Mapping of Requirements from PRC-001-1.1(ii) to PRC-027-1

Project 2007-06 System Protection Coordination

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.	Being addressed by Project 2007-06.2 Phase 2: System Protection Coordination	N/A
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	Being addressed by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. • Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition. R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.	PRC-027-1: R1 and R2 Note: Applicability changed to GO, TO and DP	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults. The process shall include: 1.1. A method to review and update the information required to develop new or revised Protection System settings. 1.2. A review of Protection System settings affected by System changes. 1.3. A review of existing entity-designated Protection System settings based on one of the following: • **Periodic Fault current studies:** A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the bus under study, and evaluated in a time interval not to exceed six calendar years, or • **Periodic review of Protection System settings:** A time interval, not to exceed six calendar years, or • A combination of the above. 1.4. A quality review of the Protection System settings prior to implementation.

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		1.5. For new or revised Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, (Transmission Owners, Generator Owners, and Distribution Providers), procedures to: 1.5.1. Communicate the proposed Protection System settings with the other functional entities. 1.5.2. Review proposed Protection System settings provided by other functional entities, and respond regarding the proposed settings. The response should identify any coordination issue(s) or affirm that no coordination issue(s) were identified. 1.5.3. Verify that any identified coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation. R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement the process established in accordance with Requirement R1.
R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator	PRC-027-1: R1 and R2	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process to develop settings for its BES Protection Systems to

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
Operators, Transmission Operators, and Balancing Authorities.	Note: Applicability changed to GO, TO and DP	operate in the intended sequence during Faults. The process shall include: 1.1. A method to review and update the information required to develop new or revised Protection System settings. 1.2. A review of Protection System settings affected by System changes. 1.3. A review of existing entity-designated Protection System settings based on one of the following: • **Periodic Fault current studies:** A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the bus under study, and evaluated in a time interval not to exceed six calendar years, or • **Periodic review of Protection System settings:** A time interval, not to exceed six calendar years, or • A combination of the above. 1.4. A quality review of the Protection System settings prior to implementation. 1.5. For new or revised Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional

		entities (Transmission Owners, Generator Owners, and Distribution Providers), procedures to: 1.5.1. Communicate the proposed Protection System settings with the other functional entities. 1.5.2. Review proposed Protection System settings provided by other functional entities, and respond regarding the proposed settings. The response should identify any coordination issue(s) or affirm that no coordination issue(s) were identified. 1.5.3. Verify that any identified coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation. R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement the process established in accordance with Requirement R1.
R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:	Being addressed by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems. R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.		
R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Remedial Action Scheme in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.	Being addressed by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Violation Risk Factor and Violation Severity Level Justification Document

Project 2007-06 System Protection Coordination

This document provides the standard drafting team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the

preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
NERC VRF Discussion	A medium VRF is appropriate for this requirement because an entity's failure to establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk-Power System. However, a violation of this requirement is unlikely to lead to Bulk-Power System instability, separation, or cascading failures. A medium VRF assignment is appropriate given the level of risk to System performance resulting from the lack of coordinated Protection Systems. For these reasons, the requirement meets the NERC criteria for a Medium VRF.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System. Requirement R1 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R1 mandates that entities establish a process to address all aspects of BES Protection System coordination, including the updating of modeling information and the exchange of Protection System data with other owners when applicable (see, Requirement R1, Parts 1.1 and 1.5).

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	Because Parts (previously called sub-Requirements) are no longer assigned individual VRFs, this Guideline is no longer applicable.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R1 and R2 which are related to developing and documenting a Protection System Maintenance Program and have VRFs of Medium.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A medium VRF is appropriate for this requirement because an entity's failure to establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the Bulk-Power System. However, a violation of this requirement is unlikely to lead to Bulk-Power System instability, separation, or cascading failures. A medium VRF assignment is appropriate given the level of risk to System performance resulting from the lack of coordinated Protection Systems. For these reasons, the requirement meets the NERC criteria for a Medium VRF.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include one Part.	The responsible entity established a process in accordance with Requirement R1, but failed to include two or more Parts. OR The responsible entity failed to establish a process in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the Severe and High VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSL uses similar language to that used in the associated requirement and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based upon a single violation, not a cumulative number of violations.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is High	
NERC VRF Discussion	A high VRF is appropriate for Requirement R2 because failure to implement the process established in Requirement R1 could, "under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition." This requirement meets the NERC criteria for a High VRF.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS. Requirement R2 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R2 mandates that entities implement the process established in Requirement R1 that incorporates all actions necessary to achieve coordination of Protection Systems.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	Because Parts (previously called sub-Requirements) are no longer assigned individual VRFs, this Guideline is no longer applicable.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R3 and R4 which are related to implementing time-based and performance-based maintenance program(s) respectively for Protection Systems.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A high VRF is appropriate for Requirement R2 because failure to implement the process established in Requirement R1 could, "under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition." This requirement meets the NERC criteria for a High VRF.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is High	
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The responsible entity implemented the process established in accordance with Requirement R1, but failed to implement one Part.	The responsible entity implemented the process established in accordance with Requirement R1, but failed to implement two or more Parts. OR The responsible entity failed to implement the process established in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no “consequence of lowering the current level of compliance.”
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the Severe and High VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSL uses similar language to that used in the associated requirement and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based upon a single violation, not a cumulative number of violations.

Reminder

Project 2007-06 System Protection Coordination
PRC-027-1

Additional Ballot and Non-binding Poll Open through May 15, 2015

Now Available

An additional ballot for draft 5 of **PRC-027-1 – Coordination of Protection System Performance During Faults** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Friday, May 15, 2015**.

PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii); therefore, the System Protection Coordination standard drafting team (SPCSDT) is proposing the retirement of those Requirements from PRC-001-1.1(ii). The SPCSDT has included a redlined version of PRC-001-1.1(ii) and a clean PRC-001-3. PRC-001-3 contains the remaining Requirements R1, R2, R5, and R6 as well as updated pro forma language for the "Effective Date" and "Compliance" sections of the standard.

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of PRC-027-1.

Balloting

Members of the ballot pool associated with this project may log in and submit their vote for the standard and non-binding poll by clicking here. If you experience any difficulties in using the electronic form, contact Arielle Cunningham.

Note: If a member cast a vote in the previous ballot, that vote will not carry over to this additional ballot. It is the responsibility of the registered voter in the ballot pool to cast a vote again in this ballot. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard and post it for an additional ballot. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Al McMeekin (via email), or at (404) 446-9675.

PRC-027-1

Formal Comment Period Open through May 15, 2015
Ballot Pools Forming through April 30, 2015

Balloting and commenting for this project are in the Standards Balloting & Commenting System (SBS)

Now Available

A 45-day formal comment period for draft 5 of **PRC-027-1 – Coordination of Protection System Performance During Faults** is open through **8 p.m. Eastern on Friday, May 15, 2015.**

PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii); therefore, the System Protection Coordination standard drafting team (SPCSDT) is proposing the retirement of those Requirements from PRC-001-1.1(ii). The SPCSDT has included a redlined version of PRC-001-1.1(ii) and a clean version of PRC-001-3. PRC-001-3 contains the remaining Requirements R1, R2, R5, and R6 as well as updated pro forma language for the "Effective Date" and "Compliance" sections of the standard.

SBS Login, Registration, Validation and Permissions

To **comment** in the SBS, you must have a contributor, voter, or proxy role.
To **join a ballot pool and vote** in the SBS, you must have a voter role.
To be a **proxy** and vote in the SBS, you must have a proxy role.

To register to become a proxy or voter in the SBS:

- Go to 'My User Profile'
- Select 'Click Here' to request additional permissions
- Select 'Voter' or 'Proxy Voter'

Commenting

Use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

Join the Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Thursday, April 30, 2015**.

Registered Ballot Body members may join the ballot pools here.

If you had previously joined the ballot pools for PRC-027-1, you **must** join these ballot pools to cast a vote. Previous PRC-027-1 ballot pool members **will not** be carried over to these ballot pools.

The ballot and non-binding poll for this posting are **additional**. Since the ballot pools for this project are outdated, new ballot pools are being formed in the SBS.

Next Steps

An **additional** ballot for the standard and ~~a~~ non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **May 6-15, 2015.**

Standards Development Process

Standards Announcement

Project 2007-06 System Protection Coordination

Additional Ballot and Non-binding Poll Results

Now Available

A formal comment period and additional ballot for **Project 2007-06 System Protection Coordination** as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern, Friday, May 15, 2015.**

The project involves two standards: **PRC-027-1 – Coordination of Protection System Performance During Faults and PRC-001-3 – System Protection Coordination.** PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii); therefore, the System Protection Coordination standard drafting team (SPCSDT) is proposing the retirement of those Requirements from PRC-001-1.1(ii). The SPCSDT included a redlined version of PRC-001-1.1(ii) and a clean version of PRC-001-3 which contains the remaining Requirements R1, R2, R5, and R6 as well as updated pro forma language for the "Effective Date" and "Compliance" sections of the standard.

The additional ballot for **PRC-027-1 and PRC-001-3** achieved a quorum, but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides detailed results for the ballot and non-binding poll.

Ballot	Non-binding Poll
Quorum /Approval	Quorum/Supportive Opinions
81.79% / 39.63%	81.13% / 39.25%

Next Steps

The SPCSDT will consider all comments received during the formal comment period, make revisions to the standard(s), and post for an additional ballot.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Al McMeekin (via email), or at (404) 446-9675.

Survey Report

Survey Details

Name 2007-06 System Protection Coordination | PRC-027-1 & PRC-001-1.1(ii)

Description

Start Date 4/1/2015

End Date 5/15/2015

Associated Ballots

2007-06 System Protection Coordination PRC-027-1 & PRC-001-1.1(ii) IN 1 ST

Survey Questions

See the Unofficial Comment Form on the Project Page for additional background information.

If you would like to bypass taking the survey, click the radio button and scroll down to submit the survey.

This will allow you to view Social Survey and agree / disagree with an already posted comment using the “thumbs up / thumbs down” feature.

Submitting a “thumbs up / thumbs down” on another entity's comment enables a negative vote to count in the calculation of consensus.

I want to bypass taking the survey

1. Do you agree that Parts 1.1 through 1.5 of Requirement R1 are the essential elements of a successful coordination process? Are there others that should be included? If not, please provide the basis for your disagreement and any proposed revisions or additions.

Yes

No

2. Do you agree with the proposed Measures? If not, please provide the basis for your disagreement and your proposed revisions.

Yes

No

3. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

Yes

No

4. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

Responses By Question

See the Unofficial Comment Form on the [Project Page] for additional background information.

If you would like to bypass taking the survey, click the radio button and scroll down to submit the survey.

This will allow you to view Social Survey and agree / disagree with an already posted comment using the "thumbs up / thumbs down" feature.

Submitting a "thumbs up / thumbs down" on another entity's comment enables a negative vote to count in the calculation of consensus.

1. Is it not clear what the differences between part 1.2 and 1.3 are.
2. Does 1.2 mean a Protection System settings review in a specific affected area due to some specific System changes? What kind of system changes (and how significant the changes are) would constitute a protection setting review?
3. Is 1.3 meant for a periodic overall review of the existing entity-designated protection system settings of all the BES elements that an entity owns? Based on 1.3, an entity has to do a fault study on every BES bus to determine if the fault current deviates by 15%. If the entity finds that the fault current at some of the BES busses indeed deviates by more than 15%, does the entity need to review the protection settings in the immediate area only or otherwise?

Richard Malloy - Idaho Falls Power - 3 - WECC

Selected Answer: No

Answer Comment:

It is confusing to the industry to have several standards pertaining to setting coordination. Why would NERC add a standard pertaining specifically to faults rather than simply revising the PRC-001 standard. Further there are several standards related to settings for generation ride through to disturbances, and UFLS settings requirements that muddy the waters of understanding and efforts required under this draft PRC-027.

Requirement (R4) of PRC-001 required the Transmission Owner to coordinate with Generation Owners on Transmission line settings. It is our belief that the TO should still be taking the lead in coordination in the draft PRC-027 requirements language.

Answer Comment:

We agree with Parts 1.2, 1.3 and 1.5 of Requirement R1, but disagree with Parts 1.1 and 1.4.

Part 1.1 is not results-based; it is overly prescriptive and an inherent and necessary element for developing new or revised Protection System settings. We suggest to remove it as it does not any value to Requirement R1.

R1.2. The wording in the draft standard is confusing. Suggest the following wording: "A review of the affected Protection System settings due to System changes as determined by the entity's process."

- The study should clearly mention that System changes will reset baseline for Fault current studies.

- The rationale box for R1.2 is open ended and may leave the impression that every change, even minor ones, will be considered a System change and be subject to an audit. The standard should better define "System changes."

Part 1.4 is unclear and unnecessary. It is unclear as to what constitutes a "quality review", and how is it measured. It is not necessary to perform any QR. If the intent is to have this included in the process document to ensure

new or revised protection system settings are properly coordinated, then this part should be revised to say, e.g.:

1.4 A check list to verify that the development of the new or revised protection system settings is coordinated among affected entities and that the proposed settings can achieve the intent of fault clearing prior to implementation.

Barbara Kedrowski - We Energies - Wisconsin Electric Power Co. - 3,4,5 - RFC

Selected Answer:

Answer Comment:

Wisconsin Electric supports the standard in concept but believes it needs more specificity. While in general we appreciate flexibility that the SDT wrote into the standard, we have seen that this leads to inconsistencies in application. Specifically, R1 states that entities shall establish a process for developing settings. It is very open ended and will be very subjective to evaluate.

We also think the timeline for activities needs to be better defined. For example, if in R1.3 you find that there has been a 15% deviation in fault current how long do you have to perform the review?

For R1.5 we need to communicate the settings to other entities and they shall review them. Does this need to be done before they are implemented or does the methodology in the procedure almost guarantee coordination? For R1.5 we would like to see in the measures what the acceptable evidence would be.

It was mentioned on the webinar that this is a forward looking standard and that no coordination review needs to be done unless triggered by R1.2 or R1.3. This should be specifically spelled out in the standard.

Subrequirement 1.4 is too prescriptive. It has the nature of an internal control rather than a compliance process. Internal controls should be left to the discretion of the Entities, not included as auditable requirements. While we understand FERC's concern with MisOperations caused by incorrect settings, that can be addressed as part of the mitigation plan of entities who fail to properly maintain their protection systems and should not be reason to dictate internal controls to the rest of the industry.

Patricia Robertson - BC Hydro and Power Authority - 1 -

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The requirement to coordinate protective relay settings has existed since the first power systems were built. BC Hydro, like all utilities, has been coordinating their protection systems as part of their normal practice and has a process for setting development, review and implementation on its protection systems. While the requirements in Draft 5 of PRC-027-1 are not substantially different than standard industry practice, proving annual compliance with these requirements (to the satisfaction of lawyers) will impose a large administrative burden. The original focus of PRC-001 made sense in that there are always communications and data gathering issues that make coordinating protection systems across different utilities more challenging than coordinating within one's own system. The new draft standard focuses too much of the utility's time and effort on proving compliance on a process that typically works well, which reduces the amount of time and effort that can be spent on areas where more time and money should be spent.

Document Name:

Likes: 0

Dislikes: 0

Thomas Foltz - AEP - 5 -

Selected Answer: No

Answer Comment:

AEP believes that R 1.2 is sufficient to cover coordination of all internal protection systems. As a result, R1 part 1.3 should be limited only to Protection Systems applied to BES Elements that electrically join Facilities owned by separate functional entities. This would require AEP to set baselines and keep track of fault currents at approximately 1800 buses. AEP has a process to review area coordination when system changes are made. All settings in an area that are affected by the change are reviewed and revised as necessary. Because of this process, it is not likely that any reviews of internal protection systems would result due to changes in fault current. Thus, this requirement would become an administrative burden without any reliability benefit for internal protection systems.

It is reasonable to require a periodic review on protection systems applied to interconnecting elements, because an entity does not have knowledge of what changes are made by another entity that may affect protection system coordination.

Joseph Bencomo - PPL NERC Registered Affiliates - 1,3,5,6 - MRO,WECC,NPCC,SERC,SPP,RFC

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The PPL NERC Registered Affiliates believe that the requirements under PRC-027 for TO/TOP are acceptable but the inclusion of GOs in the applicability of this standards, as outlined below, is problematic. Without resolution of this concern PPL is unwilling to support the approval of this proposal.

The purpose of PRC-027-1 is to ensure that “Protection System components operate in the intended sequence during Faults,” but there is no sequencing of Protection System components within a generation plant. There is need for GOs to coordinate some Protection System settings with the TO, however, but this activity is already covered by other standards.

We raised these points in NERC’s 4/27/15 webinar on PRC-027-1, but the presenters did not address the issue and instead simply stated that GO-TO coordination of loadability relays is needed, adding that this task is described in various technical publications. We agree, and prominent among these sources is, “Coordination of Generator Protection with Generator Excitation Control and Generator Capability,” which is referenced on p.5 of PRC-019 and was specifically written for PRC-019. It covers GO-TO loss-of-field coordination in part V of the paper, and generator phase-backup coordination in part VI. That is, PRC-019-1 covers the supposed gap that PRC-027-1 is attempting to address.

We also disagree with the statement made during the webinar that PRC-025-1 deals only with acceptable setting ranges for loadability relays and not coordination. The “Background” section of this document makes it clear that the standard intends to accomplish coordination, and the tables and example calculations spell-out in detail how this is to be done.

The need mentioned on p.13 PRC-027 to communicate generator and GSU impedance changes to the TO is meanwhile already accomplished by MOD-010-0 (MOD-032-1 after 7/1/15). Supplemental GO relay-setting issues are covered by the existing standards cited on p.3 of PRC-027-1, and R2.1 of PRC-001-2 presents a catch-all mandate that “Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.”

PRC-027-1 is consequently redundant for GOs, nor is there any need to change PRC-001. Enacting PRC-027-1 in its present state would cause confusion, not close gaps. An entity believing that coordination of loadability relays will not be required until PRC-027-1 becomes effective may be cited for PRC-019-1 and PRC-025-1 violations, for example.

The SDT should carefully study existing standards and trim PRC-027-1 accordingly, including making it not applicable to GOs.

The quality review of PRC-027-1 R1.4 should also be deleted. We agree that entities should apply a prepared-by-reviewed-by-approved-by process in developing relay settings, but this is standard industry practice for all calculations and procedures. It is therefore unclear what new and special quality control activities justify setting PRC-027-1 apart from all other NERC standards in this respect.

Michelle D'Antuono - Oxy - Ingleside Cogeneration LP - 5 -

Selected Answer: No

Answer Comment:

Ingleside Cogeneration (ICLP) believes that the scope of PRC-027-1 Draft 5 greatly extends beyond the concern initially raised by FERC staff. In our view, they are simply pointing out a similarity in purpose and structure between Fault relays protecting long transmission lines located fully within a single TO's footprint and those that interconnect to a neighboring TO, GO, or DP. Instead, the project team requires some level of disposition for every BES Protection System that reacts to a Fault.

Although we appreciate the flexibility allowed under Part 5.3 to designate the Protection Systems that are to be included in any one review, ICLP believes that CEAs will question any omission based upon design and/or susceptibility to changes in Fault current.

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Selected Answer: No

Answer Comment:

Tacoma Power generally agrees that Parts 1.1 through 1.5 of Requirement R1 are elements of a successful coordination process, but Tacoma Power does not agree that they are all 'essential.' Tacoma Power's specific comments follow.

Part 1.1. Tacoma Power believes that Part 1.1 is implied by the term 'review' in Parts 1.2, 1.3, and 1.5. Furthermore, as written, Part 1.1 may be difficult to audit under Requirement R2. Therefore, Tacoma Power recommends eliminating Part 1.1.

Part 1.2. Tacoma Power recommends the following verbiage for Part 1.2: "A method to review and, if necessary, update Protection System settings due to System and/or Protection System changes." Tacoma Power believes that Part 1.2 should focus on requiring a method, not the review itself, and that updates may be needed. Furthermore, as written in the current draft, Part 1.2 only refers to System changes, but an entity could change a Protection System without a System change, and this latter change could still require cascading Protection System changes. (If Part 1.4 is eliminated (see subsequent comments for Part 1.4), then the following verbiage is recommended for Part 1.2: "A method to review and, if necessary, update Protection System settings due to, and prior to implementation of, System and/or Protection System changes.")

Part 1.3. Tacoma Power generally supports Part 1.3. However, for periodic Fault current studies, no timeframe for reviewing existing entity-designated Protection System settings is specified following identification of a 15 percent or greater deviation in Fault current. To be consistent with the periodic review of Protection System settings, it is recommended that the interval for performing Fault studies, plus the timeframe to subsequently review Protection System settings, equals six calendar years, which means that Fault current studies should be performed more frequently than every six calendar years.

Part 1.3. Tacoma Power recommends changing “A review of...” to “A method to review and, if necessary, update...”

Part 1.3. Tacoma Power also recommends changing “A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground)...” to “A deviation in Fault current (either three-phase or phase-to-ground) greater than 15%...,” which should address some concerns that, for example, a 14.6% could be interpreted by an auditor as 15% due to rounding.

Part 1.3. Tacoma Power believes that clarification will be needed as to whether (1) an entity can choose between three-phase Fault current and phase-to-ground Fault current as a trigger or (2) an entity must use the greater change in the two Fault current values as a trigger.

Part 1.4. While it is a best practice, Tacoma Power does not believe that Part 1.4 is ‘essential.’ That said, if the drafting team elects to leave Part 1.4, Tacoma Power has the following comments. (1) Although rare, exceptions should be permitted (a) under bonafide emergencies and (b) when Protection System settings need to be altered during the implementation (commissioning) phase, provided that a follow-up review of quality is performed promptly (e.g., within 30 calendar days). (2) Tacoma Power recommends changing “A quality review of...” to “A review of the quality of...” (If the drafting team elects to eliminate Part 1.4, then Tacoma Power recommends that the verbiage in Part 1.2 be modified (see preceding comments for Part 1.2).)

Part 1.5. Tacoma Power generally supports Part 1.5. However, Tacoma Power believes that an exception to Part 1.5 should be granted when one engineering workgroup is responsible for Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, especially when those functional entity are part of the same company.

Part 1.5. Tacoma Power recommends a fourth sub-part: “Communicate with the other functional entities that the Protection System settings were implemented, including any alterations to Protection System settings that needed to be made during implementation.” This additional sub-part helps to close the loop.

Paul Haase - Seattle City Light - 1,3,4,5,6 - WECC

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

Seattle City Light, like many urban utilities, has very short transmission lines that require the use of communication-assisted (pilot) schemes in order to provide proper sectionalizing (coordination) of the transmission system during a fault event. Guidance is not provided in the latest version of the standard for the coordination of pilot schemes and their backup relays (67N, e.g.). The 67N relays, located at the different buses, cannot be coordinated on our system per proposed PRC-027. To address this matter, Seattle recommends allowing miscoordination of the back-up scheme, under the standard, as long as the back-up scheme is only enabled whenever the communication-assisted (pilot) scheme has failed.

Emily Rousseau - MRO - 1,2,3,4,5,6 - MRO

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The NSRF commends the SDT for the concept employed in the standard as we believe it addresses FERC's concerns and minimizes the impact on the Registered Entities. We do however have some specific comments that we believe should be addressed:

R1 states: *The **process** shall include:* , in R1.5, it states: ***procedures** to:*

The NSRF recommends that the word "procedures" be removed from R1.5.

R1.1: The requirement should be revised to "A method to review and update (when required) the information…" The industry has had past issues with do you need to update a process if there are no changes noted during your review. This addition will allow Entities to *review* and not *update* when no changes are required.

The second bullet of R1.3 states a Registered Entity must perform a "Periodic Review of Protection System settings" at a maximum interval not to exceed 6 years. In the Rational Box the SDT stated they chose 6 years because it corresponded to the maintenance period for certain relays. The NSRF believes this unfairly impacts owners of protective devices where the maintenance period is longer. Our recommendation is to revise the requirement to correspond to the maintenance period of the type of relay referenced in PRC-005. This way the setting comparison required by PRC-005 and the setting review can be accomplished at the same time making it more efficient. With thousands of Protection System relays to review every 6 years, there would be a large burden upon entities to outsource this activity. In our opinion there is not a large amount of risk in extending the interval because entities already review Protection System impacts in the areas where known construction activities change the electrical system. The second bullet of R1.3 should be revised to state "**Periodic Review of Protection Settings:** A time interval not to exceed that referenced in PRC-005 for a particular Protection System device."

Section 1.3 should be re-written to make it clear that an entity can conduct a condition based review within a given maximum time interval **and** as long as the conditions do not warrant a Protection System settings review, the comparison of the conditions to a baseline are satisfactory to prove compliance. If the conditions indicate a review should be conducted, then additional time should be granted to allow for the Protection System settings review.

The rationale for Section 1.3 should be carefully written as it states that a current differential protection scheme may not need to be included because changes in fault current will not affect the coordination of this system. The concern is that fault currents could increase to a point where CT saturation would prevent the current differential protection from operating as designed and therefore should be reviewed just like any other current sensitive protection system.

R1 section 1.4 should add clarity as to whether it applies to new or revised Protection System settings similar to R1 sections 1.1 and 1.5.

R1 section 1.5 needs to be re-written as it is fragmented and should state that the entity needs to establish a procedure and the procedure shall include the items covered under sections 1.5.1, 1.5.2 and 1.5.3. Suggested wording would be ". . . Distribution Providers), shall establish procedures to include the following items at a minimum:"

Selected Answer: No

Answer Comment:

R1.1. “A method to review and update the information required to develop new or revised Protection Sytem settings” requires entities to develop a process to review information used in two studies: Short Circuit study and Protective Device Coordination study. R1.1. only addresses the ‘What’ but does not address the ‘When’. The ‘When’ for the review of the information used in the Protective Device Coordination study is addressed in R1.2 and R1.3; however, the ‘When’ for the review of information used in the Short Circuit study is never addressed. From our understanding, the only evidence that is required for this standard with respect to the review of information used for the Short Circuit study will be documentation of the ‘What’; no evidence is required of when it was followed.

Also, the word “review” in R1.1 is confusing and suggests going back in time. Suggest revised wording as follow: “A method to update the information required to develop new or revised Protection System settings.”

R1.2. The wording in the draft standard is confusing. Protection System settings are not affected by System changes. Suggest the following wording: “A review of the affected Protection System settings due to System changes as determined by the entity’s process.”

- It was mentioned in the Webinar on April 27, 2015 that System changes will reset baseline for Fault current studies. If this is the case, then it should be made clear in the standard.

- Proving system changes will be onerous. The rationale box for R1.2 is open ended and may leave the impression that every change, even minor ones, will be considered a System change and be subject to an audit. The standard should better define “System changes.”

R1.3. The last part of the description for “Periodic Fault current studies” is confusing. Suggest the wording be changed to the following: “… at the bus under study, and this Fault Current analysis evaluated in a time interval not to exceed six calendar years, or”

With regard to the discussion on R1.1.3 at the Webinar on April 27, 2015, it was stated that once the standard is adopted Utilities have 12 months to establish their fault current baseline, if using the Periodic Fault Current Study method or 6 years to perform their next Periodic review of Protection System settings if using that method of compliance. Those time frames should be spelled out in the document, especially the 12 months because it does not appear anywhere. Perhaps the best place for this is in the Implementation Plan.

Regarding Part 1.3, the first bullet, if the entity identifies a Fault current change greater than 15 percent, the periodic review should apply only to those buses identified as having a 15 percent or greater deviation in Fault current in the study and the connected buses one station away from those buses. Footnote 1 can be revised to:

Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults. For buses where the Fault current changed by 15 percent or greater, the Protection Systems will be those applied at the bus with the change in Fault current, and connected stations one bus away.

Kathleen Black - DTE Energy - 3,4,5 - RFC

Selected Answer: No

Answer Comment:

More clarification would be helpful concerning the term "entity-designated Protection System settings". It appears that these settings that are considered to be susceptible to fault current changes. Providing a listing of susceptible Protection System setting types applicable to the GO, TO and DP would insure that nothing is missed in the review.

Jamison Cawley - Nebraska Public Power District - 1 -

Selected Answer: No

Answer Comment:

Generally the parts 1.1 to 1.4 are essential elements for successful coordination. Part 1.5 creates unnecessary complications when phasing in projects or dealing with other entities that are not responsive in a timely fashion. Part 1.5 should be deleted since it can implicate a utility that is dealing with slow to respond interconnecting neighbors. There are utilities that will respond but may not respond in a timely manner. This puts all entities unfairly under scrutiny. If Part 1.4 is followed then 1.5 is not needed. This will eliminate implicating the responsible entity when dealing with slow to respond interconnecting neighbors and avoid tracking complex timelines with multiphase projects that may not have simple implementation dates. One scenario that can cause concern can be with generator owners that may not have their own engineering staff but must hire external staff if a coordination study is required. This process issue is not always under the control of the requesting entity and can create some issues with part 1.4 as well. In this sense it is a good thing if we can show seeking concurrence is acceptable for compliance even if we cannot show a response to a request.

Selected Answer: No

Answer Comment:

We agree with Parts 1.2, 1.3 and 1.5 of Requirement R1, but disagree with Parts 1.1 and 1.4.

Part 1.1 is not results-based; it is overly prescriptive and an inherent and necessary element for developing new or revised Protection System settings. We suggest removing Part 1.1 as it does not any value to Requirement R1.

R1.2. The current wording in the draft standard is confusing. We would suggest the following alternative wording: "A review of the affected Protection System settings due to System changes as determined by the entity's process."

- **The study should clearly mention that System changes will reset the baseline for future Fault current studies.**

- **The rationale box for R1.2 is open ended and leaves the impression that every change, even minor ones, will be considered a System change and be subject to an audit. The standard should better define "System changes."**

Part 1.4 is unclear and unnecessary. It is unclear as to what constitutes a "quality review" (QR), and how is it measured. Furthermore, it is not necessary to perform any QR. If the intent is to have this included in the process document to ensure new or revised protection system settings are properly coordinated, then this part should be revised to say, e.g.:

1.4 A check list to verify that the development of the new or revised protection system settings is coordinated among affected entities and that the proposed settings can achieve the intent of fault clearing prior to implementation.

Oliver Burke - Entergy - Entergy Services, Inc. - 1 -

Selected Answer: No

Answer Comment:

Entergy is concerned with elements of Parts 1.1 through 1.5 of Requirement R1.

Entergy is concerned that requirement R.1.3 does not adequately identify the methodology for establishing “baseline Fault current values.” Entergy would suggest the inclusion in requirement R1.3 of additional language on baseline Fault current values from bottom of page 13 and top of page 14 in the Supplemental Material document, as follows:

The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect. These baseline Fault current values can be at the bus level or at the individual Element level. When performing the periodic Fault current comparison, the entity would continue to compare actual Fault current values gathered during the review against the originally established baseline values until a condition occurs that necessitates the establishment of a new baseline.

Entergy disagrees with the inclusion of the language “prior to implementation” in Requirement R1.5.3 without a means to compel a timely response to the request for coordination . Requirement R1.5.3 provides as follows:

1.5.3. Verify that any identified coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation.

Based on experience, there are situations in which a Transmission Owner has submitted relay settings information to a coordinating party and the coordinating party has not responded or is incapable of assessing the impact of the change being coordinated. A lack of coordinating party response puts the Transmission Owner at risk of non-compliance with Requirement 1.5.3. Entergy recommends that Requirement 1.5.3 be revised to (1) require the coordinating party to respond to Transmission Owner within thirty (30) days after receipt of notification of proposed Protection System settings, provided that in the event of an Emergency, the coordinating party shall be required to respond to Transmission Owner as soon as practicable under the circumstances, and (2) in the event the coordinating party does not respond to the Transmission Owner's request for coordination in a timely manner, permit the Transmission Owner to assess and implement Protection System settings without acknowledgement from the coordinating party, subject to the requirement that the Transmission Owner provide prior notice to the coordinating party of its intent to implement its proposed Protection System settings..

Answer Comment:

FE's primary concern relates to what is required of the GO to be able to comply with R1 which states the TO, GO and DP "… establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults." The GO, operates the units essentially as isolated BES elements. The term "sequence" infers it is referring to the BES as a whole, at least with regard to interconnected elements, which would then mean we need a joint process with the TO. The GO is not in a position to make that happen, nor should the GO have primary responsibility. This should be a TO responsibility, with GO providing settings as requested by TO, and GO changing settings as requested/instructed by the TO.

GTC is in support of the SERC Comments:

While the SERC PCS agrees that PRC-027 is needed, and with the methodology within draft 5, the following items must be clarified for us to support it:

1) In R1 1.2 replace '…affected by System changes' with '…affected by Bulk Electric System changes' because the NERC Glossary 'System' definition includes distribution. NERC BES Definition phase 2 process is very rigorous and includes the Elements of significance in this coordination work.

2) R1 1.3 Footnote 1 and the concept of excluding 'entity-designated' Protection System settings is troublesome. The SDT explained that footnotes are enforceable in their 4/27/2015 Webinar, and that entities will have to justify such designations. R1 1.3 Footnote 1 text should be moved into the body of the requirement, eliminating the footnote, and clarity be given on what entities would need to do to justify the Protection Systems they are designating.

3) The existing Protection System settings have been and are already coordinated. We agree with the SDT 4/27/2015 Webinar statement that PRC-027 'draws a line in the sand and goes forward from there.' Please include a statement somewhere in the R1 Rationale that memorializes the validity of

existing Protection System settings as a baseline. We recommend including this statement in the R1 part 1.3 first bullet,

Periodic Fault current studies, rationale. ‘Protection System settings existing when the Fault Current baseline is established are accepted as being coordinated consistent with the Purpose of this standard. This acknowledges that the vast majority of entities have a long history and much experience coordinating their Protection Systems. On the other hand, if an entity is unable or unwilling to make this assertion, then that entity needs to explain the second bullet, *Periodic review of Protection System settings,* in its R1 process is its means of proving coordination of existing settings.’

4) In some companies the same protective relaying group performs coordination work for separate functional entities, so the R1 1.5 communication is often in the protection setting notes themselves. Please add ‘The drafting team also recognizes there are situations where the same protective relaying group performs coordination work for separate functional entities, and in such cases the R1 Part 1.5 communication is handled via internal written documentation.’ We suggest adding in the Supplemental Material on page 15 just above Requirement R2.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Selected Answer: No

Answer Comment:

R1.5 remains ambiguous in terms of which entities are obligated to perform the tasks, and under which circumstances. Is the intent, as written, that it only applies where interconnected Facilities do not have the same ownership? Is the applicability based on the functional entity category irrespective of Facility ownership (i.e., to ensure intra-company communications)? The requirement needs to be revised to provide absolutely certainly in terms of which entities have the obligations.

Payam Farahbakhsh - Hydro One Networks, Inc. - 1 -

Selected Answer: No

Answer Comment:

Hydro One Networks Inc. agrees with NPCC on the following.:

1) Under R1.1, “A method to review and update the information required to develop new or revised Protection System settings” requires entities to develop a process to review information used in two studies: Short Circuit study and Protective Device Coordination study. The ‘When’ for the review of information used in the Short Circuit study has not been addressed. R1.1. addresses the ‘What’ but does not address the ‘When’. The ‘When’ for the review of the information used in the Protective Device Coordination study is addressed in R1.2 and R1.3. Therefore, the only evidence that is required with respect to the review of information used for the Short Circuit study will be documentation of the ‘What’; no evidence is required of “When” it was followed.

2) Further, in R1.1, the word “review” suggests going back in time. It is suggested that the wording is revised to read as follows: “A method to update the information required to develop new or revised Protection System settings.”

3) The wording for R1.2 is unclear. Protection System settings are not affected by System changes. It is suggested that the following wording be considered instead: “A review of the affected Protection System settings due to System changes as determined by the entity’s process.”

4) It was mentioned during the Webinar on April 27, 2015 that System changes will reset the baseline for Fault current studies. If this is the case, it should be explicitly stated in the standard.

5)In the rationale box for R1, Part 1.2 is open-ended and may leave the impression that every change, even minor ones, will be considered a System change and be subject to an audit. Therefore, the standard should specifically define “System changes.”

6) The last part of the description in R1.3 for “Periodic Fault current studies” is unclear. It is suggested that the wording under the first bullet in R1.3 be changed to read the following: “… at the bus under study, and this

Fault Current analysis be evaluated at a time interval not to exceed six calendar years, or”

7) With regard to the discussion on R1.3 at the Webinar held on April 27, 2015, it was stated that once the standard is adopted, utilities would be given 12 months to establish their fault current baseline, if using the Periodic Fault Current Study method, or 6 years to perform their next Periodic review of Protection System settings if using the method of compliance which requires a Periodic review. These time frames should be spelled out in the document; in particular, the 12 months given to establish a fault current baseline, as it is not stated in the standard. These dates should be stated in the Implementation Plan as well.

Chris Scanlon - Exelon - 1 -

Selected Answer: No

Answer Comment:

Please clarify R1.3. We believe the SDT intends to say that an entity must have a process to review protection system settings:

- First Bullet- Review Bus fault currents at least every six years. If review indicates that fault current has increased to 15% or more than baseline, then perform a settings review for relays associated with that bus.

- Second Bullet- Review relay settings at least every six years

- Third Bullet- Some combination of first two bullets.

If our understanding is correct, we propose a minor clarification to the first bullet in R1.3

· **Periodic Fault current studies:** A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the bus under study. The fault current must be evaluated periodically with the time interval not to exceed 6 years.

As a Generator, Part 1.3 of requirement R1 needs to be defined clearly from the GOs viewpoint stating if contribution by GO increases by 15%. It talks about a fault current at a Bus which is more appropriate for TO. GO's current contribution increases only when the Generators and Main Power transformers are replaced with machines with lower impedances. So the requirements should be tied with that rather than on a certain time.

Part 1.4 - Agree

Part 1.5.3: We remain concerned with the requirement as written. 1.5.3 is open to interpretation regarding how an entity addresses an identified coordination issue prior to implementation. As noted in the Supplemental Material, differences in Protection Philosophy, the actual risk of an unmitigated issue or the timing of a mitigation action are all areas where entities may disagree before the implementation of new settings. A change to 1.5.2 indicating that the communication between the coordinating entities should include the entities proposal for what or if any action they intend to take respecting an identified issue would be sufficient. This is consistent with the Supplemental Material explanation for Part 1.5.2

Answer Comment:

1. Ambiguity exists with respect to what "coordination" is being addressed. This should be explicitly clarified. Part 1.5 addresses coordination of information with others necessary to determine proper settings on BES Protection Systems for facilities owned by two different entities, which is consistent with the context of the existing standard. However, Parts 1.1-1.4 pertain to an entity's internal process for developing, reviewing, and validating settings, which is not considered in the current standard and is not in the same coordination context as Part 1.5. As presented, parts 1.1 through 1.4 exceeds "what needs to be done" and ventures into the "how it needs to be done" which runs counter to the intent of the NERC standards and risk-based requirements. Parts 1.1 – 1.4 should be rewritten in a manner similar to Part 1.5 as follows:

Each Transmission Owner, Generator Owner, and Distribution Owner shall implement a documented process for developing and installing coordinated settings for its Protection Systems for BES Elements associated with solely-owned Facilities to ensure the Protection Systems operate in the intended sequence during Faults.

This approach would also result in the elimination of one of the requirements as the implementation piece is captured with the documented process aspect.

Although we wish Requirement R1 to be rewritten as discussed above, we have the following additional comments with regards to the language of the requirements as currently proposed:

2. To make the existing requirement language clearer, Requirement R1 should be amended to state "……develop settings for its BES Protection Systems to ensure they operate in the intended sequence……"

3. Soon to be implemented MOD-032-1 requires Transmission Owners (TO) and Generator Owners (GO) in R2 to submit short-circuit modeling data to its Transmission Planner (TP) and Planning Coordinator (PC) on an annual cycle. The PC and TP then use this information to develop system models for use in current year and future year planning studies. As such, the TP and PC would have the most accurate composite short circuit model of the system at a point a time. PRC-027-1 does not acknowledge the significant role that the TP and PC could positively play in the review of short circuit fault current studies that is contemplated by Part 1.2 and 1.3. To this end, the TP and PC should be added as functional entities to whom this standard applies. The TP and PC should establish the baseline short circuit case annually and perform a comparison to identify buses whose fault currents have deviated by more than a certain percentage. This would then trigger a settings and coordination review by the TOs and GOs.

This is a more proactive approach that the possibility of looking at settings once every six years as currently posited by the standards. With the changes in generation due to coal unit retirements and the influx of new gas units across the system, there is a real possibility of more variation in fault current levels. An annual identification of significant deviations in fault current levels is a more effective method to achieve the desired outcome using the TP and PC as an applicable entity in this process. This would also address in part the impact of System changes as identified in Part 1.2 of the proposed standard as well.

4. What is the basis for the choice of 15% as the threshold for reviewing settings? If settings were perpetually off by 14.8%, what is the impact on intended Protection System operation? Is the risk imparted to the BES of this setting inaccuracy consistent for all Protection Systems and at all voltage levels? Is there a technical basis for this choice that contemplates risk to the BES?

5. For Part 1.3, PRC-027 intended to provide flexibility to cover the various relay applications an entity might have. However, similar to what was done in PRC-023, the team should be able to identify a non-exhaustive list of known relay applications that should be included in the review versus those that would not be.

6. The term "quality review" is ambiguous and should be replaced with a more precise description of the requirement. Suggest that the language be changed to:

"Perform an additional manual or automated technical review of the settings prior to implementation. If done manually, the individual(s) performing the additional review should not have been involved in the determination of the initial settings."

Laurie Williams - PNM Resources - Public Service Company of New Mexico - 1 -

Selected Answer: No

Answer Comment:

Comments: The requirements assume protective elements are primarily impacted by changes in fault current. For utilities, particularly in the west, that use impedance-based protection, the language in the standard may be deficient to cover parts of the protection system are not impacted by changes in Fault current. As such, the drafting team should consider how to address entities with schemes that are indifferent to fault current changes (i.e. line differential and impedance-based step distance). Perhaps these entities should be provided an exemption that only requires review when the zone is directly impacted. If these are not exempted, the Drafting Team should consider whether there is a technical basis for requiring a 6-year review on elements that are not impacted by changes in fault current conditions.

Review of distance settings and differential settings is not necessary until changes in the system require it. Current-only items, such as instantaneous over-currents, are the only items that need oversight related to changes that influence the fault study.

Answer Comment:

These general comments are based on two interpretations of Requirement R1:

1. Assuming that the intent is that the 'Process' identified in R1 applies to all new or changes to existing Protection System setting, we observe the following:

a. The inclusion of R1.2 tends to indicate that only those Protection System settings affected by System changes are covered.

b. The inclusion of the footnote in R1.3 tends to indicate that only 'entity designated' Protection Systems are included. The footnote also states 'entities will indicate' which makes this a requirement. This should be as a requirement not in a footnote. We question the advisability of having it buried in a footnote when an auditor will be expected to ask for it.

As such, if the intent is that entities shall follow their process for 'all new or changes to existing Protection Systems settings', then this language should be included in the main part of R1. If this is the intent, our opinion is the R1.2 and the footnote can be removed from the standard.

The following are specific:

	R1: add ‘all new or changes to existing’ R1.1: Agree R1.2: Disagree: we believe this requirement is duplicative to the intent of ‘all new or changes to existing’ R1.3: Agree, however, we believe the ‘entity designated’ defeats the concept of ‘all new or changes to existing’ and if it remains, it creates a reliability gap. R1.4: Agree R1.5: Agree 2. Assuming that the intent is that the ‘Process’ identified in R1 applies only to those protection systems identified in R1.2 and/or the ‘entity designated’ Protection Systems identified in the footnote, then these ‘applicable’ Protection Systems should be included in the Applicability of the Standard and R1.2 and the footnote should be removed from the standard. If this is the intent, we feel that the SDT has created a ‘reliability gap’ in that all new or changes to existing Protection Systems are not required to follow the other sub-requirements, such as reviewing the model and having a quality control check. Additionally it does not require entities to review settings on such things as current differential line protection, bus diff, bank diff, etc. schemes, thus allowing legacy incorrect settings to go undetected.

Answer Comment:

Requirement R1 should be revised to read "…establish a process or processes" instead of "a process." An Entity may choose to implement a separate process for each Part.

Part 1.1. "A method to review and update the information required to develop new or revised Protection System settings." requires entities to develop a process that includes a method to review information used in two studies: Short Circuit Study and Protective Device Coordination Study. Part 1.1 only addresses the 'what' but does not address the 'when'. The 'when' for the review of the information used in the Protective Device Coordination Study is addressed in Parts 1.2 and 1.3. The 'when' for the review of information used in the Short Circuit Study is never addressed. The only evidence that is required for this standard with respect to the review of information used for the Short Circuit Study will be documentation of the 'what'; no evidence is required of 'when' it was followed. Also, Part 1.1 is not results-based; it is overly prescriptive and an inherent and necessary element for developing new or revised Protection System settings. We suggest it be removed as it does not add any value to Requirement R1. If the drafting team decides that Part 1.1 is necessary, then additional clarification is recommended regarding the scope of information to be reviewed and to what extent the review needs to be performed. Alternative wording could also be considered such as, "A procedure to track changes to the primary system and associated information required to develop new or revised Protection System settings."

It was mentioned in the April 27, 2015 Webinar that System changes will reset the baseline for Fault current studies. If that is the case, then it should be made clear in the standard. Proving system changes will be onerous. In the Rationale Box for Requirement R1, the section referring to Part 1.2 is open ended and may leave the impression that every change, even minor ones, will be considered a System change. The standard should better define "System changes."

Part 1.3. The last part of the description for "Periodic Fault current studies" is confusing. Suggest the wording be changed to the following: "… at the bus under study, and this Fault Current analysis evaluated in a time interval not to exceed six calendar years, or"

In the Rationale for Requirement R1, under Part 1.3, in the second paragraph there is the sentence "To minimize this risk, the drafting team chose a maximum Fault current deviation of 15 percent." Yet in Part 1.3 itself it says "A 15 percent or greater deviation in Fault current…" Suggest adding or removing the words "or greater" to reflect the intent. The Rationale and Part should be consistent.

