagrees with NERC standards becoming too specific on technical issues such as protective relay coordination. Protection Engineers are highly skilled and trained in system coordination and should be left to determine the proper course of action without the hindrance of PRC-027-1 requirements. There is a reason why, historically, protection system coordination has been termed "the Art and Science of Protective Relaying." The proposed standard also mentions that "Protection Systems remove from service only those Elements required to isolate Faults..." This statement can be problematic since backup functions such as remote Zone 3 distance elements cannot be overlapped reliably yet are necessary for N-2 and beyond contingencies. Also, in some case it may be desirable to allow for intentional overlap or mis-coordination depending on the circumstances. These issues need to be resolved in the proposed standard or the standard eliminated. Specific issues: a. We have concerns over what NERC considers to be a "Protection System Study". Needs clearer definition. - Swap requirement positions R1 and R3. I.e. make R1 be R3 and R3 be R1.

Organization	Yes or No	Question 9 Comment
		b. R2.2: Provide equation. And, use “I” instead of “V” when referring to current. c. R2.2: What values are being referred to for deviation calculation? (i.e. ground current, phase current, positive sequence, etc.) d. R2.2: Clarify the fault current contribution or provide a table specifying the details e. R3.1: Last bullet, suggest making the statement “Replacement of the transformer(s)” to cover all transformers. f. R3.2: How does the neighboring entity know when to request? g. R3: What are the details to be provided? Should only be for significant changes. h. Concerned about dates and timelines associated with this standard. Often schedules and tasks change during design, checkout and commissioning. R1.1.3 and R3 need to be clarified. i. Western believes that this standard will create more questions than it answers. The standard, as written, is not clear or concise and would surely lead to CAN's and FAQ's.

Response: Thank you for your comment

a. **The drafting team believes that the definition of Protection System Study, “A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults” is understandable and succinct and does not need to be more clearly defined. Also the drafting team does not believe that Requirements R1 and R3 need to be swapped.**

b. **Per your suggestion and others, the drafting team has modified the equation to replace “V” with “I”.**

c. **The standard has been changed to refer to “Single line to ground and 3-phase for the interconnecting bus(s) under consideration” for the “deviation calculation.”**

d. **Based on comments the fault current contribution in Requirement R2, Part 2.2 has been clarified to be “for the interconnecting bus(s) under consideration.”**

Organization	Yes or No	Question 9 Comment
e. Other transformers are included in the second bullet which is now a combination of the previous version's second and third bullets. f. In R3 Part 3.2 the "neighboring entity" can request information related to the coordination of Protection Systems of an Interconnected Element whenever it desires the information. g. The details to be provided for R3 Part R3.1, Part 3.2, and Part 3.3 of the standard are discussed in their respective parts and the Application Guidelines of the standard. However, the individual circumstance may dictate additional details that are required for a relay coordination study. h. The standard takes into account "schedules and tasks" changing "during design" by not establishing "dates and timelines" for Requirement R 3 Part 3.1. The drafting team believes that Requirement R3 and Requirement R1, Part 1.1. 3 have sufficient clarity in the respective standard Requirements and the Application Guidelines associated with the Requirements. i. The posting of the standard is intended to provide the opportunity for the drafting team to address industry comments and provide clarifications to the industry which will hopefully eliminate the need for CANs and FAQs.		
Southern Minnesota Municipal Power Agency		I agree with and support the comments of the MRO's NERC Standards Review Forum (NSRF).
Response: Thank you for your comment. **Please see the response to MRO's NERC Standards Review Forum (NSRF)**		
Illinois Municipal Electric Agency		IMEA recommends language be included in 4.2 Facilities to clarify the standard does not apply to a DP protective device that only detects a fault on a transmission element and does not trip an interrupting device that interrupts current supplied directly from the BES. To minimize misinterpretation and potential impact on small entity resources, it would strengthen the standard if Section 4.2 Applicability language specifies the standard does not apply to a DP that does not own a BES Element/Facility.
Response: Thank you for your comment. **The drafting team believes Distribution Providers that own "Protection Systems installed for the purpose of detecting Faults on**		

Organization	Yes or No	Question 9 Comment
Interconnected Elements of the BES and that require coordination for isolating those faulted Elements" should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners.		
American Transmission Company		1. In general, ATC agrees with the need to modify PRC-001. However, PRC-027 as written expands the scope of PRC-001 by including Distribution Providers (DP). 2. The SDT, on both page 6 and 16 states that there is "no evidence of widespread miscoordination between Interconnected Facilities..." They further state on page 16 that "Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperation." Based on the above statements, ATC questions the need for the level of prescription in the standard. 3. ATC asks the SDT to update the numbering for measures to match the requirement numbering. 4. Reliability Standard TPL-001-2, which has been approved by NERC BOT, requires short circuit analysis. ATC believes that PRC-027-R2.1 is duplicative.
Response: Thank you for your comment. **1. The drafting team believes Distribution Providers that own Protection Systems installed for the primary function of detecting Faults on BES Elements should be included in the Applicability of this standard because these Protection Systems must be coordinated with the Protection Systems of other Facility owners. To add clarity to this issue, the drafting team revised Applicability Section 4.2 Facilities as follows: Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements. Additionally, the drafting team changed the term "Interconnected Facilities" to Interconnected "Elements" defined as follows: "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity"** **2. The drafting team stands by the quoted statement that there is "no evidence of widespread miscoordination between Interconnected Elements." However, because communication of changes at the interconnection or changes that effect the**		

Organization	Yes or No	Question 9 Comment
Protection Systems at an Interconnected Element is required for proper coordination, the "level of prescription in the standard" is required. 3. The drafting team followed the format outlined in the NERC "Standard Processes Manual," effective January 31, 2012. 4. The drafting team believes that the referenced requirement in TPL-001-2 is related to interrupting capabilities and is not directly related to Protection System coordination. The reliability intent and purpose of the two standards is different and therefore they are not "duplicative".		
Southwest Power Pool NERC Reliability Standards Development Team		1. In R2 the 24 month time period needs to be changed to 60 months. If fault currents are already being calculated for changes to the system there should be little to no need for a more current check of the fault currents. We feel like the 24 months could be burdensome to smaller entities. 2. We would ask that PRC-001-3 be retired and the requirement in it to be moved to a SAR for an existing PER training standard. It also seems incomplete that a standard with a single requirement has no measures. 3. Is there a need for the defined term "Protection System Study" in this standard to also be a new term in the NERC glossary of terms? Is there other wording that could be used in place of this new term since it is only being used as part of this standard?
Response: Thank you for your comment. 1. The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. 2. This drafting team is not addressing the refinement of PRC-001-3. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard". 3. The drafting team believes that the definition of Protection System Study is needed but based on your comment the drafting team has specified that the new term will not be added to the NERC glossary of terms.		

Organization	Yes or No	Question 9 Comment
Bonneville Power Administration		Interconnections are no more prone to misoperations than other power system elements. A logical conclusion is that if the requirements of this standard are put in place for interconnected facilities, they should be put in place for all power system elements. The industry is quickly approaching a prescriptive environment in the protective relaying field which attempts to replace experience and judgment with a massive set of rules. These rules will never be able to eliminate miscoordination and misoperations, and the more rules we have, the more time and resources are diverted from dealing with the critical issues that arise. Entities are no longer free to use experience and judgment to decide what work is most important and instead, focus time and energy on the relentless schedule of NERC requirements. The purpose of the original System Protection Coordination Standard, PRC-001, was to ensure that protection systems were coordinated among entities. This should require only a simple exchange of data between entities when new facilities are added or changes are made. BPA implores the SDT to reduce the burden of the proposed standard by simplifying it and returning to the basic original purpose.
Response: Thank you for your comment. **The drafting team agrees that "Interconnections are no more prone to misoperations than other power system elements" and that the intent of the "original System Protection Coordination Standard, PRC-001, was to ensure that protection systems were coordinated among entities." The Purpose of PRC-027-1 "To coordinate Protection Systems for Interconnected Elements …." does not imply that the requirements of PRC-027-1, when put in place for interconnected elements, should be put in place for all power system elements. Because communication of changes at the interconnection or changes that effect the Protection Systems at an Interconnected Element is required for proper coordination, the level of prescription in PRC-027-1 is required. The drafting team believes that the coordination of other system elements that are owned by the same Transmission Owner, Generator Owner, or Distribution Provider are governed by their internal protection coordination quality control processes.**		
Tacoma Power		1. Is it the expectation of the SDT that Protection System coordination issues may be identified when Protection System Studies are performed pursuant to R1.1.1? 2. If such issues are identified, is it the intention of the SDT that these issues

Organization	Yes or No	Question 9 Comment
		would constitute violations of PRC-027-1, provided that the process described in PRC-027-1 for remedying these issues is followed? 3. Transmission Owners depend on each other for accurate short circuit models. As proposed, PRC-027-1 does not appear to clearly address sharing of short circuit modeling information among Transmission Owners when incremental changes are made within a Transmission Owner's system. For example, incremental changes in adjacent Transmission Owners' systems may result in a 5% change in Fault current at an Interconnected Facility when the changes are considered separately, but when the changes are considered together, the Fault current might change by 10%. While the +/- 10 % change in an Interconnected Facility's Fault current value as a trigger appears to be reasonable, the proposed standard offers no guidance or requirements concerning the accuracy of an entity's short circuit model or the methods used to determine Element impedances. This issue is most pronounced for zero-sequence impedance, and to a lesser extent negative-sequence impedance, since these parameters are used infrequently in system planning studies. It seems that some standardized approach for determining impedance parameters may need to be developed, whether in this standard or in another standard, provided that some latitude is afforded entities based upon sound engineering judgment. 4. In R2.2, why is it not sufficient to simply include the following in the parentheses: "single line to ground and 3-phase for the bus(s) under consideration"?" 5. The formulas in R2 use V for current. For clarity's sake, current should be denoted using the letter I." 6. Under R3.2, if all applicable entities agree to a schedule, was it the intention of the SDT that the agreed-upon schedule could be longer than 30 calendar days? 7. M8 requires that an entity have evidence that other entities received

Organization	Yes or No	Question 9 Comment
		information pursuant to R3.3.1 and R3.3.2. What if, despite due diligence, one or more entities do not acknowledge receipt? 8. Since notification pursuant to R3.3 is after the fact, to be compliant, an entity depends upon one or more other entities to acknowledge receipt, but there does not appear to be a regulatory requirement for them to acknowledge receipt in a timely manner, only a requirement to confirm that the changes are acceptable within 30 days of receipt pursuant to R4.3. Consequently, if Entity A notifies Entity B of changes pursuant to R3.3 in 15 calendar days, Entity B would have until 45 calendar days following the change to respond. However, by this time, Entity A might not have documentation that it met its requirements under R3.3. Another challenge with R3.3 and R4.3 is that the language seems to assume that both entities will agree to the changes. While this should usually be the case, there may be instances in which the entity receiving notice may not find the changes acceptable. 9. Additionally, the language in R4.3 may influence the entity receiving the notice to deem the changes as being acceptable, even if they are not, in order to meet the 30 calendar day timeframe. 10. Tacoma Power thanks the SDT for including Figure 4 in the Application Guidelines. 11. In Figure 5 of the Application Guidelines, why would it be necessary to check for coordination issues with Protection System settings associated with Breakers A, B, C, and D? Is this language intended to address reverse elements that are independent of communications systems? Is it intended to include bus differential, which would be the scheme commonly applied? Or, is there some other reason? 12. To what extent can this standard be enforced within a Transmission Owner's system? For example, in Figure 1 of the Application Guidelines, in addition to verifying that there are no coordination issues between Protection System

Organization	Yes or No	Question 9 Comment
		settings associated with Breaker A and, say, Breaker F, does the SDT intend that this standard could be construed to grant regulatory authority to audit that a Protection System Study was completed to verify that there are no coordination issues between Protection System settings associated with Breaker F and other breakers within Transmission Owner S's system? 13. While Protection System settings associated with Breakers A and F may be coordinated, Breaker F may not be coordinated with other Protection System settings within Transmission Owner S's system such that Protection System settings associated with Breaker A might also not be coordinated for some Faults within Transmission Owner S's system. It is believed that this type of situation should be rare and that the scope of this proposed standard should be limited to audit and enforcement of Protection Systems at the Interconnected Facilities, as depicted in Figures 1, 2, 3, and 5. Assume that there is documentation supporting coordination of Protection Systems at Interconnected Facilities. However, during a Fault, a Mis-operation occurs, and the cause of the Mis-operation is attributed to mis-coordination, despite good faith on the part of the entities to coordinate Protection Systems. Is it the intention of the SDT that this Mis-operation would be construed as a violation of PRC-027-1? For example, although they are generally addressed to some degree in Protection System Studies, but often implicitly through margins, factors of safety, etc., phenomena such as CT saturation or DC offset are not always directly analyzed in Protection System Studies and could lead to mis-coordination even if Protection System settings appear to be coordinated in documentation. 14. It is not clear what responsibility the TO has if it models a generator's short circuit capability incorrectly. 15. The proposed changes to PRC-001 (proposed version 3) are supported. 16. As a reminder to the SDT, Protection System design and application is part science and part art, and it may be difficult to thoroughly audit and enforce

Organization	Yes or No	Question 9 Comment
		the latter. Tacoma Power appreciates the opportunity to comment on the proposed standard and thanks you for your consideration of our comments.

Response: Thank you for your comment.

1. **The drafting team believes that coordination issues may be identified when Protection System Studies are performed pursuant to R1.1.1 and this is the basis for this requirement.**
2. **The drafting team believes that any coordination issues identified when Protection System Studies are performed pursuant to Requirement R1, Part R1.1.1, Part 1.1.2 or Part 1.1.3 are discovered would lead to corrective actions as identifies in the other requirements.**
3. **The drafting team believes that developing a standardized approach for determining impedance parameters is outside the scope of this project.**
4. **The drafting team believes the existing wording is appropriate and did not make your suggested change.**
5. **Per your suggestion and others, the drafting team has modified the equation to replace "V" with "I"**
6. **Under Requirement R3 Part 3.2, if all applicable entities agree to a schedule, the intention of the drafting team is that the agreed-upon schedule could be longer than 30 calendar days.**
7. **Measure M8 has been modified to indicate that information was provided within 30 days; therefore, an acknowledgement of receipt is no longer required.**
8. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3. Also based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**
9. **Based on comments, the drafting team removed Requirement R4, Part 4.3.**
10. **Thank you for the comment.**
11. **In Figure 5 of the Application Guidelines, it is necessary to check for coordination issues with Protection System settings associated with Breakers A, B, C, and D if there are reverse tripping elements that are independent of communications systems.**

Organization	Yes or No	Question 9 Comment
12. The drafting team believes that the requirements of PRC-027-1 extend to only to "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements for the BES and that require coordination for isolating those faulted Elements." As stated in the text for Figure 1 of the Application Guidelines, the only Interconnected Element identified is the transmission line between Breakers A and E. **13. A Misoperation is not a violation of this standard.** **14. The Transmission Owner is identified as the entity responsible for performing the Fault current studies in Requirement R2, Part 2.1. The standard does not address incorrect modeling of a generator's short circuit capability.** **15. Thank you for your support.** **16. Thank you for your reminder and your comments.**		
Detroit Edison		1. It is suggested that the standard include other relevant information that could be needed for a protection system study such as critical clearing times determined from stability studies. 2. In Figure 3, what Protection System Studies would be required if the Distribution Provider does not have a Protection System designed to protect BES transmission system elements? 3. Also, please clarify if the transformers in Figures 3 and 4 are BES elements. 4. Also, further clarification, including some examples, would be beneficial to explain what does and what does not constitute "Protection Systems installed to protect Transmission System Elements" by a Distribution Provider.
Response: Thank you for your comment. **1. The drafting team believes that the data required by a protection system study are discussed in the technical guideline is a suggested list. Other information such as critical clearing times may be required for a specific location's relay coordination study and can be requested by either entity as needed.** **2. The note in the description for Figure 3 states: "A Protection System Study is required per this standard for this example if a Protection System at the Distribution Provider's substation is designed to detect Faults on the BES Transmission System."**		

Organization	Yes or No	Question 9 Comment
Therefore, a Protection System Study would not be required. . **3. The drafting team believes the transformers in Figures 3 and 4 are not BES Elements.** **4. Based on your comment, the drafting team has added a note to the text of Figure 3.**		
Ingleside Cogeneration LP, (Occidental Chemical Corporation)		It would seem that M9 should be reworded slightly so that it is clear that the compliance burden is placed on the party sending the confirmation. It seems like it should read "demonstrating the confirmation was sent within the respective time frames" instead of "demonstrating the confirmation was achieved within the respective time frames." In other words, Requirement 4 compliance is solely for the confirming party to show evidence, not the submitting party.
Response: Thank you for your comment. **Based on comments, the drafting team revised Measure M9 to read: "Acceptable evidence for R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement."**		
Lincoln Electric System		1. LES recommends additional clarity be added to explain how an entity would coordinate the efforts of the many different protection schemes - for example, pilot tripping, primary, secondary, ground overcurrent, breaker failure, LOP supervised, etc. - to determine only Elements required to isolate Faults are removed from service. Does an entity consider only its fastest scheme, slowest scheme, or all of them? 2. Additionally, is an entity to consider contingencies such as primary or secondary relay out of service, loss of communications, etc.? What about backup tripping? Until the above is addressed, an entity will have a difficult time discerning what exactly needs to be studied. 3. Please take into consideration that system protection is a complicated subject and each entity has its own philosophies on how to do it. Entities should be allowed to use their individual engineering judgment when designing their

Organization	Yes or No	Question 9 Comment
		systems and ensuring it will work to their own standards as well as in compliance with the NERC standards. 4. LES is concerned that there may be potential for mis-coordination between PRC-027-1 and PRC-004-2a. If a misoperation is defined as tripping too much out of service during an event, does the entity become instantly non-compliant with PRC-027-1 since it should have been studied not to do so? Any correlation between these two standards should be considered and clearly defined. 5. LES recommends the 24 month timeframe specified in R2.1 be extended to 60 months. Historically, fault currents tend to increase gradually over time; therefore, an entity may never see a 10% increase between studies, but will most likely see a 10% increase over a larger timeframe at which point they would never be required to perform a study.

Response: Thank you for your comment.

1. **In your example, all relays responding to Fault conditions should be included in your Protection System Study.**
2. **All relays responding to Fault conditions installed for the Interconnected Element should be included in your Protection System Study.**
3. **The drafting team agrees with your assessment that each entity has its own philosophies on how to protect the system. The drafting team believes that PRC-027-1 does not infringe on the ability of entities to protect their elements. However, the purpose of PRC-027-1 is "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults."**
4. **A Misoperation is not a violation of this standard.**
5. **The drafting team believes as stated in the rational for Requirement R2 Part 2.1 that, "Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation." Specific to your question, please note that the 10% deviation is in relation to the most recent Protection System Study.**

<tr><th>Organization</th><th>Yes or No</th><th>Question 9 Comment</th></tr>
<tr><td>Massachusetts Municipal Wholesale Electric Company</td><td></td><td>MMWEC endorses the comments submitted by NPCC.</td></tr>
<tr><td colspan="3">Response: Thank you for your comment.

See the response to comments submitted by NPCC.</td></tr>
<tr><td>NPPD</td><td></td><td>1. On page 6 and 16 there are statements such as “no evidence there is widespread miscoordination between Interconnected Facilities...” and on page 16 “Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” Clarify what the need is for this standard? This proposed standard significantly increases the record keeping requirements and subsequent resources needed for each Facility owner but does not appear to have a justification.

2. I find the numerous time lines will create significant confusion and very complex data retention practices that will be difficult to track and difficult to audit. It appears the focus is more on time lines and the likely result is the content of the shared information will likely suffer due to the burden of tracking communications between entities. This draft standard includes time lines ranging from “prior to in service date, 30 days, 60 days, 90 days, 6 months, 2 years and 3 years”. I suggest fewer and longer time lines with the focus on if the sharing of information took place and not on when did it take place.

3. The SDT statement below should be generalized to the standard as a whole:

”The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated</td></tr>
</table>

Organization	Yes or No	Question 9 Comment
		project on schedule and confirm the changes are acceptable "prior to the in-service date," 4. Clarify the size of generation for Distribution Providers that would make this standard applicable for all involved entities. I would expect that the BES phase II definition or registry criteria would be referenced.
Response: Thank you for your comment. **1. The drafting team stands by the quoted statement that there is "no evidence of widespread miscoordination between Interconnected Elements." However, because communication of changes at the interconnection or changes that effect the Protection Systems at an Interconnected Element is required for proper coordination, The drafting team believes the requirements laid out in the standard are appropriate.** **2. The drafting team believes that to make PRC-027-1 measurable and enforceable, the listed times are necessary.** **3. The drafting team believes they applied reasonable and appropriate time frames for the identified activities and provided flexibility by including the option to agree upon an alternate schedule where deemed appropriate.** **4. Figure 3 is independent of the size of the generation. The intent is to identify that coordination is required where Protection Systems are installed for the purpose of detecting Faults on the Transmission System.**		
ExxonMobil Research & Engineering		PRC-001-3 has a single requirement with no associated measure. Any standard requirement whose implementation can address a reliability gap in the Bulk Electric System should possess a quality that can be measured. The SDT should modify PRC-001-3 and provide a measure for Requirement R1 or redact the standard in its entirety.

Response: Thank you for your comment. **This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".**		
Progress Energy		Progress Energy request re-evaluation of time for performing Short circuit study in R 2.1. Request 36 months which is same time frame in R1.
Response: Thank you for your comment. **Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation.**		
Dairyland Power Cooperative		R2, 2.1 "Perform a short circuit study to determine the present Fault current values, not less than once every24 months." is excessive. Yes, short circuit databases are updated annually or even more frequently at times based on system changes. However, to require a full short circuit study every 24 months is too frequent. Changes on the system don't necessarily warrant a full short circuit study, but maybe a study for the affected area. This is adding an unnecessary burden to the industry.
Response: Thank you for your comment. **Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation at the interconnecting buses. The drafting team believes studies associated with changes that would affect the coordination in less time would be triggered by other requirements in this standard.**		
MRO NSRF		1. Recommend that the wording of R2 need be modified to allow a grace period for implementation, as was done in R1. As written, R2 requires an immediate short circuit study, even if no protection system study is required by R1.1.1. 2. The SDT, on both page 6 and 16 states that there is "no evidence there is widespread mis-coordination between Interconnected Facilities..." They

		further state on page 16 that "Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations." Why, then, is this standard even needed? It adds an onerous burden of record keeping on each Facility owner without justification for doing so. 3. Since these are still zero defect standards, should exceptions be included for required operational replacements due to events (e.g. such as storms or immediate equipment replacement). When the lights are out and a technician replaces a CT or VT with a slightly different ratio but compensates by altering the relay settings, there is no way to perform an instant system protection study when the equipment change out was required to support system reliability. The NSRF understands that a "planned" changed be studied before hand, but how will this be viewed when a change is needed that is "unplanned"? Please clarify
Response: Thank you for your comment. 1. **Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation at the interconnecting buses. Based on your comment, the drafting team modified Requirement R2, Part 2.1 to read: "At least once every 24 months, perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1."** 2. **The drafting team is developing a standard based on a SAR accepted by the Standards Committee and is addressing directives issued by FERC in Order 693.** 3. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3. Requirement R3, Part 3.3 was changed to "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."**		
Manitoba Hydro		1. Regarding R1, it is not clear what specifically the Protection System Study should include. - According the application guidelines on page 17, it states:

		"Data used to determine Fault currents in performing the study", what data does this refer to? 2. Also it states that it should include "listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Interconnected Facility, and were reviewed for coordination of protective relays as part of the study". It is not clear if it should include a list of all the enabled protection elements and their settings of the protection system package or the package only. Should it include the protection system on the interconnected facilities only or on the immediate adjacent elements as well? 3. The Application guidelines say it should list any issues associated with the relay settings. It is not clear what should be considered as issues. Does a protection mis-coordination occur only under contingencies (such as primary protection element fails) consider an issue? Do backup protection elements have to coordinate with backup protection elements? 4. Regarding R2, it is not clear what fault current value should be used for the short circuit study. Should it be the total fault current of the interconnecting bus? Or should it be the total fault current of the interconnecting bus excluding the contribution from the interconnected facilities?

Response: Thank you for your comment.

1. **The drafting team declines to modify the definition of the Protection System Study but did add the following to the description in the "Guidelines and Technical Basis": "System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions." The drafting team believes that the full description in the Guidelines and Technical Basis is now adequate and appropriate.**
2. **The entity should include all protection elements reviewed for coordination. It is up to the entity to determine what and where those elements are for the particular system configuration.**
3. **It is up to the Owner to determine what is appropriate for their system and under what contingencies the relays should coordinate. Any issued identified that fall outside of their normal practice would need to be listed.**
4. **The drafting team modified Requirement 2.1 to read "At least once every 24 months: Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus**

where a Protection System Study is available per Requirement R1."		
ReliabilityFirst		ReliabilityFirst offers the following comments for consideration: 1. Requirements R1, R2 and R4 a. Requirements R1, R2 and R4 do not follow the format of a typical Results Based Standard requirement (i.e. the parent requirement simply states "the entity shall:"). Result Based Standard risk based requirements should be in the following format: "who, under what conditions (if any), shall perform what action, to achieve what particular result or outcome." ReliabilityFirst recommends modifying these three standards to conform to the Results Based Standard format. 2. Requirement R2a. ReliabilityFirst questions why Transmission Owners only need to perform a short circuit study on Interconnected Facilities and not their internal system Facilities as well (Requirement R2). ReliabilityFirst believes it would be beneficial for Transmission owners to be required to determine present fault current values (and calculate the percent deviation between the Fault current values) for all internal system Facilities. 3. Need for PRC-001-1 Requirement R1a. ReliabilityFirst believes PRC-001-1 Requirement R1 is ambiguous and believes the intent is covered in the NERC PER-003-1 standard. It will be very hard for an applicable entity to show that they are "familiar" with the purpose and limitations of protection system schemes applied in its area. Since ReliabilityFirst believes R1 does not enhance reliability, ReliabilityFirst recommends retiring PRC-001-1 Requirement R1 consistent with the effective date of the NERC PER-003-1 standard (effective date of 10/01/2012).
Response: Thank you for your comment. **1. The standard has been reviewed by NERC Quality Review for format and content.** **2. The previous PRC-001 only applied to coordination between TOPs, GOPs and BAs. The drafting team has chosen not to include internal facilities for two main reasons: the extreme documentation burden that would be involved for minimal benefit as most of this work is done by the same organization, and the drafting team believes that the entities' internal facilities are completely in their control and are the responsibility of the entity. Failure to properly design and implement internal Protection Systems would be an internal lack of procedures and/or a human performance issue which are both outside the**		

scope of this standard. **3. This drafting team is not addressing the refinement of PRC-001-1 Requirement 1. As noted in the background section, “The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard”.**		
Kansas City Power & Light		1. Requirement 1.1 of R1 states, “Perform a Protection System Study for each Interconnected Facility to verify that Protection Systems remove from service only those Elements required to isolate Faults as follows:”. The purpose of this standard should not be to remove from service only those Elements required to isolate Faults, therefore 1.1 above should state, “Perform a Protection System Study for each Interconnected Facility as follows:”. 2. Requirement 1.1.2 of R1 states, “Within 6 calendar months after determining or being notified of a 10% or greater change in Fault current for that Interconnected Facility, as described in Requirement R2, unless the entity can demonstrate such a study is not required.” Since this Requirement is an action as a result of requirement R2 and as noted in the response to question 6 above, R2 should be deleted. 3. If the SDT is adamant about having a periodic review of fault current levels then the fault current level should be increased to 20% on the protected line. A 10% fault current change is not significant enough to require a new protection system study. 4. Requirements R4.3 and R3.3 are actions as a result of a misoperation and because there is already a standard (PRC-004) that deals with misoperations these two requirements should not be covered in this standard if changes need to be made due to misoperations they should be made in the misoperation standard (PRC-004). This standard is not intended to replace the Misoperation Standard and any requirements addressing misoperations gives FERC, NERC and the Audit Teams the wrong impression of the intent of this standard. 5. All Protection System Studies are dependent on accurate system models.

		Individual Entities should not be responsible for development and maintenance of an accurate Regional model or model to be used between Regions. Individual Entities should only be responsible for providing the information on their system to the Regional Entity so that an accurate model can be maintained by the RC. I propose that this standard be applicable to the Region and require the Region to maintain an accurate model that includes zero sequence impedance and is useful for Protection System Studies. This system model also needs to be accurate between Regions for Protection System Studies that span between Regions. This will require that the standard also be applicable to NERC RRO and require RRO to oversee the process of maintaining an accurate national model or equivalents that can be used between Regions. Anything less than this is placing an unfair burden and unrealistic expectation on the TO to produce and maintain an accurate model for interconnecting Protection System Studies. 6. A dispute resolution mechanism also needs to be required to provide for instances where entities cannot come to a mutual agreement. Recommend a requirement be included for entities to request applicable RC(s) to arbitrate to bring resolution to a matter.

Response: Thank you for your comment.

1. **The drafting team has modified Requirement R1, Part 1.1 to read "Perform a Protection System Study for each Interconnected Element to coordinate Protection Systems, such that the least number of power system Elements are isolated to clear Faults as follows:" to be consistent with the Purpose.**
2. **Requirement R1, Part 1.1.2 provides for a time frame to complete a Protection System Study once a notification that the short circuit current at an Interconnected Element has changed. Requirement R2 provides for a periodic review of short circuit currents. This standard will retain this requirement.**
3. **The drafting team recognizes there are variations of margins used throughout the industry; however, the drafting team believes that the 10% margin allows notification of potential issues and corrective actions prior to reaching their typical setting margin. The drafting team did not make any of the suggested changes.**
4. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed**

Requirement R4, Part 4.3. The intent of Requirement R3, Part 3.3 is to communicate changes to a Protection System (including those discovered during an investigation) to an Interconnecting Entity as follows: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components." **5. The drafting team believes that individual entities are not responsible for regional models, they are responsible for conveying information on their own equipment and system** **6. The drafting team believes that any conflict resolution should be handled through normal company practices. The drafting team cannot make judgments on compliance.**		
Texas Reliability Entity		1. Requirement R1.1.3: While we agree with the SDT rationale that R3 notifications may occur weeks or years prior to the change, we feel that a time frame should be included in this requirement rather than leaving it open-ended. 2. We suggest that the Protection System Study be completed at least 60 calendar days prior to the in-service date for R3.1 and within 30 days after receiving notification for R3.3. If the SDT agrees with this, then an appropriate VSL should also be drafted.
Response: Thank you for your comment. **1. The drafting team believes there in not a single time frame that would be appropriate for every project and has chosen to not add a time frame.** **2. Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.". Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**		
Associated Electric Cooperative, Inc., JRO00088		1. See SERC Comments 2. Also pertaining to PRC-027-1 Page 2, Terms:, "Interconnected Facilities" definition, proposed change: Replace: "functional, operating, or corporate entities" with: "functional or operating entities" Rationale: In certain cases,

		independent Corporate entity is irrelevant to the planning and operations of these systems. As written, the underlying 6 G&Ts of AECI's JRO could technically and unnecessarily be subjected to this standard for AECI's internal Facilities, and not just Interconnected Facilities between AECI and other non-JRO entities, although AECI's JROs functionally coordinate relay settings much as a large IOU's regional departments would.
Response: Thank you for your comment. 1. **See response to SERC Comments.** 2. **Based on comments, the drafting team changed Interconnected Facilities to Interconnected Elements defined as follows, Interconnected Elements: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity.**		
Western Small Entity Comment Group		The comment group agrees with the WECC Position Paper that the standard as written requires excessive and burdensome documentation that is not needed to demonstrate coordination.
Response: Thank you for your comment. **The drafting team believes that changes affecting Protection Systems must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained.**		
PPL Corporation NERC Registered Affiliates		The cutoff date of 6/18/07 for grandfathering of studies may be appropriate for TOs and DPs in light of changes over time to their systems, but the studies that originally established GO relay settings would still be valid where the equipment has stayed the same. For the reasons discussed above, there should be no applicability of PRC-027 to independent GOs, and no changes to PRC-001-1.1 because the applicable requirements.
Response: Thank you for your comment. **The drafting team modified Requirement R1, Part 1.1.1 to make studies performed prior to 6/18/07 acceptable if the Protection System Study summaries contain the minimum attributes described in Requirement R1, Part 1.2. which now reads: "Provide to**		

the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed) within 90 calendar days after the completion of each Protection System Study."The drafting team believes the applicability of PRC-027-1 is correct and the applicability of PRC-001-3 as revised is correct.		
Santee Cooper		1. The documenting, notification and replies required in this standard will put a significant strain on the time of settings personnel. While we agree that this coordination of data is very important, any simplification of the processes would help ensure that protection system staff has the time to do other critical protective system work, in addition to interconnection studies. 2. Possible suggestions would be change R2 2.1 to a longer time period, since most re-coordinations are due to changes covered in R3. "Not less than once every third year," would fall in well with the audit schedule. Not less than once every fifth year would match TPL-001-2 draft 5. 3. Also, you could conceivably not have R3 3.3, since those are covered by the statements in 3.1 and 3.2
Response: Thank you for your comment. 1. **The drafting team believes that changes affecting Protection Systems must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained. The drafting team is not requiring a Protection System Study; only a summary of the results of the Protection System Study performed is required to be provided to the other entities. The drafting team believes the scope of a particular project will dictate the work necessary to coordinate the Protection Systems involved, and to document the coordination process.** 2. **The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate as is described in the Rationale for Requirement R2 and in the Guidelines and Technical Basis for Requirement R2. The TPL-001-2 short circuit analysis is for the purpose of assessing device interrupting ratings and is required to be performed annually (Requirement R2, Part 2.2). The part that you referenced does allow for extending the assessment in Requirement R2, Part 2.2 to five years (or even longer) but it is not an automatic extension. The drafting team points out that the Planning Assessments are performed for the Near Term Planning Horizon, which includes out-year simulations, which this standard does not require.** 3. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed**		

Requirement R4, Part 4.3. The intent of Requirement R3, Part 3.3 is to communicate changes to a Protection System (including those discovered during an investigation) to an Interconnecting Entity as follows: "Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components."		
Duke Energy		1. The order of the Requirements in PRC-027-1 should be put in chronological order to align with the Example Process outlined on page 22. 2. PRC-001-1:It's not clear that balloting for Project 2007-06 also includes PRC-001-3. 3. General comment - The vague language of R1 does not make it practicable for the responsible entities to implement the requirement. 4. The Purpose is limited to coordination/relationship with the applicable entities. The Purpose is vague as to whether it applies to the Bulk Electric System. 5. Requirement R1 does not clearly state a reliability outcome/benefit. It is not aimed to achieve one objective. The phrase "shall be familiar with the purpose and limitations of protection system schemes," is vague and not measurable. What does it mean to be "familiar" with in this context? Could this requirement be stated in a way that is measurable? The outcome is not obvious because of vague terminology. What will be the outcome of entities being "familiar purpose and limitations of protection system schemes?" The term "familiar" is too general to address a single activity. Although it can be inferred that familiarity with the purpose and limitations helps ensure reliability, what single reliability goal will be accomplished? 6. There is no measure specified for R1 (according to the Model: each requirement must have one or more associate measures used to objectively evaluate compliance with the requirement). What type of evidence could be used so the entities are compliant with the requirement? The Data Retention language mirrors the recommended default language. However, because there are no measures, which are "used as a guide in identifying which

		responsible entity must keep the evidence and for how long," where do the "3 years" come from? There is no supporting document or reference to a supporting document for justification of VRFs for PRC-001-3; although, there is one for PRC-027-1 (which does not mention PRC-001-3).No explanation is given for the "High" or "Severe" VRF for R1.Generally, how is the VSL said to be "Severe" if there are no measures for R1? Effective Date - There needs to be an explanation for the time lapse of more than 3 months between approval date and the effective date of the standard. Additional clarity is needed regarding performance requirements and how an entity would demonstrate compliance with R1.Requirement R1 doesn't support the Purpose statement of the standard.