Regarding the first bullet of Part 1.3, if the entity identifies a Fault current change equal to or greater than 15 percent, the periodic review should apply only to those buses identified as having a 15 percent or greater deviation in Fault current in the study and the connected buses one station away from those buses. Footnote 1 can be revised to:

Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults. For buses where the Fault current changed by 15 percent or greater the Protection Systems will be those applied at the bus with the change in Fault current, and connected stations one bus away.

Part 1.4 is unclear. It is unclear as to what constitutes a "quality review", and how is it measured. It is not necessary to perform any QR. If the intent is to have this included in the process document to ensure new or revised protection system settings are properly coordinated, then this part should be revised to say, e.g.:

1.4 A check list to verify that the development of the new or revised protection system settings is coordinated among affected entities and that the proposed settings can achieve the intent of fault clearing prior to implementation.

In sub-Part 1.5.1 suggest changing "other functional entities" to "impacted (or affected) functional entities".

Requirement R2 requires the Entity to implement the R1 process. The plainest reading of the requirement only requires the process to be implemented. Suggest that R1 and R2 be combined and formatted into the CIP table format. R1 becomes “establish and implement a process or processes” and then in a table format list each part and in the adjoining column the measures to demonstrate compliance.

With regard to the discussion on sub-Part 1.3.1 at the Webinar on April 27, 2015, it was stated that once the standard is adopted utilities have 12 months to establish their fault current baseline if using the Periodic Fault Current Study method, or 6 years to perform their next Periodic review of Protection System settings if using that method of compliance. Those time frames should be spelled out in the document, especially the 12 months because it does not appear anywhere. Perhaps the best place for this is in the Implementation Plan.

The existing requirement R3 in PRC-001-1.1 calls for coordination between Generator Operators and Transmission Operators with the Host Balancing Authority:

R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.

R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.

R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring T Transmission Operators and Balancing Authorities.

While the language regarding coordination by the Host Balancing Authority is not concise, the Host Balancing Authority should be made aware of relaying changes. PRC-027-1 sub-Parts 1.5.1 and 1.5.2 should be revised as follows:

1.5.1. Communicate the proposed Protection System settings with the other functional entities and the Host Balancing Authority.

1.5.2. Review proposed Protection System settings provided by other functional entities and the Host Balancing Authority, and respond regarding the proposed settings. The response should identify any coordination issue(s) or affirm that no coordination issue(s) were identified.

Answer Comment:

FMPA has previously commented that the speed at which faults are cleared is very important to reliability, and recommends the SDT consider adding a part that requires review of Protection System settings with regard to critical clearing time.

Regarding Part 1.3, either require the use of periodic Fault current studies for specified types of Protection Systems, or leave the option out. FMPA understands the importance of considering changes in Fault current when coordinating Protection Systems, but does not see the reliability benefit of providing options in Part 1.3. From a compliance perspective, it is simpler to demonstrate compliance by always choosing the time-based methodology. As presently worded, the Fault current-based option does not add any benefit for either reliability or compliance since it is not required to be used and defaults to a six year review of settings. Also, it is not clear what conditions necessitate the establishment of a new baseline. Some language from the Option 1 discussion in the supporting material describing how the baseline is determined should be incorporated into the Requirement language.

Selected Answer: Yes

Answer Comment:

TVA appreciates the efforts of the Project 2007-06 SDT in developing Draft 5 of PRC-027-1. While TVA agrees with R1 and its associated sub-parts, the following comments are offered as possible improvements:

1) In R1, Part 1.2, replace "…affected by System changes" with "…affected by **Bulk Electric System** changes" because the NERC Glossary definition of "System" includes 'distribution components'.

2) R1, Part 1.3, Footnote 1 - The SDT explained that footnotes are enforceable in the 4/27/2015 project webinar, and that entities will have to justify their PRC-027 designation criteria. We recommend the SDT consider eliminating Footnote 1, and adopt an "Attachment A" approach similar to the PRC-023 standard. Doing so would tend to bring the industry to a more common understanding of the types of Protection System devices that are intended to detect Faults and initiate an isolating action, and reduce the opportunity for "gaming" the standard.

3) We agree with the SDT 4/27/2015 Webinar statement that PRC-027 "draws a line in the sand and goes forward from there." The presumption should be that existing Protection System settings have already been coordinated. We suggest adding a statement in the R1 Rationale block that memorializes the validity of existing Protection System settings as a baseline. We recommend including this statement in the R1, Part 1.3, Periodic Fault current studies rationale -

"Protection System settings existing when the Fault Current baseline is established are accepted as being coordinated consistent with the Purpose of this standard. This acknowledges that the vast majority of entities have a long history and much experience coordinating their Protection Systems."

4) In companies where a single protective relaying group performs coordination work for separate functional entities within the company, the R1, part 1.5.1 communication is often captured in the protection setting notes themselves. Please add "The drafting team also recognizes there are situations where the same protective relaying group performs coordination work for separate functional entities within the same company, and in such cases the R1, Part 1.5.1 communication is handled via internal written documentation." We suggest adding this statement in the Supplemental Material on page 15 just above Requirement R2.

Answer Comment:

Texas RE recommends including language in R1.5.1 for entities to communicate changes or settings before they are implemented. Texas RE suggests that six years is too long of a time period between a studies of Fault currents.

In general the requirements are sound but it seems the rationale behind the timing may be inconsistent with other standards such as TPL-001-4 (an annual short circuit analysis with caveats). In essence, an entity cannot tell if there is a 15% or greater deviation in Fault current without doing a study and 6 years appears to be an inordinate amount of time to lapse. Also, the “entity designated” language allows for entities to not conduct reviews if no “settings” are “designated” which defeats the reliability aspects of this standard. Footnote 1 indicates “Protection Systems” will be included but the text of 1.3 indicates which “Protection System settings”. Is the intent to designate a particular setting which then, by default, designates the Protection System where the setting is applicable? It would be beneficial to clarify the footnote.

Erika Doot - U.S. Bureau of Reclamation - 5 -

Selected Answer: No

Answer Comment:

Reclamation believes that the draft PRC-027-1 is a major improvement over the existing ambiguous language in PRC-001-1.1 regarding relay settings coordination.

Reclamation recommends updating R1.2 to reference “Protection System changes” rather than “System changes” for consistency.

Reclamation suggests that the “Supplemental Material” for Part 1.3 be updated to state that “non-fault clearing protection other than covered under PRC-019 which do not operate for faults, but are in place to protect equipment, does not require coordination between functional entities. Examples of such protection include differential relays, volts per hertz, loss-of-field, negative sequence current, stator ground, overvoltage, under frequency and out-of-step relays designed to protect generators rather than to operate for faults on the transmission system.”

Reclamation also suggests that R1.5 and its subrequirements be updated to refer to “Facilities owned by separate registered entities,” so it is clear that R1.5 refers to settings coordination between separately owned facilities. Reclamation believes that the quality review of settings required under R1.4 will assure appropriate coordination of settings for Protection Systems at adjacent facilities owned by one registered entity acting as GO and TO. Reclamation suggests that the drafting team add a footnote to R1.5 to clarify that coordination of relay settings owned by one registered entity operating as two functional entities (e.g., GO and TO) are covered by the quality review process in R1.4. Reclamation also suggests that the “Supplemental Material” section for Part 1.4 be updated to address this issue.

Finally, Reclamation recommends that the “Supplemental Material” section be renamed the “Guidelines and Technical Basis” section because this appears to be the intent of the section and for consistency with other standards.

David Jendras - Ameren - Ameren Services - 3 -

Selected Answer: No

Answer Comment:

1) In addition to our own comments, Ameren adopts the SERC PCS comments by reference. (Note: SERC Reliability Corp may actually be the submitting entity for the SERC Protection and Control Subcommittee comments.)

2) While Ameren agrees that PRC-027 is needed (we have voted in favor of previous drafts), the following items must be clarified before Ameren can support its new form: See SERC PCS Question 1 comments 1, 2, 3, and 4; SERC Question 2 comment 1; and SERC Question 4 comments 3 and 4; and Ameren specific comment 3 below.

3) We believe that the intent for R1 part 1.2 is for the entity to review Protection System settings *directly and/or significantly* affected by the changes in Part 1.1, and that Part 1.3 will capture the incremental (or less significant) changes that accumulate over time. If so, we feel this is unclear and recommend moving the similar examples from the Part 1.2 rationale to the Part 1.1 rationale and revising Part 1.2 and its rationale as follows:

a) Part 1.2: "A review of Protection System settings directly and/or significantly affected by changes identified in Part 1.1."

b) Part 1.2 Rationale: "Reviewing the affected Protection System settings when significant changes to the information identified in Part 1.1 occur maintains coordination. For example if a new BES Element (transmission line or generator) is added, Protection System settings directly protecting that new Element must be developed. And Protection System settings on BES Elements adjacent to the new Element may well be significantly affected and therefore should be reviewed as well. On the other hand, a very small change to one Element's impedance may not by itself cause a significant enough change to trigger this Part 1.2 review; the accumulation of such minor changes will be captured via Part 1.3 of the process."

Selected Answer: No

Answer Comment:

We question the reliability value of creating an administrative requirement that will undoubtedly be rated as a high risk based on the latest risk elements documentation. Utilities have always installed and coordinated Protection Systems to protect the safety of the general public, to protect equipment from damage, to improve reliability, and to provide good customer service. If they did not do this, they would not stay in business very long and would be subject to countless sanctions and fines from regulatory agencies. Utilities already have Protection System coordination processes in place whether formally documented or simply followed by the professional engineering staff. Furthermore, professional engineering and IEEE standards already require the coordination of protection systems, which supports that the proposed Requirement R1 is not needed.

We simply do not see how adding this standard further enhances reliability. There is no evidence that there is a widespread lack of Protection System coordination. As a result, the proposed standard could actually decrease reliability by detracting from the reliability mission to focus on paperwork. There does not appear to be any explanation to how this standard will improve reliability over what industry is already doing. If Protection System engineers are further distracted from their reliability mission by additional needless paperwork, we fear that reliability will suffer.

More specifically, we are concerned that Part 1.4 could be burdensome for small entities that may only have one Protection System engineer. How can such a small entity implement a quality review process that involves peer reviews? This could be quite costly to these entities, as they would be forced to hire consultants to conduct a peer review, which may only result in minimal reliability benefits.

We question why a Distribution Provider should be required to have a process for developing Protection Systems settings. Distribution Providers that have Protection Systems installed for detecting faults on the BES will only do so at the direction of the TO and this should be covered in the Facility connection requirements in the FAC standards. We suggest removing Distribution Provider.

The supplemental material needs to be clarified to state that the applicable entity has complete flexibility to use any combination based on any criteria not just limited to voltage or Protection System applications. The supplemental material appears to limit how both options in Part 1.3 can be combined in the standard. For instance, can an entity use one option for one bus and the other option for a different bus? Can they base it on zones of protection?

How Part 1.2 is different from Part 1.3 should be further clarified. Part 1.2 focuses on reviewing necessary Protection Systems settings based on System changes. The supplemental materials focus largely on system impedance changes. Since these would contribute to changes in fault currents, would Part 1.3 trigger the need to review these? Could Part 1.2 be combined with Part 1.3?

The drafting team should consider extending the periodic review in Part 1.3 beyond six years. The supplemental material indicates this period was selected to match the maintenance cycle for PRC-005 for relays. However, some relays (i.e. monitored) have longer maintenance cycles.

We recommend removing R1 from the standard, as a formal policy is not needed for coordination of Protection Systems. However, if the drafting team determines that the requirement must remain, we ask the team to revise the requirements to streamline the process, remove as much administrative paperwork as possible, and revise the sub-parts for clarity.

Answer Comment:

AECI appreciates the flexibility afforded to industry with the process document based language of draft PRC-027-1. We agree that all elements in parts 1.1 through 1.5 are essential elements of a successfull coordination process with one small disagreement in part 1.2 that could be mitigated with two insertions of "significant" and "BES". Suggested langugage: "A review of Protection System settings affected by significant BES changes." First, the insertion of the word significant would more closely align with the SDT intent and rationale given. Second usage of BES would clearly indicate the scope of the standard, which is to coordinate protection system settings that are applicable to the BES.

Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - SPP

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The phrase “System changes” as used in R1.2 is not a defined term and is only described by a set of examples in the Supplemental Material. While this arrangement may be sufficient for compliance audits, there remains a potential gap. There may be “System changes” that warrant a review of the protection system settings that are not included in the specific set of examples provided and could lead to an entity experiencing a change that does not trigger a review of protection system settings. We suggest the Supplemental Materials include the phrase “including, but not limited to” when providing a set of example “System changes”.

The use of the undefined phrase “quality review” in R1.4 and then seemingly defining that term in the Supplemental Material could lead to issues in interpretation of what is an “adequate” quality review. The SDT should review the guidance and rationale regarding what constitutes a quality review to ensure as much potential for mis-interpretation is minimized. We would suggest the removal of R1.4.

Jamison Cawley - Nebraska Public Power District - 1 -

Selected Answer: No

Answer Comment:

There is a concern with M1 such that in order to demonstrate the required process is implemented that dated records must be provided. If the auditor can select any BES element internal to our system for review then we must show that it meets the latest process. This means we must have all internal locations updated such that they are ready for audit to the latest required process at the effective date since there is no implementation time line provided for R1. It seems R1 should also provide an initial time window in the implementation plan for the process to be created and implemented over time. For example, this time window could be 7-10 years since there may be many more internal lines (depending on voltages) and generation for a utility in comparison to say interconnecting 200kV lines with other utilities.

Answer Comment:

The measure for R1 and its subparts does not adequately address the expectations contained in the requirement. THere is no requirement to have a documented process per R1 but this certainly is the most forthright manner to achieve the reuqirement. Else, an entity will have to demonstrate for each setting how each subpart is demonstrated. Since R2 is the implementation piece, evidence of implementation is expected there. Absent a documented process document or perhaps a workflow to satsify R1, it is not clear how the evidence for R2 would be different from R1. It is also not clear without a process document or workflow how an entity would demonstrate that each process part was consistently addressed. In this regard and as offered in the comments, R1 and R2 could be combined into one requirement that speaks to "implementing a documented process".

We do not agree with Measure M1. Refer to our comments above regarding Parts 1.1 and 1.4.

M2 requires evidence that the process was implemented. To be specific this measure is not requiring the entity to retain evidence that each step of the process was implemented or that for each relay setting a package of information showing the protection system analysis, study files, communications with other Entities was executed. In comparison, PRC-005 requires an entity to maintain and retain evidence of the maintenance of protection systems; not to implement a maintenance program.

Dennis Chastain - Tennessee Valley Authority - 1,3,5,6 - SERC

Selected Answer: Yes

Answer Comment:

While TVA generally agrees with the proposed measures, the following comments are offered as possible improvements:

Since Requirement R1 emphasizes a periodic review of Protection System settings, we suggest the wording for Measure M1 be revised slightly to read "…a process to develop **and periodically review** settings…".

We suggest revising M2 so entities that choose the "Periodic Fault current studies" method as their trigger for a review of existing Protection System settings are aware that they will need appropriate documentation. Please add "If the entity uses the Periodic Fault current studies method, acceptable evidence may include, but is not limited to, a list of each BES bus, its baseline Fault current, date of the baseline, its periodically reviewed Fault current, and the date of the review." (If adopted, this would also need to be reflected in the RSAW.)

Answer Comment:

The measures do not provide guidance regarding how compliance will be measured by a Compliance Enforcement Authority. The measures are so generic that a single measure could be written for both requirements and could be summed up as “evidence that demonstrates compliance with the requirement.” According to the Standards Process Manual, a measure “provides identification of the evidence or types of evidence that may demonstrate compliance with the associated requirement.” The measures in the current draft do not identify any specific evidence or types of evidence.

There seems to be conflict with timelines, comparing the Standard itself to the Implementation Plan. R2.2 places a timeline for completion of 90 calendar days after the completion of the R1 assessment, and word has filtered down that WECC said that if the R1 assessment is completed prior to the effective date, the clock starts ticking on the R2.2 90 days. However, the implementation plan says that R2.2 has to be completed with 90 calendar days of the effective date of the Standard. That could be a very different end date for R2.2.

Answer Comment:

An entity must be in compliance with the requirements of a standard on day 1. The Implementation Plan allows 12 months after approval of the standard for this to occur. If a process is completed per R1 within 12 months, an entity is compliant with R1. But what constitutes compliance with “implementing the process established in accordance with requirement R1”? For example, if an entity’s process adopts the a six-year review cycle of its Protection System setting as permitted in the second bullet in Part 1.3, what would it be implementing on day 1?

The team should consider requiring an entity-specific implementation timeline to be included in the process developed in R1, with R2 stating that an entity shall implement its R1 process in accordance with its timeline in R2.

Answer Comment:

See our response to Question 2 above.

The implementation plan indicates there is 12 months to become compliant. This could create confusion since many aspects of the standard are based on a 6 year interval. Consider if the implementation plan should match the maximum interval or clearly address what must be completed to be compliant as part of the implementation plan.

Can the drafting team clarify if all protection systems on an entities' system must have a coordination evaluation meeting the new process for PRC-027 within the first six years? The standard also gives the impression that the baseline fault current percentage option does not require all protection systems to be evaluated for coordination until the fault current threshold is met.

CSU agrees with SMUD's Comments concerning a potentially more effective approach to PRC-027. In addition to supporting their comments CSU also would make the following comment if the standard were to remain similar to its current construction.

Is it the intention that an entity would have an initial/baseline review of all protections system settings completed prior to the effective date of this standard? If this is the intent then the implementation period needs to be extended or a phased approach adopted as is done with PRC-005-2 for example.

1. The implementation plan should explicitly indicate that entities are not expected to be 100% compliant with R2 on the effective date of the standard. Further, the implementation plan should state that the applicable entities are to begin implementing the process it established in response to R1 on the effective date of the standard.

2. There is an issue with the establishment of the baseline noted in our answer to question #4 which potentially could be addressed in the Implementation Plan.

Answer Comment:

We agree with the proposed Implementation Plan as it was explained by the SDT during the the 4/27/2015 project webinar. However, we believe a modified format would add clarity around the PRC-027-1 compliance dates. As written, it could be interpreted that every applicable Protection System setting that already exists needs to be reviewed using the process established in accordance with Requirement R1 by the “first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required to go into effect.” We believe that completing a review of all existing applicable settings concurrently with the effective date of R1 is unrealistic, and is not what the drafting team intended. We request the SDT consider modifying the Implementation Plan format as suggested below to help add clarity around the R2 compliance date for pre-existing PRC-027 applicable settings.

Requirement R1

"...first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority…"

(Rationale – consistent with the posted Implementation Plan)

Requirement R2 (for new Protection Systems to be placed in service after the effective date of R1, or for existing Protection System settings affected by Bulk Electric System changes occurring after the effective date of R1) :

"...first day of the first calendar quarter that is eighteen (18) months after the date that the standard is approved by an applicable governmental authority…"

(Rationale – this would give entities ~6 months to start implementing the R1 process for new settings and begin to build an evidence trail for R2)

Requirement R2 (for existing Protection System settings that were developed and implemented prior to the R1 effective date):

"...first day of the first calendar quarter that is eighty-four (84) months after the date that the standard is approved by an applicable governmental authority…"

(Rationale – this would more clearly communicate the six year interval intended by the drafting team, following development of the R1 process, to fully implement the initial six year review interval required by R1/1.3. Some legacy settings may be reviewed earlier if BES changes warrant.)

Error: Subreport could not be shown.

Selected Answer: No

Answer Comment:

The implementation plan is not clear when the first performance of the tasks required in the Protection System coordination process document is required. For example, when must the first review of Protection System settings per Part 1.2 or 1.3 be conducted? On the effective date of the standard? Based on a date established in the process document?

We ask the drafting team to combine PRC-001 with PRC-027 to avoid confusion and cross referencing of two standards on the same topic. This should be handled in the development phase, which would require a modification to the implementation plan.

AECI believes that for some systems, especially those with a large amount of interconnections, there may be additional time past 1 year to properly establish **accurate** baselines and coordinate a process docuent with neighbors. An additional year for development of the plan and baselines is requested. Six year review periods seems reasonable and adequate.

Answer Comment:

(1) This Standard references the terms “BES Elements.” In reviewing the NERC Glossary, there are many references to merely “Elements” without the preceding “BES” adjective, i.e., Remedial Action Scheme definition. What is the difference between “BES Elements” and “Elements” (without the BES)? Is the term “Element” without BES reference to elements that are non-BES, and if that is the case, does subpart “e.” of the RAS definition apply to non-BES Elements as there is no preceding “BES”?

(2) In R1 Part 1.3, “current baseline” is not defined. Current baseline is defined in the Supplemental Material Section, but because the Supplemental Material Section is merely guidance, can an entity make up its own definition of “current baseline”?

(3) In R1 Part 1.3, the Requirements nor the implementation plan define when a “time interval” begins. This should be in the Requirements or implementation plan, because the supplemental material section is unenforceable.

(4) In R1 Part 1.3, if a review was performed on March 1, 2017 and an entity had 6 calendar years in which to complete the review, is that 6 full calendar years? Meaning, would an entity not have to complete another review until December 31, 2023?

(5) In R1 Part 1.5.3, this Requirement merely states that the coordination issues need to be “addressed” prior to implementation. We have two questions on this requirement, the first being that after reviewing the supplemental guidance material, that under certain circumstances, such as where additional system modifications are needed, that such modifications do not need to take place before the settings changes if the entity didn’t originally place those modifications into the scope of the settings changes project. Because the Requirement does not require the modifications to take place in any future time, can the drafting team describe in more detail how these issues are “addressed prior to implementation”?

(6) In the Supplemental Material section, there are references to the terms “BES Protection System” and “Protection System.” The Standard applies to “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements.” For purposes of this Standard, is a BES Protection System a Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements?

(7) In Requirement R1, is the 15% value 15.% with two significant figures in that if we have a deviation of 14.6% we need to perform an evaluation as it rounds up to 15% or are there more significant figures, i.e., 15.0%?

(8) In Requirement R1, if an entity uses the time based option and uses a recent short-circuit study for its baseline study, does the 6-year option 2 time frame start from the time of enforcement of the Standard or from the date the short-circuit study was finalized? The answer to this question does not appear to be in the Requirement.

Mark Wilson - Mark Wilson On Behalf of: Leonard Kula, Independent Electricity System Operator, 2

Selected Answer:

Answer Comment:

As indicated in a number of our previous comments, we continue to disagree with the treatment to Requirement R1 in the proposed PRC-001-3.

Requirement R1, as written, is not measurable and should be rescinded or mapped into another standard. While revising PRC-001-3 to reflect the mapping of certain requirements (e.g. R3) to PRC-027 is necessary, not

revising other requirements that are unclear or unnecessary in the same standard that being revised fails to take advantage of the opportunity of an initiated project. Quite simply, familiarity with and knowledge of the purpose and limitations of Protection System schemes applied in an operating entity's area are inherent to the entities that are required to comply with the rest of PRC-001-2. R1, therefore, is redundant and unnecessary. In addition, this requirement is not measurable. An analogy to this argument is that an RC needs to monitor its system conditions against IROLs. Since the RC is already required to prevent exceedances of IROLs and to apply mitigating measures to reduce flows to below IROLs within Tv, having monitoring capability is inherent to achieving these objectives. Hence in IRO-009-1, there are no requirements that stipulate the need to monitor flows/conditions against IROLs.

The above view is consistent with the Independent Experts Review Panel's recommendation. If the SDT continues to opine that the retirement of PRC-001-2 Requirement R1 falls outside the scope of this project, then we would suggest the SDT to immediately submit an addendum or revised SAR to the Standards Committee for approval to post for industry comment, then revise/remove R1 accordingly.

We offered a similar comment about a year ago when the proposal was to keep only R1 in PRC-001 until this requirement is incorporated into a PER standard. No actions have been taken since. Had an addendum SAR or a revised SAR been posted then, the PRC-001-2 R1 issue would have been fully addressed by now. We are disappointed that over this period, neither NERC staff nor the PRC-027 SDT took the proactive action to proactively address/close out the issue. Today, we still have a requirement that is improper and not measurable. Once again, we urge NERC staff and the SDT to act now to post an addendum SAR or a revised SAR to fully resolve this issue. Further delay in addressing the issue until a new project is initiated may result in dragging the approval of PRC-027-1 for another several months to a year.

Barbara Kedrowski - We Energies - Wisconsin Electric Power Co. - 3,4,5 - RFC

Selected Answer:

Answer Comment:

We would like this standard to state which relay elements that NERC wants to see coordinated. This could be in an attachment similar to PRC-019-1 and 025-1. Specifically for generator protection, there are so many different protection elements used that it would make the standard easier to use for the end user and an auditor if they had a specific set of relay elements to look for.

Finally, we would like to see an exception for distributed resources similar to what project 2014-01 is working on for other standards. Typically distributed resources do not look out to the transmission system, but unless they are excluded this will need to be examined and documented.

It makes sense that, out of the five components of the NERC-defined Protection System, the owner of the Protective relays which respond to electrical quantities would be the one required to meet PRC-027. To address situations where multiple TOs or GOs may own different portions of the Protection System, LCRA TSC recommends changing to the language in the Applicability section to read as shown below:

4.1.1 Transmission Owner (that owns the Protective relays which respond to electrical quantities portion of the Protection System)

4.1.2 Generator Owner (that owns the Protective relays which respond to electrical quantities portion of the Protection System)

The applicability of PRC-027 should be limited to Protection Systems installed on interconnecting elements. There is no justification to include all BES Protection Systems in the standard. The requirements in PRC-001-2, R2 and R3, which PRC-027 is replacing, are limited to the coordination of protection systems between different entities. The SAR posted for PRC-001-1 System Protection Coordination (Project 2007-06) does not include expanding the scope of the standard to include all BES protection systems. If FERC seeks a protection system coordination standard that includes all BES protection systems, then the NERC standard development process should be followed by creating a new SAR.

It took four iterations of PRC-027-1 to come up with requirements acceptable to stakeholders that captured each relay owner's responsibility during the course of a coordinated assessment. This included the types of system changes that would trigger a coordinated study, the information to be shared, the timeframes to respond, and the expected actions to take at each point of the process. Although FERC staff did not call for the removal of those requirements, the project team has chosen to do so. These requirements should be reinstated. Without them, it is possible than an unresponsive neighbor cannot be compelled to participate in a coordinated relay assessment – leaving entities exposed to a NERC violation.

Answer Comment:

While we agree that Part 1.3 is an essential element of a successful coordination process, we have concerns about how the baseline bus fault currents are determined in the "Supplemental Material" Section addressing Part 1.3. The last paragraph on page 13 of the standard states that “The baseline can be Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect.” That implies that an entity must search its archives to determine whether it has available documentation of Fault currents that were used for initial settings. Then, only if no documentation can be found, the entity can choose to use its most recent short-circuit study data for the baseline. Tri-State believes that, if the second option is acceptable for cases when no documentation is available, it ought to be acceptable to use the most recent short-circuit study at the time the standard becomes effective for all of its bus Fault currents. Our recommendation is to remove “where not available” and the associated commas from the referenced paragraph on page 13.

Answer Comment:

Tacoma Power thanks the drafting team for their efforts and appreciates the opportunity to comment and help to guide the development of this standard.

Together with several other entities, Tacoma Power questions the need to mandate intra-entity coordination as part of an enforceable standard. Despite its reservations about the scope of the proposed standard, Tacoma Power assumes that, because FERC staff expressed concern that intra-entity coordination be included, there is little that the industry can do to limit the scope of PRC-027-1 to inter-entity coordination (i.e., Part 1.5 of Requirement R1). Tacoma Power's comments are based upon this assumption.

On page 14 of the Supplemental Material section, Tacoma Power recommends changing 'necessitates' to 'allows.' An entity may elect to review settings prematurely and reset the baseline for that/those bus(es), even though changing the baseline is not necessary.

The draft standard does not seem to address what latitude applicable entities will have when defining their tolerance for coordination. For example, under how many System contingencies does coordination need to be maintained? Must coordination be maintained for all single Protection System component failures? On the other hand, provided that planning and operations personnel/entities are aware, could applicable entities intentionally mis-coordinate Protection Systems? Tacoma Power's understanding is that the drafting team primarily has the following intents. (1) An applicable entity should be aware of how their Protection Systems will likely perform during Fault conditions under identified contingencies. (2) An applicable entity should be aware of contingencies under which Protection System performance during Faults may be unknown or adverse. (3) Operations and planning personnel/entities should be aware of contingencies under which Protection System performance during Faults may be unknown or adverse. To this end, Tacoma Power recommends that the Purpose be "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those Faults, such that the Protection Systems operate in the intended sequence during Faults." Similarly, Tacoma Power recommends Facilities be "Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those

Faults." This revised verbiage replaces "those faulted Elements" with "those Faults" to allow for removal of Elements other than the faulted Element(s), provided that the sequence is intended.

The Purpose statement includes the phrase "such that the Protection Systems operate in the intended sequence during Faults." This could be interpreted in a couple ways. The first interpretation is that the primary Protection System is supposed to operate first and not the backup Protection System. The second interpretation is that, not only does the primary Protection System need to operate first, but that the backup Protection System must be capable of operating for (detect) all Faults within the primary Protection System's zone of protection. Could the drafting team please identify the more correct interpretation of the Purpose? The burden of proof could be substantially different between the two interpretations.

If PRC-027-1 is approved, Tacoma Power's understanding is that a Mis-operation due to mis-coordination will not automatically imply that a violation of PRC-027-1 occurred.

Remove the extra 'The' just before Compliance Monitoring and Enforcement Program.

Tacoma Power believes that the drafting team should leverage the Lower and Moderate VSLs. The Lower VSL for both Requirements R1 and R2 should be for failing to include one Part. The Moderate VSL should be for failing to include two Parts, the High VSL should be for failing to include three Parts, and the Severe VSL should be for failing to include four (or more) Parts OR for failing to establish/implement the process. FERC's VSL G1 only states that the VSL assignment should not have the UNINTENDED consequence of lowering the current level of compliance. Furthermore, the scope of applicability of PRC-027-1 is much greater than PRC-001-1, so it is reasonable for PRC-027-1 to leverage the Lower and Moderate VSLs, even though PRC-001-1 did not. If the drafting team disagrees, then Part 1.5 of Requirement R1 should be separated into a separate requirement so that the other Parts of Requirement R1 can have more graduated VSLs since these other Parts do not map as well to PRC-001-1.

Compared to Requirement R1, Tacoma Power is not convinced that the justification has been made for a High VRF for Requirement R2.

Tacoma Power's understanding is that, where the NERC-defined term 'Fault' is used, the standard primarily, if not exclusively, means short circuits, as opposed to broken wires or intermittent connections.

Although entities are supposed to develop their own processes, the draft standard is specific enough that a flow chart may be helpful to visualize the process.

In the Supplemental Material section, it would be very helpful to include a series of examples of how Part 1.2 might be triggered and how an applicable entity might approach the review of Protection System settings. Examples might include a new substation, a new transmission Element, a new generator, a change in the impedance of an Element, and/or Protection System setting changes without any System change (e.g., setting philosophy change, relay replacements). In the examples, it would be helpful if the drafting team could discuss how to determine how far back into the existing System to look in response to the triggers.

Answer Comment:

In the Applicability Section of PRC-027-1, the DP applicability is limited to those DPs that "own Protection Systems identified in the Facilities section 4.2." However, throughout the standard when the DP is identified as the applicable entity, the qualifier is not included. Does the SPCSDT believe that it is clear in the requirements and rationale boxes that the DP applicability is only to those DPS that own Protection Systems identified in the Facilities section 4.2? If one were to read the requirements without fully understanding the applicability section, it appears that they are applicable to all DPs. Would it be better for clarity to include the "own Protection Systems identified in the Facilities section 4.2" language with all references to the DP?

Anthony Jablonski - ReliabilityFirst - 10 -

Selected Answer:

Answer Comment:

ReliabilityFirst agrees that PRC-027-1 helps to alleviate the risk of insufficient coordination of Protection Systems installed to detect Faults on BES Elements and isolate those faulted Elements (such that the Protection Systems operate in the intended sequence during Faults). ReliabilityFirst offers the following comments related to the term "coordination" for the Standard Drafting Team's consideration:

1. **ReliabilityFirst believes that the term "coordination" as it is used in Requirement 1, Parts 1.5.2 and 1.5.3 is ambiguous and notes that it is not defined within PRC-027-1 or the NERC Glossary Terms. Adding to this ambiguity, the term is used within a number of other Standards, and could be interpreted to refer to the setting of Protection Systems *or* to communications between entities. To add clarity to PRC-027-1, ReliabilityFirst recommends replacing the term "coordination" with the term "Protection System Coordination." Listed below is ReliabilityFirst's proposed NERC Glossary definition of "Protection System Coordination" for the Standard Drafting Team's consideration:**

Protection System Coordination - The setting of Protection Systems installed for the purpose of detecting and isolating Faults on BES Elements, such that the Protection Systems operate in a defined sequence in an effort to remove such Faults from the BES.

1. **ReliabilityFirst recommends the following changes to Requirement 1, Parts 1.5.2 and 1.5.3 to incorporate this new definition of “Protection System Coordination” (highlighted in red below):**

1.5.2. Review proposed Protection System settings provided by other functional entities, and respond regarding the proposed settings. The response should identify any Protection System Coordination issue(s) or affirm that no Protection System Coordination issue(s) were identified.

1.5.3. Verify that any identified Protection System Coordination issue(s) associated with proposed Protection System settings for the associated Elements are addressed prior to implementation.

SMUD thanks the drafting team for the opportunity to comment. SMUD would prefer more of a carrot and stick approach. SMUD views the current draft as burdensome due to the amount of documentation that will be needed to prove steps 1.1-1.4 were performed on every single BES Protection System. A better approach would be to establish a trigger or threshold that says you must follow these rules if you have “too many” coordination Misoperations. This trigger or threshold provides entities an incentive to coordinate relay settings thus avoids the compliance burden. This would be in alignment with the goal of reducing Misoperations rather than documenting procedural compliance. We think this would better represent RBS and at least we could support such an approach.

Selected Answer:

Answer Comment:

While ATC supports the direction the SDT is going on this draft Standard, there are still some concerns that result in ATC maintaining a “negative” ballot position.

On page 13 of 16 of Draft 5, ATC recommends removing the phrase, “where not available” from the last paragraph. An entity should be able to use the fault current values from the most recent short-circuit study for a baseline. Fault current values from the initial settings, while available, could be contained in many different formats from prior years and not readily available in a database.

In re-working Draft 5 of PRC-027-1, ATC recognizes and appreciates the drafting team’s efforts to allow an entity flexibility in developing its coordination process. However, ATC also believes that the focus of PRC-027-1 should be on improving BES reliability and the current draft does not necessarily achieve that end. The definition of a review could be left up to interpretation, which could lead some companies to perform the function to meet the requirement with no benefit realized. Where PRC-004 data provides a mechanism to measure performance, the better means to achieve reliability performance would allow each entity to use its company’s Misoperations data and the greater industry data to develop a program that addresses its greatest need. There is no clear connection in the

PRC-027-1 requirements to system performance using PRC-004 Misoperations data, and as echoed in our comments to Question 1, there is no feedback loop for monitoring improvement.

John Seelke - Public Service Enterprise Group - 1,3,5,6 - NPCC,RFC

Error: Subreport could not be shown.

Selected Answer:

Answer Comment:

a. Clarify the scope of PRC-027-1: We understand from the Webinar on 4/27/15 that the standard is intended to address Protection System setting for Faults associated with Normal Clearing (i.e., the Protection Systems operate properly per the definition of "Normal Clearing") and normal operation of the interrupting devices (i.e., they also operate correctly). In other words, the setting of back-up Protection Systems that would operate due to the failure of a Protection System or circuit breaker to operate correctly is outside the scope of the standard. The standard should clearly state this in the Applicability section.

b. Provide default information by separate attachments to the standard: To avoid additional work by each registered entity in developing its process under R1 process, the standard should have certain "default" information provided in separate attachments as discussed below. Furthermore, an entity should be able to either adopt the attachment or modify it, provided that its modifications are explained in its process.

· - Part 1.1: This subpart is presently "A method to review and update the information required to develop new or revised Protection System settings." We believe that "the information required to develop new or revised Protection System settings" is not entity-specific, but Protection System-specific. That information should be included in the standard via an attachment.

· - Part 1.3: This subpart should also reference an attachment to the standard that designates the Protection System types that need to be included in the periodic review. For example, It would not make sense for one entity to include some Protection System, and another entity to exclude the same protection system due to a different interpretation of the standard. There are only a finite number of protection system types, and they should be listed as “included” or “excluded” as part of the standard. That information should be included in the standard via an attachment.

c. Clarify the first bullet in Part 1.3 “Periodic Fault current studies” on two points:

· The phrase “an established Fault current baseline” is unclear with respect to timing. It would be clearer if the team replaced the aforementioned phrase with the following one: “a Fault current study that is no older than six calendar years.” Then a 2020 review for a bus under this bullet must use Fault current that was calculated in 2014 or later.

We recommend modifying the phrase “, and evaluated in a time interval not to exceed six calendar years” in the first bullet in Part 1.3 to “, with such Fault current changes evaluated in a time interval not to exceed six calendar years. “

Answer Comment:

I am compelled by other commentors that pointed out in previous drafts that the shift from inter-connected elements to intra-connected elements is potentially a broad expansion of scope for little reliability benefit. The industry just spent several years getting more definition on the scope and most other protection system issues are covered in other standards as noted in the Protection System Issues Addressed by Other Projects.

More specifically, if the intra-coordination regulatory burden does have reliability benefit it should be limited to BES Transmission Owners in the applicability section. 4.1.2, 4.1.3, and 4.2 should be eliminated.

Answer Comment:

In the past for draft 4 of PRC-027 it was stated in part 1.1.1 of the application guidelines that, “Faults on the BES, but records collected for Reliability Standard PRC-004 do not indicate that lack of coordination was the predominate root cause of reported Misoperations.” Considering this, why are additional standard requirements being implemented if data does not support it?

How was the 15% change in fault current determined? Perhaps this percentage should be eliminated and allow each entity to specify this type of fault current percentage threshold as part of their own process.

R1.3. states there should be a review of protection system “settings”. Should this state protection system “coordination-related settings”? This standard is not addressing all aspects of how to set a relay but is addressing coordination, which involves timers and time current curves rather than say a distance impedance reach magnitude. Consider if “settings” should be changed to “coordination related settings” in the standard.

A 6 year time horizon option to review settings seems a bit arbitrary. A longer time horizon may be better suited for very large systems. Consider allowing this time interval to be defined as part of the process for each utility so they can be flexible since the number of systems to coordinate will vary greatly between utilities.

For R1.1. why does PRC-027 contain all the detailed model and equipment verifications for an auditor while other standards like PRC-006, 010, 019, 023, 024 and 025 do not? The need for accurate model and equipment data is correct; however, the efforts to supply proof of this information to an auditor appears to be excessive in terms of auditing proof compared to other standards. The result of this requirement as it will be implemented in R2. is that the auditor will essentially be reviewing the relay settings and accuracy of the model and equipment records. This does not seem practical. We would recommend removal of this requirement.

In the purpose statement, could Protection Systems be changed to Protective Relays? Protective relays are installed for the purpose of detecting faults on BES elements and isolating those faulted elements. We do not feel that associated communications systems, voltage and current sensing devices, station batteries, or DC control circuitry are installed for those purposes.

In the Rationale for Requirement R1., we don’t consider all the listed examples of information to be essential for coordination, especially the functional drawings, which are very high level, and station configuration, which would be single bus/ring bus/etc. Why are these essential?

In the Rationale for Requirement R1, Part 1.2., there are absolute terms regarding system changes, such as “that alters ANY”, and “result in A change”. We suggest a change to some wording that would allow some minor changes that wouldn’t require a coordination review.

Regarding Requirement R1, we would need to review and verify all line, generator, and transformer impedances to verify our short circuit study is accurate. The supplemental material calls for a review of interconnected TO, GO, and DP information to determine whether their systems are correctly modeled in the short circuit study. This is a concern in that we would have to determine other utilities' models.

Answer Comment:

As indicated in a number of our previous comments, we continue to disagree with the treatment with respect to Requirement R1 in the proposed PRC-001-3.

Requirement R1, as written, is not measurable and should be rescinded or mapped into another standard (e.g. a PER standard) and revised to become a training requirement. While revising PRC-001-3 to reflect the mapping of certain requirements (e.g. R3) to PRC-027 is necessary, not revising other requirements that are unclear or unnecessary in the same standard that is being revised fails to take advantage of the opportunity of an initiated project. Quite simply, familiarity with and knowledge of the purpose and limitations of Protection System schemes applied in an operating entity's area are inherent to the entities that are required to comply with the rest of PRC-001-2. R1, therefore, is redundant and unnecessary. An analogy to this argument is that an RC needs to monitor its system conditions against IROLs. Since the RC is already required to prevent exceedances of IROLs and to apply mitigating measures to reduce flows to below IROLs within Tv, having monitoring capability is inherent to achieving these objectives. Hence in IRO-009-1, there are no requirements that stipulate the need to monitor flows/conditions against IROLs.

The above view is consistent with the Independent Experts Review Panel's recommendation. If the SDT continues to opine that the retirement of PRC -
001 -2 Req
would suggest the SDT to immediately submit an addendum or revised SAR

to the Standards Committee for approval to post for industry comment, then revise/remove R1 accordingly.

We offered a similar comment about a year ago when the proposal was to keep only R1 in PRC-001 until this requirement is incorporated into a PER standard. No actions have been taken since. Had an addendum SAR or a revised SAR been posted then, the PRC-001-2 R1 issue would have been fully addressed by now. We are disappointed that over this period, neither NERC staff nor the PRC-027 SDT took the proactive action to proactively address orclose out the issue. Today, we still have a requirement that is improper and not measurable. Once again, we urge NERC staff and the SDT to act now to post an addendum SAR or a revised SAR to fully resolve this issue. Further delay in addressing the issue until a new project is initiated may result in dragging the approval of PRC-027-1 for another several months to a year.

FE believes the TO should be identified as the entity to establish the system protection coordination and be responsible for PSCSs (Power System Coordination Studies), Fault Studies, Short Circuit Studies, etc., to prove coordination. Communication to the GO should also be the TO's responsibility. The GO would be responsible to implement setting changes as directed by the TO, where applicable and if able. The GO's connection to the BES normally ends/terminates with the Generator Step Up transformer so the GO does not have the data to perform any Power System Coordination Studies, Fault Studies, or Short Circuit Studies.

Greg Davis - Greg Davis On Behalf of: Jason Snodgrass, Georgia Transmission Corporation, 1

Selected Answer:

Answer Comment:

GTC is in support of the SERC Comments:

1) Please revise the Purpose because it implies the Protection System isolates the fault. The NERC defined Protection System includes the trip coil but stops there. Our suggested wording replaces ‘isolating’ with ‘initiating isolation of’, which results in ‘To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating initiating isolation of those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults.’

2) Please revise the Facilities consistent with the revised Purpose in item 1 above. Our suggested wording replaces ‘isolating’ with ‘initiating isolation of’, which results in ‘Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating initiating isolation of those faulted Elements.’

3) Supplemental Material p13 at bullet (Option 1) states ‘…from an established Fault current baseline for Protection Systems at the bus under study, …’ Please clarify that the ‘bus under study’ is typically the BES bus at or above 100kV. We suggest adding ‘For a TO the busses under study are typically their list of BES busses at or above 100kV. For a GO or DP, the busses under study are typically the list of BES busses at or above 100kV which they connect to; such busses may well be owned by the TO.’ This should also help allay some concerns about intended scope.

4) Supplemental Material p13 bottom and top of p14 states ‘The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect.’ Please delete ‘where not available’ as this is burdensome and inconsistent with the intended scope.

5) Supplemental Material p13: Please add another example to help GO understand what most likely needs to be coordinated across the GO-TO interface. We suggest adding it between ‘…its zone of protection.’ and ‘Based on stakeholder comments …’ and starting a new paragraph with your existing ‘Based on stakeholder comments …’ sentence. We suggest adding: ‘Also for example a GO would typically include the generator step-up transformer neutral time overcurrent on its H0 bushing because its fault current could change due to generator, transformer, or BES changes or a combination of them.’

Answer Comment:

CSU agrees with SMUD's Comments concerning a potentially more effective approach to PRC-027., but in regards to PRC-001 CSU has some small modifications that CSU thinks will clarify the intent of some verbiage in PRC-001.

1. R2.1 and R2.2 – "Protection System component failure that adversely impacts the Reliable Operation of the BES" should replace the verbiage currently in the standards which currently states "protective relay or equipment failure reduces system reliability." This uses defined terms that clarifies what is meant by this statement.

2. PRC-001-3, R1 – If the verbiage is not clarified using defined terms then there needs to be some clarification concerning "reduces system reliability". CSU recommends the above verbiage using defined terms to clarify this ambiguity.

Answer Comment:

1) Please revise the Purpose because it implies the Protection System isolates the fault. The NERC defined Protection System includes the trip coil but stops there. Our suggested wording replaces ‘isolating’ with ‘initiating isolation of’, which results in ‘To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating initiating isolation of those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults.’

2) Please revise the Facilities consistent with the revised Purpose in item 1 above. Our suggested wording replaces ‘isolating’ with ‘initiating isolation of’, which results in ‘Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating initiating isolation of those faulted Elements.’

3) Supplemental Material p13 at bullet (Option 1) states ‘…from an established Fault current baseline for Protection Systems at the bus under study, …’ Please clarify that the ‘bus under study’ is typically the BES bus at or above 100kV. We suggest adding ‘For a TO the busses under study are typically their list of BES busses at or above 100kV. For a GO or DP, the busses under study are typically the list of BES busses at or above 100kV which they connect to; such busses

may well be owned by the TO.' This should also help allay some concerns about intended scope.

4) Supplemental Material p13 bottom and top of p14 states 'The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect.' Please delete 'where not available' as this is burdensome and inconsistent with the intended scope.

5) Supplemental Material p13: Please add another example to help GO understand what most likely needs to be coordinated across the GO-TO interface. We suggest adding it between '…its zone of protection.' and 'Based on stakeholder comments …' and starting a new paragraph with your existing 'Based on stakeholder comments …' sentence. We suggest adding: 'Also for example a GO would typically include the generator step-up transformer neutral time overcurrent on its H0 bushing because its fault current could change due to generator, transformer, or BES changes or a combination of them.'

Answer Comment:

As indicated in a number of our previous comments, we continue to disagree with the treatment to Requirement R1 in the proposed PRC-001-3.

Requirement R1, as written, is not measurable and should be rescinded or mapped into another standard. While revising PRC-001-3 to reflect the mapping of certain requirements (e.g. R3) to PRC-027 is necessary, not revising other requirements that are unclear or unnecessary in the same standard that is being revised fails to take advantage of the opportunity of an initiated project. Quite simply, familiarity with and knowledge of the purpose and limitations of Protection System schemes applied in an operating entity's area are inherent to the entities that are required to comply with the rest of PRC-001-2. R1, therefore, is redundant and unnecessary. In addition, this requirement is not measurable. An analogy to this argument is that an RC needs to monitor its system conditions against IROLs. Since the RC is already required to prevent exceedances of IROLs

	and to apply mitigating measures to reduce flows to below IROLs within Tv, having monitoring capability is inherent to achieving these objectives. Hence in IRO-009-1, there are no requirements that stipulate the need to monitor flows/conditions against IROLs. **The above view is consistent with the Independent Experts Review Panel's recommendation. If the SDT continues to opine that the retirement of PRC-001-2 R1 Requirement falls outside the scope of this project, then we would suggest the SDT to immediately submit an addendum or revised SAR to the Standards Committee for approval to post for industry comment, then revise/remove R1 accordingly.** **We offered a similar comment about a year ago when the proposal was to keep only R1 in PRC-001 until this requirement is incorporated into a PER standard. No actions have been taken since. Had an addendum SAR or a revised SAR been posted then, the PRC-001-2 R1 issue would have been fully addressed by now. We are disappointed that over this period, neither NERC staff nor the PRC-027 SDT took the proactive action to proactively address/close out the issue. Today, we still have a requirement that is improper and not measurable. Once again, we urge NERC staff and the SDT to act now to post an addendum SAR or a revised SAR to fully resolve this issue. Further delay in addressing the issue until a new project is initiated may result in dragging the approval of PRC-027-1 for another several months to a year.(Note – The last paragraph of these SRC comments represent a consensus of the ISOs/RTOs with the exception of ERCOT.)**

Answer Comment:

Supplemental Material section 1.3, page 13/16 first bulleted paragraph (Option 1). The first two sentences are unclear, the clause starting with "or, Fault" and ending with "over time" and the following sentence starting with "the accumulation" are confusing.

Requirement R1 uses the words "to operate in the intended sequence during Faults" which makes sense for TOs but is not as clear for a GO/GOP. The SDT should attempt to address what, if anything, this means to a GO. Do GOs have to define this for faults at various locations on the transmission lines, inside the plant etc.? In general, this draft of PRC-027-1 is not clear enough for a Generator Owner (GO). The requirements applicable to a GO need to be clearly defined.

During the webinar, presenters talked about other GO relays other than distance and overcurrent, being in the scope of this standard. If that is the case, these should be clearly included in this standard and requirements for coordination should be part of this standard.

During the webinar, the presenters referred to coordination requirements discussed in IEEE standards and NERC SPCS Technical Reference Document (TRDs). Based on the response to questions asked by Exelon on the Webinar, it appears the SDT expects a GOs to implement some recommendations from IEEE guides or NERC TRDs which do not have the force of law and are not included in the requirements. The question was posed during the Webinar Q&A, "if a GO does not have protective relays which are dependent on the magnitude of fault current, then do they [drafting team] agree this standard is not applicable to the GO". The response was that there are coordination requirements in IEEE standards and NERC TRD which a GO has to address. We disagree with that explanation. IEEE Guides and NERC Technical Reference Document have good guidance but are not enforceable. The way the question was answered implies that this standard requires a GO, under the conditions as stated above, to comply with the requirements. This should not be left to Auditors interpretation. We request the drafting team clarify the requirements to address this issue.

This standard is a step in the right direction and appreciate the efforts of the drafting team. Consideration should be given to schemes not impacted by changes in fault current. Perhaps language could be added that requires review of the schemes associated with any activity that changes the impedance characteristics of a BES line or transformer. Otherwise, schemes that are indifferent to changes in fault current (i.e. step-distance and differential) should be excluded from the current requirements, and should be subject to review as noted above or the drafting team should provide a technical basis for a 6-year review cycle.

Answer Comment:

1. R1.1: Recommend expanding on existing language in the Rational/ Technical Guidelines to emphasize that 'method to review and update' is not a detailed verification of the entire model on a regular basis but a localized review where work is being done going forward.

2. R1.4: Recommend expanding on existing language in the Rational/ Technical Guidelines to indicate that this may be a simple gut check or could be a full review based on the scope of the project and/or the experience of the person doing the work. In either case, the scope of the review is up to the entity.

3. The Rational box for R1.3 correctly indicates that ‘The Fault current-based option requires an entity to first establish a Fault current baseline for Protection Systems at the bus under study to be used as a control point for future Fault current studies”; however, there is no requirement to establish such in the requirements nor in the Implementation Plan. As such, it seems like an entity could establish such a baseline sometime in the future and then make the comparison in the 60th month. As such the standard should clearly require an entity that plans to use the methodology stated in first bullet of 1.3 must establish a baseline prior to the effective date of the Standard. This could be accomplished with a new requirement in R1.3 or possibly in the Implementation Plan.

4. In the VSL tables, the second part of the OR statements for R1 and R2 are not needed and should be deleted. The first part of the OR statement includes the words “two or more”. The phase ‘or more’ includes ‘all elements’ which equates to failing to establish a review process at all.

5. There appears to be some indention/ formatting issues within the Supplemental material for R.1.3 and R.1.4.

6. During the NERC Webinar is was noted that the Supplemental material section states “The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect.” It was indicated that the language might lead an auditor to ask for evidence that an entity researched for this data. Perhaps simply remove the words ‘where available’?

We wish to express support for the direction the Standard Drafting Team has taken in this major re-write to formulate Draft 5 of the standard. Some clarifications and extension of the Implementation Plan, as noted in the comments, are all that should suffice to arrive at a future successful draft standard.

The approach that the System Protection Coordination Standard Drafting Team (SPCSDT) has taken by establishing a separate standard for Coordination of Protection System Performance During Faults (PRC -027), while another standard for protection coordination (PRC-001-3 System Protection Coordination) already exists creates an unnecessary administrative burden. The attributes of coordinating fault protection should be contained in a standard on System Protection Coordination. The argument is being made that other protection systems (UFLS, UVLS) have their own standards, and therefore fault clearing should have its own standard. There is an opportunity to consolidate and be less administrative by having only one standard.

Section 4.2 should more clearly address the applicable generator Facilities, and FMPA suggests that it mirror the latest version of PRC-005, specifically section 4.2.5.

R1 refers to "BES Protection Systems" which could be interpreted in various ways, including those that go beyond what is described in the applicability section. FMPA suggests replacing the phrase “BES Protection Systems” in R1 with “Protection Systems identified in section 4.2”.

FMPA also recommends a rephrasing of R1 to make it more grammatically correct…”establish a process to develop settings for its Protection Systems identified in section 4.2 so that they operate in the intended sequence during Faults.”

Dennis Chastain - Tennessee Valley Authority - 1,3,5,6 - SERC

Selected Answer:

Answer Comment:

1) Please consider revising the A.3 Purpose statement, and the A.4.2 Facilities statement, because they imply the Protection System isolates the fault. The NERC definition of “Protection System” includes the trip coil, but stops there. We suggest replacing “isolating” with “initiating isolation of” in both statements.

2) Supplemental Material p13 at bullet (Option 1) states “…from an established Fault current baseline for Protection Systems at the bus under study, …” Please clarify that the “bus under study” is typically the BES bus at or above 100kV. We suggest adding “For a TO the busses under study are typically their list of BES busses at or above 100kV. For a GO or DP, the busses under study are typically the list of BES busses at or above 100kV which they connect to; such busses may well be owned by the TO.” This should also help allay some concerns about intended scope.

3) Supplemental Material p13 bottom and top of p14 states “The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect.” Please delete “where not available” as this is burdensome and inconsistent with the intended scope.

4) Supplemental Material p13: Please add another example to help the GO understand what most likely needs to be coordinated across the GO-TO interface. We suggest adding it between "…its zone of protection." and "Based on stakeholder comments …" and starting a new paragraph with your existing "Based on stakeholder comments …" sentence. We suggest adding: "Also for example a GO would typically include the generator step-up transformer neutral time overcurrent on its H0 bushing because its fault current could change due to generator, transformer, or BES changes or a combination of them."

Texas RE requests clarification of the VSLs to explain if a "Part" is referring to a requirement or subrequirement. If it is referring to a subrequirement, Texas RE suggests specifically stating the subrequirement.

Texas RE suggests a thorough grammatical and consistency review on PRC-027-1 and PRC-001-3. Texas RE noticed the following:

- "The the" in Section 1.2 is duplicated;

- The timeframes and terminology are not consistent with the Rules of Procedure, risk-based compliance process, or the Glossary of Terms; and
- The VSL/VRF Levels are inconsistent with other standards being reviewed. There are not any "Levels of Non-Compliance for Generator Operators" but there are requirements for Generator Operators to follow. Is this because there are no "Measures" for those requirements with GOP responsibility? If there is not an adjustment to the VRF/VSL format, "Levels of Non-Compliance for Transmission Operators" in PRC-001-3, section 3.4 referring to Level 4 does not make sense.

Why is PRC-001-1.1 R5 (i.e. the new R3) not being deleted as part of this project? It focuses on Protection System coordination as well.

Why did the drafting team leave PRC-001 R1 in effect? The words “familiar with” have been interpreted to be a training requirement. This should be retired as PER-005-2 would capture this requirement in the systematic approach to training.

We are curious as to why the SDT has developed a Standard that requires establishing a “process” rather than a “methodology” which is more consistent with other Standards such as FAC and TPL for example (SOL Methodology, Facility Rating Methodology, etc.) Typically in the Standards, processes are included within plans and methodologies. In this Standard there seems to be a shift to a method within a process. We are curious if there is a specific, intended difference in the use of the “process” term.

Also, we would suggest capitalizing the terms ‘transmission’ and ‘load’ in Requirement R3 and sub-part R3.1 in PRC-001-3 standard as they are both defined in the NERC Glossary of Terms. Also, we would ask the drafting to provide clarity on why there are only two Measurements while there four Requirements in the standard.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those Faults, such that the Protection Systems operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

Completed Actions	Date
Standard Authorization Request (SAR) posted for comment	June 11 – July 10, 2007
SAR approved	August 13, 2007
Draft 1 of PRC-001-2 posted for comment	September 11 – October 26, 2009
Draft 1 of PRC-027-1 posted for formal comment with ballot	May 21 – July 5, 2012
Draft 2 of PRC-027-1 posted for formal comment with ballot	November 16 – December 17, 2012
Draft 3 of PRC-027-1 posted for formal comment with ballot	June 4 – July 3, 2013
Draft 4 of PRC-027-1 posted for formal comment with ballot	November 4 – December 31, 2013
Draft 5 of PRC-027-1 posted for informal comment	October 1 – October 21, 2014
Draft 5 of PRC-027-1 posted for formal comment with ballot	April 1 – May 15, 2015
Draft 6 of PRC-027-1 posted for formal comment with ballot	July 29 – September 11, 2015

Anticipated Actions	Date
10-day final ballot	October, 2015
NERC Board of Trustees (BOT) adoption	November, 2015

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Protection System Issues Addressed by Other Reliability Standards:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. Including aspects of protection coordination other than Fault coordination would cause duplication or conflict with the requirements of other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Coordination of Protection Systems for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Transmission Owner
     - **4.1.2.** Generator Owner
     - **4.1.3.** Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)
   - **4.2. Facilities:** Protection Systems installed to detect and isolate Faults on BES Elements.
5. **Effective Date:** See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:

Coordinated Protection Systems enhance reliability by isolating faulted equipment, thus reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. The stated purpose of this standard is: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those Faults, such that the Protection Systems operate in the intended sequence during Faults." Requirement R1 captures this intent by requiring responsible entities establish a process that, when followed, allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing Protection System settings.

Part 1.1 Reviewing and updating the short-circuit models used to develop new or revised Protection System settings helps to assure that settings are developed using accurate, up-to-date information.

Part 1.2 A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

Part 1.3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is essential to the reliability of the BES. Communication and review of proposed settings among these entities are necessary to identify potential coordination issues and address the issues prior to implementation of any proposed Protection System changes.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include a procedure to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically-joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit models for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.3.1. Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.3.3. Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

1.3.4. Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

1.3.4.1. Implementation or commissioning.

1.3.4.2. Misoperation investigations.

1.3.4.3. Maintenance activities.

1.3.4.4. Emergency replacements required as a result of Protection System component failure.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity established a process to develop settings for its Protection Systems, in accordance with Requirement R1.

Rationale for Requirement R2:

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities (Transmission Owners, Generator Owners, and Distribution Providers) to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Requirement R2 provides responsible entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six years, a Protection System Coordination Study for each of its BES Protection Systems identified as being affected by changes in Fault current. The six calendar year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators. At least once every six calendar years following the effective date of this standard, the entity will perform a Protection System Coordination Study when its Fault current comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the Element is connected. The baseline Fault current value(s) will be re-established whenever a new Protection

System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current based option for existing Elements when performing Protection System Coordination Studies. The footnote also allows for the creation of a baseline when a Protection System Coordination Study is performed for installing new Elements.

Option 3 provides the entity the choice of using both the time-based and Fault current based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current based methodology for Protection Systems at other Facilities.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;[1] or,
- Option 3: A combination of the above.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

[1] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance with Requirements R1, R2, and R3, and Measures M1, M2, and M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.
R2.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option

				2, or Option 3, in accordance with Requirement R2.
R3.	N/A	N/A	N/A	The responsible entity failed to utilize the process established in accordance with Requirement R1.

1		Adopted by NERC Board of Trustees	New standard developed under Project 2007-06

Attachment A

The following Protection System functions[2] are applicable to Requirement R2 if available Fault current levels are used to develop the settings for those Protection System functions:

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions are susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize current in their measurement to initiate tripping of circuit breakers. The functions listed above are included in a Protection System Coordination Study because they require coordination with other Protection Systems.
2. See the PRC-027-1 Supplemental Material section for additional information.

[2] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Purpose

The Purpose states: To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance reliability by isolating faulted equipment, reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. This standard requires that entities establish and implement a process to coordinate their BES Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current availability upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults.

The reliability objective of this requirement is to have applicable entities establish a process to develop settings for coordinating their BES Protection Systems, such that they operate in the intended sequence during Faults. The parts that are included as elements of the process ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of settings.

This standard references various publications that discuss protective relaying theory and application. The description of "coordination of protection" is from the IEEE Standard C37.113-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Entities may have differing technical criteria for the development of Protection System settings based on their own philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge; as such, a single definition or criterion for "Protection System coordination" is not practical.

The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. However, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A review and update of short-circuit models for the BES Elements under study.

The study used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers is the short-circuit study. Including a review and, if necessary, an update of short-circuit study information is necessary to ensure that information accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of a short-circuit study are only as accurate as the information that its calculations are based on.

A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. Because the results of short-circuit studies are used as the basis for protective device coordination studies, the short-circuit model should accurately reflect the physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances.

2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 A review of the developed Protection System settings.

A review of the Protection System settings prior to implementation reduces the possibility of introducing human error. A review is any systematic process of verifying the developed settings meet the technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures.

Part 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

Requirement R1, Part 1.3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.3.1 1.3.1. Provide the proposed Protection System settings to the owners of the electrically-joined Facilities.

Requirement R1, Part 1.3.1 requires the entity to include in its process a provision to provide proposed Protection System settings to other entities. This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.3.2 requires the entity receiving proposed Protection System settings to include in its process a provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response indicating Protection System coordination issues were identified, or affirmation that no issues were identified.

Part 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.3.3 requires the entity to include in their process a provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability is minimized.

Note: There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgement. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. Further, there could be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

Part 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

1.3.4.1. Implementation or commissioning.

1.3.4.2. Misoperation investigations.

1.3.4.3. Maintenance activities.

1.3.4.4. Emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2

This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;[3] or,
- Option 3: A combination of the above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

[3] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which an Element is connected. This option allows the entity to choose an interval of up to six calendar years to perform the Fault current comparisons and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

An entity that elects to use Option 2 following the effective date of the standard, must establish its baseline prior to the effective date. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current values used in the original baseline can be updated or created when a Protection System Coordination Study is performed. The baseline values at each bus to which an Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System.

> **Example:** An initial baseline is established at 10,000 amps. During the first short-circuit review, it is discovered that Fault current has increased to 11,250 amps (12.5 percent change); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next study remains at 10,000 amps because no study was performed. However, during the next Fault current comparison, the Fault current has increased to 11,500 (15 percent change); therefore, a Protection System Coordination Study is required, and a new baseline of 11,500 amps would be established.

> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

Attachment A identifies the Protection System functions susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize AC current in their measurement to initiate tripping of circuit breakers. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*. The device functions listed in Attachment A are to be reviewed provided they require coordination with other Protection Systems. The following scenarios provide some examples for applying Attachment A.

A “51 – AC inverse time overcurrent” relay connected to a CT on the neutral of a generator step-up transformer, referred to as “51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT Method)” in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are “51 – AC Inverse time overcurrent” relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a “50 – Instantaneous overcurrent” function used in conjunction with a “62 – Time-delay” function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed “21 – Distance” function, which is a “21 – Distance” function with a “62 – Time-delay” function. Another example would be a definite-time overcurrent function, which is a “50 – Instantaneous overcurrent” function with a “62 – Time-delay” function. A “50 – Instantaneous overcurrent” function used for supervising a “21 – Distance” function would <u>not</u> be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing “21 – Distance” functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is <u>not</u> used in determining the setting, “21 – Distance” functions would <u>not</u> be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, "21 – Distance" functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those ~~faulted Elements~~Faults, such that the Protection ~~System components~~Systems operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).~~ Draft 5 of PRC-027-1 modifies the applicability of the standard to include "Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements," whereas, prior drafts of the standard limited the applicability to "Protection Systems installed for the purpose of detecting Faults on Interconnecting Elements." With this change to the applicability, the coordination of Protection Systems for all "internal" or "intra-entity" connections between BES Elements are addressed.~~

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

~~N/A~~

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Protection System Issues Addressed by Other ~~Projects~~Reliability Standards:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. ~~Other~~Including aspects of protection coordination other than Fault coordination would cause duplication or conflict with the requirements of other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following ~~existing standards or current projects~~Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

~~The SPCSDT contends that including aspects of protection coordination other than Fault coordination within PRC-027-1 would cause duplication or conflict with requirements and compliance measurements of other standards.~~

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Coordination of Protection ~~System~~Systems for Performance During Faults**

2. **Number:** PRC-027-1

3. **Purpose:** To maintain the coordination of Protection Systems installed ~~for the purpose of detecting~~to detect and isolate Faults on Bulk Electric System (BES ~~Elements and isolating those faulted~~) Elements, such that ~~the~~those Protection Systems operate in the intended sequence during Faults.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner

   4.1.2. Generator Owner

   4.1.3. Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)

   ~~**4.2.**~~ **Facilities:**

   4.2. Protection Systems installed ~~for the purpose of detecting~~to detect and isolate Faults on BES Elements ~~and isolating those faulted Elements~~.

   ~~**5.**~~ **Effective Date:**

5. See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:

Coordinated Protection Systems enhance ~~BES~~ reliability by isolating faulted equipment, thus reducing the risk of ~~power system~~BES instability or Cascading ~~by isolating the faulted equipment in a timely manner –~~, and leaving the remainder of the ~~System~~BES operational and more capable of withstanding the next ~~contingency~~Contingency. When Faults occur, properly coordinated ~~protection systems~~ Protection Systems minimize the number of ~~power system~~BES Elements that are removed from service and protect ~~power system~~ equipment from damage. The stated purpose of this standard is: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those ~~faulted Elements~~Faults, such that the Protection Systems operate in the intended sequence during Faults~~.~~." Requirement R1 captures this intent by ~~mandating an entity~~ requiring responsible entities establish a process that, when followed, ~~will facilitate consistent results~~allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing ~~settings for its BES Protection Systems. The drafting team contends the parts listed below are essential elements of the coordination process~~Protection System settings.

Part 1.1 Reviewing and updating the ~~information required to coordinate Protection Systems maximizes the likelihood that the process of reviewing and developing~~ short-circuit models used to develop new or revised Protection System settings ~~is completed~~ helps to assure that settings are developed using accurate, up-to-date information. ~~Examples of information that potentially need to be reviewed are: short-circuit databases, line and transformer impedances, station configurations, current and voltage transformer ratios, adjacent Protection System settings, and relay and control functional drawings.~~

Part 1.2 ~~Reviewing~~A review of the ~~affected~~developed Protection System settings ~~when System changes occur maintains coordination. Examples of System changes are: new or revised Protection System installations, changes to a transmission system Element that alters any sequence or mutual coupling impedance, changes to generator unit(s) that result in a change in impedance, or changes to the generator step-up transformer(s) that result in a change in impedance.~~

~~**Part 1.3** Periodically reviewing Fault current values and/or existing entity-designated Protection System settings maximizes the likelihood that small incremental changes to the power system have not altered the coordination of the Protection Systems. Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults. For example, a current differential scheme may not need to be included because changes in Fault current will not affect the coordination of this system. However, an instantaneous overcurrent element would need to be reviewed because changes in Fault current may cause this element to operate for Faults outside its zone of protection. Part 1.3 provides entities the flexibility to use a Fault current-based or a time-based methodology, or a combination of the two.~~

~~The Fault current-based option requires an entity to first establish a Fault current baseline for Protection Systems at the bus under study to be used as a control point for future Fault current studies. Fault current changes on the System are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. To minimize this risk, the drafting team chose a maximum Fault current deviation of 15 percent (as compared to the entity-established baseline) and a maximum time interval of six calendar years for the Fault current analysis to be performed. The drafting team contends these maximums provide an entity with latitude to choose a Fault current threshold and time interval that best matches its protection philosophy, Protection System maintenance schedule, or other business considerations. (See the Supplemental Materials section for more detailed discussion.)~~

~~As a second option, an entity may choose to establish a periodic review of its existing Protection System settings. The maximum time interval for the review is six calendar years. The drafting team assigned a six calendar year time interval because that corresponds to the maximum allowable maintenance period established for certain relays in PRC-005-2; consequently, this allows Protection System settings revisions to be included with associated maintenance.~~

~~As a third option, an entity may choose to apply a combination of the two review methodologies based on criteria such as voltage level or Protection System application.~~

~~**Part 1.4** A quality review of the Protection System settings minimizes the introduction of~~reduces the likelihood of introducing human error ~~into the development of Protection System settings and helps to ensure the~~ and verifies that the settings produced meet the ~~entity's design specifications for Protection System performance.~~technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures~~,~~ are all examples of ~~quality~~ reviews.

Part 1.~~5~~3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is ~~critical~~essential to the reliability of the BES. ~~Communications~~Communication and review of proposed settings among these entities ~~is essential so~~are necessary to identify potential coordination issues ~~can be identified~~ and ~~addressed~~address the issues prior to implementation of any proposed Protection System changes.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include a procedure to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically-joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process ~~to develop~~for developing new and revised Protection System settings for ~~its~~ BES Elements, such that the Protection Systems ~~to~~ operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A ~~method to~~ review and update of short-circuit models for the ~~information required to develop new or revised~~BES Elements under study.

~~**1.1.**~~**1.2.** A review of the developed Protection System settings.

~~**1.2.** A review of~~For Protection System settings ~~affected by System changes.~~

~~**1.3.** A review of existing entity-designated[1] Protection System settings based on one of the following:~~

- ~~**Periodic Fault current studies:** A 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the bus under study, and evaluated in a time interval not to exceed six calendar years, or~~
- ~~**Periodic review of Protection System settings:** A time interval, not to exceed six calendar years, or~~
- ~~A combination of the above.~~

~~**1.4.** A quality review of the Protection System settings prior to implementation.~~

~~1.5.~~1.3. ~~For new or revised Protection System settings~~ applied on BES Elements that electrically join Facilities owned by separate functional entities~~,~~ (Transmission Owners, Generator Owners, and Distribution Providers), ~~procedures~~provisions to:

~~1.5.1.~~1.3.1. ~~Communicate~~Provide the proposed Protection System settings ~~with the other functional entities~~to the owner(s) of the electrically-joined Facilities.

~~1.5.2.~~1.3.2. ~~Review~~ Respond to any owner(s) that provided its proposed Protection System settings ~~provided by other functional entities, and respond regarding the proposed settings. The response should identify~~pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or ~~affirm~~affirming that no coordination issue(s) were identified.

~~1.5.3.~~1.3.3. Verify that ~~any~~ identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

1.3.4. Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

1.3.4.1. Implementation or commissioning.

1.3.4.2. Misoperation investigations.

1.3.4.3. Maintenance activities.

1.3.4.4. Emergency replacements required as a result of Protection System component failure.

~~[1] Based on the Protection System design and/or susceptibility to changes in Fault current, applicable entities (Transmission Owners, Generator Owners, and Distribution Providers) will designate what Protection Systems must be included in the review(s) to ensure these Protection Systems continue to operate in the intended sequence during Faults.~~

M1. Acceptable evidence ~~includes~~may include, but is not limited to, dated electronic or ~~physical dated records~~hard copy documentation to demonstrate that the responsible entity established a process to develop settings for its ~~BES~~ Protection Systems, in accordance with Requirement R1.

Rationale for Requirement R2:

~~Implementing the process established in Requirement R1 ensures a consistent approach to the development of Protection System settings such that BES Protection Systems operate in the intended sequence during Faults.~~Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities (Transmission Owners, Generator Owners, and Distribution Providers) to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations.*

Requirement R2 provides responsible entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six years, a Protection System Coordination Study for each of its BES Protection Systems identified as being affected by changes in Fault current. The six calendar year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators. At least once every six calendar years following the effective date of this standard, the entity will perform a Protection System Coordination Study when its Fault current comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the Element is connected. The baseline Fault current value(s) will be re-established whenever a new Protection System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current based option for existing Elements when performing Protection System Coordination Studies. The footnote also allows for the creation of a baseline when a Protection System Coordination Study is performed for installing new Elements.

Option 3 provides the entity the choice of using both the time-based and Fault current based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current based methodology for Protection Systems at other Facilities.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall ~~implement the process established in accordance~~, for each BES Element with ~~Requirement R1.~~Protection System functions identified in Attachment A: *[Violation Risk Factor: ~~High~~Medium] [Time Horizon: ~~Operations~~Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;[2] or,
- Option 3: A combination of the above.

M2. Acceptable evidence ~~includes~~may include, but is not limited to, dated electronic or ~~physical dated records~~hard copy documentation to demonstrate that the responsible entity ~~implemented the process established in~~ performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

[2] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

~~M2.~~M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider ~~that owns Protection Systems designed to detect Faults on BES Elements~~ shall each keep data or evidence to show compliance with Requirements R1~~ and~~, R2, and R3, and Measures M1, M2, and ~~M2,~~M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

~~The~~ The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Attachment A

The following Protection System functions[3] are applicable to Requirement R2 if available Fault current levels are used to develop the settings for those Protection System functions:

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions are susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize current in their measurement to initiate tripping of circuit breakers. The functions listed above are included in a Protection System Coordination Study because they require coordination with other Protection Systems.
2. See the PRC-027-1 Supplemental Material section for additional information.

[3] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations.*

Purpose~~:~~

The Purpose states: To maintain the coordination of Protection Systems installed ~~for the purpose of detecting~~to detect and isolate Faults on Bulk Electric System (BES ~~Elements and isolating those faulted~~) Elements, such that ~~the~~those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance ~~BES~~ reliability by isolating faulted equipment, reducing the risk of ~~power system~~BES instability or Cascading ~~by isolating the faulted equipment in a timely manner –~~, and leaving the remainder of the ~~System~~BES operational and more capable of withstanding the next ~~contingency~~Contingency. When Faults occur, properly coordinated ~~protection systems~~Protection Systems minimize the number of ~~power system~~BES Elements that are removed from service and protect ~~power system~~ equipment from damage. This standard requires that entities establish and implement a process to coordinate their BES Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current availability upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1~~:~~

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process ~~to develop~~for developing new and revised Protection System settings for ~~its~~ BES Elements, such that the Protection Systems ~~to~~ operate in the intended sequence during Faults.

~~This~~The reliability objective of this requirement ~~directs the~~is to have applicable entities ~~to~~ establish a process to develop settings for coordinating ~~its~~their BES Protection Systems, such that they operate in the intended sequence during Faults. The ~~drafting team contends the items~~parts that are included as elements of the process ~~are key to ensuring~~ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of ~~these~~ settings.

~~In developing this Standard, the System Protection Coordination Standard Drafting Team (SPCSDT) referenced~~This standard references various publications that discuss protective relaying theory and application. The ~~following~~ description of "coordination of protection" is from the ~~pending revision of~~ IEEE Standard C37.113~~,~~-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

~~The drafting team acknowledges that entities~~Entities may have differing technical criteria for the development of Protection System settings based on their own ~~internal tolerances.~~philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge~~. As~~; as such, a single definition or ~~criteria~~criterion for ~~'~~"Protection System ~~coordination'~~coordination" is not practical.

~~The drafting team also recognizes that the~~The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. ~~Where~~However, backup Protection Systems that are enabled to operate based on current ~~level~~ or apparent impedance with some definite or inverse time delay~~, it is important to ensure those~~ must be coordinated with other Protection Systems ~~coordinate with other Elements' Protection Systems~~of the Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A ~~method to~~ review and update of short-circuit models for the ~~information required to develop new or revised Protection System settings~~BES Elements under study.

~~Two important studies~~The study used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers ~~are~~is the short ~~-~~circuit study. Including a review and ~~protective device coordination studies. Having a method~~, if necessary, an update of ~~reviewing and updating~~short-circuit study information ~~to make sure it is correct in short circuit studies and protective device coordination studies~~ is necessary to ~~guarantee~~ensure that ~~these two studies~~ information accurately ~~reflect~~reflects the physical power system ~~being considered in~~that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of ~~the studies~~a short-circuit study are only as accurate as the information that ~~their~~its calculations are based on.

A short--circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. ~~The~~Because the results of ~~a~~ short--circuit ~~study~~studies are used as the basis for protective device coordination studies~~. Because a~~, the short--circuit ~~study~~model should~~, as~~ accurately ~~as possible, model the actual network it is representing in order to calculate true Fault currents, the method of~~reflect the ~~review and update of information for the short circuit study might include the following:~~physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances ~~to verify they are correct~~.
2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual ~~system~~System, or how the ~~system~~System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, ~~or~~and Distribution ~~Provider's~~Provider information ~~to determine whether their Systems are correctly modeled in the short circuit study~~.

~~A protective device coordination study is performed to determine the settings for protective relays to operate in the intended sequence during Faults. Protective device coordination studies are used to evaluate the application of protective devices, identify problem areas in the network, and determine solutions for existing or future device coordination.~~

~~A protective device coordination study should, as accurately as possible, represent the actual or proposed protective relaying in the network. The method for reviewing and updating information for the protective device coordination study might include the following:~~

~~1.~~ **Part 1.2** A review of ~~current and voltage transformer ratios,~~the developed Protection System settings ~~and the relay manufacture's curve characteristics to ensure the information in the protective device coordination study is correct~~.

~~2.~~ A review of the ~~adjacent relay settings to ensure those settings coordinate with the relay settings under study.~~

~~3. A review of interconnected Transmission Owner, Generator Owner, or Distribution Provider's actual and proposed relay setting changes to determine whether they are accurately represented in the protective device coordination study.~~

~~Other information that may be of value includes engineering drawings such as single-line diagrams, three-line diagrams, and relay and control functional drawings.~~

~~**Part 1.2** A review of Protection System settings affected by System changes.~~

~~Reviewing the affected Protection System settings when System changes occur maintains coordination. Examples of System changes are: new or revised Protection System installations, changes to a transmission system Element that alter any sequence or mutual coupling~~

~~impedance, changes to generator unit(s) that result in a change in impedance, or changes to the generator step-up transformer(s) that result in a change in impedance.~~

~~**Part 1.3** A review of existing entity-designated Protection System settings based on one of the following:~~

~~Periodically reviewing Fault current values and/or existing entity-designated Protection System settings maximizes the likelihood that small incremental changes to the power system have not altered the coordination of the Protection Systems. Based on the Protection System design and/or susceptibility to changes in Fault current, an entity will designate what Protection Systems must be included in the review to ensure these Protection Systems continue to operate in the intended sequence during Faults. For example, a current differential scheme may not need to be included because changes in Fault current will not affect the coordination of this system. However, settings for an instantaneous overcurrent element would need to be reviewed because changes in Fault current may cause this element to operate for Faults outside its zone of protection. Based on stakeholder comments and industry knowledge, the drafting team chose two 'triggers' for initiating a review of existing Protection System settings. Entities have the flexibility to use a Fault current-based or a time-based methodology, or a combination of the two.~~

- ~~(Option 1) A 15-percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at the busunder study, and evaluated in a time interval not to exceed six calendar years, or Fault current changes on the System are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. To minimize this risk, the drafting team chose a maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) and a maximum time interval of six calendar years for the Fault current analysis to be performed. The drafting team contends these maximums provide an entity with latitude to choose a Fault current threshold and time interval that best matches its protection philosophy, Protection System maintenance schedule, or other business considerations. The Fault current-based option requires an entity to first establish a Fault current baseline to be used as a control point for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with maximum generation and all Facilities assumed to be in service.~~

~~The baseline can be the Fault currents used for initial settings development, or where not available, the Fault current values from the most recent short-circuit study available at the time the standard goes into effect. These baseline Fault current values can be at the bus level or at the individual Element level. When performing the periodic Fault current comparison, the entity would continue to compare actual Fault current values gathered during the review against the originally established baseline values until a condition occurs that necessitates the establishment of a new baseline.~~

~~Example: Baseline is established at 10,000 amps. During the first short-circuit review, it is discovered that Fault current has increased to 11,250 amps (12.5 % change); consequently, no Protection System settings review is required since the increase is below 15% and the baseline value for next review remains at 10,000 amps. However, during the next short-circuit review, the Fault current has increased to 11,500 (15% change); therefore, a review of the Protection System settings is required, and a new baseline of 11,500 amps would be established.~~

- ~~(Option 2) A time interval, not to exceed six calendar years, or~~

  ~~As a second option, an entity may choose a time-based methodology to review Protection System settings eliminating the necessity of establishing a Fault current baseline and periodically performing short-circuit studies. This option provides the entity the flexibility to choose an interval of up to six calendar years for performing the Protection System settings review.~~

- ~~(Option 3) A combination of the above.~~

  ~~As a third option, an entity has the flexibilityto apply a combination of the two methodologies based on criteria such as voltage level or Protection System applications. For example, an entity may choose the periodic Protection System review (option 2) and review its Facilities operated above 300 kV on a six year interval, while choosing to use the Fault current review (option 1) for its Facilities operated below 300 kV and periodically compare available Fault currents against the Fault current baseline.~~

~~**Part 1.4** A quality review of the Protection System settings prior to implementation.~~

~~A quality review of the~~ Protection System settings prior to implementation reduces the possibility of introducing human error~~ being introduced into the development of the Protection System settings. A quality review~~ . A review is any systematic process of verifying ~~that~~ the developed settings meet the ~~entity's specific requirements for Protection System performance. Peer~~technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures~~ are all examples of quality reviews~~.

Part 1.~~5~~3 For~~ new or revised~~ Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities~~,~~ (Transmission Owners, Generator Owners, and Distribution Providers), ~~procedures~~provisions to:

Requirement R1, Part 1.~~5~~3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. ~~Communications~~Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.~~5~~3.1 ~~Communicate~~1.3.1. Provide the proposed Protection System settings ~~with~~to the ~~other functional entities~~owners of the electrically-joined Facilities.

Requirement R1, Part 1.~~5~~3.1 ~~mandates entities have~~requires the entity to include in its process a ~~procedure~~provision to ~~communicate~~provide proposed Protection System settings ~~with~~to other entities. ~~These communications ensure~~This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.~~5~~3.2 ~~Review proposed Protection System settings~~ Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by ~~other functional entities, and respond regarding the proposed settings. The response should identify~~identifying any coordination issue(s) or ~~affirm~~affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.~~5~~3.2 ~~mandates~~requires the entity receiving proposed Protection System settings ~~have~~to include in its process a ~~procedure to review the settings and~~provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response~~. The response must include any identified~~ indicating Protection System coordination issues were identified, or ~~affirm~~affirmation that no issues were identified.

Part 1.~~5~~3.3 Verify that ~~any~~ identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.~~5.~~3~~ mandates.~~3 requires the entity ~~have~~to include in their process a ~~procedure~~provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability ~~are~~is minimized.

~~The drafting team recognizes there~~Note: There could be instances where coordination issues are identified ~~that pose minimum risk to the reliability of the BES,~~ and the entities~~, therefore,~~ agree ~~to allow the unmitigated issue to remain~~not to mitigate all of the issues based on engineering judgement. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. ~~The drafting team also recognizes~~Further, there ~~are~~could be situations where ~~entities'~~ protection philosophies differ between entities, but ~~they~~the entities can agree that ~~there were no identified~~these differences do not create coordination issues.

Part 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

1.3.4.1. Implementation or commissioning.

1.3.4.2. Misoperation investigations.

1.3.4.3. Maintenance activities.

1.3.4.4. Emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2~~:~~

~~The~~This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall ~~implement the process~~, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established ~~in accordance with Requirement R1.~~Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;[4] or,
- ~~This requirement directs~~Option 3: A combination of the ~~applicable~~above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which an Element is connected. This option allows the entity to choose an interval of up to six calendar years to perform the Fault current comparisons

[4] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.

and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

An entity that elects to use Option 2 following the effective date of the standard, must establish its baseline prior to the effective date. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current values used in the original baseline can be updated or created when a Protection System Coordination Study is performed. The baseline values at each bus to which an Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System.

> **Example:** ~~implement the~~ An initial baseline is established at 10,000 amps. During the first short-circuit review, it is discovered that Fault current has increased to 11,250 amps (12.5 percent change); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next study remains at 10,000 amps because no study was performed. However, during the next Fault current comparison, the Fault current has increased to 11,500 (15 percent change); therefore, a Protection System Coordination Study is required, and a new baseline of 11,500 amps would be established.
>
> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

Attachment A identifies the Protection System functions susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize AC current in their measurement to initiate tripping of circuit breakers. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*. The device functions listed in Attachment A are to be reviewed provided they require coordination with other Protection Systems. The following scenarios provide some examples for applying Attachment A.

A "51 – AC inverse time overcurrent" relay connected to a CT on the neutral of a generator step-up transformer, referred to as "51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT Method)" in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are "51 – AC Inverse time overcurrent" relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function used in conjunction with a "62 – Time-delay" function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed "21 – Distance" function, which is a "21 – Distance" function with a "62 – Time-delay" function. Another example would be a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function with a "62 – Time-delay" function. A "50 – Instantaneous overcurrent" function used for supervising a "21 – Distance" function would not be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing "21 – Distance" functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is not used in determining the setting, "21 – Distance" functions would not be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, "21 – Distance" functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1~~. Implementing~~ to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, ~~minimizes~~decreases the possibility of introducing errors, and ~~maximizes~~increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes ~~was~~will be moved to this section.

~~A. Introduction~~

1. ~~**Title:** **System Protection Coordination**~~
2. ~~**Number:** PRC-001-1.1(ii)~~
3. ~~**Purpose:**~~

   ~~To ensure system protection is coordinated among operating entities.~~

4. ~~**Applicability**~~

   ~~**4.1.** Balancing Authorities~~

   ~~**4.2.** Transmission Operators~~

   ~~**4.3.** Generator Operators~~

5. ~~**Effective Date:**~~

   ~~See the Implementation Plan for PRC-001-1.1(ii).~~

ORANGE TEXT – Retirements of R1, R2, R5, and R6 occurring under Project 2007-06.2.

RED TEXT – Retirements of R3 and R4 occurring under Project 2007-06.

~~B. Requirements~~

~~**R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.~~

~~**R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:~~

~~**R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.~~

~~**R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.~~

~~**R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.~~

~~**R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.~~

- ~~Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.~~

~~**R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.~~

~~**R4.** Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.~~

~~**R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:~~

~~**R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.~~

~~**R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.~~

~~**R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.~~

~~C. Measures~~

~~**M1.** Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.~~

~~**M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Special Protection Systems in its area. (Requirement 6 Part 1)~~

~~**M3.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Special Protection Systems. (Requirement 6 Part 2)~~

~~D. Compliance~~

~~**1. Compliance Monitoring Process**~~

~~**1.1. Compliance Monitoring Responsibility**~~

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~

~~**1.2. Compliance Monitoring and Reset Time Frame**~~

~~One or more of the following methods will be used to assess compliance:~~

- ~~Self-certification (Conducted annually with submission according to schedule.)~~
- ~~Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~
- ~~Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance-Reset Period shall be 12 months from the last finding of non-compliance.~~

~~1.3. Data Retention~~

~~Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.~~

~~Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

~~1.4. Additional Compliance Information~~

~~None.~~

~~2. Levels of Non-Compliance for Generator Operators:~~

~~**2.1. Level 1:** Not applicable.~~

~~**2.2. Level 2**: Not applicable.~~

~~**2.3. Level 3**: Not applicable.~~

~~**2.4. Level 4:** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.~~

~~3. Levels of Non-Compliance for Transmission Operators:~~

~~**3.1. Level 1:** Not applicable.~~

~~**3.2. Level 2**: Not applicable.~~

~~**3.3. Level 3**: Not applicable.~~

~~**3.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**3.4.1** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.~~

~~**3.4.2** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~**4. Levels of Non-Compliance for Balancing Authorities:**~~

~~**4.1. Level 1:** Not applicable.~~

~~**4.2. Level 2**: Not applicable.~~

~~**4.3. Level 3**: Not applicable.~~

~~**4.4. Level 4:** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~E. Regional Differences~~

~~None identified.~~

~~1.1(ii)~~	~~May 29, 2015~~	~~FERC Letter Order in Docket No. RD15-3-000 approving PRC-001-1.1(ii)~~	~~Modifications to adjust the applicability to owners of dispersed generation resources.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for the Applicability Exclusion in Requirement R3.1~~

~~Coordination of new or changes to protective systems associated with dispersed power producing resources identified through Inclusion I4 of the BES definition are typically performed on the interconnecting facilities. New or changes to protective systems associated with these facilities should be coordinated with the TOP as these protective systems typically must be closely coordinated with the transmission protective systems to ensure the overall protection systems operates as designed. While the protective systems implemented on the individual generating units of dispersed power producing resources at these dispersed power producing facilities (i.e. individual wind turbines or solar panels/inverters) may in some cases need to be coordinated with other protective systems within the same dispersed power producing facility, new or changes to these protective systems do not need to be coordinated with the~~

~~transmission protective systems, as this coordination would not provide reliability benefits to the BES.~~

Implementation Plan

Project 2007-06 System Protection Coordination

Approvals Requested

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Retirements Requested

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals (for Retirements Requested)

- TOP-009-1 – Knowledge of Composite Protection Systems and Remedial Action Schemes and Their Effects

Applicable Entities

- Transmission Owner
- Generator Owner
- Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 of PRC-027-1)

New or Modified Term(s) for Glossary of Terms Used in NERC Reliability Standards

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Effective Date of New or Revised Standards

PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Reliability Standard PRC-027-1 shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and TOP-009-1. NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and TOP-009-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).

quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for New or Modified NERC Glossary Terms

The NERC Glossary Term “Protection System Coordination Study” shall become effective on the effective date for PRC-027-1.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

PRC-001-1.1(ii) – System Protection Coordination shall be retired at midnight of the day immediately prior to the day that TOP-009-1 and PRC-027-1 become effective.

Documents and information about this project are available on the project page. If you have questions, contact Standards Developer, Al McMeekin, (via email) or at (404) 446-9675.

Background Information

Project 2007-06 System Protection Coordination originated in 2007 to address directives from FERC Order 693 and other issues identified by the System Protection and Control Task Force pertaining to PRC-001. The System Protection Coordination Standard Drafting Team (SPCSDT) developed Reliability Standard PRC-027-1 with the stated purpose: "*To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.*" PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

In conjunction with Project 2007-06.2 Phase 2 of System Protection Coordination, NERC is proposing the complete retirement of PRC-001-1.1(ii). In Phase 2, Requirement R1 is being incorporated into the proposed Reliability Standard TOP-009-1. Requirements R2, R5, and R6 are proposed for retirement as the reliability objectives of those requirements are addressed by other TOP/IRO standards pending regulatory approval. The Mapping Document on that project page explains how the reliability objectives of Requirements R1, R2, R5, and R6 are addressed. The remaining two Requirements R3 and R4 of PRC-001-1.1(ii) are addressed by PRC-027-1 as shown in the Project 2007-06 System Protection Coordination Mapping Document. The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of Reliability Standards PRC-027-1 and TOP-009-1 (as proposed by Project 2007-06.2 Phase 2 of System Protection Coordination). NERC is proposing the retirement of PRC-001-1.1(ii) in the implementation plans associated with both projects. See the Phase 2 project page for more details. Collaboratively, these two projects are proposing the retirement of PRC-001-1.1(ii).

Draft 5 of PRC-027-1 was posted for formal comment and ballot from April 1 – May 15, 2015. The standard received affirmative votes totaling 39.63 percent. The drafting team appreciated the feedback industry stakeholders provided and incorporated many of the suggested revisions into draft 6 of the standard. In accordance with section **4.13: Additional Ballots** of the Standards Process Manual, the drafting team is not providing written responses to the comments with this posting because significant revisions to the standard were made and an Additional Ballot will be conducted. Based on stakeholder comments, the drafting team modified the proposed standard as follows:

Defined term

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Purpose

Changed from: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted Elements, such that the Protection Systems operate in the intended sequence during Faults" to "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults."