Response: Thank you for your comment.

1. **The standard has been reviewed by NERC Quality Review for format and content. The Example Process is intended to present one scenario, and the drafting team has decided not to change it.**
2. **This drafting team is not addressing the refinement of PRC-001-3. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".**
3. **It is unclear to the drafting team whether your comment references PRC-001-3 or PRC-027-1. This drafting team is not addressing the refinement of PRC-001-3. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".**
4. **It is unclear to the drafting team whether your comment references PRC-001-3 or PRC-027-1. However, the drafting team has revised the Purpose statement in PRC-027-1. The new Purpose statement reads: To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.**
5. **This drafting team is not addressing the refinement of PRC-001-3. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".**
6. **Based on comments, the drafting team modified the Facility Applicability 4.2 to "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements,"**

which the team believes clarifies those Protection System Elements that are required to be coordinated under this standard.		
Wisconsin Electric Power Company		1. The SDT is to be commended for their efforts in what is a very challenging standard to develop. 2. A Protection System Study by definition must assure that Protection Systems are "coordinated" at an Interconnected Facility. However, this standard does not establish any ownership for achieving a complete study. The interconnected entities are only capable of studying the portion of the system that they own. So, each entity performs their portion of the study and communicates it to the other entities. Thus, there is a lack of clarity in the standard about how the complete study gets done and is documented. With the possible exception of the Transmission Owner, no entity alone has the complete system model that is essential for documenting the complete coordination study. 3. There is also ambiguity on what a complete study looks like, and is subject to interpretation. It is unclear how the supplementary documents previously developed for PRC-001 apply to this standard. In the absence of such guidance, how will consistency be achieved for coordination of Protection Systems on the various types of Interconnection Facilities ? 4. It is suggested that Requirement R4.3 is extraneous and should be removed. If these changes are sufficient to trigger a study, then the timeframe for agreement is already specified in R4.1. We propose that the standard be revised to allow the entities to re-affirm the results of a previous study, when appropriate, rather than needing to perform another study. For example, perhaps the fault current has increased, but the coordination interval between devices is not appreciably changed. 5. The SDT notes in several places in the draft standard (pg 6, 16) that there is no evidence of widespread miscoordination between Interconnected Facilities, nor any evidence of misoperations caused by lack of coordination. 6. This suggests that if this standard is needed, that it should be simpler, less

		prescriptive, and have greater recognition of the motivation for mutual coordination that already exists. It can be argued that the tasks and time frames required in the draft standard should be left to the entities to determine.
Response: Thank you for your comment. 1. **Thank you for your support.** 2. **It is expected that the owner of the Interconnected Element will complete the Protection System Study for that element. See the Figures 1-5 and accompanying explanations.** 3. **The drafting team is not defining what every Protection System Study should look like, just the minimum that must be included into a summary that will be provided to the Interconnected Element Owner.** 4. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.** 5. **PRC-027-1 is replacing Requirements R2 and R3 of PRC-001-2. The drafting team is developing a standard based on a SAR accepted by the Standards Committee and is addressing directives issued by FERC in Order 693.** 6. **The drafting team believes that there is flexibility in the process to allow for the expertise of each entity to be used to coordinate Protection Systems.**		
ISO RTO Council SRC		The SDT recognizes that Requirement R1 falls outside the scope of Project 2007-06 and proposes that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. Left unaddressed, entities may be reluctant to vote to approve the PRC-001-2 changes. Changes made to a standard can cause unforeseen or unintended consequences that cannot be addressed because of limitations in the scope of the project. The SDT has no ability to address the matter without getting a change in scope of the project. This is a concern that applies to ALL standards changes as the industry seeks to revise and improve the NERC standards. A change in the Rules of Procedure or the Standards Development Procedures must be in place to recognize and deal with such occurrences. The SDT (SRC?) is also concerned that these proposed requirements are not

		conducive to NERC's stated goal of making the reliability standards more "results or performance oriented". Although many of the actions embodied in the proposed requirements should be performed, they are administrative in nature and do not in and of themselves provide results that will impact reliability. The industry needs to discuss and come to agreement on what reliability standards should look like in order to meet the NERC stated goal. The SRC also believes these requirements are not applicable for entities operating in the ERCOT Interconnection.
Response: Thank you for your comment. **This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, "The SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard".** **The drafting team believes the documentation identified in the requirements is necessary to support the purpose.** **The drafting team believes PRC-027-1 applies to all applicable entities that own Protection Systems within ERCOT.**		
MWDSC		The standard requires more documentation than is necessary and providing a copy of each Protection System Study is burdensome and would not result in better performance. It should be adequate to document that studies were performed and that affected entities have agreed to the results.
Response: Thank you for your comment. **The wording of Requirement R1, Part 1.2 is "Provide to each affected Interconnected Element owner a summary of the results of each Protection System Study performed pursuant to this requirement…" Transmitting the entire PSS is not required. The receiving entity per Requirement R4 Part 4.1 shall "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required."**		
Colorado Springs Utilities		1. The wording of the text under Applicability suggests that Interconnected Facilities include coordination and documentation of Transmission to Distribution interfaces. Since these are often located in different functional or

		corporate entities we feel this would require more documentation, and therefore needs clarified. 2. There are no specifications on what constitutes a significant change to a Protection System; is it a CT ratio change, a relay replacement, or anything to the whole system? For example, would a single structure replacement require notification as a line spacing change? The wording sounds good but lacks specifics that would make this a workable standard.
Response: Thank you for your comment. 1. **The standard is only applicable to Distribution Providers with "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements."** 2. **The drafting team believes when changes that "modifies the conditions used in the coordination of Protection Systems of the Interconnected Elements", they must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained. For the example cited in the comment, Requirement R3 Part 3.1 states that "Changes to a transmission system Element that changes any sequence or mutual coupling impedance" and therefore would be included in the communication.**		
ATCO Electric		There are too many timelines that are hard to keep up with. The drafting team should reduce amount of timelines to a manageable amount.
Response: Thank you for your comment. **The drafting team will continue to restrain the number of timelines, however the drafting team believes that changes affecting Protection Systems must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained.**		
Liberty Electric Power LLC		There is no generator size limit set for this standard. It should exclude generators below a threshold value. Suggest generators with an aggregate nameplate value below 500 MVA connecting through a single step-up transformer.
Response: Thank you for your comment. **The drafting team has modified the Applicability Section 4.2 Facilities to read: "Protection Systems installed for the purpose of**		

detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements". Consequently, the standard is applicable to Generator Owners that have the Facilities described above.		
Portland General Electric Company		1. This standard, as written, requires an inordinate amount of documentation that this not in line with current fault study and protection coordination tools. When combined with the timelines, this will require a complete rework of the existing processes used for protection coordination and an additional full time protection engineer. We have no history of misoperations on interconnecting lines or of backup protection on such lines to justify any additional effort to document coordination. 2. R1 leaves open to interpretation what constitutes coordination, with many unanswered questions. What is an acceptable coordination margin? How many contingencies need to be considered? Does loss of communication need to be considered? For the evidence, would an exception report showing no coordination intervals are violated be acceptable for the "summary results of each Protection System Study"? 3. Will the responsibilities outlined in the Application Guidelines be included as part of the final standard? These may not be in line with current practices. How will this requirement be audited across utilities with different coordination practices? 4. R2 requires significant cooperation between interconnecting utilities, with each keeping track of what fault currents are being used by the other. This is not in line with the use of joint system models, allowing more frequently updated fault currents to be used. Currently, the individual system models are updated by some utilities daily then they are reconciled at least annually. Protection System Studies can be run any time in between model reconciliation, with all local changes accounted for. 5. R3.1 does not provide guidance on the timing of notification for changes; the measure M6 indicates this is for future changes, but the requirement does not.

		6. Protection engineers are rarely notified in advance of transmission line changes resulting from such things a road widenings and pole replacements. Providing this information to neighboring utilities in advance will require significant changes to line design processes. Thresholds must be established to rule out minor transmission line changes that do not significantly impact the line impedance (and thus the fault current); perhaps a 10% change in impedance would be more appropriate than the general "changes to line lengths and/or conductor size or spacing". 7. This requirement should also include changes to facility ratings to ensure PRC-023 compliance. 8. R4 requires a significant change to work practices to support capital construction schedules and allow interconnecting utilities 30 days to review changes. The schedule laid out does not account for disagreements that lead to back-and-forth prior to achieving agreement. This requirement grants power to neighboring utilities to halt construction activities which could, in turn, create compliance violation of other Reliability standards.

Response: Thank you for your comment.

1. **The drafting team will continue to restrain the number of timelines, however the drafting team believes that changes affecting Protection Systems must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained.**
2. **It is up to the Owner to determine what margins are appropriate for their system and under what contingencies the relays should coordinate.**
3. **The Application Guidelines are and will be part of the standard and are consistent with the requirements of the standard. The figures in the Application Guidelines are intended to be explanatory.**
4. **The drafting team believes that the 24 month fault current review for Protection System coordination purposes is appropriate. This does not preclude an entity from performing this task more often.**
5. **The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated.**

6. The drafting team believes when a change "modifies the conditions used in the coordination of Protection Systems of the Interconnected Elements", it must be communicated to the interconnecting entity to ensure that Protection System coordination is maintained. For the example cited in the comment, Requirement R3 Part 3.1 states that "Changes to a transmission system Element that change any sequence or mutual coupling impedance" and therefore would be included in the communication. **7. The drafting team believes that FAC-009 already requires the sharing of Facility Ratings and their inclusion into the Protection System coordination standard is unnecessary.** **8. Based on comments, the drafting team revised Requirement 4, Part 4.1 to read: "Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required." Based on comments, the drafting team revised Requirement R4, Part 4.2 to read: "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.**		
American Electric Power		1. We agree with the comment in the background section that the SAR written for this project was focused on System Protection Coordination, and we recommend that PRC-001 R1 should be moved to another standard more focused on operations or training. TOP-006 R3 might be a more appropriate standard for such a requirement. 2. For R1, the standard needs to clearly state the boundaries of the required study(ies). In addition, detail is needed regarding the depth of study away from the point of interconnection, and how far into the generating unit auxiliary system or interconnecting system must be evaluated. 3. Based on the redline provided where R3 and R4 have been removed, and assuming the SDT is not willing to moving the sole remaining requirement to another standard, the title and purpose of resulting PRC-001 would need to be changed. 4. If PRC-001 R1 remains as it is, the phrase "familiar with the purpose and limitations of protection system schemes" needs additional clarity. Doing so might help prevent a CAN from being developed to provide such clarity.

		5. AEP suggests the time requirement on R4.3 associated with R3 needs to be extended to 60 days.
Response: Thank you for your comment. 1. **This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, “The SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard”.** 2. **Based on comments, the drafting team modified the Facility Applicability 4.2 to “Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements”, which the team believes clarifies those Protection System Elements that are required to be coordinated under this standard.** 3. **This drafting team is not addressing the refinement of PRC-001. As noted in the background section, “The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard”.** 4. **This drafting team is not addressing the refinement of PRC-001-3 Requirement 1. As noted in the background section, “The SPC SDT recommends that Requirement R1 remain in PRC-001-2, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard”.** 5. **Based on comments, the drafting team combined Requirement R3, Parts 3.3.1 and 3.3.2 into Part 3.3, and removed Requirement R4, Part 4.3.**		
Consumers Energy		1. We feel that this is a very difficult standard to interpret consistently as written. We think a negative vote is warranted since it is confusing and unclear for our situation. Following are specific comments to support our negative vote. 2. In regard to the Process Flow Chart on page 21 - We assume this Process Flow Chart is intended as an illustrative clarification of the standard, not a supplement to the wording. The chart claims to be a “complete representation of the process” and as such should match identically or it should be eliminated as it causes confusion. It is our interpretation that the chart does not match the standard’s wording. One example if you start with an R3 emergency replacement you end up with two conflicting results.

		Under 4.3.2 you have 30 days to confirm that the changes are acceptable. Under 1.1.3 you have to do a protection study so you are given 90 days per section 1.2. This entire chart should be verified to ensure that it matches the written standard and does not result in conflicting requirements. We suggest adding the sub-requirement labels to each flow chart item for easier reference to that section of the standard. 3. In regard to Figure 3 on page 25 - The figure appears to represent the connection of a large NERC qualified generator. Does this figure also apply to a looped source distribution system or should that follow figure 4? We would like to see a definitive example that clarifies what to do for the situation where you have a looped source distribution system. 4. In regard to Figure 4 on page 26 - the figure implies that A & B can be set to overtrip C (as no study is required) which would interrupt the BES for distribution faults. This appears to be contrary to what is intended by this standard.

Response: Thank you for your comment.

1. **The drafting team is striving to improve the standard through the balloting process.**
2. **The drafting team has modified the flowchart based on comments and to reflect all changes made to the standard.**
3. **Figure 3 is represents a generator connected to a Distribution Provider. The drafting team modified Figure 3 to indicate that the source could be a generator or a network system. The Applicability Section 4.2 Facilities states: "Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements", which the team believes clarifies those Protection System Elements that are required to be coordinated under this standard. This does not include a Protection System that would operate for a Fault on the Transmission System, if that is not its primary purpose. Figure 4 is intended to be a radial Distribution System with no source.**
4. **Figure 4 is intended to illustrate a situation where no Protection System Study is required per this standard because there is no Protection System installed to detect Faults on the BES Transmission System. This does not preclude the Transmission Owner from reviewing the Protection System to ensure the system operates as designed.**

Public Service Enterprise		We have the following additional comments:

Group		a. FORMATTING: Remove the bullets in 3.1 and replace with subparts 3.1.1, 3.1.2, etc. b. With regard to R2, we suggest that the Transmission Planner be required to perform the studies described therein, not the TO. c. Furthermore, there should be a requirement similar to that suggested in our response to #5, paragraph that each TP provide data needed by another TP needed to perform the required study. It should also address how potentially different results for the same Interconnected Facility by the several TPs should be dealt with.
Response: Thank you for your comment. **a. The drafting team has retained the format for Requirement R3, Part 3.1.** **b. Although the Transmission Planner may "define system protection and control needs", it will be the owner that is responsible for determining the implementation and coordination.** **c. The drafting team believes that nothing in the requirements precludes an entity from asking for necessary data, and requirements are needed to ensure that requested data is provided. The drafting team believes that communication between interconnecting entities is important for any change that modifies the information used to comply with Requirement R2. The drafting team believes that documentation is necessary in order to have a record that the coordination study was completed, communicated to the appropriate Entities and agreed upon.**		
Public Utility District No. 1 of Snohomish County		We note that the formulas in R2 use V for current. For clarity's sake, we believe current should be denoted using the letter I
Response: Thank you for your comment. **Per your suggestions and others, the drafting team has modified the equation to replace "V" with "I".**		
Sacramento Municipal Utility District		We note that the formulas in R2 use V for current. For clarity's sake, we believe current should be denoted using the letter I.
Response: Thank you for your comment. **Per your suggestions and others, the drafting team has modified the equation to replace "V" with "I".**		

Tri-State G & T		We think there needs to be a time frame associated with the calculation of the percent deviation after the fault duties are calculated. One way to accomplish that would be to eliminate 2.1 and add a 24 month requirement to 2.2., which would require the performance of a short circuit study anyway.
Response: Thank you for your comment. **The drafting team believes that the phrase "pursuant to Requirement R2, Part 2.1, using the following equation" implies that the calculation must be performed within the same 24 month period. As stated in the Rationale box supporting Requirement R2, Part 2.1: "Short circuit databases are customarily updated annually, so the SDT believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation."**		
NV Energy		While we agree the Protection System Studies are necessary to verify coordination of Protection Systems, we believe that the proposed Standard requires more than the necessary amount of documentation, and therefore becomes administratively burdensome. This is contrary to the principles of the Results-Based Standards. We suggest that the evidence be limited to evidence that studies were coordinated and that the applicable entities have agreed to the results of the studies.
Response: Thank you for your comment. **The drafting team believes that documentation is necessary in order to have a record that the coordination study was completed, communicated to the appropriate Entities and agreed upon. Requirement R4 Part 4.2 has been modified to read "Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes." The measure for Part 4.2 is M9, which now reads "Acceptable evidence for R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that confirmation of agreement was achieved prior to implementation of any planned Protection System(s) changes."**		
Exelon		None

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1, to coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults. This standard incorporates and enhances the coordination aspects of Requirements R3 and R4 from PRC-001-1 (now R2 and R3 of PRC-001-2). The SPC SDT is requesting a posting for stakeholder comments under a 30-day formal comment period.

Anticipated Actions	Anticipated Date
30-day Formal Comment Period with Parallel Successive Ballot	November 2012
Recirculation Ballot	January 2013

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here.

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.2 Facilities:

   Protection Systems installed for the purpose of detecting Faults on Interconnected Elements of the BES and that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focus their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and enhanced in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults."*

PRC-001-1 contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of reliability standards. The Project 2007-03 drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they address data and data requirements that are included in the proposed Reliability Standard TOP-003-2. The SPC SDT is incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 in a new standard (as recommended by the SPCTF assessment), and focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1. The SPC SDT recommends that Requirement R1 remain in PRC-001-3, until its reliability objective is addressed by either a revision to an existing standard or development of a new standard.

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

Other Aspects of coordination of Protection Systems addressed by other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency Load shedding programs are addressed by PRC-006-1 (Project 2007-01 Underfrequency Load Shedding – pending FERC approval) and generator performance during frequency excursions is being addressed by PRC-024-1 in Project 2007-09 Generator Verification.
- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed by PRC-024-1 in Project 2007-09, Generator Verification.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed by PRC-019-1 in Project 2007-09.

- Transmission relay loadability is addressed in PRC-023-1 and, pending FERC approval, PRC-023-2.
- Generator relay loadability will be addressed by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.
- Protective relay response during power swings will be addressed in Phase 3 of Project 2010-13.3, Relay Loadability.
- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

1.1. Perform a Protection System Study for each Interconnected Element on its System as follows:

1.1.1 Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected Element exists.

1.1.2 Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed).

Rationale for R1:

Part 1.1 Protection System Studies are necessary to verify coordination of Protection Systems for existing and new Interconnected Element. The drafting team defines the term "Interconnected Element" as "An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."

Part 1.1.1 The drafting team believes 48 months is an appropriate period of time for entities to perform the Protection System Studies required where no study exists. The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.

Part 1.1.2 The drafting team believes that 6 months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater Fault current deviation at an interconnecting bus, where such conditions may warrant a new Protection System Study, or to technically justify why no such study is required, e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon Fault current.

Part 1.1.3 The drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.

Part 1.2 The drafting team believes to properly ensure coordination of Protection Systems associated with Interconnected Element(s), all entities need to share the summary of results of a Protection System Study (PSS) and assess the study results. The drafting team believes that 90 calendar days is a reasonable time for the entity to provide the results of the PSS performed in accordance with Requirement R1 to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated Protection System Study, or the summary results of each Protection System Study (either in hard copy or electronic file formats) demonstrating that the time frames specified in Parts 1.1.1. and 1.1.2. Acceptable evidence of technical justification for not performing a Protection System Study as specified in Parts 1.1.2 and 1.1.3 could be documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspects of coordination.

M2. Acceptable evidence for Requirement R1, Part 1.2 demonstrating that the summary results of each Protection System Study (hard copy or electronic file formats) was provided within the specified time frame to the owner(s) of the Protection System(s) associated with the Interconnected Element(s).

R2. For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. At least once every 24 months:

2.1.1 Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1.

2.1.2 Calculate the percent deviation between the Fault current values (single line to ground and 3-phase for the interconnecting bus(s) under consideration) used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1.1, using the following equation:

$$\% \, Deviation = \left| \frac{Iscs - Ipss}{Ipss} \right| x \; 100$$

Where: I_{scs} = Fault current value from present short circuit study

> Rationale for R2: This requires a periodic review of Fault currents at the interconnecting bus and providing to the results to the applicable entities when deviations occur that meet the Requirement R2 criteria. It is important that interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the short circuit studies because they maintain the data necessary to perform the studies. The drafting team determined that 10% was an appropriate point to provide this information based on the fact that Protection Systems are typically set with margins above 10%.
>
> Part 2.1 Short circuit databases are customarily updated annually, so the drafting team believes 24 months provides the entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation. The drafting team believes studies associated with changes that would affect the coordination in less time would be triggered by other requirements in this standard. The drafting team is including this formula to assure a consistent approach is used by each Transmission Owner when calculating the percent deviation in Fault current vales.
>
> Part 2.2 The drafting team believes the 30-day time frame is reasonable for providing the Fault current information to the owner(s) of the Protection System(s) associated with the Interconnected Element.

And: I_{pss} = Fault current value used in the most recent Protection System Study

2.2. Within 30 calendar days after identification where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in Fault current of 10% or greater, provide each owner of the Protection System associated with the Interconnected Element the updated Fault current values (I_{scs}).

M3. Acceptable evidence for Requirement R2, Part 2.1 is dated documentation (hard copy or electronic file formats) that contains the present Fault current values from the short circuit study for each interconnecting bus analyzed and that identifies the percent deviation from the most recent Protection System Study Fault current values determined by the formula.

M4. Acceptable evidence that the updated Fault current values (I_{scs}), along with documentation (hard copy or electronic file formats) for Requirement R2, Part 2.2 was provided within the specified timeframe to each owner of the Protection System associated with the Interconnected Element.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnected Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

3.1. Details for any change or additions listed below; either at an existing or new Facility associated with the Interconnected Element; or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s).

- New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios

Rationale for R3: This requires the transfer of appropriate information to the entities associated with each Interconnected Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting Protection System Studies by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected Element(s). The drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information in a timely manner in order to perform a Protection System Study, as required in Parts 1.1.1, 1.1.2, and 1.1.3. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed-to schedule, if appropriate.

Part 3.3 The drafting team believes 30 calendar days is sufficient time to provide the information.

- Changes to a transmission system Element that change any sequence or mutual coupling impedance
- Changes to generator unit(s) that result in a change in impedance
- Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. Requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 calendar days of receiving a request or according to an agreed-upon schedule.

3.3. Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components.

M5. Acceptable evidence may include, but is not limited to, a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) in hard copy or electronic file formats as identified in the bulleted list for Requirement R3, Part 3.1 was provided to each responsible entity connected to the same Interconnected Element.

M6. Acceptable evidence for Requirement R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was provided according to the agreed-upon schedule, or within 30 calendar days absent such an agreement.

M7. Acceptable evidence for Requirement R3, Part 3.3 is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made was provided within 30 calendar days.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.

4.2. Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.

Rationale for R4: This requirement ensures owner(s) of Protection System(s) associated with Interconnected Elements confirm that the Protection System(s) applied are acceptable per the conditions identified in Parts 4.1 and 4.2.

Part 4.1 The drafting team believes 90 calendar days is a reasonable time for the owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of a Protection System Study. If any issues are identified that require changes then respond whether further action is required.

Part 4.2 The drafting team believes that proposed modifications (including project schedules) to Facility changes associated with the Interconnected Element, as described in Requirement R3, Part 3.1, must be communicated and accepted prior to the in-service date. Acceptance assures that the coordination of Protection Systems associated with the affected Interconnected Element is achieved.

M8. Acceptable evidence for Requirement R4, Part 4.1 is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

M9. Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that confirmation of acceptance was achieved prior to implementation of any planned Protection System(s) changes.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at an Interconnected Facility shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures M1 through M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at a Facility associated with an Interconnected Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Long-term Planning	Medium	The responsible entity performed a Protection System Study on an Interconnected Element per R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by less than or equal to 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by 10 calendar days or less.	The responsible entity performed a Protection System Study on an Interconnected Element per R1, Part 1.1.1, but was late by more than 30 calendar days. OR The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by more than 30 calendar days but less than or equal to 40 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by more than 40 calendar days but less than or equal to 50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by more than 50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 30 calendar days. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The responsible entity failed to perform a Protection System Study on an Interconnected Element per R1, Parts 1.1.1, 1.1.2, or 1.1.3, or document why a study was not required. OR The responsible entity failed to provide Protection System Study results in accordance with R1, Part 1.2.
R2	Long-term Planning	Medium	The Transmission Owner performed a short circuit study, as described in R2, Part 2.1, but was late by less than or equal to 30 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 30 calendar days but less than or equal to 40 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 40 calendar days but less than or equal to 50 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 50 calendar days. OR The Transmission Owner failed to perform a short circuit study, as described in R2, Part 2.1. OR The Transmission Owner failed to calculate the percent deviation between the Fault currents, according to the formula designated in

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element the changes in Fault currents, as described in R2, Part 2.2, but was late by less than or equal to 10 calendar days.	OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element the changes in Fault currents, as described in R2, Part 2.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days. Guidelines and Technical Basis

Requirement R1:

This requirement directs the performance of Protection System Studies for every Interconnected Element to verify coordination of existing Protection Systems where no recent study exists or when Facility configuration or Fault current deviations of 10% or more have occurred. In developing the language to define Protection System Study, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the drafting team defined the term Protection System Study for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

Protection System Studies comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The drafting team believes applicable entities should have a documented Protection System Study for each Interconnected Element to validate the Protection Systems associated with those Interconnected Elements perform in a manner consistent with the purpose of this Standard. Additionally, the drafting team believes that 48 months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected Elements that might warrant a shorter time frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

Parts 1.1.2 and 1.1.3 further direct that Protection System Studies must be completed under the following two circumstances:

1. After notification of an identified 10% or greater deviation in Fault current, the notified entities must perform a new Protection System Study of the Interconnected Element or document why a study is not required. The drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater deviation in Fault current may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the six-month time frame associated with this requirement represents a reasonable period to perform the studies that are required after identification by the 24-month Fault current review.
2. After proposing or being notified of a change at a Facility associated with the Interconnected Element, entities must perform a new Protection System Study, or technically justify why such a study is not required. The drafting team recognizes that, based on the scope of the proposed change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, "…or technically justify why such a study is not required." The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the wide variety of conditions that may be associated with a particular change. The drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date," as stipulated by Requirement R4, Part 4.2.

Requirement R1, Part 1.2 directs the entity performing the Protection System Study to provide a summary of the study results to the affected Interconnected Element owner(s). As guidance, the drafting team lists the following inputs and results of a Protection System Study that may be included in the summary provided pursuant to this requirement:

1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the Facility, and were reviewed for coordination of protective relays as part of the study including the contingencies used in the evaluation.

2. Data used to determine Fault currents in performing the study, along with a listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
3. A listing of any issues associated with the relay settings of the other owner(s) at the Facility that were identified by the study.
4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The drafting team investigated various inputs that would trigger a review of the existing Protection System Studies and determined, through the experience of the drafting team members, along with informal surveys of several regional protection and control committees, that variations in Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates a periodic review of Fault currents and includes the calculation of the percent deviation between the Fault current values used in the most recent Protection System Study and the present Fault current values indicated by the short circuit study performed pursuant to this requirement. This calculation is necessary to identify Fault current changes that must be communicated in accordance with Requirement R2, Part 2.2.

Polling of drafting team membership and various protection engineering committees indicates that short circuit databases are customarily updated annually. Based on this information, the drafting team believes that requiring a 24-month periodic review of Fault currents provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation, as described in Requirement R2, Part 2.1. The drafting team believes studies associated with changes that would affect the coordination in less than 24 months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2 further directs the Transmission Owner to, within 30 calendar days, inform each owner of the Facility associated with the Interconnected Element when short circuit studies indicate that 10% deviations in Fault current have occurred at the interconnecting bus(s). The drafting team believes the 30-day time frame associated with this requirement is reasonable for providing the Fault current information to the interconnected entity(s) and is consistent with other NERC reliability standards.

In Requirement R2, the Transmission Owner is identified as the Functional Entity responsible for performing the Fault current studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners’ short circuit models.