Applicability

Changed the Facilities language to be consistent with the revised "Purpose" of the standard. It now reads: "Protection Systems installed to detect and isolate Faults on BES Elements."

Requirements

Requirement R1

Revised the language in the core requirement to: "Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults."

Part 1.1

Revised the language from: "A method to review and update the information required to develop new or revised Protection System settings." to "A review and update of short-circuit models for the BES Elements under study."

Part 1.2

Deleted "A review of Protection System settings affected by System changes."

Part 1.3

Removed from Requirement R1. Revised and incorporated into new Requirement R2.

Part 1.4

Removed the descriptor "quality" and the phrase "prior to implementation." Part 1.4 is the new Part 1.2 and reads as follows: "A review of the developed Protection System settings."

Part 1.5

The language of Part 1.5 was revised for clarity and is the new Part 1.3.

Requirement R2
Revised the language from the previous Requirement R1, Part 1.3 and made it new Requirement R2. Removed the term “existing entity-designated” and the associated footnote. New Requirement R2 now references “Attachment A” which lists Protection System functions that are applicable to the standard, if the entity uses available Fault current levels to develop Protection System settings. These are the only functions that require study to determine that coordination is maintained for those Protection System functions for each BES Element.

The language in Requirement R2, Option 2 was clarified to explain that the six-year interval is inclusive of the Fault current comparisons and any resulting Protection System Coordination Study(ies). Option 2 now includes a footnote pertaining to the development of an initial Fault current baseline as well as updating or creating baselines after the effective date of the standard. The footnote states: “The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.”

Requirement R3
The previous Requirement R2 is now Requirement R3.

Measures
Revisions commensurate with changes made to the requirements.

VSLs
Revisions commensurate with changes made to the requirements.

Description
Draft 6 of PRC-027-1 consists of three proposed requirements.

Requirement R1 mandates that entities establish a process for developing new and revised Protection System settings for BES Elements to operate in the intended sequence during Faults, and stipulates certain attributes that must be included in the process. Because Protection System designs and philosophies of entities vary, entities are provided latitude in developing their coordination processes.

Requirement R2 mandates that entities periodically perform Protection System Coordination Studies and/or compare existing Fault current values to established Fault current baselines for Protection Systems applied on BES Elements that are identified as being affected by changes in Fault current. The applicable Protection System functions are identified in Attachment A. These periodic reviews increase the likelihood that incremental changes to the BES that impact coordination are revealed. Requirement R2 provides responsible entities (Distribution Providers, Generator Owners, and Transmission Owners) with options to assess the state of their Protection System coordination.

Requirement R3 mandates that entities utilize its process established in accordance with Requirement R1. Implementing each of the elements of the process facilitates a consistent approach in the development of accurate Protection System settings, by minimizing the introduction of errors, thereby maximizing the likelihood of maintaining a coordinated Protection System.

The Project 2007-06 System Protection Coordination Standard Drafting Team (SPCSDT) is posting draft 6 of Reliability Standard PRC-027-1 “Protection System Coordination for Performance During Faults” for comment from July 29, 2015 to September 11, 2015.

Questions

1. The term “entity-designated” and its associated footnote were removed and replaced by “Attachment A.” Attachment A lists the Protection System functions applicable in the standard. Do you agree that Attachment A includes the Protection System functions that must be reviewed to maintain Protection System coordination when Fault current levels change? If not, please provide the basis for your disagreement and any proposed revisions.

   ☐ Yes
   ☐ No
   Comments:

2. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

   ☐ Yes
   ☐ No
   Comments:

3. If you have any other comments that you haven’t already provided in response to the above questions, please provide them here.

   Comments:

Mapping of Requirements from PRC-001-1.1(ii) to PRC-027-1

Project 2007-06 System Protection Coordination

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.	Being proposed to be moved to a new TOP Reliability Standard by Project 2007-06.2 Phase 2: System Protection Coordination	N/A
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	Being proposed for retirement by Project 2007-06.2 Phase 2: System Protection Coordination	N/A

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
R3. A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows. R3.1. Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. • Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition. R3.2. Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.	PRC-027-1: Requirements R1 and R2 Note: Applicability changed to GO, TO and DP	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: 1.1 A review and update of short-circuit models for the BES Elements under study. 1.2 A review of the developed Protection System settings. 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to: 1.3.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities. 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified. 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		associated BES Elements are addressed prior to implementation. 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during: 1.3.4.1. Implementation or commissioning. 1.3.4.2. Misoperation investigations. 1.3.4.3. Maintenance activities. 1.3.4.4. Emergency replacements made due to failures of Protection System components. R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: • Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or • Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years; or • Option 3: A combination of the above. R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.
R4. Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.	PRC-027-1: Requirements R1 and R2 Note: Applicability changed to GO, TO and DP	R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: 1.1 A review and update of short-circuit models for the BES Elements under study. 1.2 A review of the developed Protection System settings. 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to: 1.3.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Requirement in BOT-Adopted PRC-001-1.1(ii)	Action Taken	Requirement or Language in Proposed PRC-027-1
		1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified. 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation. 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during: 1.3.4.1. RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justification Document

Project 2007-06 System Protection Coordination

This document provides the standard drafting team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in Federal Energy Regulatory Commission (FERC) approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the

preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System (BPS). In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
NERC VRF Discussion	A VRF of Medium is appropriate for this requirement because failure by an entity to establish a process to develop settings for its Bulk Electric System (BES) Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures, or to hinder restoration to a normal condition.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS. Requirement R1 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R1 mandates that entities establish a process to address all aspects of BES Protection System coordination, including the updating of modeling information and the exchange of Protection System data with other owners, when applicable.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The requirement utilizes Parts to specify items that must be addressed within the settings development process. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R1 and R2, which are related to developing and documenting a Protection System Maintenance Program and have VRFs of Medium.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of Medium is appropriate for this requirement because failure by an entity to establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the BPS. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures, or to hinder restoration to a normal condition.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the High and Severe VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSLs use language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based upon a single violation, not a cumulative number of violations.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is Medium	
NERC VRF Discussion	A VRF of Medium is appropriate for this requirement because failure to periodically perform a Protection System Coordination Study for existing Protection Systems could lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the BES or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BES. Requirement R2 relates to one of these areas; specifically, protection systems and their coordination. Requirement R2 mandates that entities periodically perform Protection System Coordination Studies or Fault current comparisons to verify Protection Systems remain coordinated.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-010-1, Requirement R3, which relates to periodically performing comprehensive assessments to evaluate the effectiveness of UVLS Programs.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is Medium	
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of Medium is appropriate for this requirement because failure to periodically perform a Protection System Coordination Study for existing Protection Systems could lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under anticipated Emergency, abnormal, or restorative conditions, directly and adversely affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or cascading failures.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option 2, or Option 3, in accordance with Requirement R2.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."

the Current Level of Compliance	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the proposed VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSLs use language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4	The VSLs are based upon a single violation, not a cumulative number of violations.

Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF Justifications for PRC-027-1, Requirement R3	
VRF for Requirement R3 is High	
NERC VRF Discussion	A VRF of High is appropriate for this requirement because failure by an entity to utilize its process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could place the BES at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS. Requirement R2 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R3 mandates that entities utilize their process established in Requirement R1 that incorporates all actions necessary to to develop settings for its BES Protection Systems to operate in the intended sequence during Faults.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement does not use sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.

VRF Justifications for PRC-027-1, Requirement R3	
VRF for Requirement R3 is High	
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R3 and R4, which are related to implementing time-based and performance-based maintenance program(s) respectively for Protection Systems.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A VRF of High is appropriate for this requirement because failure by an entity to utilize its process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could place the BES at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R3

FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the Severe VSL is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The VSL uses language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based upon a single violation, not a cumulative number of violations.

Violation Risk Factor and Violation Severity Level Justification Document

Project 2007-06 System Protection Coordination

This document provides the standard drafting team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-027-1. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in ~~FERC~~ Federal Energy Regulatory Commission (FERC) approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the

preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System~~.~~ (BPS). In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the ~~Bulk-Power System~~BPS:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. -Each requirement must have at least one VSL.- While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance
Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
NERC VRF Discussion	A ~~medium~~ VRF of Medium is appropriate for this requirement because ~~an entity's~~ failure by an entity to establish a process to develop settings for its Bulk Electric System (BES) Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the ~~Bulk-Power System.~~ BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to ~~Bulk-Power System~~BES instability, separation, or cascading failures~~. A medium VRF assignment is appropriate given the level of risk to System performance resulting from the lack of coordinated Protection Systems. For these reasons, the requirement meets the NERC criteria for~~, or to hinder restoration to a ~~Medium VRF~~normal condition.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the ~~Bulk-Power System.~~BPS. Requirement R1 relates to two of these areas, specifically (i) protection systems and their coordination; and (ii) system modeling and data exchange. Requirement R1 mandates that entities establish a process to address all aspects of BES Protection System coordination, including the updating of modeling information and the exchange of Protection System data with other owners, when applicable ~~(see, Requirement R1, Parts 1.1 and 1.5).~~.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	~~Because Parts (previously called sub-Requirements) are no longer assigned individual VRFs, this Guideline is no longer applicable.~~This requirement does not use sub-requirements so only one VRF was assigned. The requirement utilizes Parts to specify items that must be addressed within the settings development process. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-005-2, Requirements R1 and R2, which are related to developing and documenting a Protection System Maintenance Program and have VRFs of Medium.

VRF Justifications for PRC-027-1, Requirement R1	
VRF for Requirement R1 is Medium	
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A ~~medium~~ VRF of Medium is appropriate for this requirement because ~~an entity's~~ failure by an entity to establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults could directly affect the electrical state or the capability of the ~~Bulk-Power System.~~ BPS. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to ~~Bulk-Power System~~BES instability, separation, or cascading failures~~. A medium VRF assignment is appropriate given the level of risk to System performance resulting from the lack of coordinated Protection Systems. For these reasons, the requirement meets the NERC criteria for~~, or to hinder restoration to a ~~Medium VRF~~normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	~~N/A~~The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include ~~one~~Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include ~~two or more Parts~~Requirement R1, Part 1.3. OR The responsible entity failed to establish ~~a~~any process in accordance with Requirement R1.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	While this requirement is new, it incorporates the reliability objectives of PRC-001-1.1(ii), Requirements R3 and R4, so there is no "consequence of lowering the current level of compliance."
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: N/A Guideline 2b: The language included in the High and Severe ~~and High~~ VSLs is clear and unambiguous, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for PRC-027-1, Requirement R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The ~~VSL uses similar~~ VSLs use language similar to that used in the associated requirement and is, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The ~~VSL is~~VSLs are based upon a single violation, not a cumulative number of violations.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is ~~High~~Medium	
NERC VRF Discussion	A ~~high~~ VRF of Medium is appropriate for ~~Requirement R2~~ this requirement because failure to ~~implement the process established in Requirement R1~~periodically perform a Protection System Coordination Study for existing Protection Systems could~~, “~~ lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under ~~emergency~~anticipated Emergency, abnormal, or restorative conditions ~~anticipated by the preparations~~, directly ~~cause~~and adversely affect the electrical state or ~~contribute to bulk electric system~~the capability of the BES or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or ~~a~~ cascading ~~sequence of~~ failures~~, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.” This requirement meets the NERC criteria for a High VRF~~.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	In the VSL Order, FERC identified twelve critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the ~~BPS.~~ BES. Requirement R2 relates to ~~two~~one of these areas~~,~~; specifically ~~(i)~~, protection systems and their coordination~~; and (ii) system modeling and data exchange.~~. Requirement R2 mandates that entities ~~implement the process established in Requirement R1 that incorporates all actions necessary~~periodically perform Protection System Coordination Studies or Fault current comparisons to ~~achieve coordination of~~verify Protection Systems remain coordinated.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	~~Because Parts (previously called sub-Requirements) are no longer assigned individual VRFs, this Guideline is no longer applicable.~~This requirement does not use sub-requirements so only one VRF was assigned. The VRF for this requirement is consistent with others in the standard with regard to relative risk; therefore, there is no conflict.

VRF Justifications for PRC-027-1, Requirement R2	
VRF for Requirement R2 is ~~High~~Medium	
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This requirement is consistent with NERC Reliability Standard PRC-~~005-2, Requirements~~010-1, Requirement R3~~ and R4~~, which ~~are related~~relates to ~~implementing time-based and performance-based maintenance program(s) respectively for Protection Systems~~periodically performing comprehensive assessments to evaluate the effectiveness of UVLS Programs.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	A ~~high~~ VRF of Medium is appropriate for ~~Requirement R2~~ this requirement because failure to ~~implement the process established in Requirement R1~~periodically perform a Protection System Coordination Study for existing Protection Systems could~~, "~~ lead to failure in identifying and addressing changes in Fault current that have accumulated over time. These deviations in Fault current could result in miscoordinated Protection Systems which could, under ~~emergency~~anticipated Emergency, abnormal, or restorative conditions ~~anticipated by the preparations~~, directly ~~cause~~and adversely affect the electrical state or ~~contribute to bulk electric system~~the capability of the BES, or the ability to effectively monitor and control the BES. This VRF emphasizes the risk to the BES that results from miscoordinated Protection Systems. However, a violation of this requirement is unlikely to lead to BES instability, separation, or ~~a~~ cascading ~~sequence of~~ failures~~, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition." This requirement meets the NERC criteria for a High VRF~~.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement has only one reliability objective; therefore, does not co-mingle obligations.

VSLs for PRC-027-1, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
~~N/A~~The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	~~N/A~~The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity ~~implemented the process established~~performed a Protection System Coordination Study for each BES Element, in accordance with Requirement ~~R1~~R2, Option 1, Option 2, or Option 3, but ~~failed~~was late by more than 60 calendar days but less than or equal to ~~implement one Part~~90 calendar days.	The responsible entity ~~implemented the process established~~performed a Protection System Coordination Study for each BES Element, in accordance with Requirement ~~R1~~R2, Option 1, Option 2, or Option 3, but ~~failed to implement two or~~ was late by more ~~Parts.~~ than 90 calendar days. Standards Announcement Reminder

Project 2007-06 System Protection Coordination
PRC-027-1

Additional Ballot and Non-binding Poll Open through September 11, 2015

Now Available

An additional ballot for draft six of **PRC-027-1 – Coordination of Protection Systems for Performance During Faults** and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern, Friday, September 11, 2015.**

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Balloting

Members of the ballot pools associated with this project may log in and submit their votes for the standard and associated VRFs and VSLs by clicking here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at EROhelpdesk@nerc.net (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard and post it for an additional ballot. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Al McMeekin (via email), or at (404) 446-9675.

Survey Report

Survey Details

Name 2007-06 System Protection Coordination | PRC-027-1 & PRC-001-1.1 (ii)

Description

Start Date 7/29/2015

End Date 9/11/2015

Associated Ballots

2007-06 System Protection Coordination PRC-027-1 & PRC-001-1.1(ii) Non-Binding Poll AB 2 NB

2007-06 System Protection Coordination PRC-027-1 & PRC-001-1.1(ii) AB 2 ST

Survey Questions

1. The term "entity-designated" and its associated footnote were removed and replaced by "Attachment A." Attachment A lists the Protection System functions applicable in the standard. Do you agree that Attachment A includes the Protection System functions that must be reviewed to maintain Protection System coordination when Fault current levels change? If not, please provide the basis for your disagreement and any proposed revisions.

Yes

No

2. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

3. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

Responses By Question

1. The term "entity-designated" and its associated footnote were removed and replaced by "Attachment A." Attachment A lists the Protection System functions applicable in the standard. Do you agree that Attachment A includes the Protection System functions that must be reviewed to maintain Protection System coordination when Fault current levels change? If not, please provide the basis for your disagreement and any proposed revisions.

John Fontenot - Bryan Texas Utilities - 1 -

Answer Comment:

- Attachment A does not list bus differential protection as an applicable protection function. Bus protection designed using either overcurrent, percentage differential or high impedance differential protection use a sum of currents to detect a bus fault. In an ideal world an increase in fault current would not affect the differential relays, but there are situations where an increase in fault current can negatively affect the differential relays and affect the coordination between bus differential and line relays.
  - Overcurrent and percentage differential relays are usually applied on busses where fault currents are low enough so that CT saturation does not occur. As fault currents increase, the

chances of CT saturation increase which can cause false bus differential operations for external line faults.

- High impedance differential relay voltage settings are calculated based on the voltage that could be developed across the relay with a completely saturated CT. This voltage setting is calculated using the maximum external fault current. With increased fault currents, the voltage that could develop across the relay for a saturated CT could be higher than the voltage setting of the relay. This can also cause false bus differential operations for external line faults.

Bus differential relays should be added to Attachment A to ensure that proper coordination between bus differential relays and line relays for external faults.

Answer Comment:

While I agree that the functions listed are the ones that should be reviewed if fault current levels change, I disagree with using fault current as a trigger for a review *in all circumstances*. For those functions that do not require fault current or Protection System settings from other entities in order to ensure proper coordination, entities should be able to use equipment changes as a trigger for a coordination review. Equipment changes are already used as a trigger for other Reliability Standards and would allow for entities to have a single trigger for multiple Standards. This would add an additional, more cost effective option, while still ensuring Protection Systems on all BES Elements are coordinated. The SDT should include this as another option under Requirement 2 (see proposed revision below). A fault current trigger would remain for those functions that require fault current or Protection System settings from other entities in order to ensure proper coordination.

Proposed Revision:

R2. Each TO, GO, and DP shall, for each BES Element with Protection System functions identified in Attachment A:

Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or

Option 2: . Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years; or,

Option 3: For functions that do not require Fault current or Protection System settings from other entities to ensure proper coordination, perform a PSCS prior to the implementation of new or modified Protection System settings on associated BES Elements.

Option 4: A combination of the above.

For the GO function, it would be helpful to include 51V-R and 51V-C as in scope relays in Attachment A. Also for GO, it would be helpful to note that 50/27 or 67 relays/protective functions used in generator inadvertent energization schemes are not in scope for PRC-027. Additionally, it's not clear if the 50 includes overcurrent elements used to supervise distance (21) elements.

Answer Comment:

Revision Requirement 1 allows us to develop a criteria for intended sequence which is good. Our only concern is if our criteria changes, there is no verbiage in the standard that allows for a phased implementation plan. One suggestion could be to give a 6 year cycle to be sure improvements are made will staying compliant to the proposed standard.

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Selected Answer: No

Answer Comment:

In Attachment A, it seems that 67 elements used in communication-aided protection schemes should be applicable. If a communication-aided protecton scheme is needed for coordination with remote backup (e.g., long line adjacent to a short line, perhaps), a check may need to be performed that (for example) overreaching ground overcurrent pickups are still appropriate. Tacoma Power will not object to lowering the compliance risk by leaving these elements out of Attachment A, but Tacoma Power did want to bring this to the drafting team's attention.

In Attachment A, or in the Supplemental Material section, breaker failure fault detectors should be discussed. As with the 67 element, if a breaker failure fault detector is set too high in (for example) a ring bus, remote backup protection could operate instead of the local breaker failure. As with the 67 element, Tacoma Power will not object to lowering the compliance risk by leaving these elements out of Attachment A, but it probably should be at least discussed by the drafting team and documented somewhere to avoid confusion later when/after the standard becomes effective.

Glenn Pressler - CPS Energy - 1 -

Selected Answer: No

Answer Comment:

Agree with the elements listed, but I question the wording regarding the 21 elements. It sounds as if an entity simply sets this element by just taking a percent of the Positive Sequence Line impedance, even when infeed or mutuals are present (ground only), then the entity would never need to check these elements. However, if another entity does use these factors in determining settings of these elements, then that entity would be required to periodically check the settings. This seems to give a greater degree of risk for compliance

	failure for the entity that applies a more thorough method of setting these elements while leaving no risk to the entity that uses a simpler, less thorough setting method. Generally believe entities should be required to verify through studies that these elements will only operate for their intended zone of protection whenever infeed or mutuals are present.

We agree with the classification of specific Protection System components that require coordination. In addition, this will aid the compliance enforcement process. However, clarification is requested with regard to applicability of distance protection element. Does the standard apply to distance elements used solely for non-communication aided protection schemes (for example transfer trip, carrier systems) or for all distance element applications?

Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Selected Answer: No

Answer Comment:

Hydro One Networks Inc. agrees with the NPCC on the classification of specific protection systems that would entail protection system coordination. However, Hydro One Networks Inc.. would like to ask for clarification within Attachment 1 whether distance (21) elements within communications aided protection schemes are subject to the requirements of this standard. This is because there were conflicting responses provided by the NERC SDT during the Q&A Session held on August 25th, and by NATF during the monthly meeting call on August 27th.

Answer Comment:

1. We agree with the removal of the term “entity-designated” and the addition of Attachment A to provide more clarity.
2. Note #2 in the attachment refers to additional details located in the supplemental information section of the standard. Once the standard is approved by FERC, only the applicability section and the requirements (and attachments that are incorporated by reference) will be enforceable. If the drafting team acknowledges that additional details are

	necessary to fully explain the attachment, then those details should be added at this stage of the development process.

Thomas Foltz - AEP - 5 -

Selected Answer:

Answer Comment:

AEP does not believe that 12 months is adequate for the Implementation Plan, and recommends that it be increased to 24 months, which we believe is more reasonable. The GO often relies on the TO to provide short-circuit studies, which increases the time necessary to establish the initial baseline.

Answer Comment:

The Technical Basis or Implementation Plan does not include sufficient details describing the 6 year evaluation interval. It is our understanding that this 6 year evaluation interval begins on the enforcement date allowing up to 6 years for the system analysis to be completed but this is not specifically stated so we recommend additional reference details be included to explicitly describe the Implementation times.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Selected Answer:

Answer Comment:

Salt River Project (SRP) has reviewed the Attachment A and has concerns with verifying a Fault Current baseline as required in R3. As this standard is written, this baseline must be created prior to the effective date of the standard. We strongly believe that 12 months is an inadequate amount of time to develop a formal documented process, establish a Fault Current baseline for thousands of relays, and establish a tracking tool for those Fault Current baseline changes and/or periodic review. We request that there be at least a 24 month implementation plan.

Selected Answer:

Answer Comment:

Based on our concerns regarding R1, subpart 1.2, as outlined in question 3, Duke Energy cannot agree to the proposed Implementation Plan. If the standard were to be approved as written, the expectation to review the developed Protection System settings, depending on the level of detail expected for the review, would take a significant amount of time to achieve compliance. For larger entities, with a great deal of applicable relays, additional resources would most definitely be required, and time to acquire and train those resources would be necessary. We do not feel the 12 months is an adequate amount of time to achieve compliance with the standard as written.

Checked--No

As it stands now, entities will not have adequate time, within 12 months, to develop a process, establish Fault current baselines, and establish a tracking tool for Fault current baseline changes and/or periodic review. We recommend that the Implementation Plan be extended to 24 months.

We recommend the implementation plan include a statement clarifying the start date of the 6 year cycle that is described in Requirement R2. Is it the date the standard is effective, or the date the protection system was last reviewed prior to the effective date?

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Selected Answer:

Answer Comment:

Hydro One Networks Inc. does not agree with the Implementation Plan as it is unreasonable to implement a process and establish a fault current baseline within 12 months. Further, the Implementation Plan of 12 months borders on the Long-term Planning horizon in requirement R1 itself. The NERC definition of a Long-term Planning horizon is “a planning horizon of one year or longer”. Therefore, Hydro One Networks Inc. agrees with the NPCC, and recommends that the Implementation Plan be extended from 12 months to 24 months.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Selected Answer:

Answer Comment:

If a utility is in the position to leverage a tool such as CAPE or ASPEN to automate its settings review, then the proposed implementation plan seems feasible. If a utility does not have a software tool in place, then developing and tracking the settings review may require significant resources. This may actually detract from a utility's ability to create and review relay settings.

Eric Schwarzrock - Berkshire Hathaway - NV Energy - 5 -

Selected Answer:

Answer Comment:

- Option 2 of R2 is meant to allow an entity to periodically check for a 15 percent of greater deviation in fault current. This option allows the entity to choose an interval of up to six calendar years to perform the fault current comparisons (this comes from the PRC-027-1 supplemental material). Option 2 is worded in a confusing manner so that the intent is not immediately clear without reading the supplemental material.

- Attachment A lists the protection system functions applicable to R2 including: 67 – AC directional overcurrent if used in a **non-communication-aided protection scheme**. This is probably ok if the fault current increases. If the fault current decreases, then any 67 relays used in a communication-aided protection scheme might not work correctly. If the 67 element were set to overreach the other end of the line for a POTT scheme (similar to using a zone 2 element in a POTT scheme) and the fault current decreased, it's possible that the 67 element might now see faults at a maximum distance less than the distance of the line. This would render the POTT scheme not as effective since the element used to trigger the scheme does not see the entire line.

Option 2 states that a protection coordination study should be performed when a 15 percent or greater deviation in fault current is identified. A 15 percent decrease in fault current should warrant a re-study of directional overcurrent elements used in communication aided protection scheme.

Selected Answer:

Answer Comment:

SCE&G agrees with the SERC PCS committee comments: "

Comments:

1) page 4, Please revise the Purpose and Facilities to clarify the scope.

a) Purpose: "To maintain the coordination of Protection Systems installed to protect detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults."

b) Facilities: "Protection Systems installed to detect and isolate Faults on protect BES Elements."

Also see comment #3 below. There are a large number of DP-TO interfaces and clarity on this interface is needed.

2) page 6 Rationale Option 2: augment ‘Planners and Planning Coordinators’ with ‘Transmission Owner’ so it reads "The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Owners, Transmission Planners, or Planning Coordinators." This makes it consistent with R1 1.1 itself, page 14 explanation.

3) page 13 DP Applicability is explained by ‘A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.’ A) In the vast majority of cases fault current contributions from DP networks are quite weak, usually the last to trip, and insignificant to BES coordination. B) BES Phase 2 Definition excluded networks below 50kV and at the least this should be acknowledged here. C) PRC-027-1 Draft 6 Applicability language is consistent with the PRC-005-2 language, for which PRC-005-2 Supplement states: "‘…that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.).’ The drafting team intends that this standard will follow with any definition of the Bulk Electric System. There should be no ambiguity; if the Element is a BES Element, then the Protection System **protecting** that Element should then be included within this standard." D) Add language similar to B and C in the PRC-027-1 Supplemental Material.

4) page 17 second option: Please clarify the Fault current location for the 15% deviation trigger is the BES bus. This will help the GO and DP understand their responsibility. Please insert BES before Element in this sentence "The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which an a BES Element is connected. The drafting team intends for the 100kV or above BES bus to be the Fault current location."

Thomas Foltz - AEP - 5 -

Selected Answer:

Answer Comment:

AEP supports R1 & R3. AEP believes it is reasonable to have a process to develop Protection System settings for all BES elements, and to implement that process. AEP is willing to accept the inclusion of all BES protection systems in these requirements.

AEP does not support R2 as written in draft 6. AEP believes R2 should be limited to protection systems applied on BES Elements that electrically join Facilities owned by separate functional entities. It is reasonable to require a periodic review, as prescribed in R2, on protection systems applied to interconnecting elements, because an entity does not have knowledge of what changes are made by another entity that may affect protection system coordination.

AEP believes that R1 is sufficient to cover coordination of all internal protection systems. AEP has an existing process to review area coordination when system changes are made. All settings in the area that are affected by the change are reviewed and revised as necessary. Because of this process, it is not likely that any fault current comparisons would identify a 15% deviation at any buses. Thus, this requirement would become an administrative burden without any reliability benefit for internal protection systems.

AEP proposes that R2 be changed to read:
R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) with Protection System functions identified in Attachment A:

While AEP is supportive of the overall intent and direction of PRC-027-1, we have chosen to vote negative driven by our objections to R2, as stated above.

Mark Wilson - Mark Wilson On Behalf of: Leonard Kula, Independent Electricity System Operator, 2

Selected Answer:

Answer Comment:

the HIGH VRF for Requirement R3 seems too high since failing to meet R1 (to develop the process for developing new and revised Protection System settings for BES Elements) has a MEDIUM VRF; failing to utilize this process should not have a VF that’s higher than not having the process in place to begin with.

Answer Comment:

1. We suggest that the drafting team consider the potential overlap of PRC-027-1 R1.1.1 and MOD-032-1, R1 and provide necessary clarification in the supplemental material.

2. R2, Option 2 has two actions associated with it, both of which have to be completed in one timeframe. The two actions are the fault current comparison against the baseline and the performance of a Protection System Coordination Study if the fault current comparison exceeds 15% or greater deviation. It is recommended that under this option, if an entity identifies a 15% or greater deviation in fault current value at a bus, the entity is given a set amount of time per element to complete a protection coordination study on all applicable elements at that bus.

Anthony Jablonski - ReliabilityFirst - 10 -

Selected Answer:

Answer Comment:

ReliabilityFirst agrees that PRC-027-1 helps to alleviate the risk of insufficient coordination of Protection Systems installed to detect Faults on BES Elements and isolate those faulted Elements (such that the Protection Systems operate in the intended sequence during Faults). ReliabilityFirst offers the following comments related to the term "coordination" for the Standard Drafting Team's consideration:

1. **ReliabilityFirst notes that the term "coordination" used in Requirement 1, Parts 1.3.2 and 1.3.3 is not defined within PRC-027-1 or the NERC Glossary Terms. This term is also used within a number of other Reliability Standards where it is likewise undefined. As a result, and according to FERC precedent, the dictionary definition of the term "coordination" will control. As a result, the term "coordination" could reasonably be interpreted to refer to either the setting of Protection Systems *or* to communications between entities.**

To add clarity to PRC-027-1, ReliabilityFirst recommends replacing the term "coordination" with the term "Protection System Coordination." Listed below is ReliabilityFirst's proposed NERC Glossary definition of "Protection System Coordination" for the Standard Drafting Team's consideration:

***Protection System Coordination* - The setting of Protection Systems installed for the purpose of detecting and isolating Faults on BES Elements, such that the Protection Systems operate in a defined sequence in an effort to remove such Faults from the BES.**

1. **ReliabilityFirst recommends the following changes to Requirement 1, Parts 1.3.2 and 1.3.3 to incorporate this new definition of "Protection System Coordination" (highlighted in red below):**

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any Protection System Coordination Issue(s) or affirming that no Protection System Coordination issue(s) were identified.

1.3.3. Verify that identified Protection System Coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

- Comments: Section R1.1: Consider adding additional clarity to the sub-requirement to limit the review to the modified BES Elements or BES Elements in the zone of protection. For example, the statement could be modified as follows: “A review and update of short circuit models for the modified BES Elements under study or BES Elements in the zone of protection.” This limits the scope of the short circuit model review to just the elements being studied.

Kayleigh Wilkerson - Lincoln Electric System - 5 -

Selected Answer:

Answer Comment:

LES suggests that the evidence required to meet R3 be limited and clearly defined. As currently drafted, the scope of potential evidence to demonstrate compliance with R3 would be difficult to anticipate and therefore unmanageable. Recommend the evidence be limited to entities providing short-circuit model updates (R1.1), Protection System setting reviews (R1.2), and Protection System setting coordination between owners for electrically-joined Facilities (R1.3).

LES recommends Option 2 of R2 be further clarified. It is not clear if a Protection System Coordination Study is required even if a fault current baseline hasn't deviated by 15% in 6 years. Additionally, it is also not clear what the scope of the Protection System Coordination Study is. To provide further clarity to R2 Option 2, LES suggests modifications similar to the following:

Compare present Fault current values to an established Fault current baseline in a time interval not to exceed six calendar years. A Protection System Coordination Study must be performed on the Elements connected to the bus where the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground). This Protection System Coordination Study must be completed within one calendar year of the Fault current comparison. The Fault current baseline will be updated to the present Fault current values only on the Elements for which the Protection System Coordination Study was performed.

Additionally, LES recommends protection system functions that are only enabled when other relays or associated systems fail be excluded from the R2 (e.g., overcurrent elements that are only enabled during loss of potential conditions). We feel that these protection system functions are used only as a contingency and should not fall within scope of the standard.

Selected Answer:

Answer Comment:

The NSRF believes that the same applicability exclusion used for PRC-001-1.1 (ii) or PRC-005 should be applied to PRC-027. The key is coordination at the overall wind farm interface after the power has been aggregated. Without this exclusion, the burden of the standard outweighs any reliability benefits provided.

The DGR applicability exclusion from PRC-001-1.1 (ii) should be added to R2, R3 or to Attachment A. FERC would not let a current requirement go unaddressed. Similarly, the individual generator exclusion from PRC-001-1.1 (ii) cannot be ignored. As an example, the following could be added to either a requirement or Attachment A:

- Requirement R2 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

The exclusion is required to address the blanket inclusion of individual wind turbines under the new Bulk Electric System (BES) definition Inclusion 4 (I4) and wording in Requirement 2 that states “each BES Element with Protection System functions identified in Attachment A” are to be addressed.

Another alternative is the NSRF recommends an Applicability statement such as (PRC-005-2i):

- 4.1.4 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition:
- 4.1.4.1 Protection Systems for Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above.

The NSRF would like to see the words “NERC registered” added in front of the word “owner” to ensure that entities with multiple non-NERC joint owners avoid the unnecessary administrative burden of attempting to track entities with no NERC responsibilities. With PSE and possibly LSE deregistration, entities could be connected with non-NERC entities. The NERC paper process of exchanging information could become asymmetric as only one entity has legal requirements for actions and the other doesn’t. Adding “NERC registered” should reduce unnecessary administration and create a symmetric or level set of requirements between affected entities.

In order to take advantage of Requirement R2-Option 2, a fault current baseline must be established prior to the effective date. This sets entities up for the potential to do a considerable amount of work based upon the expectation that nothing will change between the approval date and the effective date. Given the degree of change with PRC-005, there is certainly some amount of apprehension in this regard. A better method would be to allow the entity to establish the baseline within one year after the effective date or allow a phased-in approach.

There is no requirement ensuring the Transmission Owner will share the model database or Fault current study results to allow Generation Owners and Distribution Providers to complete R2 Option 1, 2 or 3. The applicability section recognizes that the TO's are the typical entity maintaining the system model for Fault studies. NSRF prefers previous draft versions that required the TO to conduct fault studies on all buses, make comparisons and notify other entities if the fault current changed.

The 6-year frequency requirement could be relaxed to be more consistent with other relay maintenance activities or there should be more justification provided for the additional cost of more frequent analysis.

Selected Answer:

Answer Comment:

We have separately submitted a Word redline with comments. However, PSEG's comments are summarized below. We would vote "Affirmative" if the SDT adopted the changes proposed in PSEG's redline.

- We propose that the SDT modify the definition of Protection System Coordination Study by limiting it to Protection Systems for BES Elements.
- We propose that the SDT add "Transmission Planner" to the Functional Entities in Section 4.1. This change is consistent with proposed changes to delete R1.1 and add R4 so that the Transmission Planner performs Fault current studies and makes them available to their TOs, GOs, and DPs in R4. As we note in the rationale for R4:

"Transmission Planners develop short circuit data bases per MOD-032-1 and utilize them in TPL-001-4 to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt. Since Transmission Planners develop and use short circuit databases, having other entities (TOs, GOs and DPs) use them could introduce errors. Therefore, Transmission

Planners should be required to calculate all Fault current values for its busses (an initial baseline and subsequent periodic updates) and make those available to its Transmission Owners, Generator Owners, and Distribution Providers."

- In R2, we eliminated the footnote in Option 2 because proposed R4 will result in an initial Fault current baseline established by the TP on or before the effective date of the standard. Given this, when would an entity's first PSCS need to be performed for its Attachment A devices under R2? For example, if Option 2 is selected, is the first PSCS required when the baseline fault current increases by 15 percent or greater?

- Other changes in language in R1, R2, and R3 are explained in comments in the redline.

Maryclaire Yatsko - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Selected Answer:

Answer Comment:

(1) Please address each of our following comments as many of them were not addressed in the last ballot action. If these comments are not addressed, Seminole may revise its ballot vote from affirmative to negative upon the next ballot action.

(2) This Standard references the terms “BES Elements.” In reviewing the NERC Glossary, there are many references to merely “Elements” without the preceding “BES” adjective, i.e., Remedial Action Scheme definition. What is the difference between “BES Elements” and “Elements” (without the BES)? Is the term “Element” without BES reference to elements that are non-BES, and if that is the case, does subpart “e.” of the RAS definition apply to non-BES Elements as there is no preceding “BES”? “BES Elements” and “Elements” are still both utilized in the Standard. Per discussions with the drafting team, it was stated that this is accidental and that there is no difference and that the team will clean these up to merely state “Elements” in the next version.

(3) In R2, if a review was performed on March 1, 2017 and an entity had 6 calendar years in which to complete the review, is that 6 full calendar years? Meaning, would an entity not have to complete another review until December 31, 2023? Could you please include the above example, or an example akin to the above in the guidelines as we want to confirm we understand that 6 full calendar years are allowed, which means that more than 72 months between tests could be taken under certain timing circumstances?

(4) In R1 Part 1.5.3, this Requirement merely states that the coordination issues need to be “addressed” prior to implementation. We have two questions on this requirement, the first being that after reviewing the supplemental guidance material, that under certain circumstances, such as where additional system modifications are needed, that such modifications do not need to take place before the settings changes if the entity didn’t originally place those modifications into the scope of the settings changes project. Because the Requirement does not require the modifications to take place in any future time, can the drafting team describe in more detail how these issues are “addressed prior to implementation”? In discussions with the drafting team regarding what “addressed” means is that any coordination issues need to be agreed upon between the entities and the entities must agree to the implementation actions and a timeframe for implementation, and depending on the circumstances,

“outstanding” updates can be implemented after implementation of proposed Protection System changes. Please confirm that this is correct.

(5) In the Supplemental Material section, there are references to the terms “BES Protection System” and “Protection System.” The Standard applies to “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements.” For purposes of this Standard, is a BES Protection System a Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements? There are still references to “BES Protection System” and “Protection System.” In discussions with the drafting team it was noted that all of these references were going to be cleaned up to merely state “Protection System”. Please confirm.

(6) In Requirement R1, is the 15% value 15.% with two significant figures in that if we have a deviation of 14.6% we need to perform an evaluation as it rounds up to 15% or are there more significant figures, i.e., 15.0%? This was discussed again with the drafting team that our comment wasn’t answered in the guidance, but per a phone conversation it was stated that anything above 15.000000000 (infinity) is a violation. We’d prefer the NERC drafting teams begin honoring significant digits as it’s not a difficult clarification and it makes compliance problematic because we can’t tell if it’s intentional or not when the drafting teams stop at a certain point. Therefore, this request is still out there, please place as many digits the team feels is significant as we will keep making this comment on every future drafted Standard, e.g., is 15.000% enough for the drafting team?

(7) In Requirement R2, if an entity uses the time based option and uses a recent short-circuit study for its baseline study, does the 6-year option 2 time frame start from the time of enforcement of the Standard or from the date the short-circuit study was finalized? The answer to this question does not appear to be in the Requirement. For Option 2, per our discussion, if a Protection System Coordination Study is performed today, the 6 year timeframe doesn’t begin until the enforcement date of the Standard, correct? We are still somewhat unclear as to when the Fault current baseline comparison needs to be performed however. For example, does a Fault current baseline need to be performed every 6 years? There is some language in the Rationale box on this issue, but that language says “may” and not “shall” so it appears this isn’t a requirement but merely a suggestion

(8) “Electrically joined Facilities” is not defined. Per past discussions, the intent appears to be to describe Facilities that are electrically joined AND are physically joined. Meaning, that if one Facility is 10 miles down the transmission line from another Facility, albeit “electrically joined” by electrons moving through both Facilities, the Facilities are not physically touching, and therefore, not covered by the intent of “electrically joined Facilities” under this Standard. Is this correct?

Jay Barnett - Exxon Mobil - 7 -

Selected Answer:

Answer Comment:

The Supplemental Material states, "The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current availability upon request by the Distribution Provider or Generator Owner," however, there is nothing in the draft of PRC-027-1 that requires this and that would ensure this is done in a timely manner. This draft might introduce the circumstance where the GO has the responsibility to periodically compare data that the TO has and maintains. The Standard should require TOs to respond to GO requests for Fault current data in a timely manner so that the GO can perform coordination studies if necessary. Another approach would be to transfer the responsibility of performing the periodic comparisons to the TOs. If the fault current changed by 15%, then the TO would notify the affected GO so that a coordination study would be performed. The same issue would exist for small TOs that do not maintain wide-area system models.

Proposed Revision:

R2.1. Upon discovery of a change in Fault current of a BES Element owned by another GO, TO, or DP, each TO shall provide the updated Fault current values to the affected owners within 90 calendar days of discovery.

OR

R2.1. Each TO that maintains Fault current values for BES Elements owned by other GOs, TOs, or DPs, shall respond to requests for such information from the GO, TO, or DP within 90 calendar days.

Also, Requirement 3 should be limited to the attributes listed in Requirement 1 in order to have a clear and consistent measure for compliance. As written, auditors would have to become familiar with each entity's entire coordination process in order to determine compliance. Instead each entity should only have to demonstrate compliance with those attributes which the Standard Drafting Team has determined are "must have" to ensure proper coordination, as described in Requirement R1.

Proposed Revision:

R3. Each TO, GO, and DP shall utilize a process that contains the minimum attributes established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Selected Answer:

Answer Comment:

Salt River Project (SRP) has concern over R1 part 1.1 and 1.2. As written, R1 calls for a “process for developing new and revised Protection System settings”. Parts 1.1 and 1.2 requires a “review and update of short-circuit models” and a “review of the developed Protection System settings”, respectively. The process defined in R1 should not have to include either review. SRP recommends changing part 1.1 and 1.2 to reflect “A methodology to evaluate ...”. In previous conversations with the SDT NERC staffer, it was communicated that the intent of this requirement was to include a methodology, however the previous draft removed the language that would have signified a methodology was required. If the intent is that a process rather than the actual review is included, it should read as such.

Answer Comment:

The applicability of the standard needs to be clarified so that dispersed resources at the individual resource prior to the point of aggregation are not subject to the standards requirements. In the transition from PRC-001.1ii., the exclusion for dispersed resources appears to have been improperly dropped from PRC-027-1. The PRC-027-1 mapping document lists PRC-001.1ii R3.1 and the dispersed resources sub-bullet exclusion but we cannot find a record indicating that there was discussion resulting in a deliberate intent to remove the exclusion in the transition from PRC-001.1ii to PRC-027-1. While a change to applicability prior to a final ballot is considered a substantive change in Section 4.14 of Standards Process Manual, we note that per the same section, "Where there is a question as to whether a proposed modification is "substantive," the Standards Committee shall make the final determination". We therefore request that the SDT bring this issue to the Standards Committee for consideration and include the dispersed generation exclusion in PRC-001.1ii in PRC-027-1 prior to final ballot.

Other options to address this concern could include, clarification in the Supplementary Material section, notes to auditors in the RSAW or the submission by the SDT of a SAR to change the applicability consistent with the dispersed generator exclusion as currently included in PRC-001-1ii .

Spencer Tacke - Modesto Irrigation District - 4 -

Selected Answer:

Answer Comment:

Hi,

I really believe the time period options for doing a Protection Coordination Study specified in R2 (Option 1 or Option 2) are much too large. When I used to attend the WECC Meetings on a regular basis, I remember how a high percentage of the major system outages were tied to mis-coordination or mis-operation of the protective relay systems of the various neighboring utilities. As the member’s protection systems are critical to the reasonable reliability of the interconnected system, waiting six years to do another fault current check for the 15% threshold is unreasonable, or allowing no threshold current check but with a fixed 6 year time period between coordination studies, is asking for trouble. I would strongly support a one year period as the required time to do a new Protection System Coordination Study for each member's BES. Remember, NERC requires annual Transmission Planning Assessments (TPL Standards), so we should not accept any lower of a standard for a Protection System Coordination Study. Thank you.

Sincerely,

Spencer Tacke

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Selected Answer:

Answer Comment:

Option 2 of R2 is meant to allow an entity to periodically check for a 15 percent of greater deviation in fault current. This option allows the entity to choose an interval of up to six calendar years to perform the fault current comparisons (this is derived from the PRC-027-1 supplemental material). The intent of Option 2 is not immediately clear without reading supplemental material. Given that compliance is measured only by the text of the requirement, R2 Option 2 should be clarified to indicate that if the 15 percent fault current baseline hasn't been exceeded, a protection coordination study isn't required even it if has been more than six calendar years.   Or is the intent of the drafting team to state that if the 15 percent baseline threshold hasn't been exceeded a coordination study isn't required?

Additionally, the evidence retention section would benefit from clarification. There could be possible confusion with the 6 year interval of the standard versus a possible audit interval of 3 years.

Another opportunity for improvement would be to align the intervals with the intervals identified in PRC-019, which would be beneficial to GOs.

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Selected Answer:

Answer Comment:

In the Supplemental Material section, there are concerns about the following paragraph: “A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.” If the generator is not a BES generator, or the generation plant is not a BES plant, the associated Protection Systems should not be under the purview of this standard unless, perhaps, they serve to provide a blocking signal to other Protection Systems associated with the BES Element or their clearing is necessary for the other Protection Systems associated with the BES Element to operate properly. For small non-BES generation, the Transmission Owner may configure its Protection Systems to properly respond with or without the small generator(s) connected. In these cases, clearing the generator(s) is arguably more about safety (isolating sources of energization) and not coordination.

It sounds like the only triggers for conducting a Protection System Coordination Study (PSCS) are the following: (1) triggered by Requirement R2, (2) triggered by the need to establish a baseline for Requirement R2 for new BES Elements or new BES Facilities, or (3) triggered by the need to establish a baseline for Requirement R2 when transitioning between Options 1 and 2. Otherwise, if there are Protection System changes, or if there are changes to existing BES

Elements, it sounds like a PSCS is not (necessarily) required, provided that the other elements identified in Requirement R1 are addressed. Is this the drafting team’s intention? If a PSCS will be required for other cases, this should be more clearly identified.

The verbiage in Requirement R2, Option 2, is a little unclear. For example, if Fault current values are compared within four calendar years, and the percentage change is less than 15%, does this reset the maximum six calendar year interval under Option 2?

Under Requirement R1, Part 1.3.4, Tacoma Power suggests appending "…scenarios such as the following:"

The Rationale for Requirement R1 includes a note about internal documentation. Tacoma Power had hoped that documentation would not explicitly be required in a scenario in which one engineering workgroup is responsible for Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, especially when those functional entities are part of the same company/organization. There is concern about the amount of extra documentation that may be involved. Furthermore, when different functional entities are part of the same company/organization, it may not be 100% clear where the DP vs. TO or TO vs. GO line should be drawn; by contrast, the same internal documentation would not be required for internal TO-TO interaction.

The emphasis of this standard should only be to show that there is not miscoordination. It is a little awkward, but Tacoma Power suggests that the Purpose statement could be reworded to the following (CAPS added to identify suggested rewording): "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems DO NOT operate in the UNintended sequence during Faults." Similarly, the definition of a PSCS could be reworded to the following: "An analysis to determine whether Protection Systems DO NOT operate in the UNintended sequence during Faults." Requirement R1 could be reworded to the following: "...such that the Protection Systems DO NOT operate in the UNintended sequence during Faults..."

Compared to Requirement R1, Tacoma Power is not convinced that the justification has been made for a High VRF for Requirement R3. Failing to implement one piece of the process established under Requirement R1, even for one BES Element, coupled with no graduated VSLs (see subsequent comment), would result in the maximum potential penalty.

Tacoma Power believes that the drafting team should leverage the Lower, Moderate, and High VSLs for Requriement R3. FERC's VSL G1 only states that the VSL assignment should not have the UNINTENDED consequence of lowering the current level of compliance. Furthermore, the scope of applicability of PRC-027-1 is much greater than PRC-001-1, so it is reasonable for PRC-027-1 to leverage the Lower, Moderate, and High VSLs, even though PRC-001-1 did not.

An example of a Protection System Coordination Study in the Supplemental Material section might be helpful.

Glenn Pressler - CPS Energy - 1 -

Selected Answer:

Answer Comment:

R1 – Generally think there should be a bit more detail or definiation provided to "Protection System settings" that require reviewing. Does this just include element set values? Or does it also include logic settings? Drawings versus output contact programming? What about communications equipment? Keeping this wide open and letting entities define goes back down the PRC-005-1 road where some entities had much higher testing and maintenance standards, but were also held to that higher standard and punished harshly when even falling just short.

R2 – Generally believe that giving the option of using fault studies or a time interval is for determining when to review coordination in R2. However, believe that if using the baseline fault studies, then the entity should have a shorter period between performing such studies. One issues with the baseline fault studies is that coordination studies may go for an additional 6 years, even if the 6 year study shows the fault current at just below the 15% threshold. I believe a 3 year or 4 year interval would be more reasonable. Otherwise, why not just use the baseline method since it too is on a 6 year interval.

Erika Doot - U.S. Bureau of Reclamation - 5 -

Selected Answer:

Answer Comment:

Reclamation suggests that the drafting team reorder R2 and R3 for clarity. This would allow the standard to follow a logical order requiring an entity to have a system protection coordination process (R1), follow it (R2), and periodically update system protection coordination studies for functions in Attachment A (R3).

Reclamation also suggests that the drafting team update R1.3.4 to clarify that communications resulting from unforeseen circumstances may be "after-the- fact notifications" rather than requiring advance communication. This would clarify that Protection System owners do not need to wait for confirmation from owners of electrically-joined Facilities before revising Protection System settings due to unforeseen circumstances. Reclamation believes that waiting for coordination with owners of electrically joined facilities in these situations could increase risks to BES reliability from faulty Protection System settings that are discovered during commissioning, misoperation investigations, and maintenance or component failures which should be addressed immediately. Reclamation suggests that this should be clear in the requirement itself, not merely mentioned in the supplemental material.

Finally, Reclamation suggests that the drafting team update M3 to provide examples of how an entity would demonstrate that it is following the process required by R1 to include more detail regarding example evidence to show compliance with each subrequirement.

1) page 4, Please revise the Purpose and Facilities to clarify the scope.
a) Purpose: “To maintain the coordination of Protection Systems installed to protect Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate
in the intended sequence during Faults.”
b) Facilities: “Protection Systems installed to protect BES Elements.”

Also see comment #3 below. There are a large number of DP-TO interfaces and clarity on this
interface is needed.

2) page 6 Rationale Option 2: augment ‘Planners and Planning Coordinators’ with ‘Transmission
Owner’ so it reads “The Fault current baseline values can be obtained from the short-circuit
studies performed by the Transmission Owners, Transmission Planners, or Planning Coordinators.”
This makes it consistent with R1 1.1 itself, page 14 explanation.

3) page 13 DP Applicability is explained by ‘A Distribution Provider may provide an electrical
interconnection and path to the BES for generators that will contribute current to Faults that
occur on the BES. If the Distribution Provider owns Protection Systems that operate for those
Faults, it is important that those Protection Systems are coordinated with other Protection Systems
that can be impacted by the current contribution to the Fault of Distribution Provider.’ A) In
the vast majority of cases fault current contributions from DP networks are quite weak, usually the
last to trip, and insignificant to BES coordination. B) BES Phase 2 Definition excluded networks

below 50kV and at the least this should be acknowledged here. C) PRC-027-1 Draft 6 Applicability
language is consistent with the PRC-005-2 language, for which PRC-005-2 Supplement states: "'…that
are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers,
etc.).' The drafting team intends that this standard will follow with any definition of the Bulk
Electric System. There should be no ambiguity; if the Element is a BES Element, then the Protection
System protecting that Element should then be included within this standard." D) Add language
similar to B and C in the PRC-027-1 Supplemental Material.

4) page 17 second option: Please clarify the Fault current location for the 15% deviation trigger
is the BES bus. This will help the GO and DP understand their responsibility. Please insert BES
before Element in this sentence "The second option allows the entity to periodically check for a 15
percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an
established Fault current baseline for Protection Systems at each bus to which a BES Element is
connected. The drafting team intends for the 100kV or above BES bus
to be the Fault current location."

Answer Comment:

Upon our review of the most recent draft of the proposed PRC-027-1 standard, we have significant concerns regarding the expectations outlined in R1, subpart 1.2. In part 1.2, the applicable Functional Entity is required to conduct or ensure some type of review is done on its Protection System settings. While the latitude that is given to the industry on how and what type of review they are to implement is recognized, we feel that specifically mandating a quality review is unnecessary. The requirement of ensuring that quality reviews are executed is not currently included in other Protection and Control standards, and is not mandated in other standard families (with the exception of CIP-014). We do not disagree with the practice of quality assurance, however, we do not support the practice of requiring an entity to do so in a Reliability Standard. Duke Energy recommends the removal of subpart 1.2 from R1.

Answer Comment:

We have a concern about the mentioning of the Transmission Planner and Planning Coordinator in the Requirement R2 Rationale Box and those entities performing the calculations for the Fault current through short circuit analysis. The Rationale Box for Requirement R2 states “The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators”. We would suggest the removal of those entities from the Rationale Box because they aren’t include in the applicability section of the standard. Additionally, we feel that the fault current calculation has been addressed in the scope of the TPL Documentation. In that documentation, it is understood that the Transmission Planner or Planning Coordinator will conduct the fault current analysis on the BES facilities however, the Transmission Planner

	would have to coordinate with the owners and determine which protection systems would be impacted.

Gerry Adamski - Essential Power, LLC - 5 -

Selected Answer:

Answer Comment:

I believe it would be appropriate to include the Transmission Planner as an applicable entity for R2 purposes as they typically maintain the fault current/short circuit values at the buses.

I had to reread R2 a couple of times to be clear that the coordination study required as part of Option 2 only applies to the buses where the deviation exceeds 15% and not required of all the buses. If an opportunity exists, a minor clarifying edit would be recommended.

in R2, the standard speaks to a deviation at a bus to which the Element is connected. Is this intended to be a bus that is part of the BES? I'm thinking of how this would be applied at a generating plant where there is the transmission voltage level bus, the generating plant bus (e.g. 18 kV), lower voltage level buses within the plant, etc. I'm wondering how this aspect would be applied in practice at a plant. Perhaps clarifying edits in the requirement language and accompanying discourse in the rationale would help clarify this…

Louis Guidry - Louis Guidry On Behalf of: John Lindsey, Cleco Corporation, 6, 5, 3, 1
Michelle Corley, Cleco Corporation, 6, 5, 3, 1
Robert Hirchak, Cleco Corporation, 6, 5, 3, 1
Stephanie Huffman, Cleco Corporation, 6, 5, 3, 1

Selected Answer:

Answer Comment:

The definition of Power System Coordination Study is defined as an analysis of the operating sequence. Our interpretation of the definition is that we have to model the relay action and demonstrate that it operates in the intended sequence. Cleco uses fault simulations to develop the settings. We do not model the relays in our short-circuit program to demonstrate the relay action.

2. The standard requires an internal review of the developed settings. Who is going to review the settings currently develop? Relay settings are an art due to the compromised required because of so many unique problems. No two people are going to solve the problem exactly the same. Should two people develop the settings and compare results?

3. The standard requires a review of the short-circuit model prior to developing settings. What constitutes a valid review?

4. Requirement 1.3 says we get a response from other owners prior to implementing settings on associated BES elements. How much time before Cleco responds is required? How much time do we have to wait for a response? What if neighboring entity request a response for many of our associated systems at once?

Jamison Cawley - Nebraska Public Power District - 1 -

Selected Answer:

Answer Comment:

Please state that when a fault current baseline is first established we are not required to show a coordination study for every protection scheme on our system. Please state that utilities are not required to show a coordination study if the baseline continues to show a fault current change less than 15%?

Requirement R2 option 2 states “Fault current values (either three phase or phase to ground) at a bus to which the Element is connected” where the RSAW states “Fault current comparison and results for each BES Element”. The RSAW and Standard should match language as closely as possible. In this case the standard states bus faults and the RSAW evidence specifies each element which is more than just a bus. It may be wise to delay industry RSAW reviews until the standard language is in a more finalized state.

Consider adding a modification to R2. There should be an allowed time line for a coordination study to take place after the 15% fault current threshold has been identified as being exceeded. This presents a risk many could step into unwittingly when the identification is close to the 6 year interval. There are circumstances where fault currents may not change until close to this 6 year interval due to system changes that may not be foreseen. We suggest the requirement include a two year window after a 15% change is identified.

Please provide a definition or examples to clarify what is considered “electrically-joined Facilities”. For example, if a line and both terminals and protection is owned by entity A at sub 1 and sub 2. All other equipment at sub 1 is owned by entity B. All equipment at Sub 2 is owned by entity A. Is sub 2 “electrically-joined”?

The RSAW in the sections for R1 and R3 states: “In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation”. We request a provision in the Standard allowing if all separate functional entities within an organization have access to the same internal documentation, then the communication aspects are not required.

In a situation where utility A does work for another utility B on their transmission system protection equipment and utility A owns all the other surrounding protection systems, please clarify how the communication evidence would change with coordination work since utility A is making all the coordination decisions. Is it acceptable to show utility A has all utility B protection system settings internally stored? Does this make utility A responsible for utility B compliance?

For a facility that has multiple bus voltages such as 115kV, 230kV and 345kV and if the fault current baseline exceeds 15% on just the 115kV bus does this mean just the elements connected to the 115kV bus must have a coordination study but not the 230 or 345kV buses?

Answer Comment:

The parenthetical phrase in sub-Part 4.1.3 of the Applicability is not necessary and should be deleted.   FPA 215 already ready limits the applicability of all reliability standards to the Bulk Power System and believe that NERC has revised the BES definition so that it should, either through application of bright line criteria or through the NERC or FERC exception process, encompass only those Elements and Facilities that are subject to FPA 215.

It should also be noted that, in this version the word “its” is deleted from Requirement 1 but that the Rationale for Requirement R1 uses the word “their” while Measure 1 uses the word “its”. We suggest changes be made so that all contain consistent verbiage. We believe that an entity can only be responsible for Protection System(s) it owns and would prefer this be explicitly indicated in the requirement(s).

As defined in the NERC Glossary, the Reliability Coordinator is the entity that is the highest level of authority who is responsible for the reliable operation of the

Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and Real-time operations. The Reliability Coordinator has the purview above and beyond that of a Transmission Operator that is broad enough to enable the calculation of Interconnection Reliability Operating Limits. Because new relay settings or revisions to relay settings can impact IROL calculations, the Reliability Coordinator must be aware of any new relay settings or revised relay settings in advance of their implementation.

For these reasons the standard needs to require that each Transmission Owner, Generator Owner and Distribution Provider notify the Reliability Coordinator that it is developing new or revised relay settings. The revision should also allow for the Reliability Coordinator to provide comments on the new or revised relay settings. To capture this, we suggest the following revision to R1:

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit models for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. Provide new or revised Protection System settings to the Reliability Coordinator.

1.3.1 Respond to the Reliability Coordinator's comments regarding the proposed new or revised Protection System settings by resolving any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.4. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.4.1. Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Also, to clarify and reinforce the nature of the broader protection coordination concern, suggest the following modification to the Purpose:

"To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection

Systems operate in the intended sequence during Faults without causing an inadvertent adverse impact anywhere on the BES."

We suggest that the drafting team review PRC-027-1 R1 Part 1.1 and MOD-032-1, R1 for a potential overlap, and if necessary provide clarification in the supplemental material.

R2, Option 2 has two actions associated with it, both of which have to be completed in one timeframe. The two actions are the Fault current comparison against the baseline and the performance of a Protection System Coordination Study if the fault current comparison exceeds 15% or greater deviation. It is recommended that under this option, if an entity identifies a 15% or greater deviation in Fault current value at a bus, the entity is given a set amount of time per element to complete a protection coordination study on all applicable elements at that bus.

In many cases, smaller entities that are interconnected to larger TOs do not develop their own Protection System settings. These settings are provided to them by the interconnecting TO and mandated to be implemented through Interconnection agreements. R1 should be revised to recognize these instances, including the Rationale for Requirement R1 words related to a "single protective relaying group performing the work for multiple functional entities," as a single group may be responsible for the process for multiple owners of BES Elements. The note should also be included in the Requirement and Measure as internal documentation will be used to determine the coordination aspects of Part 1.3.

Requirement R3 needs a "trigger" to initiate the process described therein. Suggest revising Requirement R3 to read:

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that determines a need for new or revised Protection System settings shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

To avoid confusion between modeling and protection short circuit modeling, suggest adding the word "protection" to make the term used in the standard "protection short circuit".

Answer Comment:

1) Hydro One Networks Inc. agrees with the NPCC and recommends that the NERC SDT provides clarification on the overlap of requirements between MOD-032-1, R1 (to develop short-circuit modelling data requirements) and PRC-027-1, R1 (to establish a process which includes a review and update of short-circuit models).

2) Requirement R2, Option 2, entails two actions: 1) a fault current comparison against a previously established baseline be performed, and 2) a Protection System Coordination Study be performed if the results of the comparison study exceed a deviation 15%. Presently, both these actions need to be performed within the same timeframe. However, Hydro One Networks Inc. agrees with the NPCC in that a separate time period should be allotted for an entity to complete a protection coordination study on all associa0ted elements on a bus, if a deviation of 15% or greater in the available fault current comparison is identified.

3) Further, Hydro One Networks Inc. also recommends that in the interest of clarity, the two actions within Option 2 of requirement R2 be separated out.

Answer Comment:

1. From a standards development process perspective, FMPA recognizes that there was a fair amount of industry outreach recently on this Project. Yet, given the low results (<40%) in the prior balloting, a written “consideration of comments” would have been helpful. Plus, is it surprising that this round of questions only addresses the “Attachment A” and the “Implementation Plan” and not the actual standard language.

These few questions will not necessarily gather the input needed by the SDT, in case additional improvements are needed.

2. Requirement 1.3.4 has 4 sub parts that can drive auditors to require registered entities to prove the negative. Would suggest that the four sub parts be not listed as such and instead just be collapsed into the sentence. That will reduce the likelihood that auditors will feel compelled to ask for “specific supporting evidence to prove the negative” which we were told during outreach was not the intent of the SDT.

Part 1.3.4 *Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:*

1.3.4.1. *Implementation or commissioning.*

1.3.4.2. *Misoperation investigations.*

1.3.4.3. *Maintenance activities.*

1.3.4.4. *Emergency replacements required as a result of Protection System component failure.*

3. FMPA has previously commented that the speed at which faults are cleared is very important to reliability, and does not understand why sequence is call out in the standard and associated definitions as being more important. FMPA recommends the SDT consider adding language to R1 that requires review of Protection System settings with regard to critical clearing time.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Selected Answer:

Answer Comment:

Texas RE recommends deleting the comment regarding ownership in the Functional Entities section since there is no need with risk-based compliance.

In the Evidence Retention section, Texas RE recommends changing the statement “since the last audit” to “since the last audit of these requirements.”

Texas RE is concerned there is no time frame for entities to provide settings or response to settings in R1.3 The implication is that setting should be provided before implementation by using the word “proposed” but R1.3.2 does not discuss any timeframe for a response. R1.3.4 does not discuss a time frame for communication of revised settings in an unforeseen circumstance.

The footnote for R2 could cause confusion. It is not clear that an Entity should not exceed six years between either performing a Study or comparing Fault current values. If an entity changes options before the six year mark, a Study should be done at that time to establish the baselines.

Texas RE recommends changing the severe VSL for R2 to “The responsible entity failed to perform Option 1, Option 2 or Option 3, in accordance with Requirement 2 for each element.”

The requirement to coordinate protective relay settings has existed since the first power systems were built. BC Hydro, like all utilities, has been coordinating their protection systems as part of their normal practice and has a process for setting development, review and implementation on its protection systems. While the requirements in Draft 6 of PRC-027-1 are not substantially different than standard industry practice, proving annual compliance with these requirements (to the satisfaction of lawyers) will impose a large administrative burden. The original focus of PRC-001 made sense in that there are always communications and data gathering issues that make coordinating protection systems across different utilities more challenging than coordinating within one's own system. The new draft standard focuses too much of the utility's time and effort on proving compliance on a process that typically works well, which reduces the amount of time and effort that can be spent on areas where more time and money should be spent.

Selected Answer:

Answer Comment:

The Planning Coordinator, Reliability Coordinator, and Balancing Authority must be notified when new or revised protection settings are developed.

As defined in the NERC Glossary, the Planning Coordinator is the responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems. Because the Planning Coordinator is responsible for the coordination and integration of protection systems, it must be aware of any new relay settings or revised relay settings in advance of their implementation.

As also defined in the NERC Glossary, the Reliability Coordinator is the entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The

Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision. Because new relay settings or revisions to relay settings can impact IROL calculations, the Reliability Coordinator must be aware of any new relay settings or revised relay settings in advance of their implementation.

Finally, draft requirements in the proposed TOP-009-1 reliability standard require that the Balancing Authority ensure that "… its personnel responsible for Reliable Operation of its Balancing Authority Area have knowledge of operational functionality and effects of Composite Protection Systems and Remedial Action Schemes that are necessary to perform its Real-time monitoring in order to maintain generation-Load-Interchange balance." Accordingly, Balancing Authorities will need to be provided with new or revised Protection System settings to fulfill its obligations under TOP-009-1.

Therefore, the standard needs to require that each Transmission Owner, Generator Owner and Distribution Provider notify the Planning Coordinator, Reliability Coordinator, and Balancing Authority that it is developing new or revised relay settings. The revision should also allow for the Planning Coordinator or Reliability Coordinator to provide comments on the new or revised relay settings. To capture this, the ISO/RTO Council Standards Review Committee suggests the following revision in R1:

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: ***[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]***

1.1 A review and update of short-circuit models for the BES Elements under study.

1.2 A review of the developed Protection System settings.

1.3 Provide new or revised Protection System settings to the Planning Coordinator, Reliability Coordinator, and Balancing Authority.

1.3.1 Respond to the Planning Coordinator or Reliability Coordinator's comments regarding the proposed new or revised Protection System settings.

1.4 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.4.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Also, to clarify and reinforce the nature of the broader protection coordination concern, the following modification to the Purpose is proposed:

“To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults without causing an inadvertent adverse impact anywhere on the BES.”

Selected Answer:

Answer Comment:

We request that the SDT consider the following changes/ clarifications:

Present language:

R1.1 A review and update of short-circuit models for the BES Elements under study.

Proposed:

R1.1 A review and update of short-circuit models or data for the BES Elements under study.

This change will address concerns from GOs and DPs that don't have anything to do with the short-circuit model and potentially only need the fault current data at the interconnected bus from the TO.

In the rational box for **R2:**

Present language:

The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators.

Proposed language:

The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators or Transmission Owners.

Answer Comment:

SCL General Comments

1) The Option 2 baseline should include a system-wide review of the entities instantaneous overcurrent elements, that are utilized on the BES, as well as the performance of the baseline fault study.

SCL experience has demonstrated that overreaching instantaneous overcurrent elements are one of the largest causes of miscoordination in a Protective Relay System.

2) The draft Standard, in its present form, is reminiscent of the early stages of the PRC-005 (Relay Maintenance) Standard, in that each utility will establish their own implementation (issue and installation of the relay settings) schedule timeline, without any constraints. This did not work well, for Standard PRC-005 as the utilities with strong maintenance plans were scrutinized, during audits, much more rigorously than those utilities with weaker maintenance plans, even though the weaker maintenance plans made the BES less reliable. It required several revisions of the PRC-005 Standard to get everyone on the same playing field. SCL believes that a similar situation will occur if a not-to-exceed schedule timeline is not established for the implementation of the revised relay settings.

R1. - Introduction

Modify text in paragraph to read: such that the Protection Systems, associated with the protective functions listed in Attachment A, operate in the intended sequence during faults.

R1. – Add Section 1.4

Inside of this section describe the timeline allowed to implement the revised relay settings.

For example, “new and revised relay settings necessary for the coordination of the Protection Systems, associated with the protective functions listed in Attachment A, shall be issued and installed within one year after the Protection Coordination Study has been performed”.

R2. – Option 2

Modify text in paragraph to include the following steps:

1) Compare the present fault current values to the previously established fault current baseline at each BES bus within the entitiy's system, with Protection Systems, associated with the protective functions listed in Attachment A.

2) Identify the buses where the present fault current value exceeds the baseline value by an amount that is 15%, or greater, in magnitude.

3) Perform a Protection System Coordination Study on the area of the system defined by the BES elements that are connected to the buses identified in Step 2.

4) The time interval to perform steps 1-3 shall not exceed six calendar years.

ATTACHMENT A

Modify text for relay elements as follows (line number defined at beginning of sentence):

21-1 – Zone 1 distance relay if:

• Infeed is used in determining reach (phase & ground distance), or

• zero-sequence mutual coupling is used in determining reach (ground distance)

21-2 – Zone 2 distance relay if:

• Infeed is used in determining reach (phase & ground distance), or

• zero-sequence mutual coupling is used in determining reach (ground distance)

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent if used in a non-communication-assisted protection scheme.

67 I – Directional Instantaneous overcurrent

67 T – Directional inverse time overcurrent if used in a non-communication-assisted protection scheme.

SUPPLEMENTAL MATERIAL REQUIREMENTS R1

Modify the text for the last paragraph of Section R1 just above Part 1.1 to read:

The coordination of some Protections Systems may seem unnecessary, such as for a line element that is protected solely by dual current differential relays . . . with other Protection Systems of the line element such that tripping does not unnecessarily occur for faults outside of the differential zone, unless there is a Protection System failure on the adjacent line element.

Tony Eddleman - Nebraska Public Power District - 3 -

Selected Answer:

Answer Comment:

Please state that when a fault current baseline is first established we are not required to show a coordination study for every protection scheme on our system. Please state that utilities are not required to show a coordination study if the baseline continues to show a fault current change less than 15%?

Requirement R2 option 2 states “Fault current values (either three phase or phase to ground) at a bus to which the Element is connected” where the RSAW states “Fault current comparison and results for each BES Element”. The RSAW and Standard should match language as closely as possible. In this case the standard states bus faults and the RSAW evidence specifies each element which is more than just a bus. It may be wise to delay industry RSAW reviews until the standard language is in a more finalized state.

Consider adding a modification to R2. There should be an allowed time line for a coordination study to take place after the 15% fault current threshold has been identified as being exceeded. This presents a risk many could step into unwittingly when the identification is close to the 6 year interval. There are circumstances where fault currents may not change until close to this 6 year interval due to system changes that may not be foreseen. We suggest the requirement include a two year window after a 15% change is identified.

Please provide a definition or examples to clarify what is considered “electrically-joined Facilities”. For example, if a line and both terminals and protection is owned by entity A at sub 1 and sub 2. All other equipment at sub 1 is owned by entity B. All equipment at Sub 2 is owned by entity A. Is sub 2 “electrically-joined”?

The RSAW in the sections for R1 and R3 states: “In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation”. We request a provision in the Standard allowing if all separate functional entities within an organization have access to the same internal documentation, then the communication aspects are not required.

In a situation where utility A does work for another utility B on their transmission system protection equipment and utility A owns all the other surrounding protection systems, please clarify how the communication evidence would change with coordination work since utility A is making all the coordination decisions. Is it acceptable to show utility A has all utility B protection system settings internally stored? Does this make utility A responsible for utility B compliance?

For a facility that has multiple bus voltages such as 115kV, 230kV and 345kV and if the fault current baseline exceeds 15% on just the 115kV bus does this mean just the elements connected to the 115kV bus must have a coordination study but not the 230 or 345kV buses?

Answer Comment:

ATC recommends revising PRC-027-1 to identify a clear connection between performance and the requirements of this standard. Where PRC-004 data provides a mechanism to measure performance, the better means to achieve reliability performance would allow each entity to use its company's misoperations data and the greater industry data to develop a program that addresses its greatest need.

Answer Comment:

1. For requirement R1, Part 1.1, the requirement states that the TO, GO, and DP must have a process to review and update short-circuit models for BES Elements under study. We disagree that the GO and DP must complete their own short-circuit models. Our recommendation is to allow GOs and DPs to use the TO’s short circuit study for applicable GO or DP buses.
2. For requirement R1, Part 1.3, we disagree with the requirement of documenting internal coordination, especially considering that smaller

entities may have a single protection engineer that is responsible for completing the study. Also, we disagree that there needs to be eight sub-parts for joint ownership coordination. This is administrative in nature and burdensome for compliance. This sub-part is overly complicated and creates opportunities for entities to fall out of compliance. There is little benefit to reliability for having this much detail required.

3. For requirement R2, option 1, performing studies for all applicable relays can be resource intensive, especially for smaller entities. We recommend that the drafting team consider the Cost Effective Analysis Process (CEAP) to determine if the reliability benefits outweigh the cost of compliance.
4. For requirement R2, option 2, the baseline process is complicated. We recommend stating in footnote one that the baseline for option 2 must be completed within 12 months after the standard goes into effect. Also, the measure should state that if there is not a fault current deviation greater than 15 percent, then an attestation is sufficient evidence for compliance.
5. For requirement R2, option 3, there should be specific guidance in the measures to demonstrate compliance for the combined approach, such as a baseline for applicable distance or overcurrent relays to occur within 12 months of the effective date and a Protection System Coordination Study (PSCS) for the remaining applicable Protection Systems to occur every 6 years after the effective date.
6. For requirement R3, the documentation requirements for coordination activities of new/revised settings is administrative in nature. We question the need for an administrative documentation requirement that is assessed a high risk. Industry has long history of coordinating Protection Systems and there is not any evidence of a widespread lack of Protection System coordination. We do not see how requiring a documented process will reduce the risks to reliability. Thus, we do not see how it enhances reliability and believe it could actually detract by causing applicable entities to focus on paperwork.

Selected Answer:

Answer Comment:

FE's primary concern relates to what is required of the GO to be able to comply with R1 which states the TO, GO and DP "… establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults." The GO, operates the units essentially as isolated BES elements. The term "sequence" infers it is referring to the BES as a whole, at least with regard to interconnected elements, which would then mean we need a joint process with the TO. The GO is not in a position to make that happen, nor should the GO have primary responsibility. This should be a TO responsibility, with GO providing settings as requested by TO, and GO changing settings as requested/instructed by the TO.

FE believes the TO should be identified as the entity to establish the system protection coordination and be responsible for PSCSs (Power System Coordination Studies), Fault Studies, Short Circuit Studies, etc., to prove coordination. Communication to the GO should also be the TO's responsibility. The GO would be responsible to implement setting changes as directed by the TO, where applicable and if able. The GO's connection to the BES normally ends/terminates with the Generator Step Up transformer so the GO does not have the data to perform any Power System Coordination Studies, Fault Studies, or Short Circuit Studies

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those Faults, such that the Protection Systems operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

Completed Actions	Date
Standard Authorization Request (SAR) posted for comment	June 11 – July 10, 2007
SAR approved	August 13, 2007
Draft 1 of PRC-001-2 posted for comment	September 11 – October 26, 2009
Draft 1 of PRC-027-1 posted for formal comment with ballot	May 21 – July 5, 2012
Draft 2 of PRC-027-1 posted for formal comment with ballot	November 16 – December 17, 2012
Draft 3 of PRC-027-1 posted for formal comment with ballot	June 4 – July 3, 2013
Draft 4 of PRC-027-1 posted for formal comment with ballot	November 4 – December 31, 2013
Draft 5 of PRC-027-1 posted for informal comment	October 1 – October 21, 2014
Draft 5 of PRC-027-1 posted for formal comment with ballot	April 1 – May 15, 2015
Draft 6 of PRC-027-1 posted for formal comment with ballot	July 29 – September 11, 2015

Anticipated Actions	Date
10-day final ballot	October, 2015
NERC Board of Trustees (BOT) adoption	November, 2015

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Protection System Coordination Study

An analysis to determine whether Protection Systems for BES Elements [JS1]operate in the intended sequence during Faults.

Protection System Issues Addressed by Other Reliability Standards:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. Including aspects of protection coordination other than Fault coordination would cause duplication or conflict with the requirements of other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title: Coordination of Protection Systems for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Transmission Owner
   4.1.2. Generator Owner
   4.1.3. Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)
   ~~**4.1.3.**~~**4.1.4.** Transmission Planner

   4.2. Facilities: Protection Systems installed to detect and isolate Faults on BES Elements.

5. **Effective Date:** See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:[JS2]

Coordinated Protection Systems enhance reliability by isolating faulted equipment, thus reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. The stated purpose of this standard is: “To maintain the coordination of Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those Faults, such that the Protection Systems operate in the intended sequence during Faults.” Requirement R1 captures this intent by requiring responsible entities establish a process that, when followed, allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing Protection System settings.

Part 1.1 Reviewing and updating the short-circuit models used to develop new or revised Protection System settings helps to assure that settings are developed using accurate, up-to-date information.

Part 1.2 A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

Part 1.3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is essential to the reliability of the BES. Communication and review of proposed settings among these entities are necessary to identify potential coordination issues and address the issues prior to implementation of any proposed Protection System changes.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include a procedure to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically-joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for ~~developing new and revised~~performing a Protection System Coordination Study ~~settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults~~[JS3]. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

~~1.1. A review and update of short-circuit models for the BES Elements under study.~~[JS4]

~~1.2.~~1.1. ~~A~~ Its method to review ~~of the~~its developed Protection System settings before they are applied.

~~1.3.~~1.2. For its settings for Protection Systems ~~settings applied on~~for [JS5]BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

~~1.3.1.~~1.2.1. Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

~~1.3.2.~~1.2.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

~~1.3.3.~~1.2.3. Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

~~1.3.4.~~1.2.4. Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

~~1.3.4.1.~~1.2.4.1. Implementation or commissioning.

~~1.3.4.2.~~1.2.4.2. Misoperation investigations.

~~1.3.4.3.~~1.2.4.3. Maintenance activities.

~~1.3.4.4.~~1.2.4.4. Emergency replacements required as a result of Protection System component failure.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity established a process to ~~develop settings for its~~perform a Protection System~~s~~ Coordination Study, in accordance with Requirement R1.

Rationale for Requirement R2:

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities (Transmission Owners, Generator Owners, and Distribution Providers) to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Requirement R2 provides responsible entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six years, a Protection System Coordination Study for each of its BES Protection Systems identified as being affected by changes in Fault current. The six calendar year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators. At least once every six calendar years following the effective date of this standard, the entity will perform a Protection System Coordination Study when its Fault current comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the Element is connected.

The baseline Fault current value(s) will be re-established whenever a new Protection System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current based option for existing Elements when performing Protection System Coordination Studies. The footnote also allows for the creation of a baseline when a Protection System Coordination Study is performed for installing new Elements.

Option 3 provides the entity the choice of using both the time-based and Fault current based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current based methodology for Protection Systems at other Facilities.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater ~~deviation~~ increase[JS6] in Fault current values (for either three-phase or phase-to-ground Faults) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;~~[1]~~[JS7] or,
- Option 3: A combination of the above.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

~~[1] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.~~

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 and one of the options in Requirement R2[JS8] to develop its new and revised settings for Protection System ~~settings~~ for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

Rationale for Requirement R4:

Transmission Planners develop short circuit data bases per MOD-032-1 and utilize them in TPL-001-4 to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt. Since Transmission Planners develop and use short circuit databases, having other entities (TOs, GOs and DPs) use them could introduce errors. Therefore, Transmission Planners are required to calculate all Fault current values (an initial baseline and subsequent periodic updates) and make those available to its Transmission Owners, Generator Owners, and Distribution Providers.

R4. Each Transmission Planner shall calculate the baseline Fault currents for both three-phase and phase-to-ground Faults for all its busses and make such results available its Transmission Owners, Generator Owners, and Distribution Providers. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Each Transmission Planner shall annually update the Fault currents for all its busses and make such updates available its Transmission Owners, Generator Owners, and Distribution Providers.

4.1.1. For new busses, the Fault currents initially calculated for that bus shall become its baseline Fault currents.

4.1.2. The Transmission Planner shall reset the baseline Fault currents for any bus when a Fault current (for either a three-phase or phase-to-ground Fault) is greater than or equal to 1.15 times the previously established Fault current baseline has been calculated for that bus.

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that each Transmission Planner made available its initial baseline and its annual updates of Fault current values for all its busses to its

Transmission Owners, Generation Owners, and Distribution Planners, and that it has reset the baseline Fault currents at busses in accordance with part 4.1.1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance with Requirements R1, R2, and R3, and Measures M1, M2, and M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.
R2.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option

				2, or Option 3, in accordance with Requirement R2.
R3.	N/A	N/A	N/A	The responsible entity failed to utilize the process established in accordance with Requirement R1.

Version History

Version	Date	Action	Change Tracking
1		Adopted by NERC Board of Trustees	New standard developed under Project 2007-06

Attachment A

The following Protection System functions[2] are applicable to Requirement R2 if available Fault current levels are used to develop the settings for those Protection System functions:

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions are susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize current in their measurement to initiate tripping of circuit breakers. The functions listed above are included in a Protection System Coordination Study because they require coordination with other Protection Systems.
2. See the PRC-027-1 Supplemental Material section for additional information.

[2] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Purpose

The Purpose states: To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance reliability by isolating faulted equipment, reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. This standard requires that entities establish and implement a process to coordinate their BES Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current availability upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults.

The reliability objective of this requirement is to have applicable entities establish a process to develop settings for coordinating their BES Protection Systems, such that they operate in the intended sequence during Faults. The parts that are included as elements of the process ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of settings.

This standard references various publications that discuss protective relaying theory and application. The description of "coordination of protection" is from the IEEE Standard C37.113-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Entities may have differing technical criteria for the development of Protection System settings based on their own philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge; as such, a single definition or criterion for "Protection System coordination" is not practical.

The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. However, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A review and update of short-circuit models for the BES Elements under study.

The study used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers is the short-circuit study. Including a review and, if necessary, an update of short-circuit study information is necessary to ensure that information accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of a short-circuit study are only as accurate as the information that its calculations are based on.

A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. Because the results of short-circuit studies are used as the basis for protective device coordination studies, the short-circuit model should accurately reflect the physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances.

2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 A review of the developed Protection System settings.

A review of the Protection System settings prior to implementation reduces the possibility of introducing human error. A review is any systematic process of verifying the developed settings meet the technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures.

Part 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

Requirement R1, Part 1.3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.3.1 1.3.1. Provide the proposed Protection System settings to the owners of the electrically-joined Facilities.

Requirement R1, Part 1.3.1 requires the entity to include in its process a provision to provide proposed Protection System settings to other entities. This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.3.2 requires the entity receiving proposed Protection System settings to include in its process a provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response indicating Protection System coordination issues were identified, or affirmation that no issues were identified.

Part 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.3.3 requires the entity to include in their process a provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability is minimized.

Note: There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgement. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. Further, there could be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

Part 1.3.4 Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:

1.3.4.1. Implementation or commissioning.

1.3.4.2. Misoperation investigations.

1.3.4.3. Maintenance activities.

1.3.4.4. Emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2

This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years;[3] or,
- Option 3: A combination of the above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

[3] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline by performing a Protection System Coordination Study.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which an Element is connected. This option allows the entity to choose an interval of up to six calendar years to perform the Fault current comparisons and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

An entity that elects to use Option 2 following the effective date of the standard, must establish its baseline prior to the effective date. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current values used in the original baseline can be updated or created when a Protection System Coordination Study is performed. The baseline values at each bus to which an Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System.

> **Example:** An initial baseline is established at 10,000 amps. During the first short-circuit review, it is discovered that Fault current has increased to 11,250 amps (12.5 percent change); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next study remains at 10,000 amps because no study was performed. However, during the next Fault current comparison, the Fault current has increased to 11,500 (15 percent change); therefore, a Protection System Coordination Study is required, and a new baseline of 11,500 amps would be established.

> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

Attachment A identifies the Protection System functions susceptible to changes in the magnitude of available short-circuit Fault current. These functions utilize AC current in their measurement to initiate tripping of circuit breakers. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*. The device functions listed in Attachment A are to be reviewed provided they require coordination with other Protection Systems. The following scenarios provide some examples for applying Attachment A.

A "51 – AC inverse time overcurrent" relay connected to a CT on the neutral of a generator step-up transformer, referred to as "51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT Method)" in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are "51 – AC Inverse time overcurrent" relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function used in conjunction with a "62 – Time-delay" function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed "21 – Distance" function, which is a "21 – Distance" function with a "62 – Time-delay" function. Another example would be a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function with a "62 – Time-delay" function. A "50 – Instantaneous overcurrent" function used for supervising a "21 – Distance" function would not be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing "21 – Distance" functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is not used in determining the setting, "21 – Distance" functions would not be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, “21 – Distance” functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes will be moved to this section.

Question:
2. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

Associated Ballot: 2007-06 System Protection Coordination PRC-027-1 & PRC-001-1.1(ii) AB 2 ST

There were 64 sets of responses, including comments from approximately 162 different people from approximately 112 different companies representing 10 of the 10 Industry Segments as shown on the following pages.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Howard Gugel (via email) or at (404) 446-9693.

The drafting team made grammatical edits and provided additional information in the Rationale boxes and Supplemental Material section of the draft standard. The following clarifying revisions to the balloted standard were also made:

Requirements

Requirement R1, Part 1.1

Changed from "A review and update of short-circuit models for the BES Elements under study." to "A review and update of short-circuit model data for the BES Elements under study."

Requirement R1, Part 1.3.4

Changed the format incorporating the subparts into the main body of Part 1.3.4. It now reads as follows:

"Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure."

Requirement R2

Option 2 and **Footnote:** Inserted "BES" as a modifier of Element.

Option 3: Inserted "Use" at the beginning to align formatting with options 1 and 2.

Footnote: Inserted the following to clarify where Fault current baselines can be established:

"The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA)."

Attachment A: Revised general language.

Implementation Plan

Effective Date of New or Revised Standards

Changed the implementation period of the standard from twelve (12) months to twenty-four (24) months to provide entities more time to establish the (1) Protection System settings development process, (2) Fault Current baselines, and (3) tracking tool(s) for Fault Current baseline changes and/or Protection System Coordination Studies.

Added section "**Initial Performance of Requirement R2"**

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with

Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Questions

1. **The term "entity-designated" and its associated footnote were removed and replaced by "Attachment A." Attachment A lists the Protection System functions applicable in the standard. Do you agree that Attachment A includes the Protection System functions that must be reviewed to maintain Protection System coordination when Fault current levels change? If not, please provide the basis for your disagreement and any proposed revisions.**

2. **Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.**

3. **If you have any other comments that you haven't already provided in response to the above questions, please provide them here.**

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. The term "entity-designated" and its associated footnote were removed and replaced by "Attachment A." Attachment A lists the Protection System functions applicable in the standard. Do you agree that Attachment A includes the Protection System functions that must be reviewed to maintain Protection System coordination when Fault current levels change? If not, please provide the basis for your disagreement and any proposed revisions.

Selected Answer: Yes

Angela Gaines - Portland General Electric Co. - 1,3,5,6 - WECC

Selected Answer: Yes

Eric Schwarzrock - Berkshire Hathaway - NV Energy - 5 -

Selected Answer: No

Answer Comment:

- Attachment A does not list bus differential protection as an applicable protection function. Bus protection designed using either overcurrent, percentage differential or high impedance differential protection use a sum of currents to detect a bus fault. In an ideal world an increase in fault current would not affect the differential relays, but there are situations where an increase in fault current can negatively affect the differential relays and affect the coordination between bus differential and line relays.

◦ Overcurrent and percentage differential relays are usually applied on busses where fault currents are low enough so that CT saturation does not occur. As fault currents increase, the chances of CT saturation increase which can cause false bus differential operations for external line faults.

◦ High impedance differential relay voltage settings are calculated based on the voltage that could be developed across the relay with a completely saturated CT. This voltage setting is calculated using the maximum external fault current. With increased fault currents, the voltage that could develop across the relay for a saturated CT could be higher than the voltage setting of the relay. This can also cause false bus differential operations for external line faults.

Bus differential relays should be added to Attachment A to ensure that proper coordination between bus differential relays and line relays for external faults.

Response: Thank you for your comment. The drafting team asserts your examples represent local relay setting issues, not coordination issues. Bus differential relays settings are not based on coordination with other relays.

Answer Comment:

While I agree that the functions listed are the ones that should be reviewed if fault current levels change, I disagree with using fault current as a trigger for a review *in all circumstances*. For those functions that do not require fault current or Protection System settings from other entities in order to ensure proper coordination, entities should be able to use equipment changes as a trigger for a coordination review. Equipment changes are already used as a trigger for other Reliability Standards and would allow for entities to have a single trigger for multiple Standards. This would add an additional, more cost effective option, while still ensuring Protection Systems on all BES Elements are coordinated. The SDT should include this as another option under Requirement 2 (see proposed revision below). A fault current trigger would remain for those functions that require fault current or Protection System settings from other entities in order to ensure proper coordination.

Proposed Revision:

R2. Each TO, GO, and DP shall, for each BES Element with Protection System functions identified in Attachment A:

Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six calendar years; or

Option 2: . Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the Element is connected, all in a time interval not to exceed six calendar years; or,

Option 3: For functions that do not require Fault current or Protection System settings from other entities to ensure proper coordination, perform a PSCS prior to the implementation of new or modified Protection System settings on associated BES Elements.

Option 4: A combination of the above.

Response: Thank you for your comment. An entity must use at least one of the options provided in Requirement R2 to satisfy the requirement but the standard does not preclude an entity from performing additional Protection System Coordination Studies (PSCS) based on triggers other than Fault current or from performing PSCS more frequently.

Selected Answer: Yes

Jeffrey DePriest - DTE Energy - Detroit Edison Company - 5 -

Selected Answer: Yes

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Selected Answer: No

Answer Comment: For the GO function, it would be helpful to include 51V-R and 51V-C as in scope relays in Attachment A. Also for GO, it would be helpful to note that 50/27 or 67 relays/protective functions used in generator inadvertent energization schemes are not in scope for PRC-027. Additionally, it's not clear if the 50 includes overcurrent elements used to supervise distance (21) elements.

Response: Thank you for your comment. Any variation of 51 time overcurrent relays are included in Attachment A. Unless the 50/27 and 67 Protection System functions are installed to detect and isolate Faults on BES Elements, the functions are not included in the Applicability of PRC-027. The Supplemental Material includes the following: A "50 – Instantaneous overcurrent" function used for supervising a "21 – Distance" function would not be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Jennifer Losacco - NextEra Energy - Florida Power and Light Co. - 1 - FRCC

Selected Answer: No

Answer Comment: Revision Requirement 1 allows us to develop a criteria for intended sequence which is good. Our only concern is if our criteria changes, there is no verbiage in the standard that allows for a phased implementation plan. One suggestion could be to give a 6 year cycle to be sure improvements are made will staying compliant to the proposed standard.

Response: Thank you for your comment. The process established in Requirement R1 is for developing new and revised Protection System settings for BES Elements. If an entity makes changes to its process, the entity will follow its new process to develop all future new or revised Protection System settings. There is no requirement that an entity retroactively implement its new process on previously developed Protection System settings.

Meghan Ferguson - Meghan Ferguson On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1

Selected Answer:	Yes

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Selected Answer:	No
Answer Comment:	In Attachment A, it seems that 67 elements used in communication-aided protection schemes should be applicable. If a communication-aided protecton scheme is needed for coordination with remote backup (e.g., long line adjacent to a short line, perhaps), a check may

need to be performed that (for example) overreaching ground overcurrent pickups are still appropriate. Tacoma Power will not object to lowering the compliance risk by leaving these elements out of Attachment A, but Tacoma Power did want to bring this to the drafting team's attention.

In Attachment A, or in the Supplemental Material section, breaker failure fault detectors should be discussed. As with the 67 element, if a breaker failure fault detector is set too high in (for example) a ring bus, remote backup protection could operate instead of the local breaker failure. As with the 67 element, Tacoma Power will not object to lowering the compliance risk by leaving these elements out of Attachment A, but it probably should be at least discussed by the drafting team and documented somewhere to avoid confusion later when/after the standard becomes effective.

Response: Thank you for your comment. The protective functions listed in Attachment A are included based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. The drafting team contends that the 67 element used in an overreaching communication scheme is not directly used to isolate Faults on BES Elements. With regards to breaker failure fault detectors, the drafting team does not consider your example a coordination issue but instead a local relay setting issue. Breaker failure Fault detector settings are not based on coordination with other relays.