Requirement R3:

This directs the registered functional entity initiating any change to provide the details to the other affected entities of the Interconnected Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to, power system configurations, protection schemes, schematics, instrument transformer ratios, type of relay(s), communication equipment applied for protection, and Protection System settings. The recipient will incorporate the applicable information into its Protection System Studies to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The drafting team recognizes that Facility changes at other locations can impact the Protection System Study of the Facility associated with the Interconnected Element; e.g., the addition of a large autotransformer bank or generator not directly associated with the Interconnected Element. The drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable “prior to the in-service date,” as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a Protection System Study or, absent such agreement, within 30 days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed-upon coordination when changes are made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components Based upon the limited number of instances that would occur under such circumstances, the drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

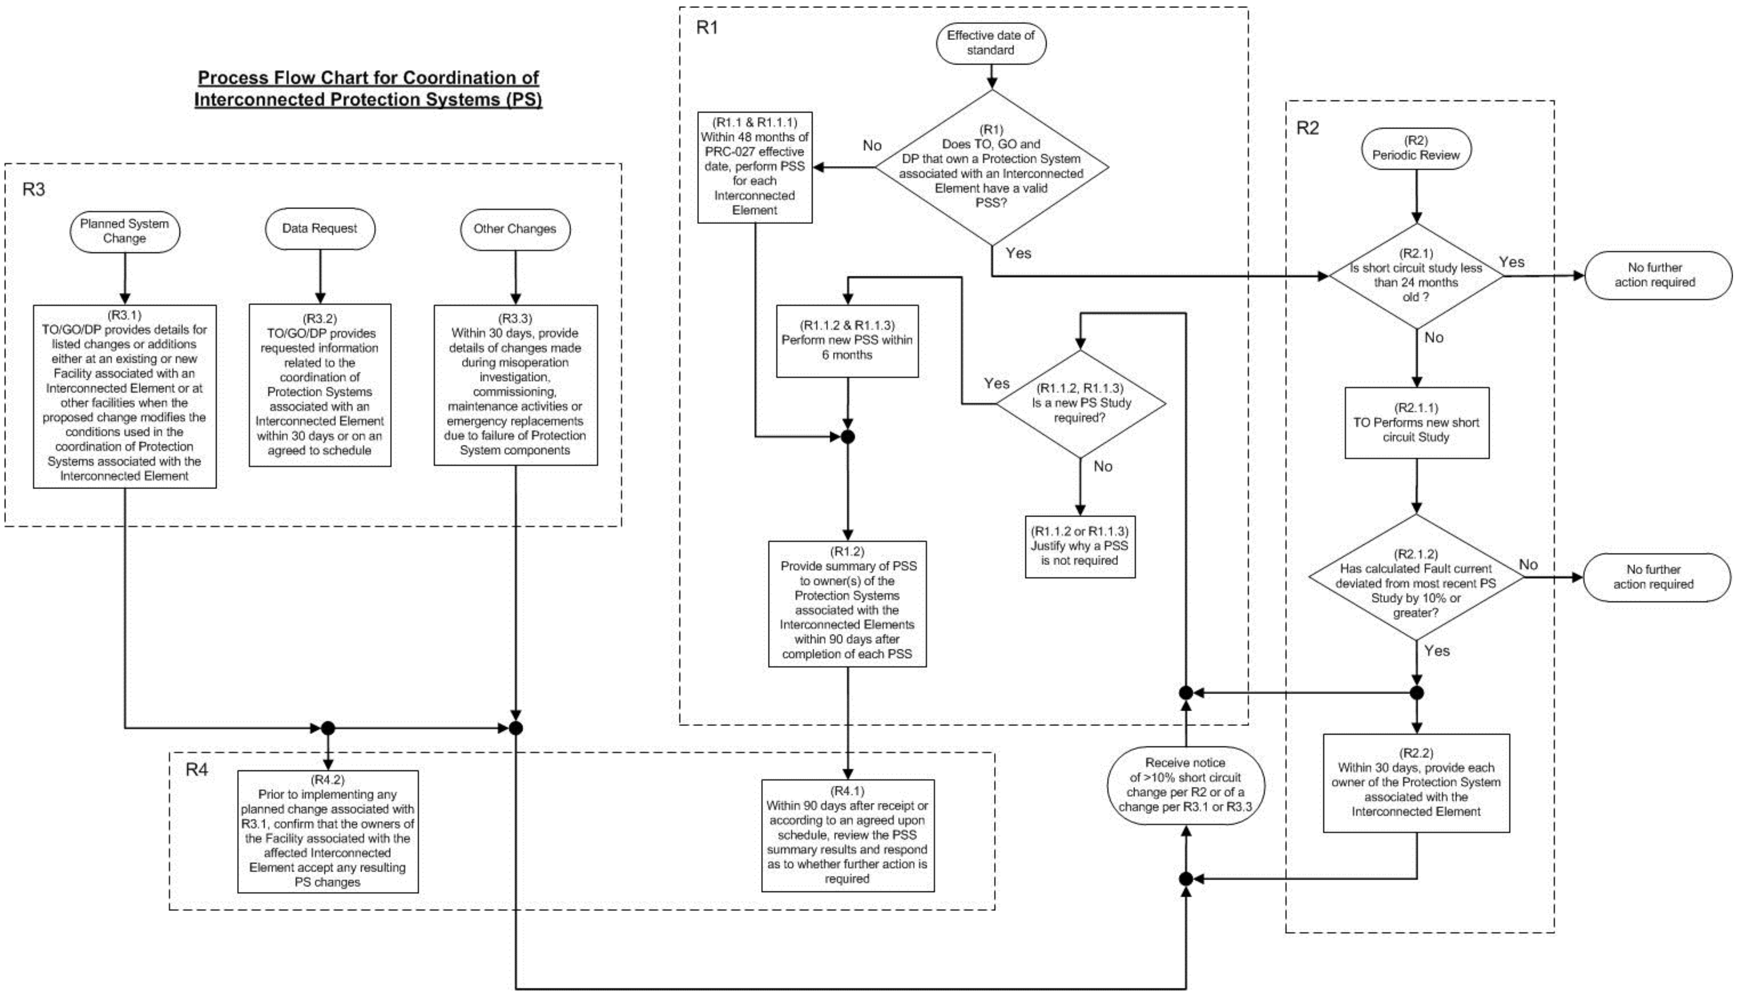
The reliability objective of this requirement is to bring the process of Protection System coordination full circle by gaining the confirmation of interconnected entities that their

Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2; or absent acceptance propose revisions to achieve acceptable results. The drafting team believes 90 calendar days after receipt of the results of a Protection System Study provides a reasonable time for the owners of Facilities to resolve differences and confirm acceptance that their Protection Systems are coordinated.

Requirement R4, Part 4.2 directs entities to confirm that planned changes described in Requirement 3.1 are acceptable prior to the in-service date of those changes. The purpose of this requirement is to assure the effects that planned changes have on Protection Systems at a Facility associated with the affected Interconnected Element have been considered by all affected entities.

Process Flow Chart: Below is a complete representation of the process, including the relationships between requirements:



Example Process

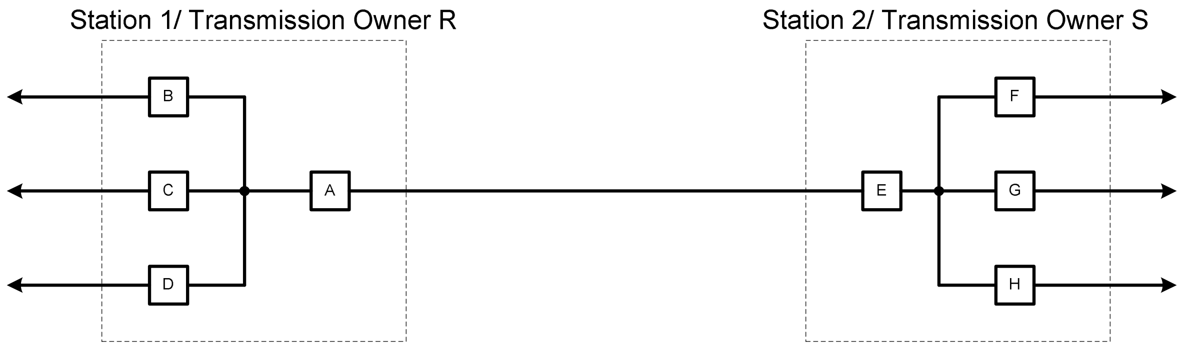
An example of the interaction between entities required to gather the information to perform an accurate study is below.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and request up-to-date Protection System information.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a Protection System Study using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the Protection System Study.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, confirm agreement that coordination is achieved.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
- Documentation of the final agreement is required prior to implementation of planned changes.

Diagrams

Introduction: The diagrams below are intended to provide guidance related to the purpose of this standard between owners of Facilities associated with the affected Interconnected Element. After the reviews and prior to implementation of the changes, the owners must reach agreement on the final settings to achieve coordination of the Protection Systems.

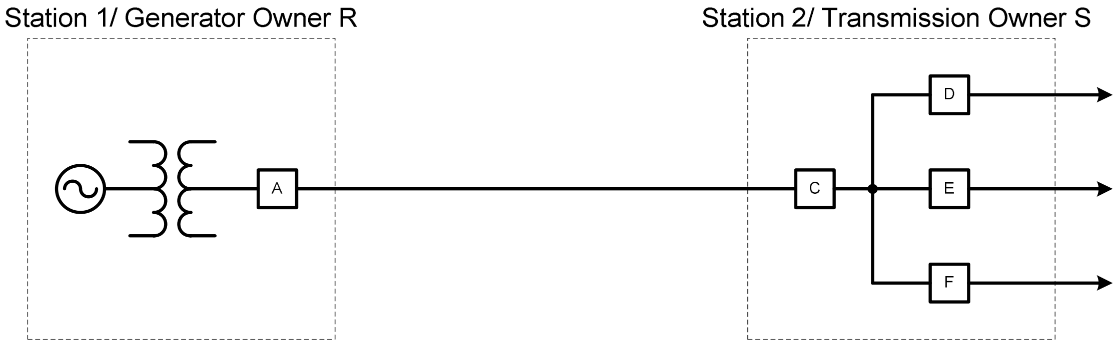
Figure 1



In Figure 1 above, the Interconnected Element between the Transmission Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 1, Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, Owner R is to review the Protection System settings associated with Breaker E (provided by Owner S) for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

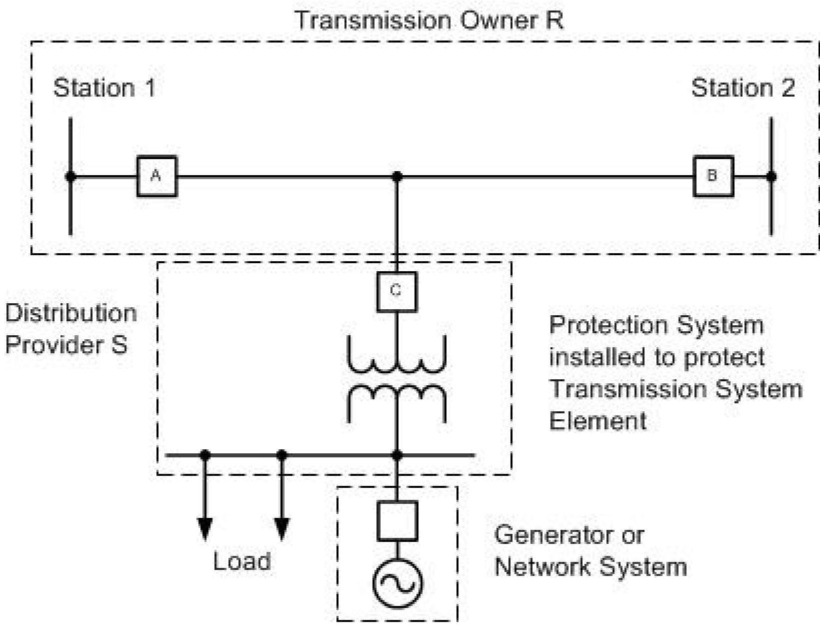
Figure 2



In Figure 2 above, the Interconnected Element between the Transmission Owner and the Generator Owner is the transmission line or bus between Breakers A and C.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 2, Transmission Owner S is to review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, Generation Owner R is to review the Protection System settings associated with Breaker C (provided by Owner S) for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3



In Figure 3 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.

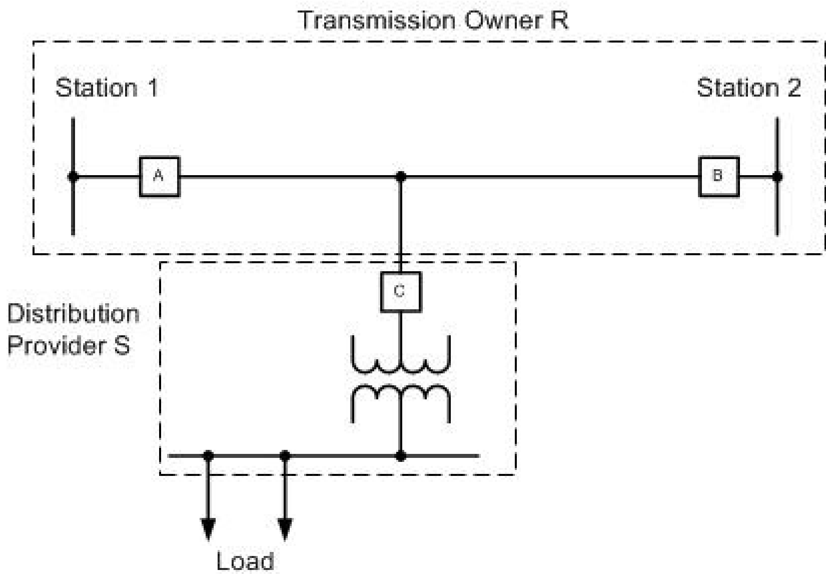
Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 3, Transmission Owner R is to review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2.

Notes:

A Protection System Study is required per this standard for this example if a Protection System at the Distribution Provider's substation is designed to detect Faults on the BES Transmission System.

"Protection Systems installed to detect faults on the BES Transmission System" are not inclusive of those relays that may operate for such faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.). As an example, reverse power relays are often installed to detect situations where the transmission source becomes de-energized and the distribution bank remains energized from a source on the low-voltage side of the transformer and the settings are calculated based on the charging current of the transformer from the low-voltage side. Although these relays may operate as a result of a Fault on a BES Element, they are not "installed to detect faults on the BES Transmission System."

Figure 4

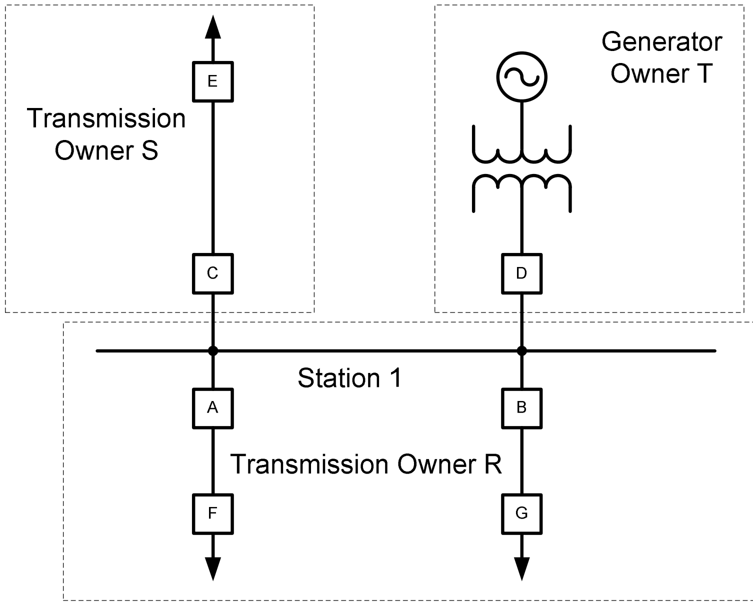


In Figure 4 above, the Interconnected Element between the Transmission Owner and the Distribution Provider is the transmission line or tap between the line and Breaker C.

Note: No specific Protection System Study is required per this standard for this example since the Protection System at the Distribution Provider's substation is not designed to protect BES transmission system Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners



In Figure 5 above, the Interconnected Element between the Transmission Owners R and S and the Generation Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at Transmission Station 1, and all direct interconnections are between Owner R and each of the other Owners connected to the bus.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 5:

Owner R is to review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S or T) for coordination issues with the Protection System settings associated with Breakers A, B.

Owner S is to review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R or T) for coordination issues with the Protection System settings associated with Breaker C. To perform this review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

Owner T is to review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R or S) for coordination issues with the Protection System settings associated with Breaker D or the Protection Systems associated with generator Protection Systems. In order to perform this review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Draft 1 of SAR posted for comment June 11, 2007 – July 10, 2007.
2. SAR approved on August 13, 2007.
3. First posting of revised standard PRC-001-2 on September 11, 2009.
4. Transitioned from a revision of PRC-001-1 to development of PRC-027-1 based on industry comments, Quality Review feedback, and consideration of FERC directives relative to the existing requirements of PRC-001-1.
5. Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPC SDT) created a new results-based standard, PRC-027-1, to coordinate Protection Systems ~~utilized to protect~~for Interconnected ~~Facilities~~Elements, such that ~~those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the~~ the least number of power system ~~performance specified within requirements established in other approved NERC Reliability Standards~~Elements are isolated to clear Faults. This standard incorporates and enhances the coordination aspects of Requirements R3 and R4 from PRC-001-1~~.~~ (now R2 and R3 of PRC-001-2). The SPC SDT is requesting a posting for stakeholder comments under a 30-day formal comment period.

Anticipated Actions	Anticipated Date
~~Post first draft of standard for 30-day Formal Comment Period.~~	~~May 2012~~
~~45-day Formal Comment Period with Parallel Initial Ballot~~	~~August 2012~~
30-day Formal Comment Period with Parallel Successive Ballot	November 2012
Recirculation Ballot	January 2013

Effective Dates:

PRC-027-1 shall become effective on the first day of the first calendar quarter that is ~~three~~six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where ~~such explicit approval is required. Where no~~ regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~three~~six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise ~~prescribed by~~made effective pursuant to the laws ~~or regulations of the~~ applicable to such ERO governmental authorities. For ~~Facility interconnections~~Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-~~-~~approved effective date.

Version History

Version	Date	Action	Change Tracking
1	TBD	Project 2007-06 – PRC-027-1	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. ~~*New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*~~

The following terms are defined for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected ~~Facilities~~~~: BES Facilities~~**Element**: An Element that ~~are~~ electrically ~~joined by one or more Element(s) and~~ joins separate Functional Entities, including those Functional Entities that are ~~owned by different functional, operating, or corporate entities.~~a part of the same Registered Entity.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** **Protection System Coordination for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To coordinate Protection Systems for Interconnected ~~Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards~~Elements, such that the least number of power system Elements are isolated to clear Faults.
4. **Applicability:**

4.1. Functional Entities:

4.1.1 Transmission Owner

4.1.2 Generator Owner

4.1.3 Distribution Provider

4.2 Facilities:

Protection Systems installed ~~at~~for the purpose of detecting Faults on Interconnected ~~Facilities.~~Elements of the BES and that require coordination for isolating those faulted Elements

5. **Background:**

On December 7, 2006, the NERC Planning Committee approved the assessment of Reliability Standard PRC-001 – System Protection Coordination, prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF noted problems with the applicability to entities and vagueness of requirements in the existing PRC-001-1 ~~Reliability Standard.~~reliability standard. The SPCTF concluded that the deficiencies of Reliability Standard PRC-001-1 were magnified by having requirements that addressed coordination of protection functions and capabilities in the operating and planning timeframes. Consequently, the SPCTF recommended that the requirements for the operating horizon and planning horizon be clearly delineated, and possibly divided into two standards.

The NERC Standards Committee approved a Standard Authorization Request that included the modifications noted by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

The Project 2007-06 – System Protection Coordination Standard Drafting Team (SPC SDT) posted an initial draft of Reliability Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPC SDT attempted to address all issues identified by the SPCTF assessment of PRC-001-1. The SPC SDT responded to the comments from the initial posting of PRC-001-2, and incorporated pertinent suggestions into the second draft of the standard in the first quarter of 2010. This second draft ~~was developed in the results-based format and~~ went through a NERC Quality Review (QR) in December 2010. Based on the results from the QR, and after informal consultations with industry stakeholders, as well as NERC and FERC staffs, the drafting team decided to follow the SPCTF recommendation and focus their knowledge and expertise on developing a new results-based standard, concentrating on the reliability aspects (the coordination of new and existing protective systems in the planning horizon) associated with Requirements R3 and R4 of PRC-001-1. These aspects of coordination are incorporated and enhanced in the proposed Reliability Standard PRC-027-1 – Protection System Coordination for Performance During Faults with the stated purpose:

> *"To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.~~To coordinate Protection Systems for Interconnected Facilities, such that those Protection Systems remove from service only those Elements required to isolate Faults, while meeting the system performance specified within requirements established in other approved NERC Reliability Standards.~~"*

PRC-001-1 ~~contains~~contained a non-specific training requirement (Requirement R1), three operating time frame requirements (Requirements R2, R5 and R6), and two planning requirements (Requirements R3 and R4). The SPC SDT transferred the responsibility of addressing the operating Requirements R2, R5, and R6 to the ~~SDT~~drafting team for Project 2007-03 Real-time Operations, charged with revising the TOP group of ~~Reliability Standards.~~reliability standards. The Project 2007-03 ~~SDT is recommending retirement of~~drafting team retired Requirements R2, R5, and R6 of PRC-001-1 because they address data and data requirements that are included in the proposed Reliability Standard TOP-003-2. The SPC SDT is incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 in a new standard (as recommended by the SPCTF assessment), and focusing on the performance of Protection Systems during Faults. Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) will be retired upon appropriate regulatory approval of the proposed standards PRC-001-3 and PRC-027-1. The SPC SDT recommends that ~~the training aspects of PRC-001-1,~~ Requirement R1 ~~be~~remain in PRC-001-3, until its reliability objective is addressed ~~in Reliability Standard PER-005-1 with~~by either a revision to ~~its Applicability section to include the Generator Operator~~an existing standard or development of a new standard.

Additionally, the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address "the appropriate use of time delays in relays~~"~~," by requiring that individual interconnected entities cooperate in designing and setting their Protection Systems to achieve coordination.

Other Aspects of coordination of Protection Systems addressed by other Projects:

Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.

- Underfrequency ~~load~~Load shedding programs are addressed by PRC-006-1 (Project 2007-01 Underfrequency Load Shedding – pending FERC approval) and generator performance during frequency excursions is being addressed by PRC-024-1 in Project 2007-09 Generator Verification.

- Undervoltage Load shedding programs are addressed by PRC-010-0 and PRC-022-1, and will be improved by Project 2008-02, Undervoltage Load Shedding. Generator performance during voltage excursions is addressed by PRC-024-1 in Project 2007-09, Generator Verification.

- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is being addressed by PRC-019-1 in Project 2007-09.

- Transmission relay loadability is addressed in PRC-023-1 and, pending FERC approval, PRC-023-2.

- Generator relay loadability will be addressed by Phase 2 of Relay Loadability: Generation, in Project 2010-13.2.

- Protective relay response during power swings will be addressed in Phase 3 of Project 2010-13.3, Relay Loadability.

- Misoperations identified as coordination issues are investigated and have Corrective Action Plans created in accordance with PRC-003-0 and PRC-004-2a, and will be improved in PRC-004-3 by Project 2010-05.1 Protection Systems: Phase 1 (Misoperations).

The SPC SDT believes that including these other aspects of protection coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.

B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

> Rationale for R1:
>
> Part 1.1 Protection System Studies are necessary to verify coordination of Protection Systems for existing and new Interconnected ~~Facilities.~~Element. The ~~SDT~~drafting team defines the term "Interconnected ~~Facilities~~Element" as "~~BES Facilities~~An Element that ~~are~~ electrically ~~joined by one or more Element(s) and are owned by different functional, operating, or corporate entities~~joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity."
>
> Part 1.1.1 ~~Protection System studies performed after June 18, 2007 (the effective date of PRC-001-1) and in accordance with PRC-001-1, are sufficient to meet Requirement R1, Part 1.1.1.~~The ~~SDT~~drafting team believes ~~that 36~~48 months is an appropriate period of time for entities to perform the ~~studies~~Protection System Studies required where no study exists. The ~~SDT~~drafting team has no evidence there is widespread miscoordination ~~between~~ of Protection Systems associated with Interconnected ~~Facilities~~Elements that warrants a shorter time~~-~~ frame.
>
> Part 1.1.2 The ~~SDT~~drafting team believes that 6 months is an appropriate period of time for entities to perform the studies required when determining, or being notified of, a 10% or greater ~~fault~~Fault current deviation at an interconnecting bus, where such conditions may warrant a new Protection System Study, or to technically justify why no such study is ~~needed~~required, ~~i.e.~~e.g., when a line is protected by dual current differential systems with no backup elements set that are dependent upon ~~fault~~Fault current.
>
> Part 1.1.3 The ~~SDT~~drafting team believes that entities must perform the studies required when proposing or being notified of changes identified in Requirement R3, or to technically justify why no such study is needed. The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. ~~The SDT believes that~~ Sspecifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change. The initiating entity has the incentive to provide the identified information as soon as possible to ensure timely implementations.
>
> Part 1.2 The ~~requirement provides for the communication of the~~

1.1. Perform a Protection System Study for each Interconnected ~~Facility~~Element on its System ~~to verify that Protection Systems remove from service only those Elements required to isolate Faults~~ as follows:

1.1.1 Within ~~36~~48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected ~~Facility exists that was performed on or subsequent to June 18, 2007~~Element exists.

1.1.2 Within ~~6~~ six calendar months after determining~~,~~ or being notified of~~,~~ a 10% or greater change in ~~fault~~Fault current ~~for that Interconnected Facility~~at an interconnecting bus, as described in Requirement R2, ~~unless the entity can demonstrate~~or technically justify why such a study is not required.

1.1.3 According to an agreed upon time frame to meet the schedule w~~W~~hen proposing or being notified of a change ~~at the Interconnected Facility~~, as described in Requirement R3, Part 3.1 or Part 3.3 ~~unless the entity can demonstrate~~, or technically justify why such a study is not required.

1.2. Within 90 calendar days after the completion of each Protection System Study ~~Provide~~ provide to ~~each affected Interconnected Facility~~ the owner~~,~~(s) of the Protection

System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the ~~Protection System(s)~~protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed)~~ within 90 calendar days after the completion of each Protection System Study~~.

M1. Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated Protection System Study, or the summary results of each Protection System Study (either in hard copy or electronic file formats) demonstrating that the ~~meeting the timeframes~~time frames specified in Parts 1.1.1. and 1.1.2~~., or documentation demonstrating why a study is not required~~. Acceptable evidence of technical justification for ~~changes described~~not performing a Protection System Study as specified in Parts 1.1.2~~.~~ and 1.1.3 could be documented engineering analyses or assessments that demonstrate the change in Fault current or the proposed system change does not impact any aspects of coordination.

~~**M2.**~~ Acceptable evidence for Requirement R1, Part 1.2 demonstrating ~~for Requirement R1, Part 1.2. is dated documentation demonstrating each affected entity received, within the specified time frame,~~that the summary results of each Protection System Study (hard copy or electronic file formats) ~~sent pursuant~~was provided within the specified time frame to ~~Requirement R1, Part 1.2.~~

M2. ~~For each~~ the owner(s) of the Protection System(s) associated with the Interconnected ~~Facility, each~~Element(s).

R2. For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

2.1. ~~Perform~~At least once every 24 months:

2.1.1 Perform a short~~-~~circuit study to determine the present ~~fault current values, not less than once every twenty-four months~~maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is

Rationale for R2: This currents at the interconnec to the applicable entities w Requirement R2 criteria. Facility owners are kept a proper performance of the Transmission Owner is id performing the short circu data necessary to perform determined that 10% was information based on the f typically set with margins

Part 2.1 Short circuit datal annually, so the drafting te entities flexibility to sched studies and calculate the p believes studies associated coordination in less time w requirements in this standa formula to assure a consis Transmission Owner whe Fault current vales.

Part 2.2 The drafting team reasonable for providing t owner(s) of the Protection Interconnected Element.

~~Rationale for R2: This requires a periodic review of fault currents and notification to the applicable entities when deviations occur that meet the Requirement R2 criteria. It is important that Interconnected Facility owners are kept aware of changes that could affect proper performance of their Protection Systems. The Transmission Owner is identified as the entity responsible for performing the fault current studies because they maintain the data necessary to perform the studies. The SDT determined that 10% was an appropriate point at which to require notification based on the fact that Protection System elements that can be affected by fault current are typically set with margins above 10%.~~

~~Part 2.1 Short-circuit databases are customarily updated annually, so the SDT believes 24 months provides the entities flexibility to schedule and perform the new short-circuit studies and calculate the percent deviation. The SDT believes studies associated with changes that would affect the coordination in less time would be triggered by other requirements in this standard.~~

~~Part 2.2 The SDT is requiring this formula to assure a consistent approach is used by each Transmission Owner when calculating the percent deviation in fault current vales.~~

~~Part 2.3 The SDT believes the 30-day time frame is reasonable for sending notification(s) to the interconnected entity(s).~~

available per Requirement R1.

~~2.1.1~~

2.1.2 Calculate the percent deviation between the ~~fault~~Fault current values (single line to ground and 3-phase for the interconnecting bus~~(s) or Element~~(s) under consideration) used in the most recent Protection System Study and the ~~fault~~Fault current values determined pursuant to Requirement R2, Part 2.1.1, using the following equation:

$$\cancel{\% \, Deviation = \left(\frac{Vscs - Vpss}{Vpss}\right) x \, 100}$$

$$\% \, Deviation = \left|\frac{Iscs - Ipss}{Ipss}\right| x \, 100$$

Where: ~~V_{scs} =~~ I_{scs} = Fault current value from present short-circuit study

And: ~~V_{pss} =~~ I_{pss} = Fault current value used in the most recent Protection System Study

~~2.1.~~**2.2.** Within 30 calendar days after identification ~~Where~~ where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in ~~fault~~Fault current of 10% or greater, ~~notify~~provide each owner of the Protection System associated with the Interconnected ~~Facility at which the 10% or greater deviation applies,~~Element the updated Fault current values (I_{scs}) ~~within 30 calendar days after identification~~.

M3. Acceptable evidence for Requirement R2, Part 2.1 is dated documentation (hard copy or electronic file formats) that contains~~ing~~ the present ~~fault~~Fault current values from the short-circuit study for each ~~Interconnected Facility~~interconnecting bus analyzed and that identifies the percent deviation from the most recent Protection System Study Fault current values determined by the formula.

~~**M4.** Acceptable evidence for R2, Part 2.2 is dated documentation (hard copy or electronic file formats) that identifies the percent deviation from the most recent Protection System Study fault current values determined by the formula pursuant to Part 2.2.~~

~~**M5.**~~**M4.** Acceptable evidence ~~for R2, Part 2.3 is documentation (hardcopy or electronic file formats) demonstrating identification of a deviation in fault~~that the updated Fault current values ~~10% or greater~~(I_{scs}), along with documentation (hard copy or electronic file formats) ~~demonstrating each affected entity received notification of such~~for Requirement R2, Part 2.2 was provided within the specified timeframe to each owner of the Protection System associated with the Interconnected Element.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each ~~Transmission Owner, Generator Owner, and Distribution Provider~~ Transmission Owner, Generator Owner, and Distribution Provider connected to ~~each Interconnected Facility, the details~~the same Interconnected Element: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]*

~~**R3.**~~ Details ~~(e.g., project schedule, protective relaying scheme types and settings) as follows: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*~~

Rationale for R3: This requires the transfer of appropriate information to the entities ~~of~~associated with each Interconnected ~~Facility~~Element due to circumstances identified in Parts 3.1, 3.2, and 3.3.

Part 3.1 The reliability objective of this requirement is to enable the process of conducting Protection System Studies by ensuring that the information is provided to the owner(s) of the Protection Systems associated with Interconnected ~~Facility owner(s) in a timely manner.~~Element(s). The ~~SDT~~drafting team believes that specifying a single time frame is not appropriate for the wide variety of conditions that will need to be evaluated. The list in the requirement is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. Examples of changes to generator units that result in impedance changes could include replacements and re-ratings. This requirement also pertains to changes identified as a result of studies performed in Part 1.1.

Part 3.2 The purpose of this requirement is to provide a means for an entity to receive the requested information ~~from an interconnected owner~~ in a timely manner in order to perform a Protection System Study, as required in Parts 1.1.1, 1.1.2, and 1.1.3. The ~~SDT~~drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide this information. The requirement also provides some flexibility for the parties involved to determine an otherwise agreed~~-~~to schedule, if appropriate.

3.1. ~~For~~for any change or additions listed below; either at an existing or new Facility associated with the Interconnected ~~Facility,~~Element; or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems ~~of~~associated with the Interconnected ~~Facilities.~~Element(s).

- New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios
- Changes to ~~line lengths and/or conductor size or spacing~~
- ~~Additions, removals, or replacements of~~ a transmission system Element~~(s)~~ that change any sequence or mutual coupling impedance
- Changes to generator unit(s) ~~including replacements, re-ratings, and impedances~~that result in a change in impedance
- ~~Replacement of~~ Changes to the generator step-up transformer(s) that result in a change in impedance

3.2. ~~According to an agreed upon schedule~~Requested information related to the coordination of Protection Systems associated with ~~a Transmission Owner, Generator Owner, or Distribution Provider, or absent such an agreement,~~an Interconnected Element within 30 calendar days of receiving a request ~~for information~~or according to an agreed-upon schedule.

~~3.3.~~ Within 30 calendar days~~ after:~~

~~3.3.1 Corrections are~~ , details of changes made ~~when~~to Protection ~~System errors are found~~Systems during Misoperation investigations, commissioning, ~~or~~ maintenance activities~~.~~

~~3.4.~~3.3. ~~Emergency~~, or emergency replacements ~~are~~ made due to failures of Protection System components.

~~M6.~~**M5.** ~~Acceptable evidence for R3, Part 3.1 is documentation (hard copy or electronic file formats) demonstrating each affected entity received project details for the changes identified in the bulleted list. Evidence~~Acceptable evidence may include, but is not limited ~~to~~ to, a summary of the future project or technical specifications of the proposed changes (e.g., project schedule, protective relaying scheme types and settings) in hard copy or electronic file formats as identified in the bulleted list for Requirement R3, Part 3.1 was provided to each responsible entity connected to the same Interconnected Element.

~~M7.~~**M6.** Acceptable evidence for Requirement ~~r~~ R3, Part 3.2 is dated documentation (hard copy or electronic file formats) demonstrating the requested information was ~~delivered~~provided according to the agreed~~-~~-upon schedule~~,~~ or within 30 calendar days absent such an agreement.

~~M8.~~**M7.** Acceptable evidence for Requirement R3, Part 3.3~~ and its subparts~~ is dated documentation (hard copy or electronic file formats) demonstrating the information pertinent to the changes made ~~pursuant to Parts 3.3.1 and 3.3.2.was received~~was provided within 30 calendar days.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Within 90 calendar days after receipt, ~~confirm agreement with~~or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2~~.~~, and respond as to whether further action is required.

~~4.2.~~ Prior to ~~the in-service date of~~ implementing any planned change ~~at the Interconnected Facility, confirm the affected Interconnected Facility owners agree~~(s) associated with ~~the Protection System(s) changes as described in~~ Requirement R3, Part 3.1~~.~~

Rationale for R4: This requirement ensures ~~owners~~owner(s) of Protection System(s) associated with Interconnected ~~Facilities~~Elements confirm that the Protection System(s) applied ~~on each of its Interconnected Facilities is~~are acceptable per the conditions identified in Parts 4.1~~, 4.2,~~ and 4.~~3~~2.

Part 4.~~1 The SDT~~1 The drafting team believes ~~ninety (~~90~~)~~ calendar days is a reasonable time for the ~~owners~~owner(s) of Protection System(s) associated with Interconnected Elements to review the summary results of ~~existing Interconnected Facilities to resolve differences and reach agreement~~a Protection System Study. If any issues are identified that require changes then respond whether further action is required.

Part 4.2 The ~~SDT~~drafting team believes that proposed modifications (including project schedules) to Facility changes associated with the Interconnected ~~Facilities~~Element, as described in Requirement R3, Part 3.1~~,~~ must be communicated and ~~agreed~~

~~4.3. Within 30 calendar days after receipt:~~

~~4.3.1 Confirm the Protection System(s) changes are acceptable pursuant to notification received per Requirement R3, Part 3.3.1.~~

~~4.4.~~4.2. ~~Confirm the~~, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes ~~are acceptable pursuant to notification received per Requirement R3, Part 3.3.2~~.

M8. Acceptable evidence for Requirement R4, ~~Parts~~Part 4.1~~, 4.2, and 4.3~~ is dated documentation (hardcopy or electronic file formats) demonstrating that response was provided according to the agreed-upon schedule, or within 90 calendar days absent such an agreement.

M9. Acceptable evidence for Requirement R4, Part 4.2 is dated documentation (hardcopy or electronic file formats) demonstrating that confirmation of acceptance was achieved ~~within the respective timeframe(s).~~prior to implementation of any planned Protection System(s) changes.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~Regional Entity or if the Responsible Entity is owned, operated or controlled by the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.~~

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at an Interconnected Facility shall keep data or evidence to show compliance with Requirements R1, R2, R3, and R4, and Measures ~~M1through~~M1 through M9, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner and Distribution Provider that owns a Protection System at a Facility associated with an Interconnected ~~Facility~~Element is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Planning, Long-term Planning	Medium	The responsible entity performed a Protection System Study on an Interconnected ~~Facility~~Element per R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Study ~~on~~at an ~~Interconnected Facility~~interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by less than or equal to ~~10~~30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by 10 calendar days or less.	The responsible entity performed a Protection System Study on an Interconnected ~~Facility~~Element per R1, Part 1.1.1, but was late by more than 30 calendar days. OR The responsible entity performed a Protection System Study ~~on~~at an ~~Interconnected Facility~~interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by more than ~~10~~30 calendar days but less than or equal to ~~20~~40 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to	The responsible entity performed a Protection System Study ~~on~~at an ~~Interconnected Facility~~interconnecting bus per R1, Part 1.1.2, or documented why a study was not required, but was late by more than ~~20~~40 calendar days but less than or equal to ~~30~~50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity performed a Protection System Study ~~on~~at an ~~Interconnected Facility~~interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by more than ~~30~~50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 30 calendar days. OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
				20 calendar days.		The responsible entity failed to perform a Protection System Study on an Interconnected ~~Facility~~Element per R1, Parts 1.1.1, 1.1.2, or 1.1.3, or document why a study was not required. OR The responsible entity failed to provide Protection System Study results in accordance with R1, Part 1.2.
R2	Long-term Planning	Medium	The Transmission Owner performed a short-~~-~~circuit study, as described in R2, Part 2.1, but was late by less than or equal to 30 calendar days.	The Transmission Owner performed a short-~~-~~circuit study as described in R2, Part 2.1, but was late by more than 30 calendar days but less than or equal to 40 calendar days.	The Transmission Owner performed a short-~~-~~circuit study as described in R2, Part 2.1, but was late by more than 40 calendar days but less than or equal to 50 calendar days.	The Transmission Owner performed a short-circuit study as described in R2, Part 2.1, but was late by more than 50 calendar days. OR The Transmission Owner failed to perform a short-circuit study, as described in R2, Part 2.1. OR The Transmission Owner failed to calculate the percent deviation between the ~~fault~~Fault

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			OR The Transmission Owner ~~notified~~provided the owner(s) of the Facility associated with the Interconnected ~~Facility owner of~~Element the changes in ~~fault~~Fault currents, as described in R2, Part 2.2, but was late by less than or equal to 10 calendar days. Guidelines and Technical Basis

Requirement R1:

This requirement directs the performance of Protection System Studies for every Interconnected ~~Facility~~Element to verify coordination of existing Protection Systems where no recent study exists or when Facility configuration or ~~fault~~Fault current deviations of 10% or more have occurred. In developing the language to define Protection System Study, the System Protection Coordination Standard Drafting Team (SPC SDT) considered various reference books discussing protective relaying theory and application, along with the following description of "coordination of protection" from the pending revision of IEEE C37.113, Guide for Protective Relay Applications to Transmission Lines:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Using the reference material cited above as guidance, the ~~SDT~~drafting team defined the term Protection System Study for use within the PRC-027-1 Reliability Standard as:

> "A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults."

Protection System Studies comprise a variety of assessments and underlying database activities that cumulatively serve to provide verification that Protection Systems will function as designed. Typical database activities performed during these studies include assembling impedance data for Fault studies and modeling Protection Systems. System conditions used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions. Ultimately, the particular studies performed depend on the protective relays installed, their application, and the Protection System philosophies of each Transmission Owner, Generator Owner, and Distribution Provider. These studies may include graphical coordination of protection characteristics on time-current or impedance graphs; relay scheme simulation studies using sequence of operations during pre-defined Faults; and sensitivity studies to confirm effective reaches, sufficient operating parameters (energy or operating torque), and adequate directional polarizing quantities.

The ~~SDT~~drafting team believes applicable entities should have a documented Protection System Study for each ~~interconnected Facility~~Interconnected Element to validate the Protection Systems associated with those Interconnected Elements perform in a manner consistent with the purpose of this Standard. Additionally, the ~~SDT~~drafting team believes that ~~36~~48 months is an appropriate amount of time for entities to perform the initial studies expected under this requirement. This period considers the time some entities may require to create project scopes, acquire proposals, and secure contracts to hire external resources that may be needed to perform the studies. The ~~SDT~~drafting team also has no evidence there is widespread miscoordination between owners of Facilities associated with Interconnected

~~Facilities~~Elements that might warrant a shorter time~~-~~ frame for the studies to be performed. Protection Systems are continually challenged by Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.

~~It should be noted that Protection System studies performed after June 18, 2007 (the effective date of PRC-001-1) are sufficient to meet Requirement R1.~~

Parts 1.1.2 and 1.1.3 further direct that Protection System Studies must be completed under the following two circumstances:

1. After notification of an identified 10% or greater deviation in ~~fault~~Fault current, the notified entities must perform a new Protection System Study of the Interconnected ~~Facility~~Element or document why a study is not required. The ~~SDT~~drafting team recognizes that, based on the Protection Systems installed (e.g., current differential), a 10% or greater deviation in ~~fault~~Fault current may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, ~~"unless the entity can demonstrate that~~"…or technically justify why such a study is not required~~"~~." The ~~SDT~~drafting team believes the ~~6~~six-month time frame associated with this requirement represents ~~is~~ a reasonable period to perform the studies that are required after identification by the 24-month ~~fault~~Fault current review.

2. After proposing or being notified of a change at ~~an~~a Facility associated with the Interconnected ~~Facility~~Element, entities must perform a new Protection System Study, or ~~document~~technically justify why such a study is not required. The ~~SDT~~drafting team recognizes that, based on the scope of the proposed change and/or the Protection Systems installed (e.g., current differential), the change may not necessitate a new Protection System Study be performed; therefore this part of the requirement includes the statement, ~~"unless the entity can demonstrate that~~"…or technically justify why such a study is not required~~"~~." The drafting team believes the timeframe associated with this requirement is contingent upon the project's scope and schedule. Specifying a time frame for performing studies associated with Requirement R3 is unnecessary because notification of such a change may occur weeks or years prior to the change due to the ~~The SDT believes that specifying a single time frame for evaluation of the~~ wide variety of conditions that may be associated with a particular change ~~is not appropriate~~.~~-~~ Th~~is is because th~~e ~~SDT~~drafting team sees the entity initiating any change as having the incentive to move this along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date~~"~~,"as stipulated by Requirement R4, Part 4.2.

Requirement R1, Part 1.2 ~~requires~~directs the entity performing the Protection System Study to provide a summary of the study results to the affected ~~owners of Protection Systems applied at interconnected Facilities.~~Interconnected Element owner(s). As guidance, the ~~SDT~~drafting team lists the following inputs and results of a Protection

System Study that may be included in the summary provided pursuant to this requirement:

1. ~~Data used to determine fault currents in performing the study along with a listing of the single-line-to-ground and 3-phase fault currents for the bus or Element at the Interconnected Facility under study.~~
2. ~~2.~~1. A listing of the Protection System(s) owned by the entity performing the study that are adjacent to the bus or Element at the ~~Interconnected~~ Facility, and were reviewed for coordination of protective relays as part of the study including the contingencies used in the evaluation.
3. 2. Data used to determine Fault currents in performing the study, along with a listing of the single-line-to-ground and 3-phase Fault currents for the bus or Element at the Facility under study.
4. 3. A listing of any issues associated with the relay settings of the other owner(s) at the ~~Interconnected~~ Facility that were identified by the study.
5. 4. Any proposed revisions to a Protection System or its protective relay settings that were identified by the study.

Requirement R2:

The ~~SDT~~drafting team investigated various inputs that would trigger a review of the existing Protection System Studies~~,~~ and determined, through the experience of the ~~SDT~~drafting team members, along with informal surveys of several regional protection and control committees, that variations in ~~fault~~Fault currents of 10% or more are an appropriate indicator that an updated Protection System Study may be necessary. These variations could result from the accumulation of incremental changes over time. This requirement mandates a periodic review of ~~fault~~Fault currents and includes the calculation of the percent deviation between the ~~fault~~Fault current values used in the most recent Protection System Study and the present ~~fault~~Fault current values indicated by the short-~~-~~circuit study performed pursuant to this requirement. This calculation is necessary to identify ~~fault~~Fault current changes that must be communicated in accordance with Requirement R2, Part 2.~~3~~2.

Polling of ~~SDT~~drafting team membership and various protection engineering committees indicates that short-~~-~~circuit databases are customarily updated annually. Based on this information, the ~~SDT~~drafting team believes that requiring a 24-month periodic review of ~~fault~~Fault currents provides entities additional flexibility to schedule and perform these studies and calculate the percent deviation, as described in Requirement R2, Part 2.~~2~~1. The ~~SDT~~drafting team believes studies associated with changes that would affect the coordination in less than 24-~~-~~months would be triggered by conditions addressed by other requirements in this standard.

Requirement R2, Part 2.2~~3~~ further directs the Transmission Owner to, within 30 calendar days, inform ~~interconnected~~ each owner of the Facility ~~owners~~associated with the Interconnected Element when short-~~-~~circuit studies indicate that 10% deviations in ~~fault~~Fault current have occurred at the ~~Interconnected Facility.~~interconnecting bus(s).

The ~~SDT~~drafting team believes the 30-day time frame associated with this requirement is reasonable for ~~sending notification~~providing the Fault current information to the interconnected entity(s) and is consistent with other NERC ~~Reliability Standards~~reliability standards.

In Requirement R2, the Transmission Owner is identified as the ~~functional entity~~Functional Entity responsible for performing the ~~fault~~Fault current studies because they maintain the data required to perform the studies. Generator data (including data provided by Distribution Providers) is incorporated into the Transmission Owners' short circuit models.

Requirement R3:

This ~~requires the Interconnected Facility owners to evaluate the impact to their Protection Systems due to proposed changes by requiring~~directs the registered functional entity initiating ~~the changes~~any change to provide the details to the other affected entities of the Interconnected ~~Facility.~~Element so that the owners can evaluate the impact to their Protection Systems due to proposed changes. Documentation provided to these other owners may include, but is not limited to~~:~~, power system configurations~~;~~, protection schemes~~;~~, schematics~~;~~, instrument transformer ratios~~;~~, type of relay(s~~);~~), communication equipment applied for protection~~;~~, and Protection System settings. The recipient will incorporate the applicable information into its Protection System Studies to evaluate whether changes are required.

The list of applicable changes provided in Requirement R3, Part 3.1 is inclusive, as it comprises either the protective equipment itself or the power system Elements that affect the coordination of Protection Systems. The ~~SDT~~drafting team recognizes that ~~other~~ Facility changes ~~not directly associated with the interconnection~~at other locations can impact the Protection System Study of the Facility associated with the Interconnected ~~Facilities~~Element; e.g., the addition of a large autotransformer bank or generator not directly associated with the Interconnected ~~Facilities.~~Element. The ~~SDT~~drafting team believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the ~~SDT~~drafting team sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable "prior to the in-service date~~"~~," as stipulated by Requirement R4, Part 4.2.

Requirement R3, Part 3.2 allows for entities to agree upon a schedule, appropriate to the circumstances, for providing the details needed to conduct a Protection System Study or, absent such agreement, within 30 days of a request for this information. This requirement provides a means for entities to receive requested information in a timely manner. In consideration of circumstances where the information may not be readily available or may be incomplete due the retirement of personnel, the purging of records, change of ownership, etc., it also provides the flexibility of mutually agreeing to a schedule for exchanging information. The ~~SDT~~drafting team believes 30 calendar days after receipt of the request is a sufficient amount of time to provide the requested information where no other agreement exists.

Additionally, this requirement includes a provision for providing details associated with changes to the previously agreed~~-~~upon coordination when~~: (1)~~ changes are made to Protection ~~System errors are found~~Systems during ~~misoperation~~Misoperation investigations, commissioning, ~~or~~ maintenance activities~~; (2)~~, or emergency replacements ~~are~~ made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the ~~SDT~~drafting team believes 30 calendar days after determining that changes are required is an appropriate time frame for providing the associated details to affected entities.

Requirement R4:

The reliability objective of this requirement is to bring the process of Protection System coordination full~~-~~ circle by gaining the confirmation of interconnected entities that their Protection Systems are coordinated consistent with the purpose of this standard. Cooperative participation of ~~Interconnected~~ Facility owners in communicating Protection System(s) design, and study results will achieve coordination of Protection Systems for reliable operation of the BES during Faults.

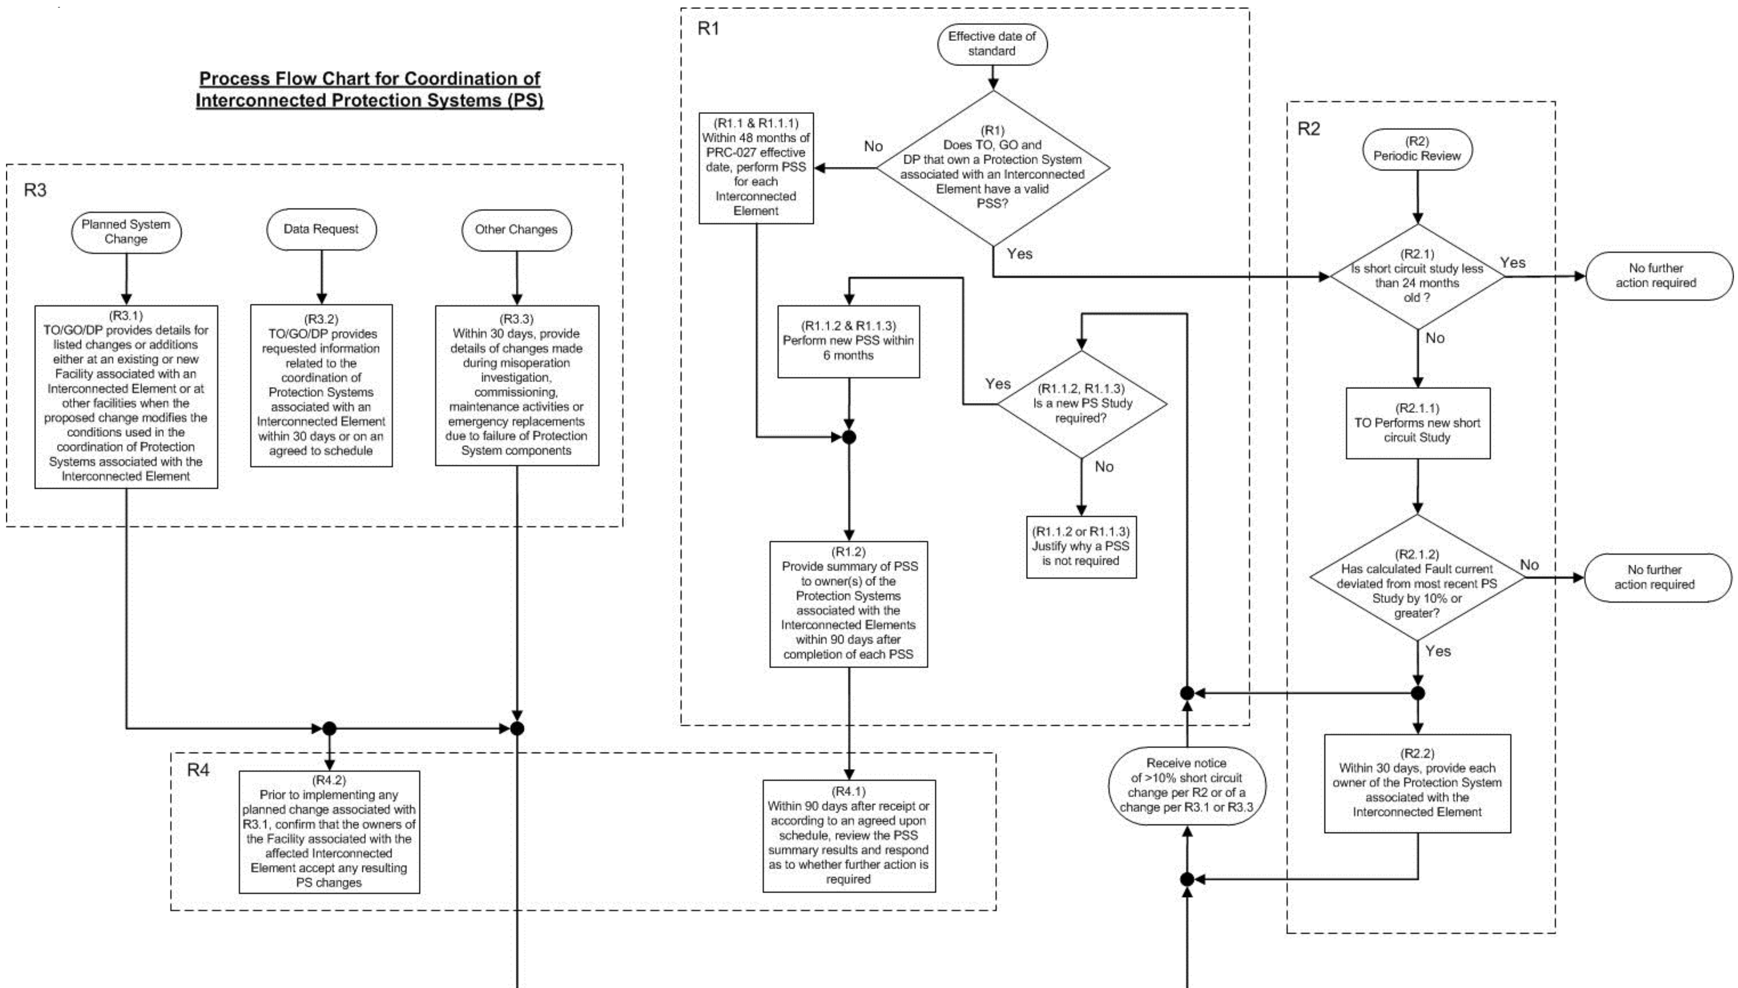
Requirement R4, Part 4.1 directs applicable entities, within 90 calendar days after receipt, to ~~confirm agreement with~~review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2~~,~~; or absent ~~such agreement,~~acceptance propose revisions to achieve acceptable results. The ~~SDT~~drafting team believes 90 calendar days after receipt of the results of a Protection System Study provides a reasonable time for the owners of ~~Interconnected~~ Facilities to resolve differences and ~~reach agreement~~confirm acceptance that their Protection Systems are coordinated.

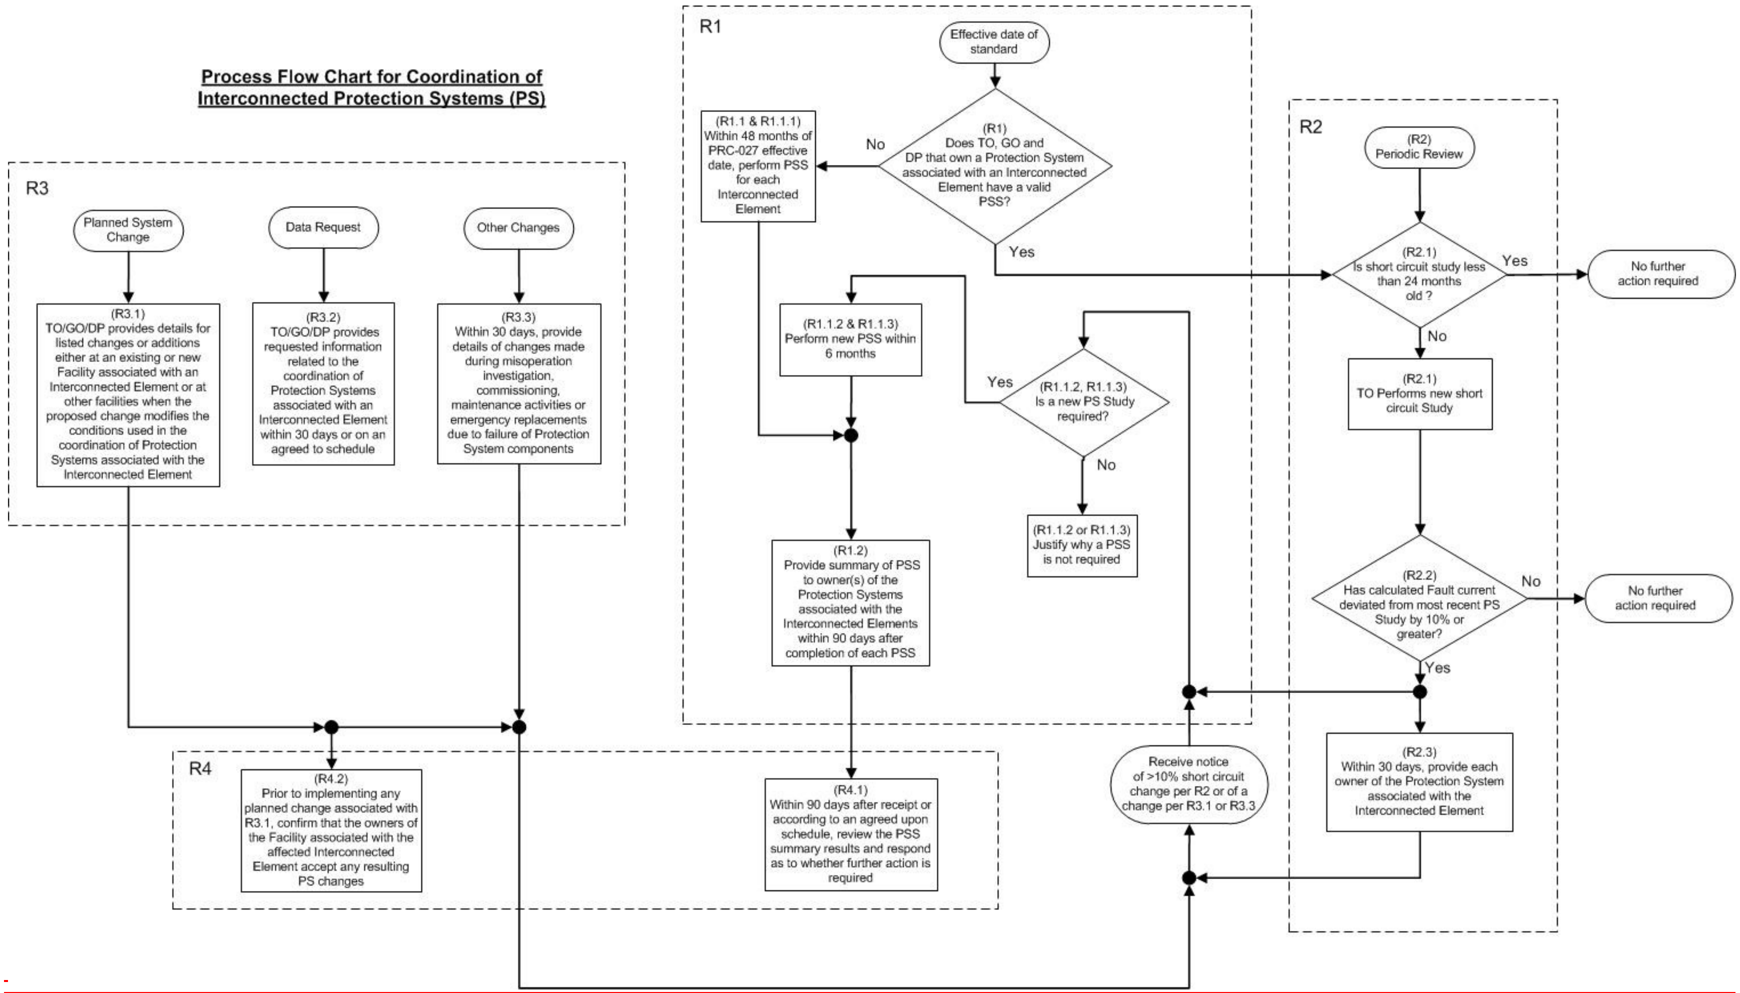
Requirement R4, Part 4.2 directs entities to confirm that planned changes described in Requirement 3.1 are acceptable prior to the in-service date of those changes. The purpose of this requirement is to assure the effects that planned changes have on Protection Systems at a Facility associated with the affected Interconnected ~~Facilities~~Element have been considered by all affected entities.

~~Requirement R4, Parts 4.3.1 and 4.3.2 direct confirmation within 30 calendar days that changes are acceptable when corrections are made due to Protection System errors found during misoperation investigations, commissioning, or maintenance activities, or when emergency replacements are made due to failures of Protection System components. Based upon the limited number of instances that would occur under such circumstances, the SDT believes 30 calendar days provides adequate time for achieving such agreement.~~

Process Flow Chart

: Below is a complete representation of the process, including the relationships between requirements:





Process Flow Chart for Coordination of Interconnected Protection Systems (PS)
R1
Effective date of standard
(R1) Does TO, GO and DP that own a Protection System associated with an Interconnected Element have a valid PSS?
No
Yes
(R1.1 & R1.1.1) Within 48 months of PRC-027 effective date, perform PSS for each Interconnected Element
(R1.1.2 & R1.1.3) Perform new PSS within 6 months
Yes
(R1.1.2, R1.1.3) Is a new PS Study required?
No
(R1.1.2 or R1.1.3) Justify why a PSS is not required
(R1.2) Provide summary of PSS to owner(s) of the Protection Systems associated with the Interconnected Elements within 90 days after completion of each PSS
R2
(R2) Periodic Review
(R2.1) Is short circuit study less than 24 months old ?
Yes
No further action required
No
(R2.1) TO Performs new short circuit Study
(R2.2) Has calculated Fault current deviated from most recent PS Study by 10% or greater?
No
No further action required
Yes
(R2.3) Within 30 days, provide each owner of the Protection System associated with the Interconnected Element
Receive notice of >10% short circuit change per R2 or of a change per R3.1 or R3.3
R3
Planned System Change
Data Request
Other Changes
(R3.1) TO/GO/DP provides details for listed changes or additions either at an existing or new Facility associated with an Interconnected Element or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element
(R3.2) TO/GO/DP provides requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 days or on an agreed to schedule
(R3.3) Within 30 days, provide details of changes made during misoperation investigation, commissioning, maintenance activities or emergency replacements due to failure of Protection System components
R4
(R4.2) Prior to implementing any planned change associated with R3.1, confirm that the owners of the Facility associated with the affected Interconnected Element accept any resulting PS changes
(R4.1) Within 90 days after receipt or according to an agreed upon schedule, review the PSS summary results and respond as to whether further action is required

Example Process

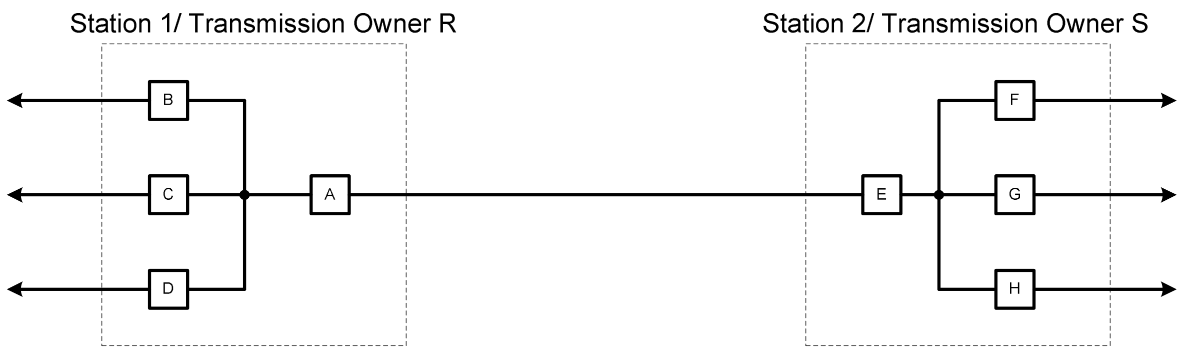
An example of the interaction between entities required to gather the information to perform an accurate study is below.

- The initiating entity (Entity A) will contact the interconnected entity (Entity B) and request up-to-date Protection System information.
- Upon receipt of the above request for information, Entity B will provide the information within 30 calendar days, or an agreed upon time frame.
- Entity A will perform a Protection System Study using the information received.
- Entity A will provide a summary of the results of the study to Entity B within 90 calendar days of completing the Protection System Study.
- Entity B will review the summary information and, within 90 calendar days of receiving the study results from Entity A, confirm agreement that coordination is achieved.
    - In cases where the study reveals that changes to Protection Systems are needed, Entity B would propose to Entity A revisions that achieve acceptable results.
- Documentation of the final agreement is required prior to implementation of planned changes.

Diagrams

Introduction: The diagrams below are intended to provide guidance related to the ~~responsibilities associated with the~~ purpose of this ~~Standard~~standard between owners of Facilities associated with the affected Interconnected ~~Facilities.~~Element. After the reviews and prior to implementation of the changes, the owners must reach agreement on the final settings to achieve coordination of the Protection Systems.

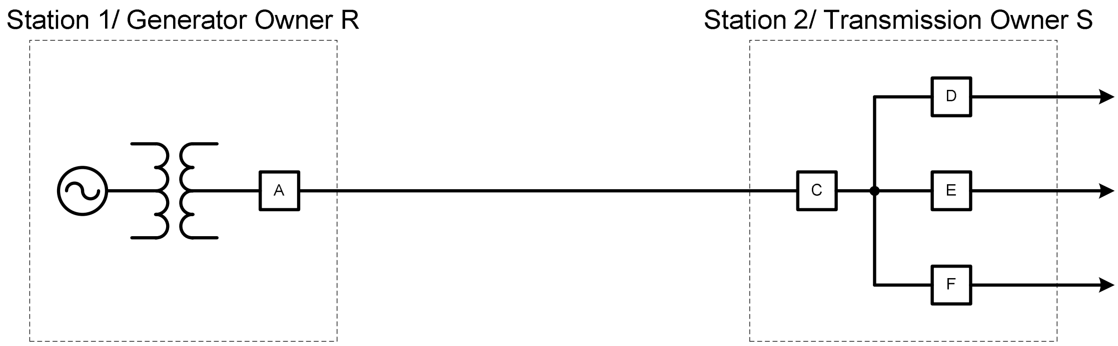
Figure 1



In Figure 1 above, the ~~interconnecting~~ Interconnected Element between the Transmission ~~Interconnected Facilities (Station 1 – Transmission Owner R and Station 2 – Transmission Owner S)~~Owners is the transmission line between Breakers A and E.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 1, ~~the responsibility for~~ Owner S is to ~~verify that~~review the Protection System settings associated with Breaker A (provided by Owner R) ~~do not result in~~for coordination issues with the Protection System settings associated with Breakers E, F, G, and H. Likewise, ~~the responsibility for~~ Owner R is to ~~verify that~~review the Protection System settings associated with Breaker E (provided by Owner S) ~~do not result in~~for coordination issues with the Protection System settings associated with Breakers A, B, C, and D.