Glenn Pressler - CPS Energy - 1 -

Selected Answer: No

Answer Comment: Agree with the elements listed, but I question the wording regarding the 21 elements. It sounds as if an entity simply sets this element by

	just taking a percent of the Positive Sequence Line impedance, even when infeed or mutuals are present (ground only), then the entity would never need to check these elements. However, if another entity does use these factors in determining settings of these elements, then that entity would be required to periodically check the settings. This seems to give a greater degree of risk for compliance failure for the entity that applies a more thorough method of setting these elements while leaving no risk to the entity that uses a simpler, less thorough setting method. Generally believe entities should be required to verify through studies that these elements will only operate for their intended zone of protection whenever infeed or mutuals are present.

Response: Thank you for your comment. The drafting team recognizes that entities have different protection philosophies to develop 21 element settings. If an entity does not consider infeed and no zero-sequence mutual impedances are present, the coordination of 21 elements would not need to be reviewed on a periodic basis because the settings are not based on available Fault current.

Selected Answer: Yes

Answer Comment:	We agree with the classification of specific Protection System components that require coordination. In addition, this will aid the compliance enforcement process. However, clarification is requested with regard to applicability of distance protection element. Does the standard apply to distance elements used solely for non-communication aided protection schemes (for example transfer trip, carrier systems) or for all distance element applications?

Response: Thank you for your comment. If infeed is not used in determining the settings of the 21 elements used in the communication-aided Protection System, then 21 elements would not be included in the Protection System Coordination Study because settings are not developed based on available Fault current. The Supplemental Material section provides additional information on this subject.

Selected Answer:	Yes

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3 Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Selected Answer:	No

Answer Comment: Hydro One Networks Inc. agrees with the NPCC on the classification of specific protection systems that would entail protection system coordination. However, Hydro One Networks Inc.. would like to ask for clarification within Attachment 1 whether distance (21) elements within communications aided protection schemes are subject to the requirements of this standard. This is because there were conflicting responses provided by the NERC SDT during the Q&A Session held on August 25th, and by NATF during the monthly meeting call on August 27th.

Response: Thank you for your comment. If infeed is not used in determining the settings of the 21 elements used in the communication-aided Protection System, then 21 elements would not be included in the Protection System Coordination Study because settings are not developed based on available Fault current. The Supplemental Material section provides additional information on this subject.

Selected Answer: Yes

Answer Comment: 1. We agree with the removal of the term “entity-designated” and the addition of Attachment A to provide more clarity.

2. Note #2 in the attachment refers to additional details located in the

supplemental information section of the standard. Once the standard is approved by FERC, only the applicability section and the requirements (and attachments that are incorporated by reference) will be enforceable. If the drafting team acknowledges that additional details are necessary to fully explain the attachment, then those details should be added at this stage of the development process.

Response: Thank you for your comments. Note 2 does not indicate that additional details are necessary to understand Attachment A. Note 2 simply indicates that additional discussion is provided in the Supplemental Material section of the standard, just as additional discussion is provided for the requirements, etc.

2. Do you agree with the proposed Implementation Plan? If not, please provide the basis for your disagreement and your proposed revisions.

John Fontenot - Bryan Texas Utilities - 1 -

Selected Answer:

Answer Comment: yes

RoLynda Shumpert - SCANA - South Carolina Electric and Gas Co. - 1,3,5,6 - SERC

Selected Answer:

Answer Comment: Yes,

SCE&G agrees with the SERC PCS committee comments: "It is our understanding that the 6-year evaluation interval begins on the enforcement date, allowing up to 6 years to complete a full system analysis. However, with this not being explicitly stated in the technical basis or implementation plan, we would recommend including that distinction in some location. "

Response: Thank you for your comment. To provide additional clarity, the drafting team added the following to the Implementation Plan.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System

Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Gul Khan - Gul Khan On Behalf of: Rod Kinard, Oncor Electric Delivery, 1

Selected Answer:

Answer Comment: Yes

Thomas Foltz - AEP - 5 -

Selected Answer:

Answer Comment: AEP does not believe that 12 months is adequate for the Implementation Plan, and recommends that it be increased to 24 months, which we believe is more reasonable. The GO often relies on the TO to provide short-circuit studies, which increases the time necessary to establish the initial baseline.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Mark Wilson - Mark Wilson On Behalf of: Leonard Kula, Independent Electricity System Operator, 2

Selected Answer:

Answer Comment: **The Implementation Plan should be extended to 24 months. As it stands now, entities only have 12 months after regulatory approvals to develop a process, establish Fault Current baseline, and establish a tracking tool for Fault Current baseline changes and/or periodic review**

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Mark Kenny - Northeast Utilities - 3 -

Selected Answer:

Answer Comment: We strongly believe that 12 months is an inadequate amount of time for an entity to develop a formal documented process, establish a Fault Current baseline, and establish a tracking tool for Fault Current baseline changes and/or periodic review. We recommend that the Implementation Plan should be extended to 24 months.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its

Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Joe O'Brien - NiSource - Northern Indiana Public Service Co. - 6 -

Selected Answer:

Answer Comment: Regarding Implementation Plan: NIPSCO believes 12 month implementation plan is very challenging and inadequate. NIPSCO recommends 24 months for implementation plan to allow entities sufficient time to establish resources and derive processes.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Selected Answer:

Answer Comment: The Technical Basis or Implementation Plan does not include sufficient details describing the 6 year evaluation interval. It is our understanding that this 6 year evaluation interval begins on the enforcement date allowing up to 6 years for the system analysis to be completed but this is not specifically stated so we recommend additional reference details be included to explicitly describe the Implementation times.

Response: Thank you for your comment. To provide additional clarity, the drafting team added the following to the Implementation Plan.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Answer Comment: Yes.

1) For R2, if an entity decides to go with option 1, does it mean that the entity is not required to do a Protection System Coordination Study until 6 years from the effective date of the standard?

Response: Thank you for your comment. To provide additional clarity, the drafting team added the following to the Implementation Plan.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Jay Barnett - Exxon Mobil - 7 -

Selected Answer:

Answer Comment: Agree.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Selected Answer:

Answer Comment: Salt River Project (SRP) has reviewed the Attachment A and has concerns with verifying a Fault Current baseline as required in R3. As this standard is written, this baseline must be created prior to the effective date of the standard. We strongly believe that 12 months is an inadequate amount of time to develop a formal documented process, establish a Fault Current baseline for thousands of relays, and establish a tracking tool for those Fault Current baseline changes and/or periodic review. We request that there be at least a 24 month implementation plan.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Dale Goodwine	Duke Energy	SERC	5
Greg Cecil	Duke Energy	RFC	6

Selected Answer:

Answer Comment:

Based on our concerns regarding R1, subpart 1.2, as outlined in question 3, Duke Energy cannot agree to the proposed Implementation Plan. If the standard were to be approved as written, the expectation to review the developed Protection System settings, depending on the level of detail expected for the review, would take a significant amount of time to achieve compliance. For larger entities, with a great deal of applicable relays, additional resources would most definitely be required, and time to acquire and train those resources would be necessary. We do not feel the 12 months is an adequate amount of time to achieve compliance with the standard as written.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Selected Answer:

Answer Comment: Checked--No

As it stands now, entities will not have adequate time, within 12 months, to develop a process, establish Fault current baselines, and establish a tracking tool for Fault current baseline changes and/or periodic review. We recommend that the Implementation Plan be extended to 24 months.

We recommend the implementation plan include a statement clarifying the start date of the 6 year cycle that is described in Requirement R2. Is it the date the standard is effective, or the date the protection system was last reviewed prior to the effective date?

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

The date of the last Protection System review prior to the effective date of the standard is not relevant in considering the initial performance of Requirement R2. The six-year interval begins on the effective date of the standard. To provide additional clarity, the drafting team added the following to the Implementation Plan.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Selected Answer:

Answer Comment: Hydro One Networks Inc. does not agree with the Implementation Plan as it is unreasonable to implement a process and establish a fault current baseline within 12 months. Further, the Implementation Plan of 12 months borders on the Long-term Planning horizon in requirement R1 itself. The NERC definition of a Long-term Planning horizon is "a planning horizon of one year or longer". Therefore, Hydro One Networks Inc. agrees with the NPCC, and recommends that the Implementation Plan be extended from 12 months to 24 months.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Selected Answer:

Answer Comment: If a utility is in the position to leverage a tool such as CAPE or ASPEN to automate its settings review, then the proposed implementation plan seems feasible. If a utility does not have a software tool in place, then developing and tracking the settings review may require significant resources. This may actually detract from a utility's ability to create and review relay settings.

Response: Thank you for your comment. Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

Answer Comment: yes

3. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

John Fontenot - Bryan Texas Utilities - 1 -

Answer Comment: none

Angela Gaines - Portland General Electric Co. - 1,3,5,6 - WECC

Answer Comment: Portland General Electric Company (PGE) thanks you for the opportunity to comment on this standard. PGE's System Protection group finds the proposed standard to be generally acceptable. We would, however, request that the drafting team review part 2 of PRC-023-3 Attachment A and consider exclusion of the relay elements listed in 2.1 from the requirement of PRC-027.

Response: Thank you for your comment. The drafting team reviewed PRC-023-3, Attachment A, and sees no reliability benefit in making your suggested change. Depending upon an entity's protection philosophy, the relay elements excluded by Part 2.1 of PRC-023-3 Attachment A may or may not meet the criteria for inclusion in Attachment A of PRC-027-1. The protective functions listed in Attachment A of PRC-027-1 are included based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. The drafting team contends that the functions listed in Attachment A and only those functions require review when available Fault current levels increase or decrease.

Eric Schwarzrock - Berkshire Hathaway - NV Energy - 5 -

Answer Comment: • Option 2 of R2 is meant to allow an entity to periodically check for a 15 percent of greater deviation in fault current. This option allows the entity to choose an interval of up to six calendar years to perform the fault current comparisons (this comes from the PRC-027-1 supplemental material). Option 2 is worded in a confusing manner so that the intent is not immediately clear without reading the supplemental material.

• Attachment A lists the protection system functions applicable to R2 including: 67 – AC directional overcurrent if used in a **non-communication-aided protection scheme**. This is probably ok if the fault current increases. If the fault current decreases, then any 67 relays used in a communication-aided protection scheme might not work correctly. If the 67 element were set to overreach the other end of the line for a POTT scheme (similar to using a zone 2 element in a POTT scheme) and the fault current decreased, it's possible that the 67 element might now see faults at a maximum distance less than the distance of the line. This would render the POTT scheme not as effective since the element used to trigger the scheme does not see the entire line.

Option 2 states that a protection coordination study should be performed when a 15 percent or greater deviation in fault current is identified. A 15 percent decrease in fault current should warrant a re-study of directional overcurrent elements used in communication aided protection scheme.

Response: Thank you for your comment. Option 2 of Requirement R2 requires that both the Fault current comparison and any resulting Protection System Coordination Study (from the identification of a 15% or greater deviation in Fault current) be performed within a maximum 6-calendar-year timeframe. The drafting team notes that the purpose of the Rationale boxes and Supplemental Material section is to provide additional guidance and rationale regarding the tenets of the basic requirements of the standard. Though the Rationale boxes move to the Supplemental Material section of the standard when it becomes effective, both of these informational pieces remain a permanent part of the standard for entities and auditors to reference. Further, the draft Reliability Standard Audit Worksheet (RSAW) for PRC-027-1 explains what evidence is required to demonstrate compliance with this requirement.

RoLynda Shumpert - SCANA - South Carolina Electric and Gas Co. - 1,3,5,6 - SERC

Answer Comment:

SCE&G agrees with the SERC PCS committee comments: "

Comments:

1) page 4, Please revise the Purpose and Facilities to clarify the scope.

a) Purpose: "To maintain the coordination of Protection Systems installed to protect detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults."

b) Facilities: "Protection Systems installed to detect and isolate Faults on protect BES Elements."

Also see comment #3 below. There are a large number of DP-TO interfaces and clarity on this interface is needed.

2) page 6 Rationale Option 2: augment 'Planners and Planning Coordinators' with 'Transmission Owner' so it reads "The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Owners, Transmission Planners, or Planning Coordinators." This makes it consistent with R1 1.1 itself, page 14 explanation.

3) page 13 DP Applicability is explained by 'A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.' A) In the vast majority of cases fault current contributions from DP networks are quite

weak, usually the last to trip, and insignificant to BES coordination. B) BES Phase 2 Definition excluded networks below 50kV and at the least this should be acknowledged here. C) PRC-027-1 Draft 6 Applicability language is consistent with the PRC-005-2 language, for which PRC-005-2 Supplement states: "'…that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.).' The drafting team intends that this standard will follow with any definition of the Bulk Electric System. There should be no ambiguity; if the Element is a BES Element, then the Protection System **protecting** that Element should then be included within this standard." D) Add language similar to B and C in the PRC-027-1 Supplemental Material.

4) page 17 second option: Please clarify the Fault current location for the 15% deviation trigger is the BES bus. This will help the GO and DP understand their responsibility. Please insert BES before Element in this sentence "The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which an a BES Element is connected. The drafting team intends for the 100kV or above BES bus to be the Fault current location."

Response: Thank you for your comment.

The drafting team contends that the acts described in the Purpose statement "…detect and isolate Faults on Bulk Electric System (BES) Elements…" are the same as providing protection for those Elements. The drafting team declines to make the suggested change. (a) The drafting team contends that the phrase provided in section 4.2. Facilities, "…detect and isolate Faults on Bulk Electric System (BES) Elements…" is the same as providing protection for those Elements. The drafting team declines to make the suggested change.

The drafting team contends that the phrase provided in section 4.2. Facilities, "…detect and isolate Faults on Bulk Electric System (BES) Elements…" is the same as providing protection for those Elements. The drafting team declines to make the suggested change.

The drafting team modified the Rationale box for Requirement R2 to include the Transmission Owner as you suggest.

Thank you for your comment. PRC-027-1 is consistent in its applicability to Protection Systems designed to detect (and isolate) Faults on BES Elements, and will, therefore follow with any definition of the Bulk Electric System as you suggest. Protection System Coordination is about isolating Faults in an intended sequence, not just about protecting Elements from Faults. PRC-027-1 will also follow with any definition of the Bulk Electric System.

The drafting team made the suggested change.

Gul Khan - Gul Khan On Behalf of: Rod Kinard, Oncor Electric Delivery, 1

Answer Comment: n/a

Thomas Foltz - AEP - 5 -

Selected Answer:

Answer Comment: AEP supports R1 & R3. AEP believes it is reasonable to have a process to develop Protection System settings for all BES elements, and to implement that process. AEP is willing to accept the inclusion of all BES protection systems in these requirements.

AEP does not support R2 as written in draft 6. AEP believes R2 should be limited to protection systems applied on BES Elements that electrically join Facilities owned by separate functional entities. It is reasonable to require a periodic review, as prescribed in R2, on protection systems applied to interconnecting elements, because an entity does not have knowledge of what changes are made by another entity that may affect protection system coordination.

AEP believes that R1 is sufficient to cover coordination of all internal protection systems. AEP has an existing process to review area coordination when system changes are made. All settings in the area that are affected by the change are reviewed and revised as necessary. Because of this process, it is not likely that any fault current comparisons would identify a 15% deviation at any buses. Thus, this requirement would become an administrative burden without any reliability benefit for internal protection systems.

AEP proposes that R2 be changed to read:
R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) with Protection System functions identified in Attachment A:

While AEP is supportive of the overall intent and direction of PRC-027-1, we have chosen to vote negative driven by our objections to R2, as stated above.

Response: Thank you for your comment. The drafting team asserts it is difficult to support the position that having a procedure to develop settings alone will achieve the purpose of PRC-027-1: "To **maintain** the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults." The intent of Requirement R2 is to prevent existing Protection Systems (where no system modifications have occurred) from becoming uncoordinated due to incremental changes in Fault current that have occurred over time.

Likes:	0

Dislikes: 0

Mark Wilson - Mark Wilson On Behalf of: Leonard Kula, Independent Electricity System Operator, 2

Answer Comment: the HIGH VRF for Requirement R3 seems too high since failing to meet R1 (to develop the process for developing new and revised Protection System settings for BES Elements) has a MEDIUM VRF; failing to utilize this process should not have a VF that's higher than not having the process in place to begin with.

Response: Thank you for your comment. The drafting team modeled the VRFs for Requirements 1 and 3 after other FERC-approved NERC Reliability Standards. The VRFs for the requirements that required establishing or developing processes were lower VRFs than those requirements mandating the implementation or utilization of the processes. Please refer to the Violation Risk Factor and Violation Severity Level Justification Document for PRC-027-1.

Mark Kenny - Northeast Utilities - 3 -

Answer Comment:

1. We suggest that the drafting team consider the potential overlap of PRC-027-1 R1.1.1 and MOD-032-1, R1 and provide necessary clarification in the Supplemental Material.

2. R2, Option 2 has two actions associated with it, both of which have to be completed in one timeframe. The two actions are the fault current comparison against the baseline and the performance of a Protection System Coordination Study if the fault current comparison exceeds 15% or greater deviation. It is recommended that under this option, if an entity identifies a 15% or greater deviation in fault current value at a bus, the entity is given a set amount of time

	per element to complete a protection coordination study on all applicable elements at that bus.

Response: Thank you for your comments.

There is no overlap or conflict between PRC-027-1 Requirement R1, Part 1.1 and MOD-032-1, Requirement R1. Requirement R1 Part 1.1 of PRC-027-1 ensures that the short-circuit model data is reviewed for accuracy before being used to develop new or revised Protection System settings.

Option 2 of Requirement R2 is a Fault current based methodology for determining when a PSCS must be performed for Protection System functions listed in Attachment A. The second action you mention (performing a Protection System Coordination Study) is only required when a 15% or greater deviation from the established baseline fault current at the bus to which the Element is connected is identified. An entity can judiciously select the interval that a comparison of present Fault current values to an established Fault current baseline is made; thereby allowing adequate time after the identification of the Fault current deviation to perform the Protection System Coordination Study.

Anthony Jablonski - ReliabilityFirst - 10 -

Answer Comment:	**ReliabilityFirst agrees that PRC-027-1 helps to alleviate the risk of insufficient coordination of Protection Systems installed to detect Faults on BES Elements and isolate those faulted Elements (such that the Protection Systems operate in the intended sequence during Faults). ReliabilityFirst offers the following comments related to the term "coordination" for the Standard Drafting Team's consideration**: 1. **ReliabilityFirst notes that the term "coordination" used in Requirement 1, Parts 1.3.2 and 1.3.3 is not defined within PRC-027-1 or the NERC Glossary Terms. This term is also used within a number of other Reliability Standards**

where it is likewise undefined. As a result, and according to FERC precedent, the dictionary definition of the term "coordination" will control. As a result, the term "coordination" could reasonably be interpreted to refer to either the setting of Protection Systems *or* to communications between entities.

To add clarity to PRC-027-1, ReliabilityFirst recommends replacing the term "coordination" with the term "Protection System Coordination." Listed below is ReliabilityFirst's proposed NERC Glossary definition of "Protection System Coordination" for the Standard Drafting Team's consideration:

***Protection System Coordination* - The setting of Protection Systems installed for the purpose of detecting and isolating Faults on BES Elements, such that the Protection Systems operate in a defined sequence in an effort to remove such Faults from the BES.**

1. **ReliabilityFirst recommends the following changes to Requirement 1, Parts 1.3.2 and 1.3.3 to incorporate this new definition of "Protection System Coordination" (highlighted in red below):**

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any Protection System Coordination Issue(s) or affirming that no Protection System Coordination issue(s) were identified.

1.3.3. Verify that identified Protection System Coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Response: Thank you for your comments.

The definition of the term Protection System Coordination Study in PRC-027-1 and its use throughout the standard is sufficient to eliminate any misunderstanding of the term coordination in Requirement R1, Parts 1.3.2 and 1.3.3. The Supplemental Material section also contains the description of the "coordination of protection" from the pending revision of IEEE Standard C37.113-1999 (Reaffirmed: 2004), Guide for Protective Relay Applications to Transmission Lines which provides further guidance regarding the term "coordination". The drafting team contends a new term "Protection System Coordination" is not warranted.

Joe O'Brien - NiSource - Northern Indiana Public Service Co. - 6 -

Answer Comment: Regarding R2: NIPSCO believes that measurement criteria M2 for Protection System Coordination Studies (PSCS) is not very clear. Standard needs to provide a clear direction as to what is considered an acceptable form of evidence for PSCS.

Response: Thank you for your comment.

The drafting team developed the definition of Protection System Coordination Study with a focus on producing results that achieve the purpose of PRC-027-1 (ensuring Protection Systems operate in the [entity's] intended sequence during Faults) without prescribing how the studies be performed, or how the results must be presented. Measure M2 states that documentation of the Protection System Coordination Study is acceptable evidence.

Larry W Bateman	Transmission Compliance	SERC	1,3
Jeffrey N Bailey	Nuclear Compliance	SERC	5
Russell Deane	Nuclear Compliance	NPCC	5

Answer Comment: • Comments: Section R1.1: Consider adding additional clarity to the sub-requirement to limit the review to the modified BES Elements or BES Elements in the zone of protection. For example, the statement could be modified as follows: "A review and update of short circuit models for the modified BES Elements under study or BES Elements in the zone of protection." This limits the scope of the short circuit model review to just the elements being studied.

Response: Thank you for your comment. Requirement R1 mandates that an entity establish a process for developing new and revised Protection System settings for BES Elements. This process shall be used each time new or revised Protection System settings are developed. Requirement R1, Part 1.1 ensures that the model data is accurate for the System protected by the new or revised Protection Systems.

Kayleigh Wilkerson - Lincoln Electric System - 5 -

Answer Comment: LES suggests that the evidence required to meet R3 be limited and clearly defined. As currently drafted, the scope of potential evidence to demonstrate compliance with R3 would be difficult to anticipate and therefore unmanageable. Recommend the evidence be limited to entities providing short-circuit model updates (R1.1), Protection System setting reviews (R1.2), and Protection System setting coordination between owners for electrically-joined Facilities (R1.3).

LES recommends Option 2 of R2 be further clarified. It is not clear if a Protection System Coordination Study is required even if a fault current baseline hasn't deviated by 15% in 6 years. Additionally, it is also not clear what the scope of the Protection System Coordination Study is. To provide further clarity to R2 Option 2, LES suggests modifications similar to the following:

Compare present Fault current values to an established Fault current baseline in a time interval not to exceed six calendar years. A Protection System Coordination Study must be performed on the Elements connected to the bus where the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground). This Protection System Coordination Study must be completed within one calendar year of the Fault current comparison. The Fault current baseline will be updated to the present Fault current values only on the Elements for which the Protection System Coordination Study was performed.

Additionally, LES recommends protection system functions that are only enabled when other relays or associated systems fail be excluded from the R2 (e.g., overcurrent elements that are only enabled during loss of potential conditions). We feel that these protection system functions are used only as a contingency and should not fall within scope of the standard.

Response: Thank you for your comment.

Measures provide examples of evidence that may be used by entities to demonstrate compliance with the applicable requirements. The only time the "scope" of evidence could be limited is when there is only one type of evidence that will suffice.

The drafting team contends that Requirement R2 is clear that a Protection System Coordination Study is only required *"…**when the comparison identifies a 15 percent or greater deviation in Fault current values**…"*, and that it is not necessary to state the opposite – that a PSCS is not required when a 15% deviation is not identified. Further, the draft Reliability Standard Audit Worksheet (RSAW) for PRC-027-1 explains what evidence is required to demonstrate compliance with this requirement.

The drafting team developed the definition of Protection System Coordination Study with a focus on producing results that achieve the purpose of PRC-027-1 (ensuring Protection Systems operate in the [entity's] intended sequence during Faults) without prescribing how the studies be performed, or how the results must be presented. The drafting team also recognizes that Protection System designs and philosophies vary amongst entities, and performing a coordination study is more of an art than an exact science.

The drafting team reviewed PRC-023-3, Attachment A, and sees no reliability benefit in making your suggested change. Depending upon an entity's protection philosophy, the relay elements excluded by Requirement R2, Part 2.1 of PRC-023-3 Attachment A may or may not meet the criteria for inclusion in Attachment A of PRC-027-1. The protective functions listed in Attachment A of PRC-027-1 are included based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. The drafting team contends that the functions listed in Attachment A and only those functions require review when available Fault current levels increase or decrease.

Jeremy Voll - Basin Electric Power Cooperative - 3 -

Answer Comment: The BEPC believes that the same applicability exclusion used for PRC-001-1.1 (ii) or PRC-005 should be applied to PRC-027. The key is coordination at the overall wind farm interface after the power has been aggregated. Without this exclusion, the burden of the standard outweighs any reliability benefits provided.

Response: Thank you for your comments.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

For Requirement R2, the drafting team added language to the footnote to explain that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), the common point of connection at 100 kV or above, and the BES aggregation point (total capacity greater than 75 MVA) for dispersed power producing resources.

Answer Comment:

The NSRF believes that the same applicability exclusion used for PRC-001-1.1 (ii) or PRC-005 should be applied to PRC-027. The key is coordination at the overall wind farm interface after the power has been aggregated. Without this exclusion, the burden of the standard outweighs any reliability benefits provided.

The DGR applicability exclusion from PRC-001-1.1 (ii) should be added to R2, R3 or to Attachment A. FERC would not let a current requirement go unaddressed. Similarly, the individual generator exclusion from PRC-001-1.1 (ii) cannot be ignored. As an example, the following could be added to either a requirement or Attachment A:

- Requirement R2 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.

The exclusion is required to address the blanket inclusion of individual wind turbines under the new Bulk Electric System (BES) definition Inclusion 4 (I4) and wording in Requirement 2 that states “each BES Element with Protection System

	functions identified in Attachment A" are to be addressed. Another alternative is the NSRF recommends an Applicability statement such as (PRC-005-2i): • 4.1.4 Protection Systems for the following BES generator Facilities for dispersed power producing resources identified through Inclusion I4 of the BES definition: • 4.1.4.1 Protection Systems for Facilities used in aggregating dispersed BES generation from the point where those resources aggregate to greater than 75 MVA to a common point of connection at 100 kV or above. The NSRF would like to see the words "NERC registered" added in front of the word "owner" to ensure that entities with multiple non-NERC joint owners avoid the unnecessary administrative burden of attempting to track entities with no NERC responsibilities. With PSE and possibly LSE deregistration, entities could be connected with non-NERC entities. The NERC paper process of exchanging information could become asymmetric as only one entity has legal requirements for actions and the other doesn't. Adding "NERC registered" should reduce unnecessary administration and create a symmetric or level set of requirements between affected entities. In order to take advantage of Requirement R2-Option 2, a fault current baseline must be established prior to the effective date. This sets entities up for the potential to do a considerable amount of work based upon the expectation that nothing will change between the approval date and the effective date. Given the degree of change with PRC-005, there is certainly some amount of apprehension in this regard. A better method would be to allow the entity to establish the baseline within one year after the effective date or allow a phased-in approach.

There is no requirement ensuring the Transmission Owner will share the model database or Fault current study results to allow Generation Owners and Distribution Providers to complete R2 Option 1, 2 or 3. The applicability section recognizes that the TO's are the typical entity maintaining the system model for Fault studies. NSRF prefers previous draft versions that required the TO to conduct fault studies on all buses, make comparisons and notify other entities if the fault current changed.

The 6-year frequency requirement could be relaxed to be more consistent with other relay maintenance activities or there should be more justification provided for the additional cost of more frequent analysis.

Response: Thank you for your comments.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

For Requirement R2, the drafting team added language to the footnote to explain that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), the common point of connection at 100 kV or above, and the BES aggregation point (total capacity greater than 75 MVA) for dispersed power producing resources.

John Seelke - PSEG - 1,3,5,6 - NPCC,RFC

Group Name: PSEG

Group Member Name	Entity	Region	Segments
Joseph Smith	Public Service Electric and Gas	RFC	1
Jeffrey Mueller	Public Service Electric and Gas Co.	RFC	3
Tim Kucey	PSEG Fossil LLC	RFC	5
Karla Jara	PSEG Energy Resources & Trade LLC	RFC	6

Answer Comment:

We have separately submitted a Word redline with comments. However, PSEG's comments are summarized below. We would vote "Affirmative" if the SDT adopted the changes proposed in PSEG's redline.

• We propose that the SDT modify the definition of Protection System Coordination Study by limiting it to Protection Systems for BES Elements.

• We propose that the SDT add "Transmission Planner" to the Functional Entities in Section 4.1. This change is consistent with proposed changes to delete R1.1 and add R4 so that the Transmission Planner performs Fault current studies and makes them available to their TOs, GOs, and DPs in R4. As we note in the rationale for R4:

"Transmission Planners develop short circuit data bases per MOD-032-1 and utilize them in TPL-001-4 to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt. Since Transmission Planners develop and use short circuit databases, having other entities (TOs, GOs and DPs) use them could introduce errors. Therefore, Transmission Planners should be required to calculate all Fault current values for its busses (an initial baseline and subsequent periodic updates) and make those available to its Transmission Owners, Generator Owners, and Distribution

Providers."

• In R2, we eliminated the footnote in Option 2 because proposed R4 will result in an initial Fault current baseline established by the TP on or before the effective date of the standard. Given this, when would an entity's first PSCS need to be performed for its Attachment A devices under R2? For example, if Option 2 is selected, is the first PSCS required when the baseline fault current increases by 15 percent or greater?

• Other changes in language in R1, R2, and R3 are explained in comments in the redline.

Response: Thank you for your comments.

Thank you for your suggested revisions. The drafting team reviewed them and does not agree that they are necessary or that they provide additional clarity.

The SDT asserts that the Protection Systems referenced in the definition of a Protection System Coordination Study are those that are specified in the applicability which states: "Protection Systems installed to detect and isolate Faults on BES Elements."

The drafting team disagrees that Transmission Planners need to be added to the applicability of PRC-027-1. It is the owners' responsibility to obtain any information needed to fulfill their functional entity obligations.

That is correct. Requirement R2 states that a Protection System Coordination Study is required "…when the comparison identifies a 15 percent or greater deviation in Fault current values…"

Maryclaire Yatsko - Seminole Electric Cooperative, Inc. - 1,3,4,5,6 - FRCC

Answer Comment:	(1) Please address each of our following comments as many of them were not addressed in the last ballot action. If these comments are not addressed, Seminole may revise its ballot vote from affirmative to negative upon the next ballot action. (2) This Standard references the terms “BES Elements.” In reviewing the NERC Glossary, there are many references to merely “Elements” without the preceding “BES” adjective, i.e., Remedial Action Scheme definition. What is the difference between “BES Elements” and “Elements” (without the BES)? Is the term “Element” without BES reference to elements that are non-BES, and if that is the case, does subpart “e.” of the RAS definition apply to non-BES Elements as there is no preceding “BES”? “BES Elements” and “Elements” are still both utilized in the Standard. Per discussions with the drafting team, it was stated that this is accidental and that there is no difference and that the team will clean these up to merely state “Elements” in the next version. (3) In R2, if a review was performed on March 1, 2017 and an entity had 6 calendar years in which to complete the review, is that 6 full calendar years? Meaning, would an entity not have to complete another review until December 31, 2023? Could you please include the above example, or an example akin to the above in the guidelines as we want to confirm we understand that 6 full calendar years are allowed, which means that more than 72 months between tests could be taken under certain timing circumstances?

(4) In R1 Part 1.5.3, this Requirement merely states that the coordination issues need to be “addressed” prior to implementation. We have two questions on this requirement, the first being that after reviewing the supplemental guidance material, that under certain circumstances, such as where additional system modifications are needed, that such modifications do not need to take place before the settings changes if the entity didn’t originally place those modifications into the scope of the settings changes project. Because the Requirement does not require the modifications to take place in any future time, can the drafting team describe in more detail how these issues are “addressed prior to implementation”? In discussions with the drafting team regarding what “addressed” means is that any coordination issues need to be agreed upon between the entities and the entities must agree to the implementation actions and a timeframe for implementation, and depending on the circumstances, “outstanding” updates can be implemented after implementation of proposed Protection System changes. Please confirm that this is correct.

(5) In the Supplemental Material section, there are references to the terms “BES Protection System” and “Protection System.” The Standard applies to “Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements.” For purposes of this Standard, is a BES Protection System a Protection Systems installed for the purpose of detecting Faults on BES Elements and isolating those faulted elements? There are still references to “BES Protection System” and “Protection System.” In discussions with the drafting team it was noted that all of these references were going to be cleaned up to merely state “Protection System”. Please confirm.

(6) In Requirement R1, is the 15% value 15.% with two significant figures in that if we have a deviation of 14.6% we need to perform an evaluation as it rounds up to 15% or are there more significant figures, i.e., 15.0%? This was discussed again with the drafting team that our comment wasn’t answered in the guidance,

but per a phone conversation it was stated that anything above 15.000000000 (infinity) is a violation. We'd prefer the NERC drafting teams begin honoring significant digits as it's not a difficult clarification and it makes compliance problematic because we can't tell if it's intentional or not when the drafting teams stop at a certain point. Therefore, this request is still out there, please place as many digits the team feels is significant as we will keep making this comment on every future drafted Standard, e.g., is 15.000% enough for the drafting team?

(7) In Requirement R2, if an entity uses the time based option and uses a recent short-circuit study for its baseline study, does the 6-year option 2 time frame start from the time of enforcement of the Standard or from the date the short-circuit study was finalized? The answer to this question does not appear to be in the Requirement. For Option 2, per our discussion, if a Protection System Coordination Study is performed today, the 6 year timeframe doesn't begin until the enforcement date of the Standard, correct? We are still somewhat unclear as to when the Fault current baseline comparison needs to be performed however. For example, does a Fault current baseline need to be performed every 6 years? There is some language in the Rationale box on this issue, but that language says "may" and not "shall" so it appears this isn't a requirement but merely a suggestion

(8) "Electrically joined Facilities" is not defined. Per past discussions, the intent appears to be to describe Facilities that are electrically joined AND are physically joined. Meaning, that if one Facility is 10 miles down the transmission line from another Facility, albeit "electrically joined" by electrons moving through both Facilities, the Facilities are not physically touching, and therefore, not covered by the intent of "electrically joined Facilities" under this Standard. Is this correct?

Response: Thank you for your comment.

Thank you for noting the inconsistency. The drafting team modified all references to Elements to include BES to clarify that the standard is only applicable to BES Elements.

Your understanding of the meaning of “calendar years” is correct. The drafting team included an example in the Supplemental Material.

If additional system modifications are needed, then “addressing prior to implementation” would mean it was discussed and an acceptable solution was agreed to by all parties. As noted in the Supplemental Material “There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgment.” Therefore, in some cases, there may be no implementation actions.

Thank you for noting the inconsistency. The drafting team removed the BES modifier of Protection Systems in the three locations it was referenced in the Supplemental Material.

The drafting team asserts that “15 percent or greater deviation” is clear and that it is not necessary to include significant digits.

The date of the last Protection System review prior to the effective date of the standard is not relevant in considering the initial performance of Requirement R2. The six-year interval begins on the effective date of the standard. The drafting team added the following to the Implementation Plan.

1) **Initial Performance of Requirement R2**
For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

If an entity initially intends to use Option 2 as a review method for those BES Elements with Protection System functions identified in Attachment A, Fault current baselines for those BES Elements must be established prior to the effective date of the standard. Once the baseline is established, an entity must compare the Fault current baseline to the present Fault current value at the bus under study at least once every six-calendar years. The Fault current baseline is only updated each time a Protection System

Coordination Study is performed. Please see the Supplemental Material section of the standard for further discussion and examples.

Requirement R1, Parts 1.3.1 and 1.3.4 use the term “electrically joined Facilities” and are referring to Requirement R1, Part 1.3 which uses the phrase: “For Protection System settings applied on BES Elements that electrically join Facilities...” The drafting team asserts that no definition is necessary. The Facilities do not have to be physically touching to be electrically joined by a BES Element.

Mike Smith - Manitoba Hydro - 1 -

Answer Comment:

1) Manitoba Hydro suggests that the title of this standard is changed from “Coordination of Protection Systems for Performance During Faults” to: “Protection System Coordination Performance During Faults”

2) For section 1.3.4.2, “Misoperation investigation” may be better replaced by “Protection System operation investigation”

3) For R2, there seems to be no incentive (nor requirement) for entities to go with option 2 since they still have to do this study within 6 years regardless the level of fault current changes anyway.

Response: Thank you for your comments.

The drafting team declines to make the two suggested changes.

For existing Protection Systems, Requirement R2, Option 2 provides the entity the option to perform a Fault current comparison once every six-calendar-years as a trigger to determine the need for a Protection System Coordination Study (PSCS). Until a 15 percent or greater deviation in Fault current is identified through the Fault current comparisons, no PSCS is required.

Jay Barnett - Exxon Mobil - 7 -

Answer Comment:

The Supplemental Material states, "The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current availability upon request by the Distribution Provider or Generator Owner," however, there is nothing in the draft of PRC-027-1 that requires this and that would ensure this is done in a timely manner. This draft might introduce the circumstance where the GO has the responsibility to periodically compare data that the TO has and maintains. The Standard should require TOs to respond to GO requests for Fault current data in a timely manner so that the GO can perform coordination studies if necessary. Another approach would be to transfer the responsibility of performing the periodic comparisons to the TOs. If the fault current changed by 15%, then the TO would notify the affected GO so that a coordination study would be performed. The same issue would exist for small TOs that do not maintain wide-area system models.

Proposed Revision:

R2.1. Upon discovery of a change in Fault current of a BES Element owned by another GO, TO, or DP, each TO shall provide the updated Fault current values to the affected owners within 90 calendar days of discovery.

OR

R2.1. Each TO that maintains Fault current values for BES Elements owned by other GOs, TOs, or DPs, shall respond to requests for such information from the GO, TO, or DP within 90 calendar days.

Also, Requirement 3 should be limited to the attributes listed in Requirement 1 in order to have a clear and consistent measure for compliance. As written, auditors would have to become familiar with each entity's entire coordination process in order to determine compliance. Instead each entity should only have to demonstrate compliance with those attributes which the Standard Drafting Team has determined are "must have" to ensure proper coordination, as described in Requirement R1.

Proposed Revision:

R3. Each TO, GO, and DP shall utilize a process that contains the minimum attributes established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

Response: Thank you for your comments.

The drafting team disagrees that it is necessary to have a requirement that mandates the Transmission Owner share the model database or Fault current studies and declines to make the suggested change.

The drafting team contends that Requirement R3 is clear and declines to make the suggested change.

Joshua Andersen - Salt River Project - 1,3,5,6 - WECC

Answer Comment:

Salt River Project (SRP) has concern over R1 part 1.1 and 1.2. As written, R1 calls for a "process for developing new and revised Protection System settings". Parts 1.1 and 1.2 requires a "review and update of short-circuit models" and a "review of the developed Protection System settings", respectively. The process defined in R1 should not have to include either review. SRP recommends changing part 1.1 and 1.2 to reflect "A methodology to evaluate ...". In previous conversations with the SDT NERC staffer, it was communicated that the intent of this requirement was to include a methodology, however the previous draft removed the language that would have signified a methodology was required. If the intent is that a process rather than the actual review is included, it should read as such.

Response: Thank you for your comment. The drafting team intends that the established process include provisions for the reviews described in Requirement R1, Parts 1.1 and 1.2. The provisions for the reviews can certainly describe an entity's methodology for achieving the reviews.

John Bee	BGE, ComEd, PECO LSE's	RFC	3

Answer Comment: The applicability of the standard needs to be clarified so that dispersed resources at the individual resource prior to the point of aggregation are not subject to the standards requirements. In the transition from PRC-001.1ii., the exclusion for dispersed resources appears to have been improperly dropped from PRC-027-1. The PRC-027-1 mapping document lists PRC-001.1ii R3.1 and the dispersed resources sub-bullet exclusion but we cannot find a record indicating that there was discussion resulting in a deliberate intent to remove the exclusion in the transition from PRC-001.1ii to PRC-027-1. While a change to applicability prior to a final ballot is considered a substantive change in Section 4.14 of Standards Process Manual, we note that per the same section, "Where there is a question as to whether a proposed modification is "substantive," the Standards Committee shall make the final determination". We therefore request that the SDT bring this issue to the Standards Committee for consideration and include the dispersed generation exclusion in PRC-001.1ii in PRC-027-1 prior to final ballot.

Other options to address this concern could include, clarification in the Supplementary Material section, notes to auditors in the RSAW or the submission by the SDT of a SAR to change the applicability consistent with the dispersed generator exclusion as currently included in PRC-001-1ii .

Response: Thank you for your comments.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

For Requirement R2, the drafting team added language to the footnote to explain that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), the common point of connection at 100 kV or above, and the BES aggregation point (total capacity greater than 75 MVA) for dispersed power producing resources.

The drafting team provided this same information in the Rationale box, the Supplemental Material, and the RSAW.

Barbara Kedrowski - WEC Energy Group, Inc. - 3,4,5,6 - RFC

Answer Comment: We would like to see an exception for distributed resources similar to what project 2014-01 is working on for other standards. Typically distributed resources do not look out to the transmission system, but unless they are excluded this will need to be examined and documented.

Response: Thank you for your comments.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

For Requirement R2, the drafting team added language to the footnote to explain that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), the common point of connection at 100 kV or above, and the BES aggregation point (total capacity greater than 75 MVA) for dispersed power producing resources.

Spencer Tacke - Modesto Irrigation District - 4 -

Answer Comment: Hi,

I really believe the time period options for doing a Protection Coordination Study specified in R2 (Option 1 or Option 2) are much too large. When I used to attend the WECC Meetings on a regular basis, I remember how a high percentage of the major system outages were tied to mis-coordination or mis-operation of the protective relay systems of the various neighboring utilities. As the member's protection systems are critical to the reasonable reliability of the interconnected system, waiting six years to do another fault current check for the 15% threshold is unreasonable, or allowing no threshold current check but with a fixed 6 year time period between coordination studies, is asking for trouble. I would strongly support a one year period as the required time to do a new Protection System Coordination Study for each member's BES. Remember, NERC requires annual Transmission Planning Assessments (TPL Standards), so we should not accept any lower of a standard for a Protection System Coordination Study. Thank you.

Sincerely,

Spencer Tacke
Senior Electrical Engineer
Modesto Irrigation District
209-526-7414
spencert@mid.org.

Response: Thank you for your comment. Six-calendar years is the maximum period allowed by the standard. The standard does not preclude an entity from performing Protection System Coordination Studies more frequently, if desired.

Jeffrey DePriest - DTE Energy - Detroit Edison Company - 5 -

Answer Comment: It appears that if Option 1 is selected for R2, an entity has six years from the effective date to complete the study and also evidence for R3 would not be required until this same date. Please confirm.

Functional Entities, under Applicability and each requirement, should include Transmission Planners.

Response: Thank you for your comments.

Your understanding of Requirement R2, Option 1 is correct; however, evidence for Requirement R3 would be required if any new or revised Protection System settings were developed any time after the effective date of the standard.

The drafting team disagrees that Transmission Planners need to be added to the applicability of PRC-027-1. It is the owners' responsibility to obtain any information needed to fulfill their functional entity obligations.

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP

Answer Comment:

Option 2 of R2 is meant to allow an entity to periodically check for a 15 percent of greater deviation in fault current. This option allows the entity to choose an interval of up to six calendar years to perform the fault current comparisons (this is derived from the PRC-027-1 supplemental material). The intent of Option 2 is not immediately clear without reading supplemental material. Given that compliance is measured only by the text of the requirement, R2 Option 2 should be clarified to indicate that if the 15 percent fault current baseline hasn't been exceeded, a protection coordination study isn't required even it if has been more than six calendar years. Or is the intent of the drafting team to state that if the 15 percent baseline threshold hasn't been exceeded a coordination study isn't required?

Additionally, the evidence retention section would benefit from clarification. There could be possible confusion with the 6 year interval of the standard versus a possible audit interval of 3 years.

Another opportunity for improvement would be to align the intervals with the intervals identified in PRC-019, which would be beneficial to GOs.

Response: Thank you for your comment.

The drafting team notes that the purpose of the Rationale boxes and Supplemental Material section is to provide additional guidance and rationale regarding the tenets of the basic requirements of the standard. Though the Rationale boxes move to the Supplemental Material section of the standard when it becomes effective, both of these informational pieces remain a permanent part of the standard for entities and auditors to reference. Further, the draft Reliability Standard Audit Worksheet (RSAW) for PRC-027-1 makes clear what evidence is required to demonstrate compliance with this requirement.

The drafting team contends that Requirement R2 is clear that a Protection System Coordination Study (PSCS) is only required *"…**when the comparison identifies a 15 percent or greater deviation in Fault current values**…"*, and that it is not necessary to state the opposite – that a PSCS is not required when a 15% deviation is not identified.

The drafting team asserts that the evidence retention section is clear and no clarification is needed.

The drafting team does not see any benefit in aligning the intervals of the two standards. PRC-027-1 does not preclude an entity from using a shorter time period than the six-calendar-years specified in Requirement R2.

Answer Comment: SMUD supports Salt River Project comments.

Response: Please see the drafting team's responses to the referenced comments.

John Merrell - Tacoma Public Utilities (Tacoma, WA) - 1 -

Answer Comment: In the Supplemental Material section, there are concerns about the following paragraph: "A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider." If the generator is not a BES generator, or the generation plant is not a BES plant, the associated Protection Systems should not be under the purview of this standard unless, perhaps, they serve to provide a blocking signal to other Protection Systems associated with the BES Element or their clearing is necessary for the other Protection Systems associated with the BES Element to operate properly. For small non-BES generation, the Transmission Owner may configure its Protection Systems to properly respond with or without the small generator(s) connected. In these cases, clearing the generator(s) is arguably more about safety (isolating sources of energization) and not coordination.