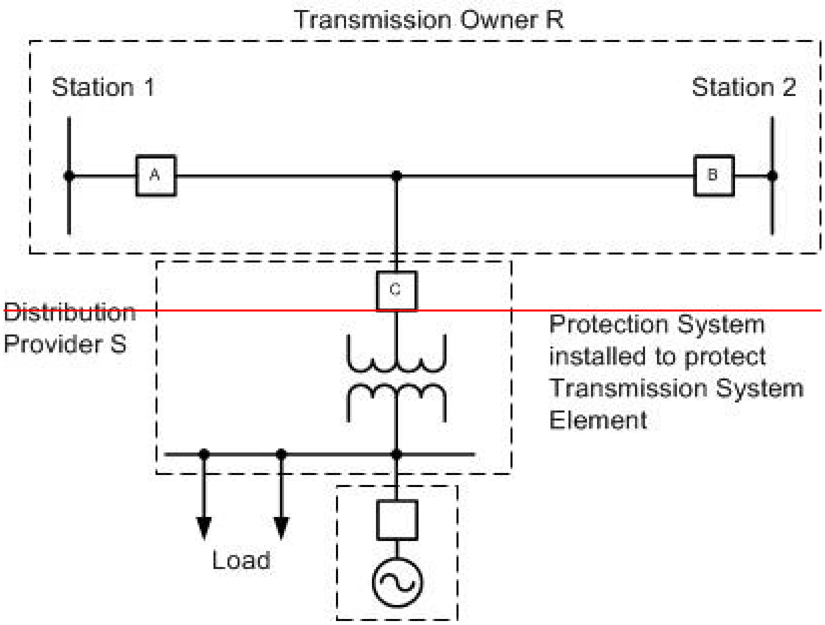
Figure 2

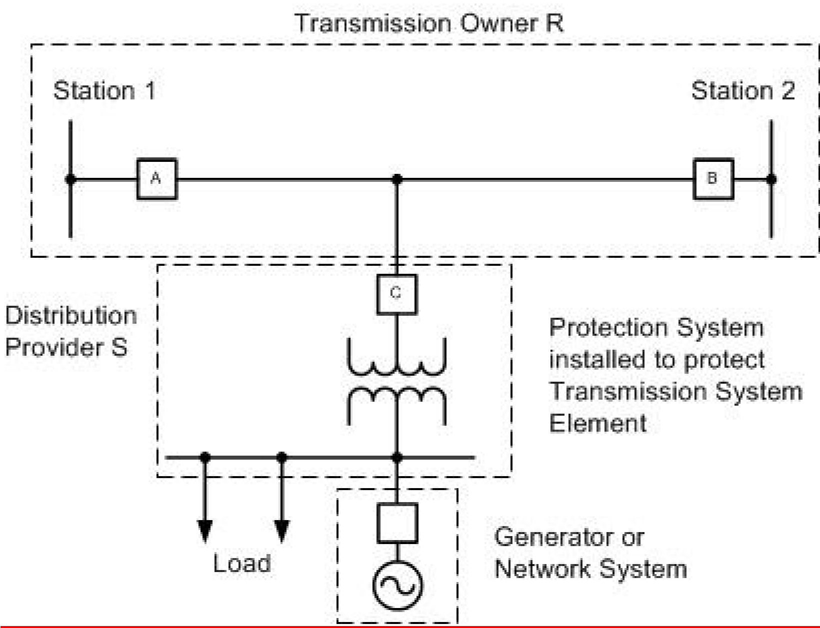


In Figure 2 above, the ~~interconnecting~~ Interconnected Element between the Transmission ~~to Generation Interconnected Facilities (Station 1 – Generation~~ Owner ~~R~~ and ~~Station 2 – Transmission~~the Generator Owner ~~S)~~ is the transmission line or bus between Breakers A and C.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 2, ~~the responsibility for~~ Transmission Owner S is to ~~verify that~~review the Protection System settings associated with Breaker A (provided by Owner R) and the generator Protection Systems ~~do not result in~~for coordination issues with the Protection System settings associated with Breakers C, D, E, and F. Likewise, ~~the responsibility for~~ Generation Owner R is to ~~verify that~~review the Protection System settings associated with Breaker C (provided by Owner S) ~~do not result in~~for coordination issues with the Protection System settings associated with Breaker A or the generator Protection Systems.

Figure 3





In Figure 3 above, the ~~interconnecting~~ Interconnected Element between the Transmission Owner ~~to~~and the Distribution Provider ~~(with a generator) Interconnected Facilities (Transmission Owner R line between Breakers A and B – Distribution Provider S)~~ is the transmission line or tap between the line and Breaker C.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 3, ~~the responsibility for~~ Transmission Owner R is to ~~verify that~~review the Protection System settings associated with Line Breaker C (provided by Distribution Provider S) ~~and the generator Protection Systems do not result in~~for coordination issues with the Protection System settings associated with Breakers A and B and other Protection Systems at stations 1 and 2. ~~Likewise, the responsibility for Distribution Provider S is to verify that the Protection System~~

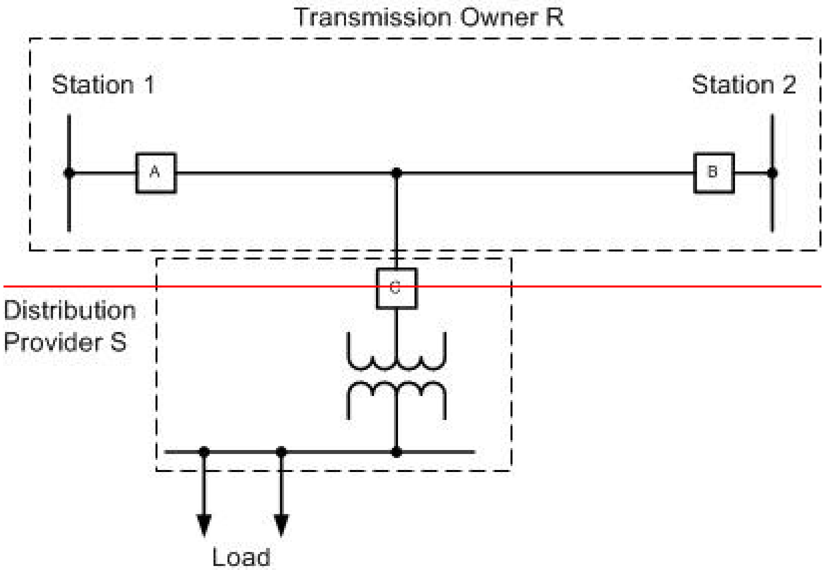
~~settings associated with Breakers A and B (provided by Owner R) do not result in coordination issues with the Protection System settings associated with Breaker C and the generator Protection Systems. In order to perform this verification, it will be necessary that the Generator Owner provide Distribution Provider S with its generator Protection System settings.~~

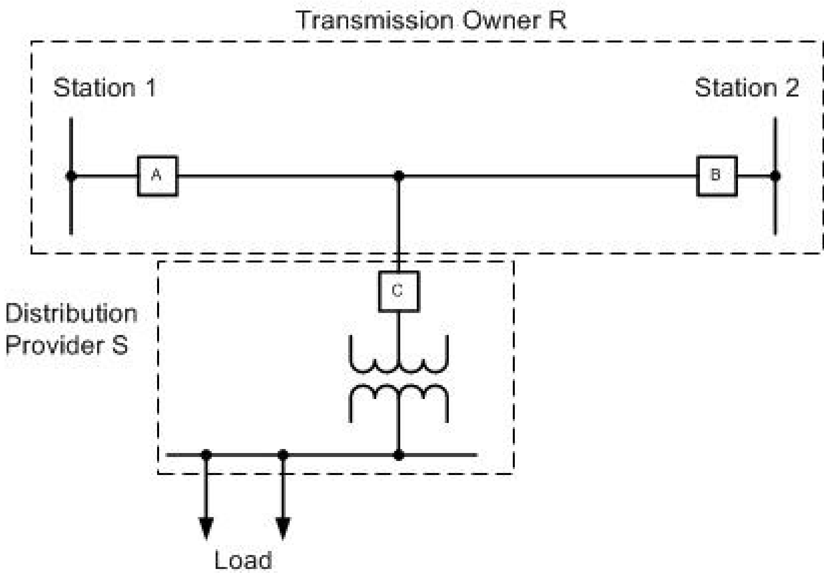
~~Note:~~ Notes:

A Protection System Study is required per this ~~Standard~~standard for this example if a Protection System at the Distribution Provider's substation is designed to ~~protect BES transmission system Elements~~detect Faults on the BES Transmission System.

"Protection Systems installed to detect faults on the BES Transmission System" are not inclusive of those relays that may operate for such faults, but are not installed specifically for that purpose (i.e. transformer overcurrent, reverse power, etc.). As an example, reverse power relays are often installed to detect situations where the transmission source becomes de-energized and the distribution bank remains energized from a source on the low-voltage side of the transformer and the settings are calculated based on the charging current of the transformer from the low-voltage side. Although these relays may operate as a result of a Fault on a BES Element, they are not "installed to detect faults on the BES Transmission System."

Figure 4



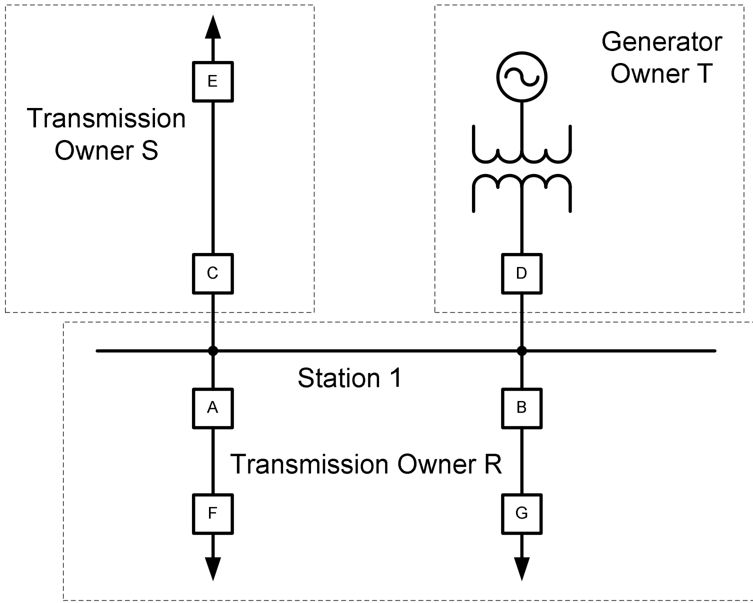


In Figure 4 above, the ~~interconnecting~~ Interconnected Element between the Transmission Owner ~~to~~and the Distribution Provider ~~Interconnected Facilities (Transmission Owner R line between Breakers A and B – Distribution Provider S)~~ is the transmission line or tap between the line and Breaker C.

Note: No specific Protection System Study is required per this ~~Standard~~standard for this example since the Protection System at the Distribution Provider's substation is not designed to protect BES transmission system Elements.

Figure 5

Transmission/Generation Facility with Multiple Owners



In Figure 5 above, the ~~interconnecting~~Interconnected Element between the Transmission Owners R and S and the Generation Owner T is the common Transmission bus. In this example, Transmission Owner S and Generator Owner T are not directly interconnected to each other at Transmission Station 1, and all direct interconnections are between Owner R and each of the other Owners connected to the bus.

Example: For the purposes of conducting the Protection System Study associated with the Facilities in Figure 5:

~~The responsibility for~~ Owner R is to ~~verify that~~review the Protection System settings associated with Breaker C, E, D, and the generator Protection System (provided by Owners S or T) ~~do not result in~~for coordination issues with the Protection System settings associated with Breakers A, B.

~~The responsibility for~~ Owner S is to ~~verify that~~review the Protection System settings associated with Breakers A, F, B, G, D, and the generator Protection System (provided by Owners R or T) ~~do not result in~~for coordination issues with the Protection System settings associated with Breaker C. To perform this ~~verification~~review, it will be necessary that Transmission Owner R provide Owner S with its settings for Breakers A, F, B, and G, as well as the settings for Breaker D and generator Protection System settings provided to Owner R by Generator Owner T.

~~The responsibility for~~ Owner T is to ~~verify that~~review the Protection System settings associated with Breakers A, F, B, G, C, and E (provided by Owners R or S) ~~do not result in~~for coordination issues with the Protection System settings associated with Breaker D or the Protection Systems associated with generator Protection Systems. In order to perform this ~~verification~~review, it will be necessary that Transmission Owner R provide Generator Owner T with its settings for Breakers A, F, G, and B, as well as the settings for Breaker C and E provided to Owner R by Transmission Owner S.

Unofficial Comment Form
2nd Draft of PRC-027-1: Protection System Coordination for Performance During Faults

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the 2nd draft of the standard for Protection System Coordination for Performance During Faults. Comments must be submitted by 8 p.m. Eastern **December 17, 2012**. If you have questions please contact Al McMeekin at al.mcmeekin@nerc.net or by telephone at 803-530-1963.

http://www.nerc.com/filez/standards/System_Protection_Project_2007-06.html

Background Information:
The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPCSDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. Additionally, the SPCSDT determined that the training aspects of PRC-001-1 Requirement R1 are more appropriately addressed by Reliability Standard PER-005-1 with revision to its Applicability section to include the Generator Operator. Therefore, PRC-001-3 was created to retain Requirement R1 only, as identified in the implementation plan for PRC-027-1. The two remaining requirements, Requirements R3 and R4 of PRC-001-1 address the coordination of new and existing protective systems. These aspects of coordination are incorporated in the proposed standard PRC-027-1 Protection System Coordination for Performance During Faults.

Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012. The SPCSDT has responded to stakeholder comments and incorporated pertinent suggestions into the standard. The SPCSDT is presenting the second draft of PRC-027-1 for stakeholder review and comment.

For questions 1-5, please provide specific comments related to the individual question.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Based on stakeholder comments, the drafting team modified the Purpose of this standard to "To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults." Do you agree with this Purpose? If not, please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. The drafting team is proposing two definitions for use only with PRC-027-1 as follows:

   Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity

   Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

   Do you agree with these definitions, if not please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

3. In Requirement R1, the drafting team modified the time frame to allow entities 48 months to have a documented Protection System Study completed for each Interconnected Element if no Protection System Study exists. Note, the drafting team has allowed inclusion of all previously performed Protection System Studies whose summary of results include, at a minimum, the protective relay settings reviewed, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. In Requirement R4, the drafting team replaced the need to ‘reach agreement’ with ‘confirming acceptance.’

   Do you agree with this change? If not, please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

5. The requirements and associated measures were modified to indicate that information was ‘provided’ instead of ‘demonstrating that each affected entity received notification.’ Do you agree with this change? If not, please provide specific suggestions for change in the comment area.

   ☐ Yes

   ☐ No

   Comments:

Project 2007-06 System Protection Coordination Mapping Document

Mapping Document Showing Translation of PRC-001-2 – System Protection Coordination to PRC-027-1 – Protection System Coordination for Performance During Faults

Updated 10-31 to reflect changes made to requirements

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area.	Retained	NA
R2. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. **R2.1** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.	PRC-027-1, R1, R3, & R4 Note: Applicability changed to GO, TO and DP	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **1.1.** Perform a Protection System Study for each Interconnected Element on its System as follows: **1.1.3.** According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required.

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
R2.2 Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.		**1.2.** Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed). **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Transmission Owner, Generator Owner, and Distribution Provider connected to the same Interconnected Element: **3.1.** Details for any change or additions listed below; either at an existing or new Facility associated with the Interconnected Element; or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s). • New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios • Changes to a transmission system Element that change any sequence or mutual coupling impedance • Changes to generator unit(s) that result in a change in impedance

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		• Changes to the generator step-up transformer(s) that result in a change in impedance **3.2.** Requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 calendar days of receiving a request or according to an agreed-upon schedule. **3.3.** Within 30 calendar days, details of changes made to Protection Systems during Misoperation investigations, commissioning, maintenance activities, or emergency replacements made due to failures of Protection System components. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **4.2.** Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, confirm the owner(s) of each Facility associated with the affected Interconnected Element accept any resulting Protection System(s) changes.
R3. Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing	PRC-027-1, R1, R2, R3, & R4 Note: Applicability	**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall: **1.1.** Perform a Protection System Study for each Interconnected Element on its System as follows: **1.1.1.** Within 48 calendar months after the effective date of this standard, if no Protection System Study for that Interconnected

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
Authorities.	changed to GO, TO and DP	Element exists. **1.1.2.** Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required. **1.2.** Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, Fault currents used, any issues identified, and any revisions proposed). **R2.** For each Facility associated with an Interconnected Element on its System, the Transmission Owner shall: **2.1.** At least once every 24 months: **2.1.1** Perform a short circuit study to determine the present maximum available Fault current values (single line to ground and 3-phase) at the interconnecting bus where a Protection System Study is available per Requirement R1. **2.1.2.** Calculate the percent deviation between the Fault current values (single line to ground and 3-phase for the interconnecting bus(s) under

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		consideration) used in the most recent Protection System Study and the Fault current values determined pursuant to Requirement R2, Part 2.1.1, using the following equation: Where: I_{scs} = Fault current value from present short-circuit study And: I_{pss} = Fault current value used in the most recent Protection System Study **2.2.** Within 30 calendar days after identification where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in Fault current of 10% or greater, provide each owner of the Protection System associated with the Interconnected Element the updated Fault current values (Iscs). **R3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall provide to each Responsible Entity connected to the same Interconnected Element: **3.2.** Requested information related to the coordination of Protection Systems associated with an Interconnected Element within 30 calendar days of receiving a request or according to an agreed-upon schedule. **R4.** Each Transmission Owner, Generator Owner, and Distribution Provider

Standard: PRC-001-2 - System Protection Coordination		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language or Comment in PRC-027-1**
		shall: **4.1.** Within 90 calendar days after receipt, or according to an agreed upon schedule, review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to whether further action is required.

Implementation Plan

Project 2007-06 System Protection Coordination
PRC-027-1

Approvals Requested

- PRC-027-1 Protection System Coordination for Performance During Faults
- PRC-001-3 System Protection Coordination

Applicable Entities

Standard	Applicable Entities					
	TO	GO	DP	TOP	GOP	BA
PRC-027-1: Protection System Coordination for Performance During Faults	X	X	X			
PRC-001-3: System Protection Coordination				X	X	X

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."*

And further:

> *"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."*

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. For Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

PRC-001-3 – System Protection Coordination

Same effective date as PRC-027-1.

Effective Date for Definitions

The two proposed definitions (Interconnected Facilities and Protection System Study) shall become effective at the same time as PRC-027-1.

Retirement:

PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.

PRC-001-3: System Protection Coordination				X	X	X

Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions for use only within PRC-027-1, and should remain with the standard upon approval rather than being moved to the NERC Glossary of Terms:

Interconnected ~~Facilities~~Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity~~BES Facilities that are electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities~~.

Protection System Study: A study that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults.

Background

On December 7, 2006, the NERC Planning Committee approved the assessment of Standard PRC-001-1 (System Protection Coordination) prepared by the NERC System Protection and Control Task Force (SPCTF). The SPCTF asserted:

> *"The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In*

addressing the 'operating horizon, operations planning horizon, and planning horizon' protection coordination issues, the deficiencies in the current standard are magnified."

And further:

"The SPCTF… recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards."

The Standard Committee approved the Standard Authorization Request with modifications by the SPCTF for posting on June 5, 2007. The SAR was posted for comment from June 11, 2007 – July 10, 2007, and was subsequently approved.

With the development of the proposed Reliability Standard PRC-027-1, the Standard Drafting Team (SDT) for Project 2007-06 – System Protection Coordination, has followed the observations and recommendation of the NERC SPCTF assessment of PRC-001-1 which had six requirements. The SDT accomplishes this by:

1. Incorporating and building upon the elements of the two planning horizon Requirements R3 and R4 of PRC-001-1 (now R2 and R3 of PRC-001-2) and moving those requirements into a new standard (as recommended by the SPCTF assessment), focusing on the performance of Protection Systems during Faults.
2. Assigning responsibility for coordination of Protection Systems during Faults to the appropriate functional entities – the Protection System equipment owners, specifically: Transmission Owners, Generator Owners, and Distribution Providers.
3. Transferring the responsibility of addressing the three operating horizon Requirements R2, R5, and R6 of PRC-001-1 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standard(s) within that project. (The NERC Board of Trustees approved these changes proposed by the Project 2007-03 team when it approved PRC-001-2 on May 9, 2012.)
4. Leaving the legacy Requirement R1 of PRC-001-2 in PRC-001-3 (thereby not creating a reliability gap) until it is incorporated into a new or revised reliability standard.

Effective Date of New or Revised Standards and Definitions

PRC-027-1 - Protection System Coordination for Performance During Faults

PRC-027-1 shall become effective on the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter that is six months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. ~~on the first day of the first calendar quarter that is three months beyond the date that this standard is approved by applicable regulatory authorities, where such explicit approval is required. Where no regulatory approval is required, the standard shall become effective on the first day of the first calendar quarter that is three~~

~~months beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise prescribed by the laws or regulations of the applicable ERO governmental authorities.~~ For ~~Facility Interconnections~~ Interconnected Elements between Canadian Facilities (that recognize the NERC Board of Trustees or other ERO governmental authority approval) and U.S. Facilities (that recognize FERC approval), the effective date shall be the FERC-approved effective date.

PRC-001-3 – System Protection Coordination
Same effective date as PRC-027-1.

Effective Date for Definitions

The two proposed definitions (Interconnected Facilities and Protection System Study) shall become effective at the same time as PRC-027-1.

Retirement:

PRC-001-2 – Protection System Coordination shall be retired at midnight the day before PRC-001-3 becomes effective.

Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1 — Protection System Coordination for Performance During Faults.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved reliability standards, as defined in the ERO Sanction Guidelines.

The System Protection Coordination Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric

System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to requirements of reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and, therefore, concentrated its approach on the reliability impact of the requirements.

PRC-027-1 Protection System Coordination for Performance During Faults is a new Reliability Standard with the stated purpose: "*To coordinate Protection Systems for Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults.*" PRC-027-1 has four (4) requirements that incorporate and enhance the reliability intent of Requirements R3 and R4 of PRC-001-1. The new standard addresses the aspects of coordination for new Protection Systems, as well as changes to existing Protection Systems. The new requirements describe the steps necessary to achieve coordination. The coordination process requires entities to work individually and collaboratively, exchanging information and communicating in a timely manner, and confirming acceptance of Protection System settings and schemes.

All four requirements are assigned VRFs of Medium. The assignment of the Medium VRFs was made based on the premise that failure to perform these coordination activities by themselves would not directly cause or contribute to bulk power system instability, separation, or a Cascading sequence of failures. For a requirement to be assigned a "High" VRF, there should be the expectation that failure to meet the required performance "will" result in instability, separation, or Cascading failures, and this is usually not the case when an applicable entity fails to 'coordinate' activities. While the SDT agrees that, under some circumstances, it is possible that a failure to perform the required activities may hinder the coordination process; however, the failure would not, by itself, result in instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the bulk power system regardless of the situation. Thus, this requirement meets NERC's criteria for a Medium VRF.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications

VRF Justifications – PRC-027-1, R1	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to perform a Protection System Study for each Interconnected Element to verify that Protection Systems coordinate such that the least number of power system Elements are isolated to clear Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R1 is similar in scope to Requirements R2, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R1 directs that Protection System Studies are performed for every Interconnected Element to verify coordination of existing Protection Systems. This requirement is similar to Requirement R1 of FAC-002-1, which also requires studies be performed and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Study for each Interconnected Facility to verify that Protection Systems coordinate such that the least number of power system Elements are isolated to clear Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R1 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R1			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Study on an Interconnected Element per R1, Part 1.1.1, but was late by less than or equal to 30 calendar days. OR The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by less than or equal to 30 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by 10 calendar days or less.	The responsible entity performed a Protection System Study on an Interconnected Element per R1, Part 1.1.1, but was late by more than 30 calendar days. OR The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by more than 30 calendar days but less than or equal to 40 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by more than 40 calendar days but less than or equal to 50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity performed a Protection System Study at an interconnecting bus per R1, Part 1.1.2, or documented why a study was not required but was late by more than 50 calendar days. OR The responsible entity provided the Protection System Study results in accordance with R1, Part 1.2, but was late by more than 30 calendar days. OR The responsible entity failed to perform a Protection System Study on an Interconnected Element per R1, Parts 1.1.1, 1.1.2, or 1.1.3, or document why a study was not required. OR The responsible entity failed to provide Protection System Study results in accordance with R1, Part 1.2.

VSL Justifications – PRC-027-1, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R2	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to periodically review, calculate the percent deviation in fault current values used as inputs for updating Protection System Study(s), and to provide each owner of the Protection System associated with the Interconnected Element of requisite deviations in fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R2 is similar in scope to Requirements R1, R3 and R4, as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R2 facilitates a periodic review of Fault currents and notification of owner(s) of the Protection System(s) associated with the Interconnected Element(s). This requirement is similar to Requirement R6 of BAL-005-0.2b in that it also requires the comparison of calculated data and possible notification of other entities; and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to periodically review, calculate the percent deviation in fault current values used as inputs for updating Protection System Study(s) and to provide each owner of the Protection System associated with the Interconnected Element of requisite deviations in fault currents, if necessary, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R2 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R2			
Lower	**Moderate**	**High**	**Severe**
The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by less than or equal to 30 calendar days. OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element of the changes in Fault currents, as described in R2, Part 2.2, but was late by less than or equal to 10 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 30 calendar days but less than or equal to 40 calendar days. OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element of the changes in Fault currents, as described in R2, Part 2.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 40 calendar days but less than or equal to 50 calendar days. OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element of the changes in Fault currents, as described in R2, Part 2.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The Transmission Owner performed a short circuit study as described in R2, Part 2.1, but was late by more than 50 calendar days. OR The Transmission Owner failed to perform a short circuit study, as described in R2, Part 2.1. OR The Transmission Owner failed to calculate the percent deviation between the Fault currents according to the formula designated in R2, Part 2.2. OR The Transmission Owner provided the owner(s) of the Facility associated with the Interconnected Element of the changes in Fault currents, as described in R2, Part 2.2, but was late by more than 30 calendar days. OR The Transmission Owner failed to provide the owner(s) of the Facility associated with the Interconnected Element the changes in Fault currents.

VSL Justifications – PRC-027-1, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R3	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to communicate proposed changes that modify the conditions used in the coordination of Protection Systems associated with an Interconnected Element could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R3 is similar in scope to Requirements R1, R2 and R4 as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R3 facilitates the provision of pertinent information regarding proposed changes that could impact the coordination of Protection Systems associated with an Interconnected Element. This requirement is similar to Requirement R2 of FAC-009-1 in that it also requires the provision of reliability data to other pertinent functional entities, and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to communicate proposed changes that modify the conditions used in the coordination of Protection Systems associated with an Interconnected Element could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R3 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R3			
Lower	**Moderate**	**High**	**Severe**
The responsible entity provided the requested information per R3, Part 3.2, but was late by 10 calendar days or less. OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by 10 calendar days or less.	The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 10 calendar days but less than or equal to 20 calendar days. OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 20 calendar days but less than or equal to 30 calendar days. OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity failed to provide information to the owner(s) of the Facility associated with the Interconnected Element for any proposed change identified in R3.1. OR The responsible entity provided the requested information per R3, Part 3.2, but was late by more than 30 calendar days. OR The responsible entity provided the required information identified in R3, Part 3.3, but was late by more than 30 calendar days. OR The responsible entity failed to provide the requested information.

VSL Justifications – PRC-027-1, R3	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF Justifications – PRC-027-1, R4	
Proposed VRF	**Medium**
NERC VRF Discussion	Failure to confirm acceptance for proposed changes that modify the conditions used in the coordination of Protection System(s) associated with the Interconnected Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. This requirement meets NERC's criterion for a Medium VRF.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement in PRC-027-1 is assigned a Medium VRF. Requirement R4 is similar in scope to Requirements R1, R2 and R3 as each requirement details the process steps necessary to achieve coordination.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: PRC-027-1, Requirement R4 mandates responsible entities confirm acceptance on Protection System Study results or proposed changes to Protection System(s) prior to implementation. This requirement is similar to Requirement R2 of PRC-023-1 in that it also requires agreement be obtained, and is assigned a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to confirm acceptance for proposed changes that modify the conditions used in the coordination of Protection System(s) associated with the Interconnected Element(s) could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC's definition of a Medium VRF.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: PRC-027-1, Requirement R4 addresses a single objective and has a single VRF.

Proposed VSLs for PRC-027-1, R4			
Lower	**Moderate**	**High**	**Severe**
The responsible entity confirmed acceptance of the summary results of the Protection System Study per R4, Part 4.1, but was late by 10 calendar days or less.	The responsible entity confirmed acceptance of the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The responsible entity confirmed acceptance of the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The responsible entity confirmed acceptance of the summary results of the Protection System Study per R4, Part 4.1, but was late by more than 30 calendar days. OR The responsible entity failed to confirm acceptance of the summary results of the Protection System Study per R4, Part 4.1. OR The responsible entity failed to confirm acceptance of the planned changes pursuant to R4, Part 4.2, prior to implementation of those changes.

VSL Justifications – PRC-027-1, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This is a new Requirement; consequently, there is no prior level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Standards Announcement

Project 2007-06 System Protection Coordination

Successive Ballot and Non-Binding Poll is now open through Monday, December 17, 2012

Now Available

A successive ballot of **PRC-027-1** and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels (VRFs and VSLs) is now open through **8 p.m. Eastern on Monday, December 17, 2012.**

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the Standard and opinion in the non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) posted an initial draft of the Standard PRC-001-2 on September 11, 2009 for comments. In that draft, the SPCSDT attempted to address the planning and non-operational issues identified in the assessment of PRC-001-1 performed by the NERC System Protection and Control Task Force (SPCTF) as well as the operating time frame issues identified in FERC Order 693. These operating time frame requirements involved detecting Protection System failures, informing operators and taking quick corrective actions; consequently, the SPCSDT transferred the Order 693 directives associated with Requirements R2, R5 and R6 to Project 2007-03 Real-time Operations for inclusion in the revisions of the appropriate operating standards associated within that project. Additionally, the SPCSDT determined that Requirement R1 in PRC-001-1 (a requirement for the Transmission Operator, Balancing Authority and Generator Operator to "be familiar with the purpose and limitations of protection system schemes applied in its area") is unrelated to coordination of protection systems and belongs in another project. Therefore, PRC-001-3 will retain Requirement R1 only, as identified in the implementation plan for PRC-027-1. The two remaining requirements, Requirements R3 and R4 of PRC-001-1 address the coordination of new and existing protection systems. These aspects of coordination are incorporated in the proposed standard PRC-027-1 Protection System Coordination for Performance During Faults.

Draft 1 of PRC-027-1 was posted for a 45-day formal comment and initial ballot from May 21 – July 5, 2012. The SPCSDT has responded to stakeholder comments and incorporated pertinent suggestions into the standard. The SPCSDT is presenting the second draft of PRC-027-1 for stakeholder review and comment.

For additional information please see the project page.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2007-06 System Protection Coordination

Formal Comment Period Open: November 16, 2012 – December 17, 2012

Upcoming:
Successive Ballot and Non-Binding Poll: December 7-17, 2012

Now Available

A formal comment period for **PRC-027-1 – Protection System Coordination for Performance During Faults** is open through 8 p.m. Eastern on **Monday, December 17, 2012**.

A successive ballot of **PRC-027-1** and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Friday, December 7, 2012 through 8 p.m. Eastern on Monday, December 17, 2012.**

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Monday, December 17, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at wendy.muller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Perhaps R1 could be reworded to answer the following question: "If an entity registered only as a GO owns relays that trip the generator alone (and not relays detecting a fault on any transmission lines), does this Standard apply?”
Yes

Yes
1)We agree to isolate the least number of power system elments during a fault. However, PRC-027 & PRC-001 are lack of a statement which elements be reviewed by entities. It seems like it is upto utilities to decide wchich elements to be reviewed and studied for. For the comliance purpose, how does Autority judge the reviews/documents were meeting PRC-027? 2) Pg. 2- Definitions of Terms Used in Standard- “Interconnected Element: An Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity.” – The Interconnected Element definition should be expanded upon and attached figures added showing what is and is not an interconnected element relative to the generator and generation owner. 3) Page 2 – The term “Functional Entities” as used in the definitions for “Interconnected Element” should include a definition. 4) Pg. 4- A.5 –“Other Aspects of coordination of Protection Systems addressed by other Projects: Fault clearing is the only aspect of protection coordination that is addressed by Reliability Standard PRC-027-1. Other items, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following existing standards or current projects.” – The paragraph should be more specific as to whether the “fault clearing” referenced is used for primary transmission line protection or primary generator/generator step-up transformer protection. Namely, does what is addressed in PRC-027-1 exclude fault clearing used for primary generator/generator step-up transformer protection? 5) Pg. 8- R3.- 3.1- “• New installation, replacement with different types, or modification of: protective relays or protective function settings, communication systems, current transformer ratios and voltage transformer ratios.”- The sentence should be changed to read- “• New installation, replacement with different types, or modification of: fault clearing protective relays or protective function settings, related communication systems, related current transformer ratios and voltage transformer ratios.” 6) Last paragraph on page 26 starting with “Protection Systems installed to detect faults on the BES…” has some great examples (especially the last sentence of that paragraph) of the intent of PRC-027. I think it would be useful to move or copy this type of verbiage to the beginning of the document and use it in the definitions to accomplish what Pete has commented on below.

Ingleside Cogeneration LP
Yes
Ingleside Cogeneration agrees that it is appropriate that PRC-027-1 is self-contained throughout. Even though the Purpose statement is not necessarily mandatory and effective, it is conceivable that the previous version would lead a Compliance Enforcement Authority to require evidence that fault studies account for relay performance governed by other NERC standards. This could result in the assessment of two penalties for the same violation – a double jeopardy condition that should be avoided.
Yes
No
Ingleside Cogeneration, like many other Generator Owners, does not typically perform fault studies unless we have made material changes to our transmission system interconnection. Even then, we provide modeling data to the appropriate Transmission Owners and Transmission Planners, who execute the assessments on a Regionally-standardized platform. We are not convinced that we can add value to this process – other than to demonstrate that the information required by the TO and TP was provided, and the study took place. In our view, the requirement should clearly accommodate this working arrangement. As it reads now, it seems like both the GO and the TO must perform separate assessments. The extra costs that we will incur to commission external consultants is difficult to justify when there are so many other pressing priorities (e.g.; cold weather preparedness).
No
Ingleside Cogeneration still holds to the position that a dispute resolution process needs to be defined should we reach an impasse with the TO. R4 still requires that both parties "accept" the proposed change – which means that one or the other could unreasonably demand an Protection System-related expenditure without any need to demonstrate that a corresponding reliability benefit will be realized. It is not apparent to us that this situation is already addressed in NERC's Rules of Procedure, which ultimately is the governing document for continent-wide Reliability Standards.
Group
Northeast Power Coordinating Council
Guy Zito
No
By restricting the coverage to "… Interconnected Elements, such that the least number of power system Elements are isolated to clear Faults" there is a significant gap in reliability created by the exclusion of elements such as loss of field, out-of-step, etc. An incomplete Protection System Study negates all the work needed to satisfy this Standard. Perhaps through referencing the NERC technical reference document entitled "Power Plant and Transmission

Protection Coordination", there could be a reference to which protection elements are going to be covered in this Standard and likewise what Standards will cover the protection elements not covered by this Standard. As identified by the Drafting Team, there may be no evidence of mis-coordination between traditional protections that detect faults, but for co-ordination of generator loss of excitation protection settings or out of step relaying during a fault condition – is that meant to be covered in this Standard or elsewhere? The latest draft of PRC-019-1 indicates studies conducted under that standard are for steady state conditions, not fault conditions. PRC-023 provided clear direction on what protection elements to mitigate and even provided options on how to mitigate those elements. PRC-027 should provide the similar effective vehicle to convey at least the "what" for Protection System coordination during faults between entities, and will allow entities to perform and document consistent Protection System Studies. The term "coordination" is not well defined. Does it mean ensuring owners of all terminals of a line, transformer, etc. are aware of each other's protection system design and settings, especially when the design, settings, and physical system changes? Developing a formal definition to be included in the NERC Glossary should be considered.
No
In the proposed definition of Interconnected Element "Functional Entities" is capitalized even though it is not in the NERC Glossary.
No
Due to the extensive documentation, coupled with the collaboration between entities associated with this requirement, NPCC believes 60 months is a more appropriate time frame to comply. This timeframe is also more in line with the timeframe proposed in the draft PRC-019-1 in Project 2007-09. An alternative to the "static" time frame discussed above, which would also be acceptable, would be to base the timeframe on a formula that factors in the number of interconnected power system elements that the entity must contend with.
No
This change is more ambiguous than reach agreement. How can changes to Protection Systems occur unless agreement is reached via a signed off Protection System Study? What does it mean to confirm acceptance?
Yes
We agree with the change. However, we are adding a comment on the VRFs. The VRFs should be High, not Medium. There are similar requirements in PRC-023-2 Transmission Relay Loadability, and TPL-001-2 Transmission System Planning Performance Requirements which have a High VRF. Also, from the Justification for Proposed Violation Risk Factors and Violation Severity Levels in PRC-027-1 — Protection System Coordination for Performance During Faults, the FERC VRF G4 Discussion reads "Guideline 4- Consistency with NERC Definitions of VRFs: Failure to perform a Protection System Study for each Interconnected Facility to verify that Protection Systems coordinate such that the least number of power system Elements are isolated to clear Faults could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, it is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The applicable entities are always responsible for maintaining the reliability of the Bulk

Electric System, regardless of the situation. Therefore, this Violation Risk Factor level conforms to NERC’s definition of a Medium VRF.” Poor protection system coordination during a disturbance can create severe system conditions faster than Operators can respond to them, leading to system instability or a cascading failure. These circumstances are consistent with the NERC definition of a High VRF.
Individual
Andrew Z. Pusztai
American Transmssion Company, LLC
Yes
However, ATC recommends that the Purpose statement in the Standard be modified by adding the word “intended” : “To coordinate Protection Systems for Interconnected Elements, such that the least number of intended power system Elements are isolated to clear Faults.”
No
The Interconnected Element definition should be expanded to clarify that PRC-027 is applicable to only BES Elements as demonstrated in Figure 4 of the Standard’s Application Guidelines on pg. 27. • ATC recommends that the SDT please modify the definition of Interconnected Element as follows: “A Bulk Electric System Element that electrically joins separate Functional Entities, including those Functional Entities that are a part of the same Registered Entity” If “Functional Entity” is used and capitalized in the definition above, the term should be defined in the standard or be made part of the “Glossary of Terms Used in NERC Reliability Standards.” Furthermore, NERC’s “Reliability Functional Model version 5” states: “The following terms are used in the Functional Model and do not appear in the NERC Glossary. Functional Entity. The term used in the Functional Model which applies to a class of entity that carries out the Tasks within a Function.”
No
The SDT states that there is no evidence of wide spread misoperation due to lack of coordination. However, R1 requires a utility to establish an evidence package of legacy coordination that predates PRC-001’s effective date. While 48 months is an improvement to PRC-027, that timeframe still imposes a significant burden on utilities, especially those that are not vertically integrated. ATC recommends that the SDT consider changing the implementation period for R1 from 48 months to 72 months.

Yes
Group
ATCO Electric
Rowell Crisostomo

No
ATCO Electric (AE) has an existing protection review program that runs on 5 year cycle. Each year, AE review approximately 20% of AE’s transmission system to ensure the protection is in place or needs adjustment. Can the drafting team increase 48 month duration to 60 months?
Additional comments from AE that does not fit any specific question: (1) Timelines: There are too many hard timelines that aren’t consistent between individual requirements (24 months, 6 months, 90 days, 30 days, agreed upon time frame, prior to implementation, etc.). Keeping track of these timelines and evidence gathering will take considerable time and effort. Can the drafting team reduce the amount of timelines to make this standard manageable? Can the drafting team anticipate how to audit this standard during the standard development process? (2) There are requirements referred to other requirements and vice versa. Can the drafting team not to refer the requirements back and forth? Can the drafting team anticipate how to audit this standard during the standard development process?

The language in the Statement of Purpose needs to be reworded. The phrase “such that the least number of power system Elements are isolated to clear faults” may restrict certain protection practices in widespread use today, where coordination on tapped distribution facilities is achieved via auto-reclosing rather than via coordinated time delays. For example, a BES line (protected by a high speed DCB or POTT pilot scheme) is tapped by a distribution provider as demonstrated in Figure 3 of the Application Guidelines. Very often for distribution taps like these, rather than requiring the distribution provider to establish a costly transmission class pilot scheme terminal at breaker C with communication links to A & B, it is common to let the pilot scheme reach into (but not thru) the transformer at C. For faults in the transformer the high speed transformer relays will operate to trip and lockout breaker C. However, the pilot scheme at A & B will also trip simultaneously. Breaker C will lockout and A & B will auto-reclose to restore the line. Coordination is achieved via auto-reclosing. For faults on the line, A & B will trip via the pilot scheme, and if generation happens to be running either C will trip, or the generator will trip depending on scheme design. Reclosing at A & B would be delayed and / or voltage supervised to ensure generation has been removed prior to auto-reclosing. In the

above scenarios since the line tripped for a fault in the transformer, or the generator tripped for a fault on the line, it would violate the requirement that “the least number of power system Elements are isolated to clear faults”. The language used in the proposed definition of Protection System Study is better; using the phrase “demonstrates ... Protection Systems operate in the desired sequence for clearing faults”. The problem here is who determines what is the “desired sequence”? Would a scheme, which is purposely designed as described above and acknowledged by the Transmission Planner and Transmission Operator, be considered to operate in the “desired sequence” for clearing faults? The language in the standard needs to be re-visited to enable these types of protection interfaces with distribution providers having limited generation resources connected downstream. Also, if system reliability was truly an issue for this example, the interconnection should not have been a simple tap on the line, but rather a ring bus should have been established at the interconnection point. In conclusion, we suggest re-wording the Purpose to read: “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence for clearing Faults.” This statement is consistent with the stated definition of the Protection System Study, on which the measures of this standard are based.
Yes
No
Each owner should already possess information demonstrating that their protective devices are set to “coordinate” with adjacent protection systems. However, the documentation that presently exists may not be in the form of a formal “coordination study” in a format suitable for audit purposes. Some guidance should be provided indicating what form of documentation is expected, especially by the TO. For instance, on transmission tie lines between different TO’s coordination of zone distance elements is fairly straightforward and can be accomplished without a traditional “coordination study”. Also settings on pilot schemes need to be exchanged in order to allow for proper operation, but this is also not what is considered a traditional “coordination study”. On the other hand, coordination between GO’s and TO’s is even more complicated. Without some direction as to what specific documentation is required it is difficult to estimate how many existing interconnection points would have to be re-visited in order to produce the required auditable documentation. Some specific examples of what specific type of documentation is required would be helpful. To be safe, most likely all interconnection points would be revisited to ensure adequate compliance documentation. Also, for each revised Protection Study produced (per R1.1) a formal review (R1.2) and approval (R4.1) would be required. As such, with the large number of interconnection points on the system a 60 month time frame would be more appropriate. The SDT acknowledged that they had no evidence that there is widespread miscoordination between Interconnected Facilities when establishing the arbitrary 48 month requirement.
No
We find that changing the wording from “confirming acceptance” to “reaching agreement” does little to address the root problem associated with mandating mutual agreement. We suggest Requirement R4 be removed entirely or extensively re-written to address the concerns

outlined below: Requirement R4 is by far the most controversial aspect of this standard, particularly when mutual agreement between independent parties must be achieved. What if agreement cannot be reached, which entity would be held non-compliant? As currently written, the standard could lengthen schedules significantly for small projects. Consider for example the arrangement depicted in Figure 2 of the Application Guidelines. Suppose Transmission Owner S (T.O. S) initiates a Protective System change at Station 2 to raise the time dial of the back-up ground overcurrent relay on breaker D to maintain coordination with downstream relays. T.O. S performs the Protection Study and forwards the results to Generator Owner R (G.O. R). The study recommends that G.O. R must raise the time delay on breaker A to maintain coordination. Since breaker A is at the top of the coordination string, no other option may be available. Most likely the G.O. does not have protection engineers on staff and contract engineering support may be required to review the recommendation. As such, it could take several months for the engineering services to be acquired and the Protection Study reviewed. What if the G.O. is unwilling to increase clearing times for breaker A due to through fault concerns on the GSU transformer (even though the expected clearing times fall below ANSI transformer damage curves)? T.O. S is prohibited from making the change by R4.2 until agreement is reached. Which party is found non-compliant if an agreement cannot be reached? What if the change is not made because agreement could not be reached, and breaker D subsequently misoperates due the recognized miscoordination condition? A corrective action plan (per PRC-004) would be developed that would suggest the settings on breaker A be raised. Who would be found non-compliant if the corrective action plan was not enacted? This is the problem with mandating that an agreement between two parties be reached. It is further compounded by requiring that an agreement be reached within a set timeframe. It is unreasonable and unfair to hold one party non-compliant due to the failure of another party to reach agreement. Furthermore, in the example provided above, it is a detriment to reliability to delay implementation of the setting change on breaker D just because mutual agreement could not be reached. It is important to ensure that information on new, or modified, Protection Systems are shared between parties, so that each party may assess the impact of the change and ensure their Protection Systems are properly set and coordinated. The emphasis should be on sharing of information (such as relay setting changes) and not the details of performing the “Protection System Study” and all the associated approval schedules. As such, it may be reasonable to have a Reliability Standard to ensure setting information has been exchanged (which was the original intent of the PRC-001-1 standard). But it should be left at that. Mandating mutual agreement with compliance implications, without providing a clear division of responsibilities and assignment of who will be held non-compliant if agreement cannot be reached is unfair to either party.
Yes
We agree with this change. However, we have several other comments concerning this standard in addition to those expressed in response to Questions 1 thru 5. Usually there is a space on the comment form to enter these additional comments. Absent one, we offer these additional comments as an addendum to Question 5. 1) Requirement R2: The phrase “Facility associated with an” contained in R2 is confusing and unnecessary and should be eliminated. R2 should simply read “For each Interconnected Element on its System, the Transmission Owner

shall:” 2) Requirement R2, Parts 2.1.1 and 2.1.2: Remove the term “interconnecting bus” and replace it with the phrase “point of interconnection between the Entities.” The point of interconnection between the entities is more descriptive in that the interconnection point may not be a physical “bus”, but rather the terminals of a line disconnect switch, terminals of a breaker, specific transmission pole, etc. Even though the point of interconnection is often modeled in a short circuit program as a “bus”, the term “interconnecting bus” has no physical meaning. 3) Requirement R3, Part 3.3: A footnote should be added stating that this requirement does not apply to those temporary setting changes that sometimes are applied during commissioning, maintenance, or investigative testing activities to verify performance of individual protective elements, provided the original settings were returned upon the conclusion of the testing activity. For example, in multifunction relays when testing backup time delayed protective elements (i.e., zone distance or time overcurrent elements) it may be necessary to temporarily disable high speed elements (i.e., pilot or zone 1 elements). 4) The SDT states that “the requirements in the proposed Reliability Standard PRC-027-1 take into account Recommendation 21 C of the Final Report on the August 14, 2003 Blackout in the United States and Canada written by the U.S.-Canada Power System Task Force, which identified the need to address the appropriate use of time delays in relays”. However, a word search of the 2003 Blackout Report revealed no mention of miscoordination of time delays on relays during fault clearing as being a contributing factor. The mention of “the appropriate use of time delays in relays” in the 2003 Blackout Report was in the context of the actuating time of relays in response to system overload conditions, and generator protection to voltage and frequency excursions during stressed system conditions. The concern was that relays operated on overload before system operators could react and that some generators tripped (exacerbating the collapse) before other system schemes (UFLS or UVLS) could operate. The solution was not to increase the time delay on Zone 3 relays (which would have been intolerable for fault clearing purposes) but to address the relay loadability issue in PRC-023, to make them immune from operating under heavy load conditions. Similarly the premature tripping of generators on voltage and frequency protection during stressed system conditions (not fault conditions) and coordination with system UFLS and UVLS schemes was discussed in the report. Likewise those issues have now been addressed, or are being addressed, in PRC-006, PRC-010, PRC-022, PRC-019, and PRC-024. Similarly in the recent Southwest Blackout of 2011 the operation of relay schemes during overload conditions was a contributing factor. There was again no evidence of miscoordination of relay schemes during fault conditions. The unexpected operation of relays and SPS’s during overload conditions could have been avoided by proper application of existing standards PRC-023 and PRC-014-0. Based on the above, where is the historical evidence that the cause of major disturbances or cascading outages were the direct result of protective relay systems that were not properly coordinated during fault conditions? Reliability Standards should be adopted based on a need to address a known, or probable, reliability issue. As such, although we support the overall desire to ensure that protective systems are “properly coordinated”; we see little value in developing a new Reliability Standard to address something that is routinely practiced and which has not been demonstrated to be a contributor to major system disturbances, or cascading outages. Even the SDT in their rationale for Requirement R1.1 stated that they have no evidence that there is

widespread miscoordination between Interconnected Facilities. In lieu of a formal standard to address relay coordination during faults, a simple technical reference document on Protective System Coordination issues may provide equal benefit to the industry. The above comment was also submitted with Draft 1 of the standard. In their response the SDT stated that PRC-027 was being developed in response to FERC Order 693. However, Order 693 only directs NERC to address specific deficiencies in PRC-001 surrounding certain measures and levels of non-compliance relating to the notification and response to the detection of failures in relay protection systems. As such, we believe PRC-027 goes well beyond what is was directed by FERC, and the stated purpose of the SAR. We urge the SDT to revisit FERC Order 693 and revise this standard as appropriate to address only the stated FERC directives.

Yes
Yes
No
The comment group agrees that Protection Systems associated with Interconnected Elements must be coordinated. However, the reliability goal should be strictly focused on documenting the associated owners (parties) are cooperating, and in agreement with protection settings to achieve proper coordination. A requirement to have a documented Protection System Study completed will not improve on a simple statement from the parties that proper coordination has been agreed upon. Provision of a Protection System Study as compliance evidence (in whole or a summary) implies recourse to check its completeness or accuracy. For complex systems, this is very subjective. However, the Standard as written intends to make no effort to verify the completeness or accuracy of a Protection System Study; the intent is to simply verify that it exists. Since the Protection System Study is not subject to review, its production as compliance evidence is nothing more than added bulk.
Yes
Yes
1. The comment group has no comments regarding this question. 2. This form provides no general comment area, so we are providing our additional comments here. We referenced the WECC Position Paper in the last round of comments, but now see that WECC did not submit comments. We urge the SDT to take a look at the paper. We received our copy from steve@wecc.biz . We can also forward a copy if an email address is provided. For the team's convenience, here is the relevant text: "WECC staff and WECC subject matter experts have reviewed the proposed standard and agree with the purpose of the standard. WECC staff and WECC subject matter experts agree that Protection Systems must be coordinated. However

some subject matter experts believe that the proposed standard requires more documentation than is necessary and that the requirement to provide a hard copy or an electronic copy of each Protection System Study is administratively burdensome and not reflective of the intent of Results Based Standards. These subject matter experts believe that evidence that studies are coordinated and that entities have agreed to the results of System Protections Studies is adequate.” We see that the SDT responded to Salt River Project’s and other’s similar concerns regarding hard copies by stating that that only summaries are needed, but we still see the standard as overly burdensome compared with the possible benefit. Tennessee Valley Authority, Dominion Power, Southwest Power Pool, the Nebraska Public Power District, Dairyland Power Cooperative, the Bonneville Power Administration, and the SERC Protection and Control Subcommittee provided some specific suggestions to reduce documentation burden which were all rejected. We urge the SDT to review these recommendations again.

The SDT may want to consider additional language for the Protection System Study definition, to clarify that the study demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults as well as clear the Faults within the maximum time frame defined by the Transmission Planner in order to maintain System Stability. Another consideration would be that the study incorporates all of the applicable Fault contingencies (Category B and C) as defined in the NERC Reliability Standards (TPL-002 and TPL-003) or any Regional standards.
Yes
No
TRE agrees with the need to notify the Facility Owner of the proposed changes. However, if the receiving entity does not agree with the proposed changes, there needs to be a venue to reach consensus. The receiving entity should be able to suggest changes based on technical rationale to resolve the disparities. A provision for dispute resolution needs to be provided. TRE suggests re-wording R4.2 to – “Prior to implementing any planned change(s) associated with Requirement R3, Part 3.1, notify the Facility owner(s) associated with the affected Interconnected Element. If consensus cannot be reached on the proposed Protection System(s)

changes, each entity shall document the technical rationale for its position on each disputed issue prior to implementation.”
Yes
OTHER COMMENTS (not responsive to any specific question asked above): R2.2: We suggest a minor change "...indicates a deviation in ***single line to ground or 3-phase*** Fault current of 10% or greater ....” R3.1: Based on recent work by the Protection System Misoperation Task Force (PSMTF), changes in logic settings should also be included (e.g. directionality V/Q logic, trip equations, carrier echo logic and coordination timers, carrier dip switch settings, etc.). We would suggest modifying the first bullet to say”...modification of: protective relays or protective function or logic settings, communication systems,....” The SDT may also want to consider adding an item to the list - “Changes to the transmission system topology that change the equivalent impedance or fault current.”

The purpose is laudable, but the means by which it is to be achieved needs more work. The Application Guidelines section of PRC-027 makes reference to, “the entity performing the Protection System Study [for R1],” but the standard provides no indication of who this should be. This responsibility is simply assigned to, “Each Transmission Owner, Generation Owner, and Distribution provider.” The obligation placed on GOs by use of the word “each” in R1 cannot be fulfilled, however, except under the circumstance of having a vertically-integrated utility. An independent GO does not have knowledge of the TO’s system, and in a deregulated market is not allowed to have such knowledge. The TO and TOP are provided with detailed information of the GO’s equipment, however, and therefore perform all interconnection-related studies. This is as it should be, because changes in the transission don’t matter to a GO. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO’s system. The best approach would be to restrict the applicability of PRC-027 in its entirety exclusively to TOs, with GO obligations remaining as per PRC-001, i.e. reporting changes and addressing any issues raised by the TOP. If GOs that own substations, distribution systems and numerous miles of transmission conductors (e.g. large-scale wind farms) need to be included in PRC-027 the standard should say so, rather than pulling in all GOs regardless of whether or not it makes any sense for them to be involved. The most that could reasonably be asked of independent GOs under R1 is to have a valid interconnection service agreement (ISA), since a coordination study is performend by the TOP prior to offering an ISA. Such studies remain in the possession of the TOP, not the GO, so a detailed level of evidence could not be asked of the GO.
No
The term Functional Entity needs a definition. It is capitalized in PRC-027 but is not defined in

the standard or in the NERC Glossary. It is nonetheless evident that a GO and TO are different Fnctional Entities, but the nature of the Element that joins them and thereby constitutes the Interconnected Element is unclear. Is this the transmission line? If so, would the TO be responsible for the R1 study if the ownership scope of an independent GO ends at the high-side terminals of the GSU or at an HV disconnect switch? Would the responsibility be shared if, as sometimes happens, the ownership split occurs at the fenceline, leaving a small part of the transmission line the property of the GO while the rest belongs to the TO? The definition of a Protection System Study needs to include identification of the party responsible for performing this work. This cannot be the GO if dealing with a deregulated market; since, as explained above, such parties are not allowed access to information about the TO's system.
No
The time frame is not the issue. R1 should apply only to TOs, as explained above. The only responsibilities of GOs should be those already stated in PRC-001 regarding changes to equipment.

The purpose should mirror the objectives of the Protection System Study: “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence.” There are cases where industry practice is to “overtrip”, for example, for a tapped non-BES distribution transformer fault by tripping BES line breakers and reclosing. Also it may be a common practice to use zone 1 extension or acceleration schemes. There can be good reasons for intentionally tripping more than “the least number of Elements to clear a Fault”. The Purpose statement as currently written is in conflict with these valid industry practices, and needs to be modified.
Yes
No
We strongly believe that 60 months would be a more achievable time frame to study the many interconnections that an entity may have. This will also allow Generator Owners the time needed to gain the resources required to perform these studies, since they may not be presently so equipped. As stated by the drafting team in the rationale for R1 there is no evidence of wide spread mis-coordination of Protection Systems associated with Interconnected Elements. It would also be helpful to provide a better description of what is required to be included in a Protection System Study. For example, is the study required to include pilot scheme timing and element coordination, breaker failure coordination, coordination under minimum and maximum fault current cases, etc?
No
The current draft standard lacks any clear responsibility for performing the complete Protection System Study, especially if the interconnected parties cannot accept or reach an agreement. The recommended change is to make the Transmission Owner accountable for the overall Protection System Study, at least at the Generator-Transmission interconnections. The other entities such as Generator Owners should be responsible to provide the necessary data required for the overall study. This makes the most sense based on limited resources and capabilities, as well as access to all data. This is especially true for independent Generator Owners that operate in the deregulated market. It is not feasible to make all entities somehow responsible for the study.

AEP recommends replacing all references to “generator Protection Systems” with “Generator Owner equipment that provides backup system protection”, and suggest adding language to the standard for clarification. The scope of Generator Owner Protection Systems applicable to this standard is not clear from the verbiage within the standard or the definition of Interconnected Element. AEP believes that the SDT did not intend to require the GO to include all generator Protection Systems under this standard (as shown in Figure 2 on page 25 and Figure 5 on page 28 of the clean draft), but instead meant to limit the scope of relaying to be coordinated to only the Generator Owner equipment that provides backup system protection. AEP agrees with the definition of Protection System Study, however, we disagree with using the acronym PSS within the standard as PSS is also the recognized acronym for Power System Stabilizer. Usage of this acronym (for example, in the Process Flow Chart) would cause unnecessary confusion.
No
AEP believes that 48 months to complete a Protection System Study is too short of a time frame, especially for Interconnected Elements which do not have an existing study. NERC’s rationale for R1 states that “the drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame.” If this is the case, then there should be no issue with extending this

timeframe. AEP believes that 72 months is a more reasonable timeframe for the following reasons: * The Transmission Owner will need to complete their own studies, as well as provide data to the entities they interconnect with (i.e. TO’s, GO’s, and DP’s). This dependency would effectively shorten the amount of time the functional entity has to complete their studies to less than 48 months. * Before the work of the first bullet point above can be completed, entities must develop an agreed-upon list of Interconnected Elements and associated owners of the Protections System(s) associated with each Element. Once again, the time required to complete this task erodes into the entire time allowed to perform the study. In short, much of this work must be sequentially rather than in parallel, further justifying the need for an increased timeframe. * The resources needed to complete the required studies will also be impacted by a number of other standards currently in draft including: PRC-006-1, PRC-019-1, PRC-024-1, PRC-025-1 and PRC-004-3. The work required to perform both the proposed studies of this standard, as well as the other standards listed above, requires a Subject Matter Expert possessing a specific skillset gained from years of protection experience. Due to the limited number of such SMEs, industry will be very challenged in meeting all the proposed requirements given the limited number of such resources. In addition, the demand for qualified outside resources might be greater than their actual availability due to the time constraints involved.
Yes
Yes
Because the comment form provides no section to provide “general comments”, AEP offers them below. AEP would like to inform the drafting team that our negative vote on this standard is primarily driven by a) the lack of clarify in regards to its scope (as discussed in the response to Q2) and b) the timeframe allotted to perform the Protection System Study (as discussed in the response to Q3). It would be more appropriate for R 1.1.1 to be included in the implementation plan, rather than embedded within the standard itself. The proposed standard is difficult to follow, in the way that it jumps back and forth among requirements. We would encourage any changes which might increase the readability of the proposed standard.
Individual

No
Functional entity is not defined. System Studies should be defined as "a study performed by a TO that demonstrates.....etc."
No
R1 should not apply to GOs. GOs are not allowed to have the TO information needed for a system study under market rules.
Yes

Yes
Individual
Nazra Gladu
Manitoba Hydro
Yes
Although Manitoba Hydro agrees with question 1, we have the following general comment: (1) The purpose statement and R1.2 refers to Elements within the ‘power system’ which is not defined, while the ‘Facilities’ refers to ‘Elements of the BES’ and the ‘Requirements’ reference Interconnected Element on a particular entities’ ‘System’ or ‘transmission system'. Should these be consistent or has this been done purposefully?
Yes
Although Manitoba Hydro agrees with question 2, we have the following general comments: (1) Please clarify why definitions are to remain with standard upon approval and not be moved to the Glossary. Are these definitions applicable only to this particular standard? If this is the case, this could lead to uncertainty if similar terms are going to be used or defined elsewhere. (2) Compliance 1.1 – The word ‘Compliance’ in the first line should not be capitalized and (CEA) should follow the word ‘authority’. Since ‘Regional Entity’ is a defined term, ‘Entity’ needs to be capitalized. (3) Compliance 1.2 – The second paragraph should begin with ‘Each’, not ‘The’. We suggest that the reference to an ‘Interconnected Facility’ in the second paragraph should be changed to ‘a Facility associated with an Interconnected Element’ to make it consistent with the rest of the standard, including the third paragraph of 1.2.
Yes
Although Manitoba Hydro agrees with question 3, we have the following general comments: (1) R2, 2.1.1 – Reference to the Protection System Study should be the most recent Protection System Study to be consistent with the rest of the requirement and the use of the word ‘available’ is a little problematic. What if no study exists? As we read it, the requirement to do a study is within 48 months of the effective date of the standard, while the requirement to do a short circuit study is at least every 24 months. If the Protection System Study is not available, is there no requirement to do the short circuit study? (2) R2, 2.2 – For clarity, we suggest rewording the first sentence to read ‘Within 30 calendar days after identification, through the calculation performed pursuant to Requirement R2, Part 2.1.2, of a deviation in…’ (3) R3, 3.1 – No time frame is given and it is unclear as to whether these details are to be only for proposed or future changes or additions, or whether it can be ‘notice after the fact’ (when read with the remaining requirements, it would be assumed it is ‘prior notice’, but that’s not clear on the face of this part 3.1). In addition, should ‘facilities’ be capitalized in 3.1? Also, there needs to be consistent references to ‘changes and additions’ or just ‘changes’ within this R3 as currently there are references to both made. (4) R3, 3.2 – We suggest moving the time frame to the start of the Part for consistency with the drafting of other Parts and for ease of reading. (5) R3, 3.3 –

We believe that the timeline is incomplete. Assuming that the timeline is meant to be 'within 30 calendar days of the (proposed?) changes or additions being made'. (6) VSLs/VRF table: R1, R3 – For consistency, the references should read 'less than or equal to 10 calendar days' instead of '10 calendar days or less'. (7) VSLs/VRF table: R4 – All of the references to 4.1 appear to be incorrect because 4.1, as currently drafted, does not require confirmation of acceptance of the summary results.
No
(1) R4, 4.2 – The concept of 'accept' the changes are problematic. We are unclear as to what exactly this means? Is it something more than acknowledging that the changes are occurring? Does it go so far as 'agreement' with the changes? What happens if the owner does not 'accept' the changes? (2) R4, 4.1 – For consistency with wording the in R3, 'planned change' should be 'proposed change' or 'addition'.
Yes
Although Manitoba Hydro agrees with question 5, we have the following general comments: (1) M1 – The word 'that' in the third line should be deleted and we believe that the words 'is dated documentation' are missing after 'Acceptable evidence for Requirement R1, 1.2. (2) M3 – For consistency, the word 'formula' should be replaced with calculation in Requirement R2, 2.1.2. (3) M4 – For clarity and consistency with the other Measures, we suggest rewording the opening sentence to read 'Acceptable evidence for Requirement R2, Part 2.2 is dated documentation (hard copy or electronic file formats) demonstrating that the updated Fault current values were provided within….'. (4) M5 – The wording of this section does not match the wording of the requirement. The words 'in hard copy or electronic file formats' should follow the word summary, not after the word settings.