	It sounds like the only triggers for conducting a Protection System Coordination Study (PSCS) are the following: (1) triggered by Requirement R2, (2) triggered by the need to establish a baseline for Requirement R2 for new BES Elements or new BES Facilities, or (3) triggered by the need to establish a baseline for Requirement R2 when transitioning between Options 1 and 2. Otherwise, if there are Protection System changes, or if there are changes to existing BES Elements, it sounds like a PSCS is not (necessarily) required, provided that the other elements identified in Requirement R1 are addressed. Is this the drafting team's intention? If a PSCS will be required for other cases, this should be more clearly identified. The verbiage in Requirement R2, Option 2, is a little unclear. For example, if Fault current values are compared within four calendar years, and the percentage change is less than 15%, does this reset the maximum six calendar year interval under Option 2? Under Requirement R1, Part 1.3.4, Tacoma Power suggests appending "...scenarios such as the following:" The Rationale for Requirement R1 includes a note about internal documentation. Tacoma Power had hoped that documentation would not explicitly be required in a scenario in which one engineering workgroup is responsible for Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities, especially when those functional entities are part of the same company/organization. There is concern about the amount of extra documentation that may be involved. Furthermore, when different functional entities are part of the same company/organization, it may not be 100% clear where the DP vs. TO or TO vs. GO line should be drawn; by contrast, the same internal documentation would

not be required for internal TO-TO interaction.

The emphasis of this standard should only be to show that there is not miscoordination. It is a little awkward, but Tacoma Power suggests that the Purpose statement could be reworded to the following (CAPS added to identify suggested rewording): "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems DO NOT operate in the UNintended sequence during Faults." Similarly, the definition of a PSCS could be reworded to the following: "An analysis to determine whether Protection Systems DO NOT operate in the UNintended sequence during Faults." Requirement R1 could be reworded to the following: "...such that the Protection Systems DO NOT operate in the UNintended sequence during Faults..."

Compared to Requirement R1, Tacoma Power is not convinced that the justification has been made for a High VRF for Requirement R3. Failing to implement one piece of the process established under Requirement R1, even for one BES Element, coupled with no graduated VSLs (see subsequent comment), would result in the maximum potential penalty.

Tacoma Power believes that the drafting team should leverage the Lower, Moderate, and High VSLs for Requriement R3. FERC's VSL G1 only states that the VSL assignment should not have the UNINTENDED consequence of lowering the current level of compliance. Furthermore, the scope of applicability of PRC-027-1 is much greater than PRC-001-1, so it is reasonable for PRC-027-1 to leverage the Lower, Moderate, and High VSLs, even though PRC-001-1 did not.

An example of a Protection System Coordination Study in the Supplemental Material section might be helpful.

Response: Thank you for your comments.

If the Distribution Provider that provides the path to the BES of a non-BES generator installs Protection Systems to detect and isolate Faults on BES Elements, then those Protection Systems would be applicable to PRC-027-1.
A Protection System Coordination Study is only required to be performed in Requirement R2.

Performance of the Fault current comparison, as provided in your example, would reset the clock for the six-calendar-year, maximum interval. Please see the example provided in the Supplemental Material section of the standard.

The drafting team declines to make the suggested change.

The note "In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation." is intended to minimize the documentation requirements for the subject functional entities. A single document that provides the required evidence would be sufficient for use by both functional entities. If an entity has a single group performing its coordination work for separate functional entities within an organization, it should make that declaration in its process.

The drafting team contends that maintaining the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults, as stated in the Purpose of PRC-027-1, achieves the same objective as ensuring the negative does not occur (that they do not operate in an unintended sequence). It is the drafting team's position that ensuring coordination is maintained requires less effort than proving that miscoordination does not exist.

Regarding Requirement R3, the drafting team disagrees and asserts that an entity is either utilizing its process or not.
The drafting team contends that failure to implement Requirement R1 could have an adverse effect on the reliability of the Bulk Electric System and, therefore, the High VRF for Requirement R3 is justified.

The drafting team did not provide an example of a Protection System Coordination Study because there are many different forms entities could use to develop their settings and verify coordination.

Glenn Pressler - CPS Energy - 1 -

Answer Comment:	R1 – Generally think there should be a bit more detail or definiation provided to "Protection System settings" that require reviewing. Does this just include element set values? Or does it also include logic settings? Drawings versus output contact programming? What about communications equipment? Keeping this wide open and letting entities define goes back down the PRC-005-1 road where some entities had much higher testing and maintenance standards, but were also held to that higher standard and punished harshly when even falling just short. R2 – Generally believe that giving the option of using fault studies or a time interval is for determining when to review coordination in R2. However, believe that if using the baseline fault studies, then the entity should have a shorter period between performing such studies. One issues with the baseline fault studies is that coordination studies may go for an additional 6 years, even if the 6 year study shows the fault current at just below the 15% threshold. I believe a 3 year or 4 year interval would be more reasonable. Otherwise, why not just use the baseline method since it too is on a 6 year interval.

Response: Thank you for your comment.

The drafting team disagrees that more detail is necessary. The Protection System settings that require reviewing are those that ensure the Protection Systems operate in the intended sequence during Faults.

Six-calendar-years is the maximum period allowed by the standard. The standard does not preclude an entity from performing Protection System Coordination Studies more frequently, if desired.

Erika Doot - U.S. Bureau of Reclamation - 5 -

Answer Comment:

Reclamation suggests that the drafting team reorder R2 and R3 for clarity. This would allow the standard to follow a logical order requiring an entity to have a system protection coordination process (R1), follow it (R2), and periodically update system protection coordination studies for functions in Attachment A (R3).

Reclamation also suggests that the drafting team update R1.3.4 to clarify that communications resulting from unforeseen circumstances may be "after-the-fact notifications" rather than requiring advance communication. This would clarify that Protection System owners do not need to wait for confirmation from owners of electrically-joined Facilities before revising Protection System settings due to unforeseen circumstances. Reclamation believes that waiting for coordination with owners of electrically joined facilities in these situations could increase risks to BES reliability from faulty Protection System settings that are discovered during commissioning, misoperation investigations, and maintenance or component failures which should be addressed immediately. Reclamation suggests that this should be clear in the requirement itself, not merely mentioned in the supplemental material.

Finally, Reclamation suggests that the drafting team update M3 to provide examples of how an entity would demonstrate that it is following the process required by R1 to include more detail regarding example evidence to show compliance with each subrequirement.

Response: Thank you for your comments.

The drafting team declines to make the suggested change. If a Protection System Coordination Study performed in accordance with Requirement R2 identifies revised settings are necessary, an entity will use its process (Requirement R3) to develop those settings.

The drafting team disagrees that further clarification is necessary regarding Part 1.3.4. As written, the drafting team contends the intent is clear that an entity may notify the other entities after any Protection System settings are revised resulting from the unforeseen circumstances.

The drafting team asserts that the evidence an entity will need to demonstrate compliance with its process will be dependent upon its process, and because every entity's process for developing settings could be different, the drafting team declines to make the suggested changes to Measure M3.

David Greene - SERC - 10 - SERC

Group Name: SERC PCS

Group Member Name	Entity	Region	Segments
Paul Nauert	Ameren	SERC	1
Charlie Fink	Entergy	SERC	1
David Greene	SERC staff	SERC	10

Answer Comment:

1) page 4, Please revise the Purpose and Facilities to clarify the scope.
a) Purpose: "To maintain the coordination of Protection Systems installed to protect Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults."
b) Facilities: "Protection Systems installed to protect BES Elements."

Also see comment #3 below. There are a large number of DP-TO interfaces and clarity on this interface is needed.

2) page 6 Rationale Option 2: augment 'Planners and Planning Coordinators' with

'Transmission Owner' so it reads "The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Owners, Transmission Planners, or Planning Coordinators." This makes it consistent with R1 1.1 itself, page 14 explanation.

3) page 13 DP Applicability is explained by 'A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.' A) In the vast majority of cases fault current contributions from DP networks are quite weak, usually the last to trip, and insignificant to BES coordination. B) BES Phase 2 Definition excluded networks below 50kV and at the least this should be acknowledged here. C) PRC-027-1 Draft 6 Applicability language is consistent with the PRC-005-2 language, for which PRC-005-2 Supplement states: "'…that are installed for the purpose of detecting Faults on BES Elements (lines, buses, transformers, etc.).' The drafting team intends that this standard will follow with any definition of the Bulk Electric System. There should be no ambiguity; if the Element is a BES Element, then the Protection System protecting that Element should then be included within this standard." D) Add language similar to B and C in the PRC-027-1 Supplemental Material.

4) page 17 second option: Please clarify the Fault current location for the 15% deviation trigger is the BES bus. This will help the GO and DP understand their responsibility. Please insert BES before Element in this sentence "The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which a BES Element is connected. The drafting team intends for the 100kV or above BES

bus
to be the Fault current location."

Response: Thank you for your comments.

The drafting team contends that the acts described in the Purpose statement "…detect and isolate Faults on Bulk Electric System (BES) Elements…" are the same as providing protection for those Elements. The drafting team declines to make the suggested change. (a) The drafting team contends that the phrase provided in section 4.2. Facilities, "…detect and isolate Faults on Bulk Electric System (BES) Elements…" is the same as providing protection for those Elements. The drafting team declines to make the suggested change.

The drafting team contends that the phrase provided in section 4.2. Facilities, "…detect and isolate Faults on Bulk Electric System (BES) Elements…" is the same as providing protection for those Elements. The drafting team declines to make the suggested change.

The drafting team modified the Rationale box for Requirement R2 to include the Transmission Owner as you suggest.

Thank you for your comment. PRC-027-1 is consistent in its applicability to Protection Systems designed to detect (and isolate) Faults on BES Elements, and will, therefore follow with any definition of the Bulk Electric System as you suggest. Protection System Coordination is about isolating Faults in an intended sequence, not just about protecting Elements from Faults. PRC-027-1 will also follow with any definition of the Bulk Electric System.

The drafting team made the suggested change.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RFC

Group Name: Duke Energy

Group Member Name	Entity	Region	Segments

Doug Hils	Duke Energy	RFC	1
Lee Schuster	Duke Energy	FRCC	3
Dale Goodwine	Duke Energy	SERC	5
Greg Cecil	Duke Energy	RFC	6

Answer Comment: **Upon our review of the most recent draft of the proposed PRC-027-1 standard, we have significant concerns regarding the expectations outlined in R1, subpart 1.2. In part 1.2, the applicable Functional Entity is required to conduct or ensure some type of review is done on its Protection System settings. While the latitude that is given to the industry on how and what type of review they are to implement is recognized, we feel that specifically mandating a quality review is unnecessary. The requirement of ensuring that quality reviews are executed is not currently included in other Protection and Control standards, and is not mandated in other standard families (with the exception of CIP-014). We do not disagree with the practice of quality assurance, however, we do not support the practice of requiring an entity to do so in a Reliability Standard. Duke Energy recommends the removal of subpart 1.2 from R1.**

Response: Thank you for your comment. The drafting team asserts that Requirement R1, Part 1.2 is an essential part of the settings development process and declines to make the suggested change.

Answer Comment: We have a concern about the mentioning of the Transmission Planner and Planning Coordinator in the Requirement R2 Rationale Box and those entities performing the calculations for the Fault current through short circuit analysis. The Rationale Box for Requirement R2 states "The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators". We would suggest the removal of those entities from the Rationale Box because they aren't include in the applicability section of the standard. Additionally, we feel that the fault current calculation has been addressed in the scope of the TPL Documentation. In that documentation, it is understood that the Transmission Planner or Planning Coordinator will conduct the fault current analysis on the BES facilities however, the Transmission Planner would have to coordinate with the owners and determine which protection systems would be impacted.

Response: Thank you for your comment. The drafting team notes that the purpose of the Rationale boxes and Supplemental Material section is to provide additional guidance and rationale regarding the tenets of the basic requirements of the standard. Though the Rationale boxes move to the Supplemental Material section of the standard when it becomes effective, both of these informational pieces remain a permanent part of the standard for entities and auditors to reference. Further, the draft Reliability Standard Audit Worksheet (RSAW) for PRC-027-1 explains what evidence is required to demonstrate compliance with this requirement. The drafting team declines to make the suggested change but did add the Transmission Owner as another source for Fault current values.

Gerry Adamski - Essential Power, LLC - 5 -

Answer Comment:

I believe it would be appropriate to include the Transmission Planner as an applicable entity for R2 purposes as they typically maintain the fault current/short circuit values at the buses.

I had to reread R2 a couple of times to be clear that the coordination study required as part of Option 2 only applies to the buses where the deviation exceeds 15% and not required of all the buses. If an opportunity exists, a minor clarifying edit would be recommended.

in R2, the standard speaks to a deviation at a bus to which the Element is connected. Is this intended to be a bus that is part of the BES? I'm thinking of how this would be applied at a generating plant where there is the transmission voltage level bus, the generating plant bus (e.g. 18 kV), lower voltage level buses within the plant, etc. I'm wondering how this aspect would be applied in practice at a plant. Perhaps clarifying edits in the requirement language and accompanying discourse in the rationale would help clarify this…

Response: Thank you for your comments.

The drafting team disagrees that Transmission Planners need to be added to the applicability of PRC-027-1. It is the owners' responsibility to obtain any information needed to fulfill their functional entity obligations.

As written, Option 2 specifies the performance of a Protection System Coordination Study is only required *"…when the comparison identifies a 15 percent or greater deviation in Fault current values…**at a bus to which the Element is connected**…"* Please reference the Rationale box and Supplemental Material sections of the standard for further discussion and examples associated with Requirement R2.

The Applicability section, Part 4.2. Facilities of PRC-027-1 limits the requirements of PRC-027-1 to Protection Systems installed to detect and isolate Faults on BES Elements. To address your concern, the drafting team clarified the language of Option 2 by adding the BES descriptor to modify Element. The Rationale and Supplemental Material sections also reflect this revision.

Louis Guidry - Louis Guidry On Behalf of: John Lindsey, Cleco Corporation, 6, 5, 3, 1
Michelle Corley, Cleco Corporation, 6, 5, 3, 1
Robert Hirchak, Cleco Corporation, 6, 5, 3, 1
Stephanie Huffman, Cleco Corporation, 6, 5, 3, 1

Answer Comment:

The definition of Power System Coordination Study is defined as an analysis of the operating sequence. Our interpretation of the definition is that we have to model the relay action and demonstrate that it operates in the intended sequence. Cleco uses fault simulations to develop the settings. We do not model the relays in our short-circuit program to demonstrate the relay action.

2. The standard requires an internal review of the developed settings. Who is going to review the settings currently develop? Relay settings are an art due to the compromised required because of so many unique problems. No two people are going to solve the problem exactly the same. Should two people develop the settings and compare results?

3. The standard requires a review of the short-circuit model prior to developing settings. What constitutes a valid review?

4. Requirement 1.3 says we get a response from other owners prior to implementing settings on associated BES elements. How much time before Cleco responds is required? How much time do we have to wait for a response? What if neighboring entity request a response for many of our associated systems at once?

Response: Thank you for your comments.

The drafting team chose not to be prescriptive in defining a Protection System Coordination Study. The method to perform the analysis to determine whether the Protection Systems operate in the intended sequence during Faults is left to the individual entity's discretion.

A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

A valid review would be one that ensures that the information in the short-circuit model accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings.

The drafting team provided flexibility for entities to establish processes that best work for their protection philosophies and business practices. Communication with neighboring entities is required for certain provisions within the process; the drafting team asserts that entities will collaborate on schedules to ensure both parties' needs are met.

Jamison Cawley - Nebraska Public Power District - 1 -

Answer Comment:

Please state that when a fault current baseline is first established we are not required to show a coordination study for every protection scheme on our system. Please state that utilities are not required to show a coordination study if the baseline continues to show a fault current change less than 15%?

Requirement R2 option 2 states “Fault current values (either three phase or phase to ground) at a bus to which the Element is connected” where the RSAW states “Fault current comparison and results for each BES Element”. The RSAW and Standard should match language as closely as possible. In this case the standard states bus faults and the RSAW evidence specifies each element which is more than just a bus. It may be wise to delay industry RSAW reviews until the standard language is in a more finalized state.

Consider adding a modification to R2. There should be an allowed time line for a coordination study to take place after the 15% fault current threshold has been identified as being exceeded. This presents a risk many could step into unwittingly when the identification is close to the 6 year interval. There are circumstances where fault currents may not change until close to this 6 year interval due to system changes that may not be foreseen. We suggest the requirement include a two year window after a 15% change is identified.

Please provide a definition or examples to clarify what is considered “electrically-joined Facilities”. For example, if a line and both terminals and protection is owned by entity A at sub 1 and sub 2. All other equipment at sub 1 is owned by entity B. All equipment at Sub 2 is owned by entity A. Is sub 2 “electrically-joined”?

The RSAW in the sections for R1 and R3 states: “In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation”. We request a provision in the Standard allowing if all separate functional entities within an organization have access to the same internal documentation, then the communication aspects are not required.

In a situation where utility A does work for another utility B on their transmission system protection equipment and utility A owns all the other surrounding protection systems, please clarify how the communication evidence would change with coordination work since utility A is making all the coordination decisions. Is it acceptable to show utility A has all utility B protection system settings internally stored? Does this make utility A responsible for utility B compliance?

For a facility that has multiple bus voltages such as 115kV, 230kV and 345kV and if the fault current baseline exceeds 15% on just the 115kV bus does this mean just the elements connected to the 115kV bus must have a coordination study but not the 230 or 345kV buses?

Response: Thank you for your comments.

The drafting team asserts that Requirement R2 and the footnote clearly indicate when a Protection System Coordination Study is required based on the option(s) selected. For Option 2, the drafting team interprets both of your statements to be correct.

The language and intent of the requirements contained in the final standard will be reflected in the final RSAW.

An entity can judiciously select the interval that a comparison of present Fault current values to an established Fault current baseline is made; thereby allowing adequate time after the identification of the Fault current deviation to perform the Protection System Coordination Study.

Requirement R1, Parts 1.3.1 and 1.3.4 use the term “electrically joined Facilities” and are referring to Requirement R1, Part 1.3 which uses the phrase: “For Protection System settings applied on BES Elements that electrically join Facilities...” The drafting team asserts that no definition is necessary. For your example, sub 2 is electrically joined to sub 1; however, because the Protection Systems in both subs are owned by the same functional entity, Requirement R1, Part 1.3 is not applicable.

The note “In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.” is intended to minimize the documentation requirements for the subject functional entities. A single document that provides the required evidence would be sufficient for use by both functional entities. If an entity has a single group performing its coordination work for separate functional entities within an organization, it should make that declaration in its process.

In the case where utility A performs the settings calculations for both parties (utility A & B), those settings and the associated documentation for those settings would need to be sent to utility B. Utility A would not be responsible for utility B compliance. Note that utility B is required to develop a process that may include the use of contractors to develop Protection System settings.

Yes. The drafting team agrees with your interpretation.

Answer Comment:

The parenthetical phrase in sub-Part 4.1.3 of the Applicability is not necessary and should be deleted. FPA 215 already ready limits the applicability of all reliability standards to the Bulk Power System and believe that NERC has revised the BES definition so that it should, either through application of bright line criteria or through the NERC or FERC exception process, encompass only those Elements and Facilities that are subject to FPA 215.

It should also be noted that, in this version the word “its” is deleted from Requirement 1 but that the Rationale for Requirement R1 uses the word “their” while Measure 1 uses the word “its”. We suggest changes be made so that all contain consistent verbiage. We believe that an entity can only be responsible for Protection System(s) it owns and would prefer this be explicitly indicated in the requirement(s).

As defined in the NERC Glossary, the Reliability Coordinator is the entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and Real-time operations. The Reliability Coordinator has the purview above and beyond that of a Transmission Operator that is broad enough to enable the calculation of Interconnection Reliability Operating Limits. Because new relay settings or revisions to relay settings can impact IROL calculations, the Reliability Coordinator must be aware of any new relay settings or revised relay settings in advance of their implementation.

For these reasons the standard needs to require that each Transmission Owner, Generator Owner and Distribution Provider notify the Reliability Coordinator that it is developing new or revised relay settings. The revision should also allow for the Reliability Coordinator to provide comments on the new or revised relay settings. To capture this, we suggest the following revision to R1:

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit models for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. Provide new or revised Protection System settings to the Reliability Coordinator.

1.3.1 Respond to the Reliability Coordinator's comments regarding the proposed new or revised Protection System settings by resolving any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.4. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.4.1. Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Also, to clarify and reinforce the nature of the broader protection coordination concern, suggest the following modification to the Purpose:

"To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults without causing an inadvertent adverse impact anywhere on the BES."

We suggest that the drafting team review PRC-027-1 R1 Part 1.1 and MOD-032-1, R1 for a potential overlap, and if necessary provide clarification in the supplemental material.

R2, Option 2 has two actions associated with it, both of which have to be completed in one timeframe. The two actions are the Fault current comparison against the baseline and the performance of a Protection System Coordination Study if the fault current comparison exceeds 15% or greater deviation. It is recommended that under this option, if an entity identifies a 15% or greater deviation in Fault current value at a bus, the entity is given a set amount of time per element to complete a protection coordination study on all applicable elements at that bus.

In many cases, smaller entities that are interconnected to larger TOs do not develop their own Protection System settings. These settings are provided to them by the interconnecting TO and mandated to be implemented through Interconnection agreements. R1 should be revised to recognize these instances, including the Rationale for Requirement R1 words related to a "single protective relaying group performing the work for multiple functional entities," as a single group may be responsible for the process for multiple owners of BES Elements. The note should also be included in the Requirement and Measure as internal documentation will be used to determine the coordination aspects of Part 1.3.

Requirement R3 needs a “trigger” to initiate the process described therein. Suggest revising Requirement R3 to read:

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that determines a need for new or revised Protection System settings shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

To avoid confusion between modeling and protection short circuit modeling, suggest adding the word ”protection” to make the term used in the standard “protection short circuit”.

Response: Thank you for your comments.
The drafting team included the parenthetical to address comments received from Distribution Providers that wanted additional clarity during previous postings of PRC-027-1.

It is the intent of the drafting team that an entity is only responsible for its Protection Systems and the team asserts that the language in the requirement and the measure is clear. The drafting team declines to make the suggested change.

The drafting team appreciates the suggestions but contends they do not add to reliability and declines to make the suggested changes to the requirements and purpose of the draft standard.

There is no overlap or conflict between PRC-027-1 Requirement R1, Part 1.1 and MOD-032-1, Requirement R1. Requirement R1 Part 1.1 of PRC-027-1 ensures that the short-circuit model data is reviewed for accuracy before being used to develop new or revised Protection System settings.

Option 2 of Requirement R2 is a Fault current based methodology for determining when a Protection System Coordination Study (PSCS) must be performed for Protection System functions listed in Attachment A. The second action you mention (performing a PSCS) is only required when a 15% or greater deviation from the established baseline Fault current at the bus to which the Element is connected is identified. An entity can judiciously select the interval that a comparison of present Fault current values to an established Fault current baseline is made; thereby allowing adequate time after the identification of the Fault current deviation to perform the Protection System Coordination Study.

The note "In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation." is intended to minimize the documentation requirements for the subject functional entities. A single document that provides the required evidence would be sufficient for use by both functional entities. If an entity has a single group performing its coordination work for separate functional entities within an organization, it should make that declaration in its process. The note is also included in the RSAW.

The drafting team contends that Requirement R3 is clear that the trigger for utilizing your process is whenever you need to develop new or revised Protection System settings. The drafting team declines to make the suggested change.

The drafting team declines to make the suggested change.

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC

Answer Comment: N/A

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Answer Comment: Texas RE recommends deleting the comment regarding ownership in the Functional Entities section since there is no need with risk-based compliance.

	In the Evidence Retention section, Texas RE recommends changing the statement “since the last audit” to “since the last audit of these requirements.”

Response: Thank you for your comments.

The drafting team included the parenthetical to address comments received during previous postings of the draft standard from Distribution Providers requesting additional clarity.
The referenced language in the Evidence Retention section is boilerplate language. The drafting team declines to make the suggested change.

Kenn Backholm - Snohomish County PUD No. 1 - 6 -

Answer Comment:	Public Utility District No. 1 of Snohomish County supports Salt River Project comments.

Oshani Pathirane - Oshani Pathirane On Behalf of: Paul Malozewski, Hydro One Networks, Inc., 1, 3
Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3

Answer Comment:	1) Hydro One Networks Inc. agrees with the NPCC and recommends that the NERC SDT provides clarification on the overlap of requirements between MOD-032-1, R1 (to develop short-circuit modelling data requirements) and PRC-027-1, R1 (to establish a process which includes a review and update of short-circuit models). 2) Requirement R2, Option 2, entails two actions: 1) a fault current comparison against a previously established baseline be performed, and 2) a Protection System Coordination Study be performed if the results of the comparison study

exceed a deviation 15%. Presently, both these actions need to be performed within the same timeframe. However, Hydro One Networks Inc. agrees with the NPCC in that a separate time period should be allotted for an entity to complete a protection coordination study on all associa0ted elements on a bus, if a deviation of 15% or greater in the available fault current comparison is identified.

3) Further, Hydro One Networks Inc. also recommends that in the interest of clarity, the two actions within Option 2 of requirement R2 be separated out.

Response: Thank you for your comments.

There is no overlap or conflict between PRC-027-1 Requirement R1, Part 1.1 and MOD-032-1, Requirement R1. Requirement R1 Part 1.1 of PRC-027-1 ensures that the short-circuit model data is reviewed for accuracy before being used to develop new or revised Protection System settings.

Option 2 of Requirement R2 is a Fault current based methodology for determining when a Protection System Coordination Study (PSCS) must be performed for Protection System functions listed in Attachment A. The second action you mention (performing a PSCS) is only required when a 15% or greater deviation from the established baseline Fault current at the bus to which the Element is connected is identified. Mike Blough	Kissimmee Utility Authority	FRCC	5
Mark Brown	City of Winter Park	FRCC	3
Mace Hunter	Lakeland Electric	FRCC	3

Answer Comment:

1. From a standards development process perspective, FMPA recognizes that there was a fair amount of industry outreach recently on this Project. Yet, given the low results (<40%) in the prior balloting, a written "consideration of comments" would have been helpful. Plus, is it surprising that this round of questions only addresses the "Attachment A" and the "Implementation Plan" and not the actual standard language. These few questions will not necessarily gather the input needed by the SDT, in case additional improvements are needed.

2. Requirement 1.3.4 has 4 sub parts that can drive auditors to require registered entities to prove the negative. Would suggest that the four sub parts be not listed as such and instead just be collapsed into the sentence. That will reduce the likelihood that auditors will feel compelled to ask for "specific

supporting evidence to prove the negative" which we were told during outreach was not the intent of the SDT.

Part 1.3.4 *Communicate with the other owner(s) of the electrically-joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during:*

1.3.4.1. *Implementation or commissioning.*

1.3.4.2. *Misoperation investigations.*

1.3.4.3. *Maintenance activities.*

1.3.4.4. *Emergency replacements required as a result of Protection System component failure.*

3. FMPA has previously commented that the speed at which faults are cleared is very important to reliability, and does not understand why sequence is call out in the standard and associated definitions as being more important. FMPA recommends the SDT consider adding language to R1 that requires review of Protection System settings with regard to critical clearing time.

Response: Thank you for your comments.

The drafting team appreciates your thoughts regarding a "consideration of comments" document from the previous posting and the concerning the questions associated with the most recent posting. The drafting team received many constructive changes during the previous comment period for draft 5 of the standard and chose to adopt many of them, incorporating them into draft 6. The team concentrated on improving the standard rather than responding to the many comments received. With this past posting, the questions reflected two primary aspects of the standard along with the general question that is designed to capture all other topics stakeholders want addressed or have questions on. Based on the comments submitted with this posting, that effort was successful.

The drafting team reformatted Requirement R1, Part 1.3.4 to address your concern. It now reads: Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

The drafting team asserts that critical clearing times are developed in planning studies and System performance is assessed through the TPL standards. PRC-027-1 is addressing the coordination of Protection Systems such that they operate in the intended sequence during Faults.

Rachel Coyne - Texas Reliability Entity, Inc. - 10 -

Answer Comment:

Texas RE recommends deleting the comment regarding ownership in the Functional Entities section since there is no need with risk-based compliance.

In the Evidence Retention section, Texas RE recommends changing the statement “since the last audit” to “since the last audit of these requirements.”

Texas RE is concerned there is no time frame for entities to provide settings or response to settings in R1.3 The implication is that setting should be provided before implementation by using the word “proposed” but R1.3.2 does not discuss any timeframe for a response. R1.3.4 does not discuss a time frame for communication of revised settings in an unforeseen circumstance.

The footnote for R2 could cause confusion. It is not clear that an Entity should not exceed six years between either performing a Study or comparing Fault current values. If an entity changes options before the six year mark, a Study should be done at that time to establish the baselines.

Texas RE recommends changing the severe VSL for R2 to "The responsible entity failed to perform Option 1, Option 2 or Option 3, in accordance with Requirement 2 for each element."

Response: Thank you for your comments.

The drafting team included the parenthetical to address comments received during previous postings of the draft standard from Distribution Providers requesting additional clarity.

The referenced language in the Evidence Retention section is boilerplate language. The drafting team declines to make the suggested change.

The drafting team provided flexibility for entities to establish processes that best work for their protection philosophies and business practices. Communication with neighboring entities is required for certain provisions within the process; the drafting team asserts that entities will collaborate on schedules to ensure both parties' needs are met.

The drafting team asserts the language of Requirement R2 and the footnote are clear.

The drafting team asserts the phrase "in accordance with Requirement R2" is sufficient, and declines to make the suggested change to the VSL.

Alex Chua - Pacific Gas and Electric Company - 5 -

Answer Comment: Abstain

Matt Culverhouse - City of Bartow, Florida - 3 -

Answer Comment:

1. From a standards development process perspective, we recognize that there was a fair amount of industry outreach recently on this Project. Patricia Robertson - BC Hydro and Power Authority - 1 -

Group Name: BC Hydro

Group Member Name	Entity	Region	Segments
Patricia Robertson	BC Hydro and Power Authority	WECC	1
Venkataramakrishnan Vinnakota	BC Hydro and Power Authority	WECC	2
Pat G. Harrington	BC Hydro and Power Authority	WECC	3
Clement Ma	BC Hydro and Power Authority	WECC	5

Answer Comment:

The requirement to coordinate protective relay settings has existed since the first power systems were built. BC Hydro, like all utilities, has been coordinating their protection systems as part of their normal practice and has a process for setting development, review and implementation on its protection systems. While the requirements in Draft 6 of PRC-027-1 are not substantially different than standard industry practice, proving annual compliance with these requirements (to the satisfaction of lawyers) will impose a large administrative burden. The original focus of PRC-001 made sense in that there are always communications and data gathering issues that make coordinating protection systems across different utilities more challenging than coordinating within one's own system. The new draft standard focuses too much of the utility's time and effort on proving compliance on a process that typically works well, which reduces the amount of time and effort that can be spent on areas where more time and money should be spent.

Response: Thank you for your comment. The drafting team agrees that most entities have processes to develop Protection System settings that achieve proper coordination of the Bulk Electric System. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System. The drafting team contends these requirements were crafted in a manner that provides entities the ability to continue to follow their individual protection philosophies and practices, with minimal administrative impact.

Kathleen Goodman	ISO-NE	NPCC	2
Mark Holman	PJM	RFC	2
Terry Bilke	MISO	MRO	2

Answer Comment:

The Planning Coordinator, Reliability Coordinator, and Balancing Authority must be notified when new or revised protection settings are developed.

As defined in the NERC Glossary, the Planning Coordinator is the responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems. Because the Planning Coordinator is responsible for the coordination and integration of protection systems, it must be aware of any new relay settings or revised relay settings in advance of their implementation.

As also defined in the NERC Glossary, the Reliability Coordinator is the entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision. Because new relay settings or revisions to relay settings can impact IROL calculations, the Reliability Coordinator must be aware of any new

relay settings or revised relay settings in advance of their implementation.

Finally, draft requirements in the proposed TOP-009-1 reliability standard require that the Balancing Authority ensure that "… its personnel responsible for Reliable Operation of its Balancing Authority Area have knowledge of operational functionality and effects of Composite Protection Systems and Remedial Action Schemes that are necessary to perform its Real-time monitoring in order to maintain generation-Load-Interchange balance." Accordingly, Balancing Authorities will need to be provided with new or revised Protection System settings to fulfill its obligations under TOP-009-1.

Therefore, the standard needs to require that each Transmission Owner, Generator Owner and Distribution Provider notify the Planning Coordinator, Reliability Coordinator, and Balancing Authority that it is developing new or revised relay settings. The revision should also allow for the Planning Coordinator or Reliability Coordinator to provide comments on the new or revised relay settings. To capture this, the ISO/RTO Council Standards Review Committee suggests the following revision in R1:

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1 A review and update of short-circuit models for the BES Elements under study.

1.2 A review of the developed Protection System settings.

1.3 Provide new or revised Protection System settings to the Planning Coordinator, Reliability Coordinator, and Balancing Authority.

1.3.1 Respond to the Planning Coordinator or Reliability Coordinator's comments regarding the proposed new or revised Protection System settings.

1.4 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.4.1 Provide the proposed Protection System settings to the owner(s) of the electrically-joined Facilities.

Also, to clarify and reinforce the nature of the broader protection coordination concern, the following modification to the Purpose is proposed:

"To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults without causing an inadvertent adverse impact anywhere on the BES."

Response: Thank you for your comments.
The drafting team appreciates the suggestions but contends those changes are not necessary in PRC-027-1. Between Phase 1 and Phase 2 of System Protection Coordination, all of the planning and operational aspects of coordination are addressed. The drafting team declines to make the suggested changes.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC

Group Name:	Southern Company

Group Member Name	Entity	Region	Segments
Robert A. Schaffeld	Southern Company Services, Inc.	SERC	1
R. Scott Moore	Alabama Power Company	SERC	3
William D. Shultz	Southern Company Generation	SERC	5
John J. Ciza	Southern Company Generation and Energy Marketing	SERC	6

Answer Comment:

We request that the SDT consider the following changes/ clarifications:

Present language:

R1.1 A review and update of short-circuit models for the BES Elements under study.

Proposed:

R1.1 A review and update of short-circuit models or data for the BES Elements under study.

This change will address concerns from GOs and DPs that don't have anything to do with the short-circuit model and potentially only need the fault current data at the interconnected bus from the TO.

In the rational box for **R2:**

Present language:

The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners and Planning Coordinators.

Proposed language:

The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators or Transmission Owners.

Response: Thank you for your comments. The drafting team made the suggested clarifying changes.

Tony Eddleman - Nebraska Public Power District - 3 -

Answer Comment:

Please state that when a fault current baseline is first established we are not required to show a coordination study for every protection scheme on our system. Please state that utilities are not required to show a coordination study if the baseline continues to show a fault current change less than 15%?

Requirement R2 option 2 states "Fault current values (either three phase or phase to ground) at a bus to which the Element is connected" where the RSAW states "Fault current comparison and results for each BES Element". The RSAW and Standard should match language as closely as possible. In this case the standard states bus faults and the RSAW evidence specifies each element which is more than just a bus. It may be wise to delay industry RSAW reviews until the standard language is in a more finalized state.

Consider adding a modification to R2. There should be an allowed time line for a coordination study to take place after the 15% fault current threshold has been identified as being exceeded. This presents a risk many could step into unwittingly when the identification is close to the 6 year interval. There are

	circumstances where fault currents may not change until close to this 6 year interval due to system changes that may not be foreseen. We suggest the requirement include a two year window after a 15% change is identified. Please provide a definition or examples to clarify what is considered "electrically-joined Facilities". For example, if a line and both terminals and protection is owned by entity A at sub 1 and sub 2. All other equipment at sub 1 is owned by entity B. All equipment at Sub 2 is owned by entity A. Is sub 2 "electrically-joined"? The RSAW in the sections for R1 and R3 states: "In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation". We request a provision in the Standard allowing if all separate functional entities within an organization have access to the same internal documentation, then the communication aspects are not required. In a situation where utility A does work for another utility B on their transmission system protection equipment and utility A owns all the other surrounding protection systems, please clarify how the communication evidence would change with coordination work since utility A is making all the coordination decisions. Is it acceptable to show utility A has all utility B protection system settings internally stored? Does this make utility A responsible for utility B compliance? For a facility that has multiple bus voltages such as 115kV, 230kV and 345kV and if the fault current baseline exceeds 15% on just the 115kV bus does this mean just the elements connected to the 115kV bus must have a coordination study but not the 230 or 345kV buses?

Response: Thank you for your comments.

The drafting team asserts that Requirement R2 and the footnote clearly indicate when a Protection System Coordination Study is required based on the option(s) selected. For Option 2, the drafting team interprets both of your statements to be correct.

The language and intent of the requirements contained in the final standard will be reflected in the final RSAW.

An entity can judiciously select the interval that a comparison of present Fault current values to an established Fault current baseline is made; thereby allowing adequate time after the identification of the Fault current deviation to perform the Protection System Coordination Study.

Requirement R1, Parts 1.3.1 and 1.3.4 use the term “electrically joined Facilities” and are referring to Requirement R1, Part 1.3 which uses the phrase: “For Protection System settings applied on BES Elements that electrically join Facilities...” The drafting team asserts that no definition is necessary. For your example, sub 2 is electrically joined to sub 1; however, because the Protection Systems in both subs are owned by the same functional entity, Requirement R1, Part 1.3 is not applicable.

The note “In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.” is intended to minimize the documentation requirements for the subject functional entities. A single document that provides the required evidence would be sufficient for use by both functional entities. If an entity has a single group performing its coordination work for separate functional entities within an organization, it should make that declaration in its process.

In the case where utility A performs the settings calculations for both parties (utility A & B), those settings and the associated documentation for those settings would need to be sent to utility B. Utility A would not be responsible for utility B compliance. Note that utility B is required to develop a process that may include the use of contractors to develop Protection System settings.

Yes. The drafting team agrees with your interpretation.

Answer Comment:

SCL GENERAL COMMENTS

1) The Option 2 baseline should include a system-wide review of the entities instantaneous overcurrent elements, that are utilized on the BES, as well as the performance of the baseline fault study.

SCL experience has demonstrated that overreaching instantaneous overcurrent elements are one of the largest causes of miscoordination in a Protective Relay System.

2) The draft Standard, in its present form, is reminiscent of the early stages of the PRC-005 (Relay Maintenance) Standard, in that each utility will establish their own implementation (issue and installation of the relay settings) schedule timeline, without any constraints. This did not work well, for Standard PRC-005 as the utilities with strong maintenance plans were scrutinized, during audits, much more rigorously than those utilities with weaker maintenance plans, even though the weaker maintenance plans made the BES less reliable. It required several revisions of the PRC-005 Standard to get everyone on the same playing field. SCL believes that a similar situation will occur if a not-to-exceed schedule timeline is not established for the implementation of the revised relay settings.

R1. - Introduction

Modify text in paragraph to read: such that the Protection Systems, associated with the protective functions listed in Attachment A, operate in the intended sequence during faults.

R1. – Add Section 1.4

Inside of this section describe the timeline allowed to implement the revised relay settings.

For example, “new and revised relay settings necessary for the coordination of the Protection Systems, associated with the protective functions listed in Attachment A, shall be issued and installed within one year after the Protection Coordination Study has been performed”.

R2. – Option 2

Modify text in paragraph to include the following steps:

1) Compare the present fault current values to the previously established fault current baseline at each BES bus within the entitiy’s system, with Protection Systems, associated with the protective functions listed in Attachment A.

2) Identify the buses where the present fault current value exceeds the baseline value by an amount that is 15%, or greater, in magnitude.

3) Perform a Protection System Coordination Study on the area of the system defined by the BES elements that are connected to the buses identified in Step 2.

4) The time interval to perform steps 1-3 shall not exceed six calendar years.

ATTACHMENT A

Modify text for relay elements as follows (line number defined at beginning of sentence):

21-1 – Zone 1 distance relay if:

• Infeed is used in determining reach (phase & ground distance), or

• zero-sequence mutual coupling is used in determining reach (ground distance)

21-2 – Zone 2 distance relay if:

• Infeed is used in determining reach (phase & ground distance), or

• zero-sequence mutual coupling is used in determining reach (ground distance)

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent if used in a non-communication-assisted protection scheme.

67 I – Directional Instantaneous overcurrent

67 T – Directional inverse time overcurrent if used in a non-communication-assisted protection scheme.

SUPPLEMENTAL MATERIAL REQUIREMENT R1

Modify the text for the last paragraph of Section R1 just above Part 1.1 to read:

The coordination of some Protections Systems may seem unnecessary, such as for a line element that is protected solely by dual current differential relays with other Protection Systems of the line element such that tripping does not unnecessarily occur for faults outside of the differential zone, unless there is a Protection System failure on the adjacent line element.

Response: Thank you for your comments.

The standard does not preclude an entity from performing a system-wide review of its instantaneous overcurrent elements, if desired. The drafting team declines to make the suggested change.

The drafting team declines to make the suggested changes.

Andrew Pusztai - American Transmission Company, LLC - 1 -

Answer Comment: ATC recommends revising PRC-027-1 to identify a clear connection between performance and the requirements of this standard. Where PRC-004 data provides a mechanism to measure performance, the better means to achieve reliability performance would allow each entity to use its company's misoperations data and the greater industry data to develop a program that addresses its greatest need.

Response: Thank you for your comment. PRC-027-1 does not preclude an entity from evaluating its System based on PRC-004 data as another tool to minimize Misoperations due to coordination issues.

Answer Comment:

1. For requirement R1, Part 1.1, the requirement states that the TO, GO, and DP must have a process to review and update short-circuit models for BES Elements under study. We disagree that the GO and DP must complete their own short-circuit models. Our recommendation is to allow GOs and DPs to use the TO's short circuit study for applicable GO or DP buses.
2. For requirement R1, Part 1.3, we disagree with the requirement of documenting internal coordination, especially considering that smaller entities may have a single protection engineer that is responsible for completing the study. Also, we disagree that there needs to be eight sub-parts for joint ownership coordination. This is administrative in nature and burdensome for compliance. This sub-part is overly complicated and creates opportunities for entities to fall out of compliance. There is little benefit to reliability for having this much detail required.
3. For requirement R2, option 1, performing studies for all applicable relays can be resource intensive, especially for smaller entities. We recommend that the drafting team consider the Cost Effective Analysis Process (CEAP) to determine if the reliability benefits outweigh the cost of compliance.
4. For requirement R2, option 2, the baseline process is complicated. We recommend stating in footnote one that the baseline for option 2 must be completed within 12 months after the standard goes into effect. Also, the measure should state that if there is not a fault current deviation greater than 15 percent, then an attestation is sufficient evidence for compliance.
5. For requirement R2, option 3, there should be specific guidance in the measures to demonstrate compliance for the combined approach, such as a

baseline for applicable distance or overcurrent relays to occur within 12 months of the effective date and a Protection System Coordination Study (PSCS) for the remaining applicable Protection Systems to occur every 6 years after the effective date.

6. For requirement R3, the documentation requirements for coordination activities of new/revised settings is administrative in nature. We question the need for an administrative documentation requirement that is assessed a high risk. Industry has long history of coordinating Protection Systems and there is not any evidence of a widespread lack of Protection System coordination. We do not see how requiring a documented process will reduce the risks to reliability. Thus, we do not see how it enhances reliability and believe it could actually detract by causing applicable entities to focus on paperwork.

Response: Thank you for your comments.

The drafting team made a clarifying change in the Requirement and complementary changes in the Rational Box and Supplemental Material.

The note "In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation." is intended to minimize the documentation requirements for the subject functional entities. A single document that provides the required evidence would be sufficient for use by both functional entities. The drafting team contends that Part 1.3 is not administrative. The reliability objective is to ensure that the owners of Protection Systems have communicated and addressed any identified coordination issues prior to implementing the Protection Systems.

The drafting team does not agree that the work associated with Requirement R2, Option 1 is extensive, particularly for smaller entities. Entities have the choice to utilize Option 2.

Based on yours and others comments, the drafting team lengthened the implementation period of the standard to twenty-four months to provide an entity adequate time to establish its Protection System settings development process, establish Fault Current baselines, and establish a tracking tool for Fault Current baseline changes and/or Protection System Coordination Studies.

The drafting team contends that utilizing the process established in Requirement R1 ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Doug Hohlbaugh - FirstEnergy - Ohio Edison Company - 4 -

Answer Comment:

FE's primary concern relates to what is required of the GO to be able to comply with R1 which states the TO, GO and DP "… establish a process to develop settings for its BES Protection Systems to operate in the intended sequence during Faults." The GO, operates the units essentially as isolated BES elements. The term "sequence" infers it is referring to the BES as a whole, at least with regard to interconnected elements, which would then mean we need a joint process with the TO. The GO is not in a position to make that happen, nor should the GO have primary responsibility. This should be a TO responsibility, with GO providing settings as requested by TO, and GO changing settings as requested/instructed by the TO.

FE believes the TO should be identified as the entity to establish the system protection coordination and be responsible for PSCSs (Power System Coordination Studies), Fault Studies, Short Circuit Studies, etc., to prove coordination. Communication to the GO should also be the TO's responsibility. The GO would be responsible to implement setting changes as directed by the TO, where applicable and if able. The GO's connection to the BES normally ends/terminates with the Generator Step Up transformer so the GO does not have the data to perform any Power System Coordination Studies, Fault Studies, or Short Circuit Studies

Response: Thank you for your comments.

The drafting team disagrees with your premise. The drafting team contends that the Generator Owner needs to have a process to develop its Protection System settings and must follow Requirement R1, Part 1.3 to ensure they coordinate with the Transmission Owner. The Generator Owner has the ultimate responsibility, not the Transmission Owner, for setting its Protection Systems such that they operate in the intended sequence during Faults.

The drafting team agrees that the Transmission Owner may provide the Generator Owner the short-circuit model data; however, the Generator Owner still needs to have a process to develop its Protection System settings and must follow Requirement R1.

End of report

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

Completed Actions	Date

Draft 6 of PRC-027-1 posted for 10-day final ballot.	October 5 – 14, 2015

Anticipated Actions	Date
NERC Board of Trustees (BOT) adoption	November, 2015

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Protection System Issues Addressed by Other Reliability Standards:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. Including aspects of protection coordination other than Fault coordination would cause duplication or conflict with the requirements of other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Coordination of Protection Systems for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.
4. **Applicability:**

    4.1. Functional Entities:

    4.1.1. Transmission Owner

    4.1.2. Generator Owner

    4.1.3. Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)

    4.2. Facilities: Protection Systems installed to detect and isolate Faults on BES Elements.

5. **Effective Date:** See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:

Coordinated Protection Systems enhance reliability by isolating faulted equipment, thus reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. The stated purpose of this standard is: "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults." Requirement R1 captures this intent by requiring responsible entities establish a process that, when followed, allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing Protection System settings.