Midwest Reliability Organization NERC Standards Review Forum
Joseph DePoorter
Yes
Yes
No
The NSRF recommends that this Standard be filtered through the paragraph 81 criteria. If not, the NSRF recommends the following items. Although supportive of the extended timeframe in R1, the NSRF is concerned that the proposed Part 1.2 is overly prescriptive. Considering the sheer quantity of microprocessor relay settings that could potentially be reviewed as part of a Protection System Study, having to provide associated owner(s) the results of every protective relay setting reviewed would be unnecessarily burdensome with little benefit to reliability. Recommend the drafting team revise Part 1.2 to require entities to only provide information related to settings being proposed for change and have all other settings be made available upon request. Please clarify the application of R1, Part 1.2 in the event that both ends of the

Interconnected Element are owned by the same entity. In consideration that final settings and internal documentation would provide proof that everything was looked at accordingly, would the entity still need to develop and distribute a summary internally as well? Recommend revising Part 1.2 to only require functionally separate entities to provide documentation of the results of the Protection System Study. Rather than specify the details to be shared as a result of a Protection System Study, recommend Part 1.2 be modified to remove “power system Elements to be isolated, contingencies evaluated” as a minimum requirement. Having entities share their evaluation methods with other Entities appears to be unnecessary administrative work. Considering that it is the responsibility of the individual entity to perform their studies correctly, another entity should not have to worry about, nor does it have the responsibility for keeping tabs on, whether an external study was done to a single or double contingency level, what external Facilities become isolated, etc. Additionally, the NSRF is concerned with the phrase “Fault current used” as it applies to R1, Part 1.2. In consideration that Fault current values do not necessarily mean that two entities are using like models, recommend a comparison of boundary equivalents be used instead to ensure that the models are comparable between entities. If not, entities would potentially be sharing every value for every iteration to ensure like models. Suggested revisions to R1, Part 1.2 in support of the above comments are as follows: 1.2. Within 90 calendar days after the completion of each Protection System Study provide to the owner(s) of the Protection System(s) associated with Interconnected Element(s) that include two or more Registered Entities, a summary of the results of each Protection System Study performed pursuant to this requirement, (including, at a minimum, proposed revisions to the protective relay settings reviewed, power system Elements to be isolated, contingencies evaluated, boundary equivalents at necessary buses Fault currents used, any issues identified, and any additional revisions proposed). If existing documentation does not include enough detail to meet the requirement for an acceptable Protection System Study, utilities will be forced to add to the existing documentation for compliance purposes even though the existing settings coordination is adequate. This will place additional compliance burden on utilities while not necessarily improving reliability. Since there is no evidence of widespread mis-coordination of Protection Systems associated with Interconnection Elements, it would seem reasonable to have this standard apply to any changes made to an existing Protection System or all new Protection Systems.
No
R4, Part 4.2: In consideration that R4, Part 4.1 already requires entities to review the results of a Protection System Study and provide any related feedback, recommend Part 4.2 be removed from the standard. Without additional guidance within the standard specifying the timeframe in which an entity must provide its confirmation, the entity implementing the planned change could potentially be left waiting indefinitely for confirmation despite the study already being reviewed and accepted as part of Part 4.1. If part 4.2 is not removed, recommend that additional guidance be provided concerning time frames (90 days?).
In addition to the previous comments outlined above, the NSRF offers the following comments for the drafting team’s consideration. Recommend the timeframes in R1.1.1 and R2.1 be stated in calendar years. The NSRF is concerned that a utility would be found in violation of this standard if one study was done in February of 2012 and the next one in March 2014 based on

the current wording. The intent of a results-based standard is not to have these types of technicalities built into them. An entity cannot study a part of the system that they do not own. The examples at the end of the draft in the Application Guidelines appear to imply that they should. Settings should be obtained from remote ends of a tie line only to be used in conjunction with studying the settings for which an entity has direct control. If an entity can't issue setting changes for a relay, then the entity can't study it to see what the settings should be. If both ends need adjustment then an iterative coordination back and forth between Entities should be performed. The majority of utilities would not feel comfortable accepting an external entity's settings changes for their own equipment. Recommend additional wording be added to the Application Guidelines to the further clarify the drafting team's intent. R2, Part 2.1.1: Recommend R2, Part 2.1.1 be revised to only require short circuit values be 'studied' at buses for which the entity in question specifically owns. For Interconnected Facilities between two entities, fault current values should be 'requested' by the neighboring utility. This would be beneficial to ensure that both entities are comparing models to keep them as up to date as possible. Better yet are boundary equivalents as discussed in previous comments. R2, Part 2.2: Similar to our previous comment for R1, Part 1.2, the proposed language in Part 2.2 appears to indicate that internal Interconnected Elements would require additional documentation and notification beyond what is necessary. This should only be required of Interconnected Elements in which there are two or more owners. Proof of study should be adequate for internal situations. 2.2 Within 30 calendar days after identification where the calculation performed, pursuant to Requirement R2, Part 2.1.2, indicates a deviation in Fault current of 10% or greater, provide each owner of the Protection System associated with the Interconnected Element, that include two or more Registered Entities, the updated Fault current values (Iscs).

Yes
Under figure 2 in the application guidelines the example need to be reviewed and text added to clearly identify the intent of the drafting team. For example is the scope for Generator Owners in figure 2 just the backup system protection for the Transmission Owners system? It's not clear in the examples given. This issue is also present in figure 5. We agree that if the scope is just for the backup system protection it is ok but the wording does not clearly state this. Also using PSS as an acronym for Protection System Study could be confused in the flowchart of this standard with power system stabilizers since there isn't any text to spell out that it is referring to Protection System Study.
No
We are concerned that 48 months could still not be sufficient for these studies. We would ask that the team consider 72 months. There is a concern that with all the companies having new standards to comply with, the Transmission Owners/Generation Owners are being overloaded and have the same resources.

No
How would "fault currents used" be presented for coordination of distance relays ? Also if the above items must be included, at a minimum, they need to be enumerated in requirement R1.
No
It is not clear where the old text "reach agreement" and the new text "confirming acceptance" were/are used. Also, "confirming acceptance" is vague in meaning.
Yes
National Grid offers the following additional comments that do not pertain to Question 5. The comments are included here since the Comment Form did not have an additional question concerning if we had additional comments. 1. Page 4: Other Aspects of coordination of Protection Systems addressed by other Project needs to be included in the final standard since it delineates what is not included in this one. 2. Page 8: Para.R2.1.2 should be reworded as it allows for a series of increments in fault current each less than 10% but which when summed over a number of review periods could collectively exceed 10%. 3. Application Guidelines: a.

Page 21: “Data used to determine Fault currents….” is essentially the short circuit model and the associated data base of line, transformer and generator impedances and connections. If that what is expected then it should be so stated otherwise “data” leaves a lot open to the reader’s conjecture. b. Page 25: Decision point regarding R2.1.2 has the same issue as identified above in comment 2. c. Diagrams Fig. 1, 2, 3, 4, 5: The text that goes with these diagrams is inappropriate in its assignment of responsibilities for who reviews what coordination and the change of wording from “verify” to “review” does not resolve this problem. It is a protection system owner’s responsibility to coordinate their system with adjacent systems and it is the same owner’s responsibility to model adjacent systems in sufficient detail to enable that owner to perform that coordination. Fig . 2, 5: The text refers to “generator protection” which can mean a wide range of protection functions such as but not limited to those related to voltage, frequency, loss of field, over-excitation and more. These were excluded on page 4 of the standard and their exclusion here should be emphasized. Fig. 3, Notes following figure 3 exclude reverse power as being a protection system installed to detect faults on the BES Transmission System. We disagree. In our system and other systems in NE reverse power was historically installed specifically to detect and clear backfeed to a faulted transmission system.

The Purpose given assumes that the most important outcome of a protection system operation is that the least number of power system elements are isolated to clear a fault. While it is true that it is usually desirable to prevent parallel paths from opening, in many cases it might be

perfectly acceptable for adjacent elements to operate. BPA believes it may be more economical to have a protection system that isolates elements in addition to the faulted element if the isolation of the additional elements does not result in problems for the BES. A suggested Purpose statement that takes this philosophy into account is: To insure that separate Functional Entities properly coordinate with each other the protective systems for elements that interconnect their electrical systems so that only the intended power system elements will be isolated to clear a fault.
No
With regard to the definition of Interconnected Element, BPA believes the term should be interconnecting element, because the element is not interconnected, rather the systems of the functional entities are interconnected by the element. The point of interconnection between two functional entities is typically where two elements meet, such as between a line and a switch, and it is not a clear which element is the interconnected element. For example, suppose that a line from one entity terminates through a breaker at the bus of another entity's substation. Which is the interconnected element, the line, the breaker, or the bus? In another example, a generator ties to a transmission providers BES through a step-up transformer. Which is the interconnected element, the step-up transformer or the transmission line? Additionally, if a distribution provider taps off of a transmission provider's 230kV line through a disconnect switch, is the disconnect switch the interconnected element? BPA asks that the definition of Interconnecting Element be further clarified to provide the specific criteria that entities are expected to apply to come up with a consistent response in all such instances. The SDT attempted to illustrate the concept of the interconnected element through some examples in the Application Guidelines; however, the selection of the interconnected element in these examples neither follows logically from the standard nor provides the additional clarity necessary to enable industry participants to apply it in a manner that enables all users to come up with the same answers.. BPA believes the standard needs a clearer definition of an interconnected element. With regard to the definition of a protection system study, the definition given is too vague to provide a clear understanding of what is required by the standard.
No
BPA believes that the requirement to provide a protection system study for each interconnected element is onerous, and as a result, any amount of time is too short.
No
According to this standard, something as simple as changing a CT ratio must now be communicated to all interconnected functional entities and documented. The interconnected functional entities must then "confirm acceptance" of the CT ratio change before the change can be made. The acceptance must then also be documented. This level of bureaucracy is unnecessary and counterproductive. The change from "reach agreement" to "confirming acceptance" is irrelevant.
No
BPA believes that the requirements and measures are onerous and should be eliminated. The change in wording is irrelevant. Additional Comments R1.1 requires a protection system study

to be performed, but does not explain what is required for a protection system study. R1.2 lists some minimum requirements of a protection system study, but leaves many unanswered questions, for example: Which relays must be included in the study? Where are the faults to be applied? What contingencies should be applied for the study? How many buses back into the system must be reviewed? R1.1.2 introduces the term “interconnecting bus” with no definition of what it is. R2 is a requirement that pertains to each facility associated with an interconnected element. The use of the word “associated” is too vague and leaves the interpretation of this requirement wide open. In R2, the need to perform a new protection system study is based on a 10% or greater increase in fault current. Since many relays are based on impedance or differential methods, the value of fault current has no bearing on their need for a coordination review. R2, therefore, results in an unnecessary and useless burden when applied to elements protected with these relays.

We do not believe that the drafting team appropriately identified the correct Applicable Functional Entities for this Standard. We also believe existing Standards could be modified to resolve any reliability gap rather than creating a new Standard. As a result, while the Purpose of this standard may seem to be reasonable, we feel that the drafting team should either 1)Change the Purpose to state “To conduct necessary studies to ensure Protection Systems for Interconnected Elements are studied, such that the least number or power system Elements are isolated to clear Faults.” And change the Applicable Functional Entities to the Transmission Planner or 2) modify existing Standards, instead, as described below. The short-circuit studies should be conducted by the Transmission Planner. From Appendix 5B of the Registration Criteria the: • Transmission Planner is the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.” • Distribution Provider is the entity that provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.” TPL-001, TPL-002, and TPL-003 already require the system studies are conducted. These Standards should be modified to include any additional studies that the drafting team feels are a gap. As noted in the drafting teams Rational for Part R2.1 “Short circuit databases are customarily updated annually so the drafting team believes 24 months provides entities flexibility to schedule and perform the new short circuit studies and calculate the percent deviation.” That being said, there is no current Requirement for the Distribution Provider to provide the information to the databases so that the Transmission Planner can conduct the

studies on the Interconnection Facilities. We recommend that MOD-010 and MOD-012 should be modified to include the Distribution Provider instead. For new facilities, FAC-002-1 already requires the coordination of changes in the Facilities.

APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. Changes to the interconnection fault currents do not happen that fast and a 30 days delay does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

What information comprises a Protection System Study (PSS)? In the Application Guidelines, from Figure 1 on p. 24, each owner that receives a PSS is “to review the Protection System setting” associated with the other owner’s breaker that would operate to clear a Fault on the transmission line that connects each Interconnected Element. Is this (Protection System settings) the ONLY information that needs to be transmitted in a PSS by each owner? The SDT should itemize ALL of the information it believes needs to be included in a PSS that is to be transmitted between owners of an Interconnected Element and include that information in the examples in the Application Guideline. This information should also be listed into the PSS definition, thereby defining its scope.
No
The issue is consistency in what comprises a valid PSS. For example, for "contingencies evaluated," it seems that each owner should evaluate a core set of the same contingencies as opposed to this being an owner-by-owner decision. The lack of specificity as to what is required for a PSS is the issue.

Comment on Requirement R1.2. The time frame listed may not be adequate under all circumstances or situations. Luminant recommends that the language be changed in this requirement as follows: "… Protection System Study performed pursuant to this requirement (including at a minimum, the Protection System(s) reviewed, any issued identified, and any revisions proposed) shall be within 90 days or in accordance to an agreed-upon schedule with a Transmission Owner, Generation Owner, or Distribution Provider." This would align with R4.1 that also provides the same time frame. The corresponding measures will also need to be modified if this language is accepted.

Ameren
Yes
We are voting negative for three reasons, one provided below and two are included in response to Question #3. Ameren also supports the SERC Protection & Control Subcommittee (PCS) comments and hereby includes them by reference rather than repeating them all. (1) We request that the SDT replace "detect Faults on the BES Transmission System" with "protect the BES Transmission System" in all three places where it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry.
Yes
Yes
(2) Requirement R2 requires short circuit study every 24 months even though the SDT's own rationale is that other requirements will trigger Protection System Studies first. Thus we believe that R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. (3) VSL escalation in 10 days is not representative of the severity of the violation. The SDT correctly points out in R1 rationale that it "has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements." We have about 500 Interconnected Elements per our present understanding of Draft 2 definitions and guidance. We recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity's Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels, respectively. Specifically, Lower would apply to up to 5% so that even a single Interconnected Element would be a violation.

Where is the term Functional Entity defined? Consider changing the term Protection System Study to Protection System Coordination Study. There are two reasons for this recommendation. First, the abbreviation for Protection System Study is PSS, which is also the common abbreviation for power system stabilizer. Second, the term Protection System Coordination Study emphasizes the primary purpose of PRC-027-1: to coordinate Protection Systems.
Yes
Yes
Yes
Additional Comments: Why is there a version 4 for PRC-001 (under Version History) when the

standard being balloted is version 3 (PRC-001-3). PRC-027-1 does not appear to impose any requirements as to how quickly issues identified in a Protection System Study are addressed. It may be difficult to impose such a timeframe since some issues may just require a relay setting change, while others may require more drastic scheme modification, including design, procurement, installation, and commissioning. Perhaps requirements could be added to develop, within a specified timeframe, and then implement a mutually agreeable Corrective Action Plan. As written, it appears that an entity can be compliant with Protection System Studies that always indicate existing coordination issues, which does not completely achieve the purpose of the standard. Without a mechanism to close the loop, PRC-027-1 appears to require a lot of documentation and coordination without any guarantee that existing coordination issues will ultimately be resolved. R4.1 really only requires entities to come to terms on the Protection System Study, but does not explicitly require any other course of action on existing coordination issues. In M1, the sentence ending in "…demonstrating that the time frames specified in Parts 1.1.1 and 1.1.2" in a fragmented sentence. Also, should this sentence have "and 1.1.3" at the end? M2 is a fragmented sentence. M4 is a fragmented sentence. As written, it may be difficult to audit parts of R3.1. Some of the language seems to be subjective and implicitly left to engineering judgment. First, it is not completely clear what the drafting team intended by the wording "associated with" or how an auditor might interpret that wording. Second, please consider changing "…or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s)" to "…or at other facilities when the proposed change modifies the conditions used in the coordination of Protection Systems associated with the Interconnected Element(s), as stipulated in the existing Protection System Study." This should make it easier to audit this aspect of R3.1. Third, regarding the second through fourth bullets, engineering judgment will be required to determine when impedances need to be changed. For example, minor modifications could be made to a transmission line that, in a purely academic sense, could change the impedance; however, an entity may opt not to update the impedance based upon engineering judgment that the change is not significant to the impedance model. For emphasis, under R3.2, considering changing "…within 30 calendar days of receiving a request or according to an agreed-upon schedule" to "…within 30 calendar days of receiving a request or according to an agreed-upon schedule, which may be longer or shorter than 30 calendar days." R4.2 does not seem to explicitly require that a Protection System Study be completed before implementing changes indicated in R3.1, only that the changes are accepted. R1.1.3 seems to suggest that the Protection System Study must be completed prior to implementation. However, according to the flow chart, it appears that a Protection System Study could be produced (in theory) six months after the changes were made. Furthermore, the flow chart applies the six-month timeframe even to R1.1.3, which does not match the text in R1.1.3.

(1) Austin Energy (AE) notes an inconsistency in R1.1.3 and the flowchart on page 22 of the clean version of Draft #2. R1.1.3 states that a Protection System Study is required “according to an agreed upon time frame” whereas the flowchart on page 22 says “perform the PSS within 6 months.” AE asks the SDT to update the flowchart to match the requirement language. (2) AE believes the VSLs for R4 are not consistent with the language of the standard, specifically R4.1 and R4.2. For example, the Severe VSL language should read “The responsible entity reviewed the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and responded as to whether further action is required, all per R4, Part 4.1, but was late by more than 30 calendar days. OR The responsible entity failed to review the summary results of a Protection System Study, as described in Requirement R1, Part 1.2, and respond as to

whether further action is required, all per R4, Part 4.1. OR The responsible entity failed to confirm acceptance of any resulting Protection System(s) changes prior to implementing any planned change(s) associated with Requirement R3, Part 3.1 per R4, Part 4.2." AE is concerned about the current VSL language because it indicates the need to confirm acceptance of planned changes (e.g., new installation) instead of the resulting Protection System(s) changes.

Dominion
Louis Slade
Yes
Dominion appreciates the SDT's agreement that in PRC 001 there were different interpretations of the term "coordination. Based on the SDT response to our Draft 1 comment regarding "coordination", we now understand that 'coordination' in PRC 027 Title and Purpose is referring to the technical aspects of coordinating relay settings. 2). Please reconsider Dominion previous recommendations to change the Title. "Protection System Interconnected Element Coordination for Performance During Faults" or "Protection System Coordination for Interconnected Elements" have more specificity and meaning to the standards intent for coordinating relays on interconnections.
Yes
Yes
Yes
Dominion interprets the wording "confirming acceptance" to mean that there are no major disagreements and that generally the methods between entities are acceptable using industry protection practices even if different protection setting philosophies' exists. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually

agreed upon response time, can be considered as confirmation of acceptance. The initiating party should not be restricted from applying appropriate settings due to the lack of acceptance confirmation from the other entity.
Yes
1). Please replace “detect Faults on the BES Transmission System” with “protect the BES Transmission System” in all three places it appears in Figure 3. This proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 2). Dominion respectfully disagrees with the SDT feedback comment on Draft 1 where it was recommended to remove references from one Requirement to another Requirement. Dominion was not challenging consistency with the recommendation but were stating the need to simplify the wording in the standard. Each Requirement can stand on its own without the additional Requirement reference. By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement due to the fact that that it causes you to read between Requirements. Isn’t this the purpose of the Process chart in the guidelines? 3). Under R1 – MI measure wording does not read as a completed statement. Dominion suggests removing ‘that’ from the first sentence to “….demonstrating time frames”. 4). Dominion respectfully disagrees with the SDT feedback that in R2 the term “deviation” is synonymous with “change”. Deviation refers to variation from a standard, norm or mean. This is not a statistical calculation but a simple measure of change 5). In R3- 3.2, there appears to be a formatting issue. Any Requirement that references a calendar day is worded where the Calendar date is at the beginning of the statement; for example R3- 3.3. Need to change wording in R3- 3.2 for consistency throughout document to read “Within 30 calendar days of receiving a request or according to an agreed upon schedule, requested information related to coordination….”). 6) In Draft #1 Dominion wrote: “Throughout this Draft 1 of the standard, there are references that illustrate documentation requirements that are inconsistent. Recommend all be written as “(hard copy or electronic file formats)”. The SDT responded saying “Each measurement in the standard (M1 through M10) has as evidence the statement “dated documentation (hardcopy or electronic file formats).” This is not the case; the point was that M1 reads “either in hardcopy or electronic file formats”. This is minor but needs to be changed for consistency.
Group
SERC Protection and Controls Subcommittee (PCS
David Greene
Yes
Based on the SDT response to our Draft 1 comment regarding the use of ‘coordination’, we understand ‘coordination’ in the Title and Purpose to mean the technical aspect of relay coordination.
Yes

Yes
Yes
1) The protection criteria and philosophies between entities can differ. For example, one entity may use the practice of coordinating for normal and single worst case contingency conditions, which is included in information/documentation provided to the neighboring entity in such Protection System Studies. The neighboring entity may have a slightly different protection criteria or philosophy, so exceptions may be required on a case by case basis using the “art and science” of protective relaying. Therefore, interpretation of ‘confirming acceptance’ means there may be differences in protection elements used by each entity but that there were no major disagreements and that generally the methods were acceptable and included using industry protection practices. 2) If parties do not respond with a review of changes, confirming acceptance becomes burdensome. In the event that confirmation of acceptance of the changes is not received by the initiating party they should be allowed to proceed once the 90 days, or mutually agreed upon response time, has expired. Failure to respond with confirmation of acceptance within the 90 days, or mutually agreed upon response time, can be considered as confirmation of acceptance.
Yes
Other comments (not associated with Question 5) are being provided which could not be addressed in the questions listed above: 1). R2 requires short circuit study every 24 months even though the SDT’s own rationale is that other requirements will trigger Protection System Studies first. Thus R2 increases burden on entities unduly, and we propose every 60 months consistent with TPL-001-2 draft 8 R2 2.6.1, which NERC has already filed for FERC approval. We understand that TPL short circuit study may be for a different purpose but that purpose is of commensurate importance. 2). Please replace “detect Faults on the BES Transmission System” with “protect the BES Transmission System” in all three places it appears in Figure 3. Our proposed revised wording is consistent with the rest of the wording in your example Figure 3, the Figure 4 wording, and NERC Interpretation 2009-17 already approved by the industry. 3). VSL escalation in 10 days is not representative of the severity of the violation. The SDT correctly points out in R1 rationale that it “has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements.” Many entities have numerous Interconnected Elements, and recommend the percentage approach allowed within NERC guidelines, as more representative of violation severity. We propose percentage breakpoints of 5, 10, 15 and 20% of an entity’s Interconnected Elements being late for Lower, Moderate, High, and Severe Violation Levels, respectively. Specifically, Lower would apply to up to 5% so that even a single Interconnected Element would be a violation. 4). Throughout the 1st and 2nd draft of this standard, there are Requirements that make reference to another Requirement. This occurs in several places (R1-1.1.2, R1-1.1.3, R2-2.1.1, R2.1.2, R2-2.2, R4-4.1, R4-4.2). By referring to another Requirement within a specific Requirement, it makes the overall standard difficult to follow and distracts from the objective of a specific Requirement because of having to read between two Requirements to understand the overall meaning. We appreciate the Drafting Teams perspective, but the SERC PCS believes that such cross references are

confusing. 5). Under R1 – MI measure wording does not read as a completed statement. Suggest removing 'that' from the first sentence. 6) The process chart is a direct indication that this process and undertaking for entities will be overwhelming. New systems will be required to track many details of timeframe requirements and communication dates. Additional resources will be required placing increased workload for an effort to change the process that already works for us when working with other entities. The Drafting Team indicated, 'there is no evidence there is widespread miscoordination of protection systems.'

ACES Standards Collaborators
Ben Engelby
No
(1) We disagree with the inclusion of the "least number of power system Elements" in the purpose. The purpose should be to simply coordinate the Protection Systems for Interconnected Elements. While trying to minimize the number of Elements that should be removed from service is a laudable goal, it will create an incentive for auditors to determine if there is a better way to protect the registered entities systems. How else could an auditor know that the absolute minimum of Elements have been determined unless they tried optimize the zone of protection themselves. The use of different but related terms causes confusion. For instance, what is the difference among "power system Elements," "Elements," and "Interconnected Elements"? Based on the definition of "Element," we assume "power system Elements" is intended to be the same. If so, we suggest dropping "power system" to avoid confusion. (2) Similar to the purpose statement, the Applicability Section, (4.2) Facilities is unclear. The statement "Interconnected Elements of the BES that require coordination for isolating those faulted Elements" includes superfluous language. In general, NERC enforces standards against the BES. Thus, it is not necessary to include "of the BES." To ensure absolute clarity, we suggest the definition of Interconnected Element be modified to specifically limit it to the BES as well. Also, we recommend striking everything after Interconnected Elements in the purpose statement as it is unnecessary and provides no additional clarification on the Facilities to which the standard applies. (3) Because no generic questions asking for additional comments was provided, we are providing our concerns that do not fall under one of the specific questions asked of the drafting team here. (4) Please change the wording of Part 1.2 as the current wording has some unintended consequences. We think "to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement" should be changed to "to the other owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of the associated Protection System Study." The current language literally reads that the TO, GO, and DP shall provide the PSS results to itself. It also reads that all the Protection System Studies for a TO, GO, or DP must be provided to the other protection system owners of all of the Interconnected Elements even if the other owners only own protection systems for one of the TO, GO, or DP's Interconnected Elements. As an example, consider that TO X shares two separate Interconnected Elements with TO Z and GO A.

The Interconnected Element between TO X and TO Z is called Tie-line B and the Interconnected Element between TO X and GO A is GSU C. The requirement would literally require TO X to share its Protection System Study results for both Tie-line B and GSU C with both GO A and TO Z even though, GO A has no interest in Tie-Line B and TO Z has no interest in GSU C. This could be solved with the simple edit described above. (5) We find that addition of "For each Facility associated with an Interconnected Element on its System" in R2 confusing. First, what is an associated Facility? Second what is intended by the use of Facility instead of Element? Considering Interconnected Facility in the last draft was change to Interconnected Element and Facility was used in this requirement, it would appear some delineation is meaning is intended between Element and Facility. Since Element and Facility have nearly the same meaning in the NERC Glossary of Terms that delineation is unclear and we would appreciate further explanation of the intent. (6) We found the inclusion of quotes on the phrase "Protection Systems installed to detect faults on the BES Transmission System" confusing. There is no reference. We suggest removing the quotes as they are superfluous. The meaning is still communicated without them. If they remain, please provide a reference. We assumed it came from section 4.2. If the quote did come from that section, it is not quite correct. It is missing "for the purpose of detecting" and "faults" is not capitalized. (7) The purpose statement of PRC-001-3 needs to be further modified. With the deletion of all of the requirements but Requirement R1, the purpose to "ensure system protection is coordinated among operating entities" is no longer achieved.
No
(1) We recommend modifying the definition of Interconnected Element such that is dependent on actual registered entity ownership rather than functional entities. As an example, a generation Element would only be considered an Interconnection Element if the GO and TO were separate corporate entities. If the functions were the same registered entity, coordination would already occur and the generation Elements should not be considered an Interconnected Element. To do otherwise will only cause significant compliance problems that may not support reliability. A utility that owns generation and transmission may not have a clear point of interconnection. This would be especially true for units installed prior to the advent of open access in the mid-1990s. If the point of interconnection is not well defined, how can an Interconnected Element be defined? It would be arbitrary to pick the GSU or an Element in the switchyard. Furthermore, focusing on ownership would actually make the proposed standard consistent with the existing PRC-001-2. That standard does not explicitly require coordination among different function entities within the same registered entity. (2) Interconnection Element definition is proposing an administrative burden of having to coordinate within the same registered function. Documenting coordination efforts made to external functions is reasonable for reliability; however, keeping records of internal coordination is unnecessary. What would an entity be required to show if there was only one protection system engineer in the organization? Would that single person be required to document coordination among him/her self? We feel that this portion of the definition should be struck – it is more appropriate to clarify the coordination of protection system elements should be among external registered entities in the requirements. There should not be any requirement for internal protection system coordination, especially not in a definition.

No
(1) While we do not disagree with the time frame, we question if it should be part of the requirement. It makes more sense to include the time frame for initial compliance of a requirement in the implementation plan. In that way, the initial compliance time frame does not persist in the standard long after it is no longer needed. It is common to utilize the implementation plan to describe initial compliance dates, especially when the requirement is asking for documented studies. After the studies are complete, there is not a need for a timeframe. Furthermore, FERC approves implementation plans as part of the standards package so there is no issue with whether the implementation plan is enforceable. (2) Conceptually, we agree with the intent of the standard and this requirement as it is presented in the application guidelines. However, more refinement is needed to make this requirement mirror what is explained in the application guidelines. For instance, we recommend clearly stating in Requirement R1 that the responsible entity is only responsible for performing Protection System Studies (PSS) for only those breakers it owns and are protecting the Interconnection Element. The standard is close to capturing this intent with the statement "its System" in Part 1.1. It would be better it if was changed to "Perform a Protection System Study for each of its Protection Systems that are protecting an Interconnected Element." A GO and DP do not really have systems so the current language is not appropriate for these functions. The application guidelines provide this clarity and would be helpful if the intent was clearly stated in the requirements.
Yes
(1) We had no issues with the use of agreement in the previous version. Coordination of protection systems is important enough to obtain agreement. Furthermore, we believe confirming acceptance and reaching agreement are synonymous. If two entities need to "resolve differences and confirm acceptance that their Protection Systems are coordinated," that is the same as stating that the entities need to reach an agreement.
No
(1) The measures do not match the requirements. For example, R4 requires entities to confirm acceptance, which would demonstrate that each affected entity received notification. Again, the drafting team is using synonyms that produce the same result as the prior draft. To show evidence that the information was "provided" would have to be some sort of notification of receipt. (2) Does the drafting team intend further actions for coordination beyond providing the studies to applicable entities? (3) We recommend the drafting team develop an RSAW to better explain how compliance would be measured against this standard. (4) Thank you for the opportunity to comment.
Group

Sasa Maljukan
Yes
We agree with this Purpose statement and we commend the drafting team for moving this

standard in the right direction. However, in line with our previous comments from the first posting, there still seems to be a significant gap in reliability by not identifying what elements of the Protection System need to be co-ordinated between entities. Perhaps this can even reside in the Application Guide. A poor or incomplete Protection System Study is worthless and negates all the work needed to satisfy this standard. As identified by the drafting team, there may be no evidence of mis-coordination between traditional protections that detect faults, but for co-ordination of say generator loss of excitation protection settings or out of step relaying during a fault condition – is that meant to be covered in this standard or elsewhere? The latest draft of PRC-019-1 indicates studies conducted under that standard are for steady state conditions – not fault conditions. PRC-023 provided clear direction on what protection elements to mitigate and even provided options on how to mitigate those elements. We feel PRC-027 is an effective vehicle to convey at least the "what" for Protection System co-ordination during faults between entities and will allow entities to perform and document consistent Protection System Studies.
No
For Protection System Study: Suggest adding a phrase:"A study between two or more interconnected power system Elements that demonstrates existing or proposed Protection Systems operate in the desired sequence for clearing Faults".
No
Hydro One believes 60 months is a more appropriate time frame to conduct, document and obtain consensus for a protection system study. This timeframe is also more in line with the timeframe proposed in the draft PRC-019-1 in Project 2007-09. Large entities and small entities have the same time frame to complete this work which seems unreasonable. Alternatively, an extended period should be provided based on a formula that factors the quantity of interconnected power system elements.
No
This change seems more ambigious than "reach agreement". How can changes to Protection Systems occur unless agreement is reached via a signed off Protection System Study? What does it mean to "confirm acceptance"?
Yes
Individual
Michael Moltane
ITC
Yes
No
The general idea of the Interconnected Element is acceptable. However, when one Registered Entity takes care of coordination between two Functional Entities, or coordinates all protection coordination between the two systems, the documentation will become onerous and not

enhance the reliability of the BES. The definition of the Protection System Study still needs further clarification. It is not clear what calculations/documentation must be kept to properly demonstrate compliance with the requirement of a "study." Past practice may have kept calculations and correspondence, which adequately demonstrate "evidence of coordination," but might or might not be adequate to a "protection system study" for future coordination efforts.
No
The amount of work required to comply with this requirement may be significant and may impact ongoing efforts to upgrade and improve the system. The above items that need to be documented can often be discussed and agreed to verbally between parties and are were often not part of a permanent record. The additional record keeping required may be significant and not add to the reliability of the BES.
Yes
Yes
Figures 1-5 designate a preferred responsibility of coordination on either entity which contradicts with intent of R3. R3 details all the changes which must be provided to the adjacent utility, seemingly so they can coordinate their protection over yours. However, Figures 1-5 place the coordination responsibility on the utility which does not own the Protection System. I agree that R3 should remain almost as-is. However, the coordination responsibilities in Figures 1-5 should be reversed or preferably removed. Owner R should be responsible for coordinating Breaker A relays. Only the owner should be responsible for coordinating this relay. SDT needs to define the term "interconnecting bus" and perhaps identify the interconnecting bus in Figures 1-5. In Figures 1-4 the Interconnected Element is a line.
Individual
Michael Falvo
Independent Electricity System Operator
Yes
We agree with the purpose statement, but suggest to add "settings" after protection system (with the "s" removed") to make it clear that it is the coordination of the settings, not the design of protection systems.
No
The definition of Interconnected Element is confusion since there is a mixture of Functional Entities and Registered Entities, and some in the industry equate Functional Entities to Registered Entities. To avoid this confusion, we suggest to replace Functional Entities with asset owners or facility owners. If deemed desirable, the asset owners can be qualified by Transmission Owners, Generator Owners and Distribution Providers in parentheses
Yes
Yes

We agree with the intent of the proposed changes, but believe some editorial changes are necessary for more clarity. We suggest the following wording for the SDT's consideration: "Confirm with the owner(s) of each Facility associated with the affected Interconnected Element that it accepts (or acceptance of) the resulting Protection System(s) changes." In fact, Part 4.1 could also be worded to add clarity: "Within 90 calendar days after receipt of the proposed Protection System(s) changes,"
No
(1) We do not have a strong view one way or the other with respect to "provided" versus "demonstrating". However, the wording used among Measures needs to be consistent. For example, in M1 the wording is "Acceptable evidence for Requirement R1, Part 1.1 and its subparts, Parts 1.1.1. and 1.1.2, and 1.1.3 is a dated Protection System Study, or the summary results of…" seems reasonable since it shows the examples for "acceptable evidence". The examples listed illustrate what constitute "acceptable evidence". However, in M2, the wording "Acceptable evidence for Requirement R1, Part 1.2 demonstrating that the summary results of each Protection System Study (hard copy or electronic file formats) was provided…." Does not illustrate what constitutes "acceptable evidence", thereby leaving that to interpretation. We suggest M2 (and M4) be reworded along the same line as that for the other Measures (M1, M3, M5 to M9). (2) The Comment Form does not have a question on "Do you have any other comments?" Therefore, we are submitting the following comment under this Question. We reiterate our concerns previously expressed with respect to PRC-001: We do not agree with the proposed PRC-001-3 for the following reasons: a. The purpose statement is inappropriate as the standard now does not address Protection System coordination among operating entities. b. Requirement R1, as written, is not measurable and should be rescinded. If this is a training requirement, it should be transferred to the appropriate PER standards. c. Measures M1 is removed from the standard. This does not conform with the Elements of a Reliability Standard template, specifically those specified in the "Mandatory and Enforceable Sections of a Standard". d. The SDT holds the position that Requirement R1 belongs to another project and thus has proposed that R1 remain in PRC-001-2 until its reliability objective is addressed by either a revision to an existing standard or development of a new standard. However, leaving this not measurable and unnecessary requirement in PRC-001-3 is an incomplete and perhaps irresponsible move given the SDT is assigned the task to change or transform PRC-001 into a revised or new standard. At a minimum, the SDT could have proposed a revision to the SAR or this project to expand the scope and identify the appropriate PER standard which can be a home for Requirement R1, and made the appropriate wording change accordingly. Having a new PRC-027-1 standard to house some of the PRC-001-2 standard but not finding a home for the remaining R1 does not help reliability. We urge the SDT to propose a revision to the SAR, or seek the Standards Committee's advice/direction for appropriate actions. The SDT's response to our previous comment was "This subject is outside the scope of this drafting team; however, your comment will be forwarded to NERC staff." We do not believe that the staff has brought this to the Standards Committee's attention. Note that the Standards Committee is responsible for managing the standards development process and as such, can make an informed decision to either request the SDT to expand its scope (via an amended SAR) to address the PRC-001 issue, or to ask staff or the SDT to prepare a separate SAR to address the issue in parallel.

Leaving the PRC-001 hanging out there without a recourse is not a satisfactory solution, and may in fact harm reliability. Once again, we urge the SDT to take the initiative to bring this issue to the Standards Committee, with a proposal to amend the SAR or prepare a new SAR, or seek its advice and direction before continuing work on this project.
Individual
Anthony Jablonski
ReliabilityFirst
No
ReliabilityFirst abstains and offers the following comments for consideration: 1. Requirement R1, Part 1.1.1 a. ReliabilityFirst questions the rationale for the 48 calendar month window to perform a Protection System Study if NO study exists. ReliabilityFirst believes that a Protection System Study is one of the fundamental reasons for the standard and believes if NO study had ever been performed, one should be performed as soon as possible (12 months). Within the rationale section, the SDT states: "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements that warrants a shorter time frame." With no widespread mis-coordination of protection systems, ReliabilityFirst questions the actual need for the standard itself. 2. It is not clear where the 10% threshold in Part 1.1.2 and calculated in Part 2.1.2 is applied. Does the 10% threshold apply to the total bus Fault current at the interconnecting bus or the contributing Elements? If it is the total, then there are situations where some of the sources into the bus may change their contribution quite a bit more than the 10% threshold but yet the total change could be less than 10%. Protective relaying is set in reference to the Element it is protecting or, to be more precise, the instrument transformers associated with an Element. The 10% threshold should be applied to the Interconnecting Element as its contributing quantities could change significantly even if the total Fault current stayed nearly the same. It is the Fault quantities on the Element that the interconnection protection sees – not the total bus Fault current (unless the Interconnecting Element is a bus). It is also not clear which phase or sequence currents are being used in the %Deviation calculation. Is it 3I0 (3 times zero sequence) current for single line to ground Faults and I1 (positive sequence) current for 3-phase Faults? It should be noted that if variations in Fault current of 10% are acceptable, then entities may need to adjust their criteria to use margins of 15% or more to consider other sources of error such as relay and instrument transformer accuracy.
Yes
ReliabilityFirst abstains and offers the following comments for consideration: 2. Requirement R4 Violation Severity Level a. During the previous comment period, ReliabilityFirst recommended that VRF for R4 be changed to "High" since this is dealing with interconnection protection systems. The SDT response by indicating they "…believes the VRF for Requirement R4 more aligns with the NERC criteria for a medium risk. " After reading the NERC criteria for a medium risk, ReliabilityFirst would agree only if the Time Horizon of this requirement is

changed to “Long Term Planning”
ReliabilityFirst offers the following comments on the VSLs for consideration: 1. Requirement R3 VSL a. ReliabilityFirst believes VSL for Requirement R3 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” Requirement R3, Part 3.1 and 3.1 requires the entity to provide “details” and the associated VSLs references “information”. ReliabilityFirst recommends the SDT modify the VSL to be consistent with the language in the requirement. b. It is unclear which requirement the last VSL under the “Severe” category is referring to. ReliabilityFirst recommends adding the Part number in which the VSL is associated with. 2. Requirement R4 VSL a. ReliabilityFirst believes VSL for Requirement R4, Part 4.1 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” The VSLs associated with Part 4.1 use the language “confirmed acceptance” though the language in the actual Part talks about review of summary results and response as to whether further action is required. ReliabilityFirst recommends the SDT modify the VSL to be consistent with the language in the requirement as follows: “The responsible entity reviewed the summary results of a Protection System Study and responded as to whether further action is required per R4, Part 4.1, but was late by 10 calendar days or less”

R1 The requirement is written to be applicable to Transmission Owners. In our case we have several lines where we do not own the Interconnecting Element, but operate the Protection System at one terminal. Based on the Glossary, we believe this makes us a Transmission Operator. If this interpretation is accurate, there would seem to be a gap in the Applicability of the Standard, as it does not include the Operator. R2 We are wondering why this Requirement is only applicable to the Transmission Owner. Should it not be applicable to all the functional entities similar to the language used in R1, R3, and R4? General comments In reviewing the Standard, there was confusion related to the Protection System Study and what the 10% was measured against. We believe that the Protection System Study referred to in the Standard is that group of faults and contingencies used to create the in-service settings of the relay. Could this be clarified? Additionally, the exchange of information between Functional Entities is a

critical part of PRC-027, however, no mechanism is in place to ensure proper contact information is available. Employee movement within a utility may render contact information obsolete. In addition, Independent Power Producers, such as wind farms, are not typically staffed by local personnel or by individuals with a knowledge of System Protection. Because PRC-027 relies so heavily on the exchange of information it is not sufficient to simply place time lines on the transfer of data between Functional Entities. Additional controls to ensure that these data requests reach the appropriate people is needed.

See page 19 of the redline PRC-027 Guidelines and Technical Basis. " System condition used in Protection System Studies include maximum generation with the transmission system under normal operating conditions and under single contingency conditions." Please clarify that "single contingency conditions" refers to breaker failure or protective system failure. It is not intended to mean single contingency operating conditions such as line or transformers out of service.

Clarification is necessary for the definition of "Interconnected Element" which requires the TO and GO function within a company to treat each other as if they were unrelated entities and apply all of this standard's requirements.
No
"The results based objective is that the registered entities communicate and coordinate with each other. A simple statement by both entities that they have reviewed each other's settings and agree they coordinate is sufficient proof that the reliability objective of this standard is met." Performance of a PSS is an intermediate step toward achieving coordination. It does not improve reliability if an entity does not act on it. Only in the final step – when agreed upon changes are made – does system reliability actually improve. The standard should consist of R3.1 (one side makes a change which triggers a review), followed by R4.2 (all parties agree to

the changes to be implemented). Documenting the process steps between these two points in time does not improve system reliability.
Yes
Yes
Although this is unrelated to Question 5 there was no other space allocated for the for “any other comments.” While this is most likely a clerical error, we feel it is not appropriate to post a standard without making such a question available.

seattle city light
paul haase
Yes
No
Seattle City Light does not agree with the use of Functional Entity in the definition of Interconnected Element. Seattle has several objections. First, although “Functional Entity” is capitalized in the draft Standard, this term is not defined in the NERC Glossary of Terms. A second objection is that “Functional Entity” in this role does not add clarity to the Standard. “Functional Entity” is defined in the NERC Reliability Functional Model as “the term used in the Functional Model which applies to a class of entity that carries out the Tasks within a Function.” This definition refers to other terms defined only with the Functional Model document (“Task,” “Function”). It is not illuminating as to defining the bodies joined by Elements. The third and strongest objection is that use of the term “Functional Entity” in the proposed definition is incorrect and inconsistent with the NERC Functional Model, and as such creates confusion about Standard obligations for entities registered for more than one function. The NERC Functional Mode Version 5 (November 30, 2009) explicitly does not require any particular organization or assignment of functional Tasks or ownership of Elements for any multi-function entity. Functional tasks and Elements exist undifferentiated across an entity as a whole, and the NERC Functional Model document states clearly that no further differentiation is expected, required, or implied. (See, for example, p. 7 “The Functional Model describes a functional entity envisioned to ensure that all of the Tasks related to its Function are performed. The Model, while using the term ‘functional entity’, is a guideline and cannot prescribe responsibility” and p.8 “The Model is independent of any particular organization or market structure.”) Seattle City Light, for example, is a vertically integrated municipal utility registered for 11 functions: BA, DP, GO, GOP, LSE, PC, PSE, RP, TO, TOP, and TP. Registration is

made without differentiation: no particular sub-organization within Seattle City Light is identified as owning GO Elements, TO Elements, and so on. The Model is simply that Seattle City Light or any other multi-function entity owns a set of Elements s a unit. By contrast the draft definition relies upon differentiation of ownership of Elements within a multi-function entity, so that it can be determined if the proper studies were undertaken or not. Such differentiation is outside the Model and introduces complexities and unintended consequences not envisioned by the Functional Model and the term “Functional Entity.” The same confusion about the term Functional Entity occurs in draft Standard COM-003-1. Seattle suggests that NERC immediately clarify the use of this term. Until the definition of the Functional Model is changed and changed significantly, the use of Functional Entity to define obligations within a Standard or definition (other than in the Applicability section) should be eliminated. As is it is simply a misreading, tempting as it may be, to presume that Functional Entity Tasks are assigned with greater granularity than to an organization as a whole. And it is a misreading that does not promote high quality Standards that can be consistenly enforced across auditors and across regions. You can do better, and should do better. Seattle apologies that it does not have a suggested fix at this time, because the Functional Entity approach is so fundamentally wrong. Entitly new wording would be required to capture Elements existing within the same registerd Entity.
Yes
Yes
No
Because there is no "other comments" section included in this comment form, the following comments about the timelines for specific actions are appended here. (R3.2) "Data Requests . . . . 30 Days or agreed to schedule' Seattle requests that "agreed to schedule" be clarified, in particular the limits in determing this schedule. If no further clarity is added, Seattle suggests that "or agreed to schedule" simply be deleted. (R2.1) Short Circuit Study . . . . . . 24 months SCL recommends that the time line of 24 months be removed and that the 10% change in fault current criteria serve as the replacement for this requirement. (R4.1) "Review PS Study . . . . .90 Days or agreed upon schedule" Seattle is concerned that, depending upon the complexity of the study, a lot of back and forth communication between the utility entities may be required. Please clarify 1) if each response to, or revision of the study trigger another 90 day review period and 2) the limits as the defining an "agreed to schedule." If no further clarity is added regarding agreed to schedules, Seattle suggests that "or agreed to schedule" simply be deleted.
Individual
Stephanie Monzon
PJM Interconnection

PJM supports revising the language in Requirement 1 of PRC-001 by replacing the term ‘familiar.’ This word is ambiguous and confusing in terms of the specific expectations of the applicable functional entities regarding the purpose and limitations of protection system schemes applied in its area.
Individual

Consumers Energy
The following comments are unrelated to Question 5. However, there has not been a question/section added for other/general comments. 1) In the process flow chart (page 22) the R2.2 box which states “Within 30 days, provide each owner of the Protection System associated with the Interconnected Element”, we believe the key element, “the updated Fault current values” was not included in this statement. 2) In reading the Example Process on page 23, we were expecting to be able to follow it through the process flow chart on page 22 as one possible example to guide you through the standard process. As it started off as a request for information, we assumed the flow process started in the R3 box “Data request” which indicates no further action. Yet the example process continues on. We would suggest an improved explanation paragraph be added to the “Example Process” to better clarify what the example is intended to illustrate.

No
In regard to the purpose statement, FirstEnergy supports the response submitted by the RFC Protection Subcommittee which is repeated here for convenience. The purpose should mirror the objectives of the Protection Systems Study. “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence.” The reasons being that an entity may choose to overtrip distribution transformer (non-BES) protection, to employ zone 1 extension schemes, or for other valid reasons trip more than the least number of Elements to clear a Fault.
No
FirstEnergy supports the proposed definition for Protection System Study but believes the Interconnected Element definition requires some modification. As presently written the Interconnected Element definition appears to inadvertently omit coordination of two transmission owners that have tie-lines to each others systems. The two transmission owners are not “separate Functional Entities” but rather two Registered Entities performing the same functional entity (transmission owner) obligations. Additionally, it is understood that the intent is to also require Protection System coordination at interconnection points where the point of interconnection may entail facilities owned by the same NERC Registered Entity having multiple functional entity classifications. FirstEnergy proposes the following definition for Interconnected Element “An Element that electrically joins and interconnects facilities owned by: a) separate Registered Entities, or b) the same Registered Entity, but includes multiple functional entity (DP, GO or TO) responsibilities.”
No
A) FirstEnergy supports the 48 month timeframe to complete initial Protection System Studies. However, based on the fact that the SDT may have overlooked system tie points of two transmission systems (see our response to Q2) the completion of Protection Studies may require additional time. FE could support a 48 month implementation and encourages the drafting team to consider a staggered plan that requires earlier completion for higher voltage systems. For example, 1) systems operated at 300kV and higher within 24 months, 2) systems operated at 200kV and higher up to 300kV within 36 months and 3) systems operated at 100kV and higher up to 200kV within 48 months. B) As expressed in FirstEnergy’s Draft 1 comments,

we do not support requirement text that is better placed in an Implementation Plan. A requirement should be written such that it is everlasting. As written, R1 part 1.1.1. has no meaning after the 48 month period expires. C) It is FirstEnergy's experience that the Transmission Owner would likely have the expertise and staff to perform the desired Protection System Study. The team should consider whether or not the DP and GO would typically be performing their own independent study or collaborating with the TO in a supporting role by providing data and reviewing study results. In regard to items B) and C) FirstEnergy proposes the following for Requirement R1. **Start of proposed requirement R1 text ** R1. Each Transmission Owner shall perform a Protection System Study for each Iterconnected Element on its System associated with a Generator Owner, Distribution Provider or another Transmission Owner. Each study shall include at a minimum: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning] • the protective relay settings reviewed • power system Elements to be isolated • contingencies evaluated • Fault currents used • any issues identified • any revisions proposed 1.1. Each Transmission Owner shall update its Protection System Study: 1.1.1 Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required. 1.1.2 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required. 1.2. Within 90 calendar days after the completion of each Protection System Study the Transmission Owner shall provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement. **End of proposed requirement R1 text ** FirstEnergy recommends that for ease of ordered reading that the numbering of Measures be tied to the Requirement number. For example Requirement R1 has two measures M1 and M2. Consider renumbering to M1.1 and M1.2.
No
FirstEnergy proposes that R4 Part 4.2 be deleted. The requirement is overly burdensome and R4 part 4.1 should provide sufficient evidence of whether or not the entity receiving study results believed any further action was required. Absent any such notification, the party would by default be accepting of the information. In regard to need for "acceptance" prior to planned changes FirstEnergy does not believe this is necessary. The drafting team in its rationale provided for Requirement R1 indicated "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements" therefore we do not believe R4 part 4.2 is a necessary reliability requirement. Furthermore, other changes (R3 part 3.3) potentially trigger upgraded Protection System Studies being communicated without "acceptance" prior to their implementation.
Yes
FirstEnergy supports the change described by Question 5. Other comments from FirstEnergy in addition to the specific questions asked by the drafting team: A) PRC-001-3 EFFECTIVE DATE: The PRC-001-3 standard needs to be edited to match what is stated in the Implementation Plan. The Implementation Plan indicates that both PRC-027-1 and PRC-001-3 will become effective at the same time which is stated as being the first day of the first calendar quarter

that is six months beyond the date that this standard is approved by applicable regulatory authorities. However, the PRC-001-3 standard in its Effective Date section indicates the first day of the first calendar quarter twelve months following applicable regulatory approval. B) PRC-001-3 VERSION HISTORY: The Version History of the PRC-001-3 standard needs some clean-up. The table reflects a "version 4" however this project creates version 3. Looks like the fix is to delete the row labeled version 3 and change the version 4 to reflect 3. The description text in that row is correct. C) PRC-001 VERSION CHANGES: NERC needs to consider what it plans to do with the existing NERC BoT Approved versions PRC-001-1.1 and PRC-001-2 which have yet to be filed with FERC. It is recommended that NERC suspend the filing of those standards, keep it simple and file PRC-001-3 with this project. This will avoid undo industry confusion and transition. D) PRC-001-3 MISC CLEAN-UP: Section D, Part 1.1 revise Compliance enforcement authority" to read "Compliance Enforcement Authority (CEA)". This is a defined glossary term and is shown capitalized in other areas of the standard. In the second sentence, capitalize "entity" in the reference to "Regional entity". E) PRC-001-3 R1: Seems odd to have a standard with only one requirement. The requirement states "Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area." FE proposes that R1 or an alternate be moved to PER-005.

The primary purpose of protection system coordination is to ensure faults are cleared expeditiously and well under the critical clearing time, with the stated purpose of minimizing the number of elements isolated as a secondary consideration, not a primary consideration. As such, there is no recognition of the importance of remote back-up protection that backs up primary and secondary protection, but, does not necessarily share the same goal of minimizing number of elements tripped, but, does share the goal of clearing a fault within the critical clearing time.
No
The definition of Interconnected Element limits the scope of the standard too much. The standard only requires coordination between neighboring entities and not of protection of other BES equipment within the same entity, e.g., one TO’s transmission line protection with the protection of another transmission line owned by that same TO is not within the definition of Interconnected Element. It would seem that such a requirement would be necessary, e.g., each entity ensures that their protection internal to their system coordinates with itself, and that they coordinate at the boundaries with its neighbors. That would ensure coordination across the BES. Protection System Study definition should have a time element and a consideration for the critical clearing time, e.g., “and demonstrates that the resulting clearing time meets or beats the clearing time used in studies to comply with the TPL standards” or something to that effect

No
As worded, R1 seems to require two neighboring entities to perform independent studies. We would hope that the intent of the SDT is to allow any one entity to do a study and then the neighboring entity accept the results of that study, or to perform a joint study. We suggest the SDT make conforming changes to allow this.
Yes
No
First, there should be an “any other comments” question. Seeing that there isn’t one, we are adding our other comments here. R3 – There should be thresholds of change to the bullets. For instance, changing the no-load tap changer of a GSU does minimally change the impedance of the GSU). A transmission line neighbor installing a long chain link fence along the ROW will have a minimal impact on mutual coupling. These minimal changes do not require redoing the study, so, what percentage change in impedance requires redoing the study?

Exelon agrees with the Purpose statement as stated, however the questions and layout of this comment form doesn't provide an area to provide comments as to why we are voting negative. While requiring periodic coordination studies between entities is laudable, it is unnecessary. The coordination of a protection system, by nature, is tested every time it operates. We already have a standard, PRC-004-2, that requires all transmission protection system operations to be analyzed for correctness and any misoperations reported, along with corrective action plans to mitigate their cause. Our experience indicates the bulk of protection system misoperations are not caused by a lack of coordination studies. This standard, as written, continues to be vague and will lead to an inconsistent application of the requirements. Most importantly, we believe this standard is ill advised. Coordination of protection systems between entities was not a factor in the 2003 blackout. As such it clearly goes beyond the mandate of the 2003 blackout recommendations. Implementation of this standard will add little to the reliability of the bulk electric system while adding substantially to the amount of time and money an entity spends simply on compliance activities. Contrary to the goal of enhancing reliability, this standard will simply dilute available resources to the detriment of reliability.

It seems the real purpose of this standard is “To coordinate BES Protection Systems for Interconnected Elements”. The rest of the statement is already covered as part of the protection systems design which will involve coordination or not depending on any special issues or existing design limits.
Yes
No
To mitigate compliance risks for various types of data formats for existing studies and studies older than June 2007 this standard will likely require utilities to go back and update all data so that it meets the requirements and description of evidence in the application guidelines when the requirements become enforceable. This could likely take longer than 3 years. I would recommend more time such as 6 years based on two audit periods (time depends on the number of applicable system ties as well).
No
Getting acceptance within the required time frame is not in the control of the requestor. The concern is the numerous timelines in this standard that require timely responses will create an overly complex standard that will be difficult implement and to audit. The starting points for the timelines will be difficult to audit as well since much of this must be determined between two or more entities. How will enforcement view a requesting utility that sends a timely request but the response is a late confirmation of acceptance? The numerous time lines will create significant confusion and very complex data retention practices that will be difficult to track and difficult to audit. It appears the focus is more on time lines and the likely result is the content of the shared information will likely suffer due to the burden of tracking dated communications between entities. This draft standard includes time lines ranging from “prior to in service date, 30 days, 90 days, 6 months, 2 years and 4 years”. There should be fewer and simpler time lines with the focus on if the sharing of information took place and not on when did it take place. The SDT statement below should be generalized to the standard as a whole: “The SDT believes that it is not appropriate to specify a single time frame for providing the details of the wide variety of conditions listed in Requirement R3, Part 3.1 that may be associated with a particular change. This is because the SDT sees the entity initiating any change as having the incentive to move the process along in a timely fashion in order to both keep the associated project on schedule and confirm the changes are acceptable “prior to the in-service date,” At a minimum remove the calendar day references and make them all 6 months for simplicity so the option is to use and agreed upon time or 6 months. Possible Suggestions: A simpler method would be after the initial 4 years to perform a study then every

24 months perform a short circuit study to determine the present maximum available fault current values (single line to ground and 3-phase) at the interconnecting bus per Requirement R1 and demonstrate that the fault model was provided to the interconnecting entities within this time period along with the settings so the receiving entity can review against their design. Auditing would verify this data was sent on a two year schedule. For new protection interfaces verify protection studies or relay settings or summaries of studies were exchanged for review prior to the equipment going in service.
No
Measurement 9 for R4 requires confirmation of acceptance prior to implementation of any planned protection system changes. This appears to be similar to ‘demonstrating that each affected entity received notification.’ The concern is holding one company responsible for actions of another that is not under the requestor’s control. It is recommended that there be clarification that if the requestor does not get confirmation of acceptance in the proper time line then the requestor is not accountable or subject to violations. Another option is to remove R4.2.

Although the SRC agrees that protection systems should strive to interrupt only those elements closest in to a fault to avoid excessive interruptions, there are situations where it is necessary to trip elements beyond those that only interrupt the fault. To set a result for “…the least number of power system Elements are isolated to clear Faults” misses the primary goal for a reliability standard meant to protect the interconnected bulk electric grid. NERC standards should always have the underlying purpose to prevent cascading failures that affect interconnected systems. The stated Purpose must recognize that the “least number of power system Elements are isolated to clear Faults to maintain system integrity”. For example, a relay scheme could isolate a fault on a generator connected between two line terminals by opening the breakers on both ends of the line. This would fulfill the Purpose of “least number of power system Elements”, however, a protections scheme for that segment of transmission line may require that the next terminal along that line also be interrupted in order to prevent an unintended increase in load to a particular element due to the opening of the breakers closest to the fault.
No
The definition of Interconnected Element is confusing since there are a mix of Functional Entities and Registered Entities, and some in the industry equate Functional Entities to Registered Entities. To avoid this confusion, we suggest replacing “Functional Entities” with “asset owners” or “facility owners.” If deemed desirable, the asset owners can be qualified by Transmission Owners, Generator Owners and Distribution Providers in parentheses The SRC asks if the definition for “Interconnected Facility” needs to be expanded to include situations where a Functional Entity may cross regional boundaries and have facilities that interconnect

between the two, which may or may not be the same Registered Entity.
Yes
Yes
Yes
NERC must continue to correct such requirements, as it is not the responsibility of the entity subject to a requirement to ensure another party acts.

In regard to the purpose statement, FirstEnergy supports the response submitted by the RFC Protection Subcommittee which is repeated here for convenience. The purpose should mirror the objectives of the Protection Systems Study. “To coordinate Protection Systems for Interconnected Elements, such that the Protection Systems operate in the desired sequence.” The reasons being that an entity may choose to overtrip distribution transformer (non-BES) protection, to employ zone 1 extension schemes, or for other valid reasons trip more than the least number of Elements to clear a Fault.
No
FirstEnergy supports the proposed definition for Protection System Study but believes the Interconnected Element definition requires some modification. As presently written the Interconnected Element definition appears to inadvertently omit coordination of two transmission owners that have tie-lines to each others systems. The two transmission owners are not "separate Functional Entities" but rather two Registered Entities performing the same functional entity (transmission owner) obligations. Additionally, it is understood that the intent is to also require Protection System coordination at interconnection points where the point of interconnection may entail facilities owned by the same NERC Registered Entity having multiple functional entity classifications. FirstEnergy proposes the following definition for Interconnected Element: "Interconnected Element - An Element that electrically joins and interconnects facilities owned by a)separate Registered Entities, or b) the same Registered Entity, but includes those representing multiple functional entity (DP, GO or TO) responsibilities."
No
A) FirstEnergy supports the 48 month timeframe to complete initial Protection System Studies. However, based on the fact that the SDT may have overlooked system tie points of two transmission systems (see our response to Q2) the completion of Protection Studies may require additional time. FE could support a 48 month implementation and encourages the drafting team to consider a staggered plan that requires earlier completion for higher voltage systems. For example, 1) systems operated at 300kV and higher within 24 months, 2) systems

operated at 200kV and higher up to 300kV within 36 months and 3) systems operated at 100kV and higher up to 200kV within 48 months. B) As expressed in FirstEnergy's Draft 1 comments, we do not support requirement text that is better placed in an Implementation Plan. A requirement should be written such that it is everlasting. As written, R1 part 1.1.1. has no meaning after the 48 month period expires. C) It is FirstEnergy's experience that the Transmission Owner would likely have the expertise and staff to perform the desired Protection System Study. The team should consider whether or not the DP and GO would typically be performing their own independent study or collaborating with the TO in a supporting role by providing data and reviewing study results. In regard to items B) and C) FirstEnergy proposes the following for Requirement R1. **Start of proposed requirement R1 text ** R1. Each Transmission Owner shall perform a Protection System Study for each Iterconnected Element on its System associated with a Generator Owner, Distribution Provider or another Transmission Owner. Each study shall include at a minimum: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning] - the protective relay settings reviewed - power system Elements to be isolated - contingencies evaluated - Fault currents used - any issues identified - any revisions proposed 1.1. Each Transmission Owner shall update its Protection System Study: 1.1.1 Within six calendar months after determining or being notified of a 10% or greater change in Fault current at an interconnecting bus, as described in Requirement R2, or technically justify why such a study is not required. 1.1.2 According to an agreed upon time frame to meet the schedule when proposing or being notified of a change, as described in Requirement R3, Part 3.1 or Part 3.3, or technically justify why such a study is not required. 1.2. Within 90 calendar days after the completion of each Protection System Study the Transmission Owner shall provide to the owner(s) of the Protection System(s) associated with the Interconnected Element(s) a summary of the results of each Protection System Study performed pursuant to this requirement. **End of proposed requirement R1 text ** FirstEnergy recommends that for ease of ordered reading that the numbering of Measures be tied to the Requirement number. For example Requirement R1 has two measures M1 and M2. Consider renumbering to M1.1 and M1.2.
No
FirstEnergy proposes that R4 Part 4.2 be deleted. The requirement is overly burdensome and R4 part 4.1 should provide sufficient evidence of whether or not the entity receiving study results believed any further action was required. Absent any such notification, the party would by default be accepting of the information. In regard to need for "acceptance" prior to planned changes FirstEnergy does not believe this is necessary. The drafting team in its rationale provided for Requirement R1 indicated "The drafting team has no evidence there is widespread miscoordination of Protection Systems associated with Interconnected Elements" therefore we do not believe R4 part 4.2 is a necessary reliability requirement. Furthermore, other changes (R3 part 3.3) potentially trigger upgraded Protection System Studies being communicated without "acceptance" prior to their implementation.
Yes
FirstEnergy supports the change described by Question 5. Other comments from FirstEnergy in addition to the specific questions asked by the drafting team: A) PRC-001-3 EFFECTIVE DATE: The PRC-001-3 standard needs to be edited to match what is stated in the Implementation

Plan. The Implementation Plan indicates that both PRC-027-1 and PRC-001-3 will become effective at the same time which is stated as being the first day of the first calendar quarter that is six months beyond the date that this standard is approved by applicable regulatory authorities. However, the PRC-001-3 standard in its Effective Date section indicates the first day of the first calendar quarter twelve months following applicable regulatory approval. B) PRC-001-3 VERSION HISTORY: The Version History of the PRC-001-3 standard needs some clean-up. The table reflects a "version 4" however this project creates version 3. Looks like the fix is to delete the row labeled version 3 and change the version 4 to reflect 3. The description text in that row is correct. C) PRC-001 VERSION CHANGES: NERC needs to consider what it plans to do with the existing NERC BoT Approved versions PRC-001-1.1 and PRC-001-2 which have yet to be filed with FERC. It is recommended that NERC suspend the filing of those standards, keep it simple and file PRC-001-3 with this project. This will avoid undo industry confusion and transition. D) PRC-001-3 MISC CLEAN-UP: Section D, Part 1.1 revise Compliance enforcement authority" to read "Compliance Enforcement Authority (CEA)". This is a defined glossary term and is shown capitalized in other areas of the standard. In the second sentence, capitalize "entity" in the reference to "Regional entity". E) PRC-001-3 R1: Seems odd to have a standard with only one requirement. The requirement states "Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area." FE proposes that R1 or an alternate be moved to PER-005.

The purpose is laudable, but the means by which it is to be achieved needs more work. The Application Guidelines section of PRC-027 makes reference to, “the entity performing the Protection System Study [for R1],” but the standard provides no indication of who this should be. This responsibility is simply assigned to, “Each Transmission Owner, Generation Owner, and Distribution provider.” The obligation placed on GOs by use of the word “each” in R1 cannot be fulfilled, however, except under the circumstance of having a vertically-integrated utility. An independent GO does not have knowledge of the TO’s system, and in a deregulated market is not allowed to have such knowledge. The TO and TOP are provided with detailed information of the GO’s equipment, however, and therefore perform all interconnection-related studies. This is as it should be, because changes in the transission don’t matter to a GO. We do not modify our Protection Systems in response to changes to the Fault current at an interconnecting bus, we just trip the breaker if and when required to protect the generator and GSU (or if so commanded via a special protection system). Everything involving sequencing the tripping of multiple Elements is in the TO’s system. The best approach would be to restrict the applicability of PRC-027 in its entirety exclusively to TOs, with GO obligations remaining as per PRC-001, i.e. reporting changes and addressing any issues raised by the TOP. If GOs that own substations, distribution systems and numerous miles of transmission conductors (e.g. large-