Part 1.1 Reviewing and updating the short-circuit model data used to develop new or revised Protection System settings helps to assure that settings are developed using accurate, up-to-date information. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners.

Part 1.2 A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

Part 1.3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is essential to the reliability of the BES. Communication and review of proposed settings among these entities are necessary to identify potential coordination issues and address the issues prior to implementation of any proposed Protection System changes.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include provisions to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit model data for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.3.1. Provide the proposed Protection System settings to the owner(s) of the electrically joined Facilities.

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.3.3. Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

1.3.4. Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity established a process to develop settings for its Protection Systems, in accordance with Requirement R1.

Rationale for Requirement R2:

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires Transmission Owners, Generator Owners, and Distribution Providers to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Requirement R2 provides entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six-calendar years, a Protection System Coordination Study for each of its Protection Systems identified in Attachment A. The six-calendar-year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current-based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new BES Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. In a time interval not to exceed six-calendar years following the effective date of this standard, an entity must perform a Fault current comparison. If the comparison identifies a deviation less than 15 percent, no further action is required for that six-year interval; however, if the comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the BES Element is connected, the entity must also perform a Protection System Coordination Study during the same six-year interval. The baseline Fault current value(s) will be re-established whenever a new Protection System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current-based option for existing BES Elements as well as establishing baselines for new BES Elements by performing Protection System Coordination Studies. The footnote also states that Fault current baselines for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA).

Option 3 provides the entity the choice of using both the time-based and Fault current-based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current-based methodology for Protection Systems at other Facilities.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the

comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[1] or,

- Option 3: Use a combination of the above.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than

[1] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance with Requirements R1, R2, and R3, and Measures M1, M2, and M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.
R2.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option

				2, or Option 3, in accordance with Requirement R2.

Version History

Version	Date	Action	Change Tracking
1		Adopted by NERC Board of Trustees	New standard developed under Project 2007-06

Attachment A

The following Protection System functions[2] are applicable to Requirement R2 if: (1) available Fault current levels are used to develop the settings for those Protection System functions; and (2) those Protection System functions require coordination with other Protection Systems.

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions utilize current in their measurement to initiate tripping of circuit breakers. Changes in the magnitude of available Fault current can impact the coordination of these functions.
2. See the PRC-027-1 Supplemental Material section for additional information.

[2] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Purpose

The Purpose states: To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance reliability by isolating faulted equipment, reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. This standard requires that entities establish and implement a process to coordinate their Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current data upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults.

The reliability objective of this requirement is to have applicable entities establish a process to develop settings for coordinating their Protection Systems, such that they operate in the intended sequence during Faults. The parts that are included as elements of the process ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of settings.

This standard references various publications that discuss protective relaying theory and application. The description of "coordination of protection" is from the pending revision of IEEE Standard C37.113-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Entities may have differing technical criteria for the development of Protection System settings based on their own philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge; as such, a single definition or criterion for "Protection System coordination" is not practical.

The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. However, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the BES Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A review and update of short-circuit model data for the BES Elements under study.

The short-circuit study provides the necessary Fault currents used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners. Including a review and, if necessary, an update of short-circuit study information is necessary to ensure that information accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of a short-circuit study are only as accurate as the information that its calculations are based on.

A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. Because the results of short-circuit studies are used as the basis for protective device coordination studies, the short-circuit model should accurately reflect the physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances and Fault currents.
2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 A review of the developed Protection System settings.

A review of the Protection System settings prior to implementation reduces the possibility of introducing human error. A review is any systematic process of verifying the developed settings meet the technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures.

Part 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

Requirement R1, Part 1.3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.3.1 1.3.1. Provide the proposed Protection System settings to the owners of the electrically joined Facilities.

Requirement R1, Part 1.3.1 requires the entity to include in its process a provision to provide proposed Protection System settings to other entities. This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.3.2 requires the entity receiving proposed Protection System settings to include in its process a provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response indicating Protection System coordination issues were identified, or affirmation that no issues were identified.

Part 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.3.3 requires the entity to include in their process a provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability is minimized.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Note: There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judgment. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. Further, there could be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

Part 1.3.4 Communicate with the other owner(s) of the electrically joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during implementation or commissioning, Misoperation investigations, maintenance activities, or emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2

This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[3] or,

[3] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES

- Option 3: Use a combination of the above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six-calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which a BES Element is connected. Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. This option allows the entity to choose an interval of up to six-calendar years to perform the Fault current comparisons and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

As described in the footnote for Requirement R2, Option 2, an entity that elects to initially use Option 2 must establish its baseline prior to the effective date of the standard. If an initial

---

generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current baseline values can be updated or established when a Protection System Coordination Study is performed. The baseline values at each bus to which a BES Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System. The footnote also states that the Fault current baselines may be established for BES generating resources at the generator, the BES aggregation point for dispersed power producing resources, or at the common point of connection at 100 kV or above.

> **Example:** Prior to the effective date of PRC-027-1, an entity intending to use Option 2 of Requirement R2 establishes an initial baseline; e.g., 10,000 amps at the bus to which the BES Element under study is connected. A short-circuit review performed on March 1, 2024, for example, identifies that the Fault current has increased to 11,250 amps (12.5 percent deviation); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next comparison (to be performed no later than December 31, 2030) remains at 10,000 amps because no study was required as a result of the initial comparison. During the next six-year interval, Fault current comparison identifies that the Fault current has increased to 11,500 (15 percent deviation); therefore, a Protection System Coordination Study is required (and must also be completed no later than December 31, 2030), and a new baseline of 11,500 amps would be established.

> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six-calendar-year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

The Protection System functions listed in Attachment A utilize AC current in their measurement to initiate tripping of circuit breakers and the coordination of these functions is susceptible to changes in the magnitude of available short-circuit Fault current. These functions are included in Attachment A based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. Examples of functions not included in Attachment A because they do not meet both of the criteria are differential relays and Fault detectors. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

The following provide additional information regarding the Protection System functions in Attachment A.

A “51 – AC inverse time overcurrent” relay connected to a CT on the neutral of a generator step-up transformer, referred to as “51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT

Method)" in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are "51 – AC Inverse time overcurrent" relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function used in conjunction with a "62 – Time-delay" function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed "21 – Distance" function, which is a "21 – Distance" function with a "62 – Time-delay" function. Another example would be a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function with a "62 – Time-delay" function. A "50 – Instantaneous overcurrent" function used for supervising a "21 – Distance" function would <u>not</u> be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing "21 – Distance" functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is <u>not</u> used in determining the setting, "21 – Distance" functions would <u>not</u> be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, "21 – Distance" functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

The 67 – AC directional overcurrent function utilized in Protection Systems for Transmission lines can be instantaneous overcurrent, inverse time overcurrent, or both instantaneous overcurrent and inverse time overcurrent. For example, in a communication-aided directional comparison blocking (DCB) scheme, the instantaneous overcurrent function is set very sensitive. When a single line-to-ground Fault occurs on a Transmission line, the Fault is detected by a number of Protection Systems for other Transmission lines. Signals from communication equipment are transmitted and received to block the other Protection Systems for the non-faulted Transmission lines from operating, thereby providing the coordination. A 67 – AC directional overcurrent function used in a permissive overreaching transfer trip scheme (POTT) relies on a signal from the remote end to operate and, therefore, does not require coordination with other Protection Systems.

Instantaneous overcurrent and/or inverse time overcurrent for a 67 – AC directional overcurrent function are utilized in a non-communication-aided Protection System for Transmission lines. As communication is not used to prevent operation for Faults outside a Protection System's zone of protection, coordination is necessary with other Protection Systems for buses, transformers, and other Transmission lines. The instantaneous overcurrent function should be set to not overreach the end of the Transmission line. The inverse time overcurrent function should be set to coordinate with the inverse time overcurrent function of other Protection Systems. Changes in the magnitude of available Fault current can affect the coordination.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes will be moved to this section.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination Standard Drafting Team (SPCSDT) created a new results-based standard, PRC-027-1, with the stated purpose: "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements~~for the purpose of detecting Faults on BES Elements and isolating those Faults~~, such that those Protection Systems operate in the intended sequence during Faults." PRC-027-1 clarifies the coordination aspects and incorporates the reliability objectives of Requirements R3 and R4 from PRC-001-1.1(ii).

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Protection System Issues Addressed by Other Reliability Standards:

Fault clearing is the only aspect of protection coordination addressed by Reliability Standard PRC-027-1. Including aspects of protection coordination other than Fault coordination would cause duplication or conflict with the requirements of other Reliability Standards. Specifically, other protection issues, such as over/under frequency, over/under voltage, coordination of generating unit or plant voltage regulating controls, and relay loadability are addressed by the following Reliability Standards:

- Underfrequency Load shedding programs are addressed in PRC-006-2.
- Undervoltage Load shedding programs are addressed in PRC-010-1.
- Generator performance during declined frequency and voltage excursions is addressed in PRC-024-1.
- Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection is addressed in PRC-019-1.
- Transmission relay loadability is addressed in PRC-023-3.
- Generator relay loadability is addressed in PRC-025-1.
- Protective relay response during stable power swings is addressed in PRC-026-1.
- Protection System Misoperations (including those caused by coordination issues) are addressed in PRC-004-3.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material Section of the standard.

A. Introduction

1. **Title:** **Coordination of Protection Systems for Performance During Faults**
2. **Number:** PRC-027-1
3. **Purpose:** To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.
4. **Applicability:**
   4.1. Functional Entities:
   4.1.1. Transmission Owner
   4.1.2. Generator Owner
   4.1.3. Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 below)
   4.2. Facilities: Protection Systems installed to detect and isolate Faults on BES Elements.
5. **Effective Date:** See the Implementation Plan for PRC-027-1, Project 2007-06 System Protection Coordination.

B. Requirements and Measures

Rationale for Requirement R1:

Coordinated Protection Systems enhance reliability by isolating faulted equipment, thus reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. The stated purpose of this standard is: "To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements~~for the purpose of detecting Faults on BES Elements and isolating those Faults~~, such that those Protection Systems operate in the intended sequence during Faults." Requirement R1 captures this intent by requiring responsible entities establish a process that, when followed, allows for their Protection Systems to operate in the intended sequence during Faults. Requirement R1, Parts 1.1 through 1.3 are key elements to the process for developing Protection System settings.

Part 1.1 Reviewing and updating the short-circuit model~~s~~ data used to develop new or revised Protection System settings helps to assure that settings are developed using accurate, up-to-date information. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners.

Part 1.2 A review of the developed Protection System settings reduces the likelihood of introducing human error and verifies that the settings produced meet the technical criteria of the entity. Peer reviews, automated checking programs, and entity-developed review procedures are all examples of reviews.

Part 1.3 The coordination of Protection Systems associated with BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers) is essential to the reliability of the BES. Communication and review of proposed settings among these entities are necessary to identify potential coordination issues and address the issues prior to implementation of any proposed Protection System changes.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Unforeseen circumstances could require immediate changes to Protection System settings. Requirement R1, Part 1.3.4 requires owners to include ~~a procedure~~provisions to communicate those unplanned settings changes after-the-fact to the other owner(s) of the electrically ~~-~~joined Facilities.

Note: In cases where a single protective relaying group performs coordination work for separate functional entities within an organization, the communication aspects of Requirement R1, Part 1.3 can be demonstrated by internal documentation.

R1. Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults. The process shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. A review and update of short-circuit model~~s~~ data for the BES Elements under study.

1.2. A review of the developed Protection System settings.

1.3. For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

1.3.1. Provide the proposed Protection System settings to the owner(s) of the electrically~~-~~ joined Facilities.

1.3.2. Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

1.3.3. Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

~~**1.3.4.**~~ Communicate with the other owner(s) of the electrically~~-~~ joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during~~:~~

~~**1.3.4.1.**~~ ~~Implementation~~ implementation or commissioning~~.~~

~~**1.3.4.2.**~~ , Misoperation investigations~~.~~

~~**1.3.4.3.**~~ ~~Maintenance~~, maintenance activities~~.~~

~~**1.3.4.4.**~~1.3.4. ~~Emergency~~, or emergency replacements required as a result of Protection System component failure.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity established a process to develop settings for its Protection Systems, in accordance with Requirement R1.

Rationale for Requirement R2:

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires ~~responsible entities (~~Transmission Owners, Generator Owners, and Distribution Providers~~)~~ to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. The numerical identifiers in Attachment A represent general protective device functions per ANSI/IEEE *Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Requirement R2 provides ~~responsible~~ entities with options to assess the state of their Protection System coordination.

Option 1 is a time-based methodology. The entity may choose to perform, at least once every six-calendar years, a Protection System Coordination Study for each of its ~~BES~~ Protection Systems identified ~~as being affected by changes in Fault current~~in Attachment

A. The six-calendar-year time interval was selected as a balance between the resources required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

Option 2 is a Fault current-based methodology. If Option 2 is initially selected, Fault current baseline(s) must be established prior to the effective date of this Reliability Standard. A baseline may be established when a new BES Element is installed or after a Protection System Coordination Study has been performed. The baseline(s) will be used as control point(s) for future Fault current comparisons. The Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners ~~and~~, Planning Coordinators~~. At least once every~~, or Transmission Owners. In a time interval not to exceed six-calendar years following the effective date of this standard, ~~the~~an entity ~~will~~must perform a ~~Protection System Coordination Study when its~~ Fault current comparison. If the comparison identifies a deviation less than 15 percent, no further action is required for that six-year interval; however, if the comparison identifies a 15 percent or greater deviation in Fault current values (either three-phase or phase-to-ground) at each bus to which the BES Element is connected, the entity must also perform a Protection System Coordination Study during the same six-year interval. The baseline Fault current value(s) will be re-established whenever a new Protection System Coordination Study is performed. Fault current changes on the System not directly associated with BES modifications are usually small and occur gradually over time. The accumulation of these incremental changes could affect the performance of Protection System functions (identified in Attachment A of this standard) during Fault conditions. A Fault current deviation threshold of 15 percent or greater (as compared to the established baseline) and a maximum time interval of six calendar years were chosen for these evaluations. These parameters provide an entity with latitude to choose a Fault current threshold and time interval that best match its protection philosophy, Protection System maintenance schedule, or other business considerations, without creating risk to reliability (See the Supplemental Material section for more detailed discussion).

The footnote in Option 2 describes how an entity may change from a time-based option to a Fault current-based option for existing BES Elements ~~when~~as well as establishing baselines for new BES Elements by performing Protection System Coordination Studies. The footnote also ~~allows for~~ states that Fault current baselines for BES generating resources may be established at the ~~creation~~generator, the generator step-up (GSU) transformer(s), or at the common point of ~~a~~connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline ~~when a Protection System Coordination Study is performed for installing new Elements.~~may also be established at the BES aggregation point (total capacity greater than 75 MVA).

Option 3 provides the entity the choice of using both the time-based and Fault current-based methodologies. For example, the entity may choose to utilize the time-based methodology for Protection Systems at more critical Facilities and use the Fault current-based methodology for Protection Systems at other Facilities.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[1] or,
- Option 3: Use a~~A~~ combination of the above.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity performed Protection System Coordination Study(ies) and/or Fault current comparisons in accordance with Requirement R2.

Rationale for Requirement R3:

Utilizing the processes established in Requirement R1 to develop new and revised Protection System settings provides a consistent approach to the development of Protection System settings and will minimize the potential for errors.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its settings development process established in Requirement R1, as specified in Requirement R3.

[1] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall each keep data or evidence to show compliance with Requirements R1, R2, and R3, and Measures M1, M2, and M3 since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 or Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.1 and Part 1.2.	The responsible entity established a process in accordance with Requirement R1, but failed to include Requirement R1, Part 1.3. OR The responsible entity failed to establish any process in accordance with Requirement R1.
R2.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3 but was late by less than or equal to 30 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 30 calendar days but less than or equal to 60 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 60 calendar days but less than or equal to 90 calendar days.	The responsible entity performed a Protection System Coordination Study for each BES Element, in accordance with Requirement R2, Option 1, Option 2, or Option 3, but was late by more than 90 calendar days. OR The responsible entity failed to perform Option 1, Option

				2, or Option 3, in accordance with Requirement R2.

1		Adopted by NERC Board of Trustees	New standard developed under Project 2007-06

Attachment A

The following Protection System functions[2] are applicable to Requirement R2 if: (1) available Fault current levels are used to develop the settings for those Protection System functions~~:~~; and (2) those Protection System functions require coordination with other Protection Systems.

21 – Distance if:

- infeed is used in determining reach (phase and ground distance), or
- zero-sequence mutual coupling is used in determining reach (ground distance).

50 – Instantaneous overcurrent

51 – AC inverse time overcurrent

67 – AC directional overcurrent if used in a non-communication-aided protection scheme

Notes:

1. The above Protection System functions ~~are susceptible to changes in the magnitude of available short-circuit Fault current. These functions~~ utilize current in their measurement to initiate tripping of circuit breakers. ~~The functions listed above are included in a Protection System Coordination Study because they require~~Changes in the magnitude of available Fault current can impact the coordination ~~with other Protection Systems.~~of these functions.
2. See the PRC-027-1 Supplemental Material section for additional information.

[2] ANSI/IEEE Standard C37.2 *Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.

Purpose

The Purpose states: To maintain the coordination of Protection Systems installed to detect and isolate Faults on Bulk Electric System (BES) Elements, such that those Protection Systems operate in the intended sequence during Faults.

Coordinated Protection Systems enhance reliability by isolating faulted equipment, reducing the risk of BES instability or Cascading, and leaving the remainder of the BES operational and more capable of withstanding the next Contingency. When Faults occur, properly coordinated Protection Systems minimize the number of BES Elements that are removed from service and protect equipment from damage. This standard requires that entities establish and implement a process to coordinate their ~~BES~~ Protection Systems to operate in the intended sequence during Faults.

Applicability

Transmission Owners, Generator Owners, and Distribution Providers are included in the Applicability of PRC-027-1 because they may own Protection Systems that are installed for the purpose of detecting Faults on the Bulk Electric System (BES). It is only those Protection Systems that are under the purview of this standard.

Transmission Owners are included in the Applicability of PRC-027-1 because they own the largest number of Protection Systems installed for the purpose of detecting Faults on the BES.

Generator Owners have Protection Systems installed for the purpose of detecting Faults on the BES. It is important that those Protection Systems are coordinated with Protection Systems owned by Transmission Owners to ensure that generation Facilities do not become disconnected from the BES unnecessarily. Functions such as impedance reaches, overcurrent pickups, and time delays need to be evaluated for coordination.

A Distribution Provider may provide an electrical interconnection and path to the BES for generators that will contribute current to Faults that occur on the BES. If the Distribution Provider owns Protection Systems that operate for those Faults, it is important that those Protection Systems are coordinated with other Protection Systems that can be impacted by the current contribution to the Fault of Distribution Provider.

After the Protection Systems of Distribution Providers and Generator Owners are shown to be coordinated with other Protection Systems on the BES, there will be little future impact on the entities unless there are significant changes at or near the bus that interconnects with the Transmission Owner. The Transmission Owner, which is typically the entity maintaining the system model for Fault studies, will provide the Fault current ~~availability~~data upon request by the Distribution Provider or Generator Owner. The Distribution Provider and Generator Owner will determine whether a change in Fault current from the baseline has occurred such that a review of coordination is necessary.

Requirement R1

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall establish a process for developing new and revised Protection System settings for BES Elements, such that the Protection Systems operate in the intended sequence during Faults.

The reliability objective of this requirement is to have applicable entities establish a process to develop settings for coordinating their ~~BES~~ Protection Systems, such that they operate in the intended sequence during Faults. The parts that are included as elements of the process ensure the development of accurate settings, as well as providing internal and external checks to minimize the possibility of errors that could be introduced in the development of settings.

This standard references various publications that discuss protective relaying theory and application. The description of "coordination of protection" is from the pending revision of IEEE Standard C37.113-1999 (Reaffirmed: 2004), *Guide for Protective Relay Applications to Transmission Lines*, which reads:

> *"The process of choosing current or voltage settings, or time delay characteristics of protective relays such that their operation occurs in a specified sequence so that interruption to customers is minimized and least number of power system elements are isolated following a system fault."*

Entities may have differing technical criteria for the development of Protection System settings based on their own philosophies. These philosophies can vary based on system topology, protection technology utilized, as well as historical knowledge; as such, a single definition or criterion for "Protection System coordination" is not practical.

The coordination of some Protection Systems may seem unnecessary, such as for a line that is protected solely by dual current differential relays. However, backup Protection Systems that are enabled to operate based on current or apparent impedance with some definite or inverse time delay must be coordinated with other Protection Systems of the BES Element such that tripping does not unnecessarily occur for Faults outside of the differential zone.

Part 1.1 A review and update of short-circuit model~~s~~ data for the BES Elements under study.

The short-circuit study provides the necessary Fault currents used by protection engineers to develop Protection System settings for Transmission Owners, Generator Owners, and Distribution Providers ~~is the short-circuit study.~~. Generator Owners and Distribution Providers may not have or maintain short-circuit models; consequently, these entities would obtain the short-circuit model data from the Transmission Planners, Planning Coordinators, or Transmission Owners. Including a review and, if necessary, an update of short-circuit study information is necessary to ensure that information accurately reflects the physical power system that will form the basis of the Protection System Coordination Study and development of Protection System relay settings. The results of a short-circuit study are only as accurate as the information that its calculations are based on.

A short-circuit study is an analysis of an electrical network that determines the magnitude of the currents flowing in the network during an electrical Fault. Because the results of short-circuit studies are used as the basis for protective device coordination studies, the short-circuit model should accurately reflect the physical power system.

Reviews could include:

1. A review of applicable BES line, transformer, and generator impedances and Fault currents.
2. A review of the network model to confirm the network in the study accurately reflects the configuration of the actual System, or how the System will be configured when the proposed relay settings are installed.
3. A review, where applicable, of interconnected Transmission Owner, Generator Owner, and Distribution Provider information.

Part 1.2 A review of the developed Protection System settings.

A review of the Protection System settings prior to implementation reduces the possibility of introducing human error. A review is any systematic process of verifying the developed settings meet the technical criteria of the entity. Examples of reviews include peer reviews, automated checking programs, and entity-developed review procedures.

Part 1.3 For Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities (Transmission Owners, Generator Owners, and Distribution Providers), provisions to:

Requirement R1, Part 1.3 addresses the coordination of Protection System settings applied on BES Elements that electrically join Facilities owned by separate functional entities. Communication among these entities is essential so potential Protection System coordination issues can be identified and addressed prior to implementation of any proposed Protection System changes.

Part 1.3.1 1.3.1. Provide the proposed Protection System settings to the owners of the electrically~~-~~ joined Facilities.

Requirement R1, Part 1.3.1 requires the entity to include in its process a provision to provide proposed Protection System settings to other entities. This communication ensures that the other entities have the necessary information to review the settings and determine if there are any Protection System coordination issues.

Part 1.3.2 Respond to any owner(s) that provided its proposed Protection System settings pursuant to Requirement R1, Part 1.3.1 by identifying any coordination issue(s) or affirming that no coordination issue(s) were identified.

Requirement R1, Part 1.3.2 requires the entity receiving proposed Protection System settings to include in its process a provision to respond to the entity that initiated the proposed changes. This ensures that the proposed settings are reviewed and that the initiating entity receives a response indicating Protection System coordination issues were identified, or affirmation that no issues were identified.

Part 1.3.3 Verify that identified coordination issue(s) associated with the proposed Protection System settings for the associated BES Elements are addressed prior to implementation.

Requirement R1, Part 1.3.3 requires the entity to include in their process a provision to verify that any identified coordination issue(s) associated with the proposed Protection System settings are addressed prior to implementation. This ensures that any potential impact to BES reliability is minimized.

The exclusion in PRC-001-1.1(ii), Requirement R3, R3.1 for dispersed power producing resources applies only to interconnections between different functional entities. As such, the exclusion only maps to Requirement R1, Part 1.3 in PRC-027-1. Due to the design of dispersed generation sites, the Protection Systems applied on the individual dispersed generation resources are not electrically joined Facilities owned by separate functional entities as specified in Requirement R1, Part 1.3 nor are they connected by BES Elements. Therefore Requirement R1, Part 1.3 does not apply to the Protection Systems applied on the individual dispersed generation resources. Requirement R1, Part 1.3 applies only to the Protection Systems applied on the BES Elements that electrically join Facilities owned by separate functional entities.

Note: There could be instances where coordination issues are identified and the entities agree not to mitigate all of the issues based on engineering judg~~e~~ment. It is also recognized that coordination issues identified during a project may not be immediately resolved if the resolution involves additional system modifications not identified in the initial project scope. Further, there could be situations where protection philosophies differ between entities, but the entities can agree that these differences do not create coordination issues.

Part 1.3.4 Communicate with the other owner(s) of the electrically~~-~~ joined Facilities regarding revised Protection System settings resulting from unforeseen circumstances that arise during~~:~~

~~**1.3.4.1.** Implementation~~ implementation or commissioning~~.~~

~~**1.3.4.2.**~~ , Misoperation investigations~~.~~

~~**1.3.4.3.** Maintenance~~, maintenance activities~~.~~

~~**1.3.4.4.** Emergency~~, or emergency replacements required as a result of Protection System component failure.

Requirement R1, Part 1.3.4 requires the entity to communicate revisions to Protection System settings that occur due to unforeseen circumstances and differ from those developed during the planning stages of projects.

Requirement R2

This requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall, for each BES Element with Protection System functions identified in Attachment A:

- Option 1: Perform a Protection System Coordination Study in a time interval not to exceed six-calendar years; or
- Option 2: Compare present Fault current values to an established Fault current baseline and perform a Protection System Coordination Study when the comparison identifies a 15 percent or greater deviation in Fault current values (either three phase

or phase to ground) at a bus to which the BES Element is connected, all in a time interval not to exceed six-calendar years;[3] or,

- Option 3: Use a~~A~~ combination of the above.

Over time, incremental changes in Fault current can accumulate enough to impact the coordination of Protection System functions affected by Fault current. To minimize this risk, Requirement R2 requires responsible entities to periodically (1) perform Protection System Coordination Studies and/or (2) review available Fault currents for those Protection System functions listed in Attachment A. Two triggers were established for initiating a review of existing Protection System settings to allow for industry flexibility.

In the first option, an entity may choose a time-based methodology to review Protection System settings, thus eliminating the necessity of establishing a Fault current baseline and periodically performing Fault current comparisons. This option provides the entity the flexibility to choose an interval of up to six-calendar years for performing the Protection System Coordination Studies for those Protection System functions in Attachment A. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The second option allows the entity to periodically check for a 15 percent or greater deviation in Fault current (either three-phase or phase-to-ground) from an established Fault current baseline for Protection Systems at each bus to which ~~an~~a BES Element is connected. Fault current baseline values can be obtained from the short-circuit studies performed by the Transmission Planners, Planning Coordinators, or Transmission Owners. This option allows the entity to choose an interval of up to six-calendar years to perform the Fault current comparisons and Protection System Coordination Studies. The six-calendar-year time interval was selected as a balance between the manpower required to perform the studies and the potential reliability impacts created by incremental changes of Fault current over time.

The accumulation of these incremental changes could affect the performance of Protection Systems during Fault conditions. A maximum Fault current deviation of 15 percent (when compared to the entity-established baseline) was established based on generally-accepted margins for setting Protection Systems in which incremental Fault current changes would not interfere with coordination. The 15 percent maximum deviation provides an entity with latitude to choose a Fault current threshold that best matches its protection philosophy, or other business considerations. The Fault current based option requires an entity to first establish a Fault current baseline to be used as a point of reference for future Fault current studies. The Fault current values used in the percent change calculation, whether three-phase or phase-to-ground Fault

[3] The initial Fault current baseline(s) shall be established by the effective date of this Reliability Standard and updated each time a Protection System Coordination Study is performed. The Fault current baseline for BES generating resources may be established at the generator, the generator step-up (GSU) transformer(s), or at the common point of connection at 100 kV or above. For dispersed power producing resources, the Fault current baseline may also be established at the BES aggregation point (total capacity greater than 75 MVA). If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline by performing a Protection System Coordination Study.

currents, are typically determined with all generation in service and all transmission BES Elements in their normal operating state.

~~An~~As described in the footnote for Requirement R2, Option 2, an entity that elects to initially use Option 2 ~~following the effective date of the standard,~~ must establish its baseline prior to the effective date of the standard. If an initial baseline was not established by the effective date of this Reliability Standard because of the previous use of an alternate option or the installation of a new BES Element, the entity may establish the baseline upon performing a Protection System Coordination Study. The Fault current ~~values used in the original~~ baseline values can be updated or ~~created~~established when a Protection System Coordination Study is performed. The baseline values at each bus to which ~~an~~a BES Element is connected are updated whenever a new Protection System Coordination Study is performed for the subject Protection System. The footnote also states that the Fault current baselines may be established for BES generating resources at the generator, the BES aggregation point for dispersed power producing resources, or at the common point of connection at 100 kV or above.

> **Example:** ~~An~~Prior to the effective date of PRC-027-1, an entity intending to use Option 2 of Requirement R2 establishes an initial baseline ~~is established at~~ ; e.g., 10,000 amps~~.~~ ~~During the first~~ at the bus to which the BES Element under study is connected. A short-circuit review~~, it is discovered~~ performed on March 1, 2024, for example, identifies that the Fault current has increased to 11,250 amps (12.5 percent deviation~~change~~); consequently, no Protection System Coordination Study is required since the increase is below the maximum 15 percent deviation. The baseline value for the next ~~study~~comparison (to be performed no later than December 31, 2030) remains at 10,000 amps because no study was ~~performed. However, during~~required as a result of the initial comparison. During the next six-year interval, Fault current comparison~~,~~ identifies that the Fault current has increased to 11,500 (15 percent deviation~~change~~); therefore, a Protection System Coordination Study is required~~,~~ (and must also be completed no later than December 31, 2030), and a new baseline of 11,500 amps would be established.
>
> **Note:** In the first review described above, if the entity decides to perform a Protection System Coordination Study at the 12.5 percent deviation and the results of the study indicate that the settings still meet the setting criteria of the entity, then no settings changes are required and the baseline Fault current(s) would be updated.

As a third option, an entity has the flexibility to apply a combination of the two methodologies. For example, an entity may choose the periodic Protection System review (Option 1) and review its Facilities operated above 300 kV on a six-calendar-year interval, while choosing to use the Fault current comparison (Option 2) for its Facilities operated below 300 kV.

~~Attachment A identifies the~~ The Protection System functions listed in Attachment A utilize AC current in their measurement to initiate tripping of circuit breakers and the coordination of these functions is susceptible to changes in the magnitude of available short-circuit Fault current. These functions ~~utilize AC current in their measurement to initiate tripping of circuit breakers~~are included in Attachment A based on meeting the following criteria: (1) available Fault current levels are used to develop settings, and (2) the functions require coordination with other Protection Systems. Examples of functions not included in Attachment A because they do not meet both of the criteria are differential relays and Fault detectors. The numerical identifiers in Attachment A represent general device functions according to *ANSI/IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations*.~~ The device functions listed in Attachment A are to be reviewed provided they require coordination with other Protection Systems. The following scenarios provide some examples for applying Attachment A.~~

The following provide additional information regarding the Protection System functions in Attachment A.

A "51 – AC inverse time overcurrent" relay connected to a CT on the neutral of a generator step-up transformer, referred to as "51N – AC Inverse Time Earth Overcurrent Relay (Neutral CT Method)" in ANSI/IEEE Standard C37.2, would be included in a Protection System Coordination Study. Also applicable, are "51 – AC Inverse time overcurrent" relays connected to CTs on the phases of an autotransformer for through-fault protection. Overcurrent functions used in conjunction with other functions are to be reviewed as well. An example is a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function used in conjunction with a "62 – Time-delay" function.

If the functions listed in Attachment A are used in conjunction with other functions, they would be included in a Protection System Coordination Study provided they require coordination with other Protection Systems. An example of this is a time-delayed "21 – Distance" function, which is a "21 – Distance" function with a "62 – Time-delay" function. Another example would be a definite-time overcurrent function, which is a "50 – Instantaneous overcurrent" function with a "62 – Time-delay" function. A "50 – Instantaneous overcurrent" function used for supervising a "21 – Distance" function would not be included in a Protection System Coordination Study as it does not require coordination with other Protection Systems.

Reviewing "21 – Distance" functions is limited to those applied for phase and ground distance where infeed is used in determining the phase or ground distance setting when zero-sequence mutual coupling is used in determining the setting. Where infeed is not used in determining the setting, "21 – Distance" functions would not be included in a Protection System Coordination Study, as the reach is not susceptible to changes in the magnitude of available short-circuit Fault current. Where infeed is used in determining the reach, coordination can be affected by changes in the magnitude of available short-circuit Fault current. Two examples where infeed may be used in determining the reach, are protection for a transmission line with a long tap and a three-terminal transmission line. Ground distance functions are influenced by zero-sequence mutual coupling. The ground distance measurement can appear to be greater than or less than the true distance to a Fault when there is zero-sequence mutual coupling. The influence of zero-sequence mutual coupling changes with the magnitude of available short-circuit current. Therefore, "21 – Distance" functions would be included in a Protection System Coordination Study, when zero-sequence mutual coupling is used in determining the setting.

The 67 – AC directional overcurrent function utilized in Protection Systems for Transmission lines can be instantaneous overcurrent, inverse time overcurrent, or both instantaneous overcurrent and inverse time overcurrent. For example, in a communication-aided directional comparison blocking (DCB) scheme, the instantaneous overcurrent function is set very sensitive. When a single line-to-ground Fault occurs on a Transmission line, the Fault is detected by a number of Protection Systems for other Transmission lines. Signals from communication equipment are transmitted and received to block the other Protection Systems for the non-faulted Transmission lines from operating, thereby providing the coordination. A 67 – AC directional overcurrent function used in a permissive overreaching transfer trip scheme (POTT) relies on a signal from the remote end to operate and, therefore, does not require coordination with other Protection Systems.

Instantaneous overcurrent and/or inverse time overcurrent for a 67 – AC directional overcurrent function are utilized in a non-communication-aided Protection System for Transmission lines. As communication is not used to prevent operation for Faults outside a Protection System's zone of protection, coordination is necessary with other Protection Systems for buses, transformers, and other Transmission lines. The instantaneous overcurrent function should be set to not overreach the end of the Transmission line. The inverse time overcurrent function should be set to coordinate with the inverse time overcurrent function of other Protection Systems. Changes in the magnitude of available Fault current can affect the coordination.

Requirement R3

The requirement states: Each Transmission Owner, Generator Owner, and Distribution Provider shall utilize its process established in Requirement R1 to develop new and revised Protection System settings for BES Elements.

The reliability objective of this requirement is for applicable entities to utilize the process established in Requirement R1. Utilizing each of the elements of the process ensures a consistent approach to the development of accurate Protection System settings, decreases the possibility of introducing errors, and increases the likelihood of maintaining a coordinated Protection System.

Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT adoption, the text from the rationale text boxes will be moved to this section.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2007-06 System Protection Coordination

Approvals Requested

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Retirements Requested

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals (for Retirements Requested)

- TOP-009-1 – Knowledge of Composite Protection Systems and Remedial Action Schemes and Their Effects

Applicable Entities

- Transmission Owner
- Generator Owner
- Distribution Provider (that owns Protection Systems identified in the Facilities section 4.2 of PRC-027-1)

New or Modified Term(s) for Glossary of Terms Used in NERC Reliability Standards

Protection System Coordination Study

An analysis to determine whether Protection Systems operate in the intended sequence during Faults.

Effective Date of New or Revised Standards

PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Reliability Standard PRC-027-1 shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and TOP-009-1. NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and TOP-009-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).

quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for New or Modified NERC Glossary Terms

The NERC Glossary Term “Protection System Coordination Study” shall become effective on the effective date for PRC-027-1.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

PRC-001-1.1(ii) – System Protection Coordination shall be retired at midnight of the day immediately prior to the day that TOP-009-1 and PRC-027-1 become effective.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

calendar quarter that is ~~twelve (12~~twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Effective Date for New or Modified NERC Glossary Terms

The NERC Glossary Term "Protection System Coordination Study" shall become effective on the effective date for PRC-027-1.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

PRC-001-1.1(ii) – System Protection Coordination shall be retired at midnight of the day immediately prior to the day that TOP-009-1 and PRC-027-1 become effective.

Initial Performance of Requirement R2

For each option under Requirement R2, the six-calendar-year interval begins on the effective date of PRC-027-1. The initial Protection System Coordination Study(ies) for Option 1, and the Fault current comparison(s) and any Protection System Coordination Study(ies) required as a result of the Fault current comparison(s) in Option 2 must be completed in accordance with Requirement R2 no later than six-calendar years after the effective date of PRC-027-1. However, applicable entities using Option 2 for their initial performance of Requirement R2 must establish an initial Fault current baseline by the effective date of PRC-027-1.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Final Ballot Open through October 14, 2015

Now Available

A final ballot for **PRC-027-1 – Coordination of Protection Systems for Performance During Faults** is open through **8 p.m. Eastern, Wednesday, October 14, 2015.**

Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a vote. All ballot pool members may change their previously cast vote. A ballot pool member who failed to vote during the previous ballot period may vote in the final ballot period. If a ballot pool member does not participate in the final ballot, the member's vote from the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard here. If you experience any difficulties using the Standards Balloting & Commenting System (SBS), contact Wendy Muller.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at EROhelpdesk@nerc.net (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The voting results for the standard will be posted and announced after the ballot closes. If approved, the standard will be submitted to the Board of Trustees for adoption. Once TOP-009-1 is approved by ballot and adopted by the Board of Trustees, PRC-027-1 will be filed with the appropriate regulatory authorities in conjunction with TOP-009-1 to achieve the complete retirement of PRC-001-1.1(ii).

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Al McMeekin (via email), or at (404) 446-9675.

Standards Announcement

Project 2007-06 System Protection Coordination
PRC-027-1

Final Ballot Results

Now Available

A final ballot for **PRC-027-1 – Coordination of Protection Systems for Performance During Faults** concluded **8 p.m. Eastern, Wednesday, October 14, 2015.**

The standard received sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides detailed results for the ballot.

Ballot
Quorum / Approval
89.16% / 80.94%

Next Steps

The standard will be submitted to the Board of Trustees for adoption. Once TOP-009-1 (Project 2007-06.2) is approved by ballot and adopted by the Board of Trustees, PRC-027-1 will be filed with the appropriate regulatory authorities in conjunction with TOP-009-1 to achieve the complete retirement of PRC-001-1.1(ii).

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Al McMeekin (via email), or at (404) 446-9675.

Summary of Development History and Record of Development for Project 2007-06.2 Phase 2 of System Protection Coordination

Summary of Development History for Project 2007-06.2 Phase 2 of System Protection Coordination

Summary of Development History

The development record for proposed Reliability Standard PER-006-1 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived from the standard drafting team selected to lead each project in accordance with Section 4.3 if the NERC Standards Process Manual.[2] For this project, the standard drafting team consisted of industry experts, all with a diverse set of experiences. A roster of the standard drafting team members is included in **Exhibit H**.

II. Standard Development History

A. Standard Authorization Request Development

To address a FERC directive in Order No. 693[3], a Standard Authorization Request was approved by the Standards Committee and posted in Project 2007-06 for a 30-day informal comment period from June 11, 2007 through July 10, 2007. In conjunction with Project 2007-06 System Protection Coordination (Phase 1), a subsequent Phase 2 of System Protection Coordination was initiated in 2015 to address the remaining Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii).

---

1 Section 215(d)(2) of the Federal Power Act; 16 U.S.C. §824(d) (2) (2012).

2 The NERC *Standard Processes Manual* is available at http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf.

3 Order No. 693, *Mandatory Reliability Standards for the Bulk-Power System*, 72 Fed. Reg. 16416 (2007) (to be codified at 18 C.F.R. pt. 40).

B. First Posting – Formal Comment Period, Initial Ballot and Non-Binding Poll

Proposed Reliability PER-006-1[4] was posted for a 45-day formal comment period from March 10, 2016 through April 25, 2016, with an initial ballot held from April 15, 2016 through April 25, 2016. Several documents were posted for guidance with the first draft, including the Unofficial Comment Form, Mapping Document, the Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") Justification document, and the Evaluation of Definition Impacts to Reliability Standards document. The initial ballot received 83.67% quorum, and 80.57% approval. The Non-binding Poll for VRFs and VSLs reached quorum at 80.73% of the ballot pool, and the standard and associated documents received support from 71.43% of the voters. There were 54 sets of responses to the posting, including comments from approximately 126 different individuals from approximately 93 companies representing 8 of the 10 of the industry segments.[5]

C. Final Ballot

Proposed Reliability Standard PER-006-1 was posted for a 10-day final ballot period from May 17, 2016 through May 26, 2016. The ballot for the proposed Reliability Standard and associated documents reached quorum at 88.96% of the ballot pool, and the standard received sufficient affirmative votes for approval, receiving support from 82.52% of the voters.[6]

---

[4] The standard drafting team ("SDT") initially authorized TOP-009-1 for posting to address the reliability objective of Requirement R1. However, industry comments from the initial and subsequent formal postings of TOP-009-1, led the SDT to alter its approach. The SDT decided to address the reliability objective through a Personnel Performance, Training, and Qualifications ("PER") Reliability Standard and developed PER-006-1.

Status
Final ballots for **PER-006-1 – Specific Training for Personnel** and the modified definitions of **"Operational Planning Analysis" (OPA)** and **"Real-time Assessment"(RTA)** concluded **8 p.m. Eastern, Thursday, May 26, 2016.** The voting results for the standard and definitions can be accessed via the links below. The standard and definitions will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Retirement of PRC-001-1.1(ii)
In conjunction with Project 2007-06 System Protection Coordination (Phase 1), NERC is proposing the complete retirement of PRC-001-1.1(ii). Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination. See the Mapping Document below for an explanation of how the reliability objectives of those requirements are addressed by other standards, the proposed PER-006-1 (*Specific Training for Personnel*), and the definition modifications to "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA). The remaining two Requirements R3 and R4 of PRC-001-1.1(ii) are addressed by PRC-027-1 (*Coordination of Protection Systems for Performance During Faults*). For details for Phase 1 are found on the 2007-06 project page. The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of Reliability Standards PRC-027-1 and the proposed PER-006-1 and definition modifications under Phase 2. NERC is proposing the retirement of PRC-001-1.1(ii) in the implementation plans associated with both projects.

Background
Phase 1 (2007-06)
The System Protection Coordination Standard Drafting Team developed a new Reliability Standard, PRC-027-1 to address coordination of Protection System performance during Faults. This standard incorporates and clarifies the Protection System coordination aspects of Requirements R3 and R4 contained in PRC-001-1.1 that is proposed for complete retirement.

Phase 2 (2007-06.2)
Phase 2 is addressing the remaining Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). See the Mapping Document for a complete explanation on how the reliability objectives of Requirements R1, R2, R5, and R6 are addressed by other standards, the modified definitions of OPA and RTA, and the proposed PER-006-1 Reliability Standard.

Standard(s) Affected: PER-006-1 - Specific Training for Personnel, Retirement of PRC-001-1.1 (ii) - System Protection Coordination

Purpose / Industry Need
Protection System coordination among registered owners of the Protection Systems associated with Interconnected Elements is key to the reliability of the Bulk Electric System.

Standard Authorization Request Form

Title of Proposed Standard	**PRC-001-1 — System Protection Coordination (Project 2007-06)**
Request Date	May 7, 2007

SAR Requestor Information		**SAR Type** (*Check a box for each one that applies.*)
Name NERC System Protection and Control Task Force (Attachment A)	☐	New Standard
Primary Contact Charles Rogers (SPCTF Chairman)	☒	Revision to existing Standard
Telephone 517-788-0027 Fax 517-788-0917	☐	Withdrawal of existing Standard
E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination"

The drafting team will also make the improvements to the standard identified in Attachment C – "Reliability Standards Review Guidelines" to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes

5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities
4.2. Transmission Operators
4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: ~~R2.1.~~If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. ~~R2.2.~~If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

Not only new protective systems and changes to protective systems should be coordinated. A

> **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
>
> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

> **R4.** Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

> **R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others:
>
> **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems.
>
> **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

R6.	Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures
Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

R1.2 – Generators
Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d'), sub transient reactance (X_d"), and the associated time constants (T_{do}, T_{do}', and T_{do}") for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.

R1.3 – Transmission Lines
Recommend specifying the positive and zero sequence impedance, including mutual impedances

R1.5 – Transformers
Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

> "The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes."

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the "Draft Reliability Standards Development Plan: 2007–2009", which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, "System Protection Project (2009-01)", and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, ‘Regional Reliability Organization’ with ‘Regional Entity’

Fill-in-the-blank Requirements
Do not include any ‘fill-in-the-blank’ requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, ‘Associated Documents’.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Maureen E. Long
Standards Process Manager

June 11, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Comment Periods Open

The Standards Committee (SC) announces the following standards actions:

SAR for System Protection Coordination (Project 2007-06) Posted for 30-day Comment Period June 11–July 10, 2007

The SAR for Project 2007-06 — System Protection Coordination proposes to address the FERC directives in Order 693 and to address a number of technical shortcomings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

The purpose of the proposed standard is to assure that protection system application and performance issues are coordinated among all related entities. Please use this comment form to submit comments on this SAR.

SAR for Protection System Maintenance & Testing (Project 2007-17) Posted for 30-day Comment Period June 11–July 10, 2007

This SAR for Project 2007-17 — Protection System Maintenance and Testing proposes to merge the requirements from the following standards into a single standard to reduce the costs of compliance while also improving efficiencies:

- PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing
- PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs
- PRC-011-0 — UVLS System Maintenance and Testing
- PRC-017-0 — Special Protection System Maintenance and Testing

The SAR also proposes to address the FERC directives in Order 693 and to address a number of technical shortcomings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

The purpose of the proposed standard is to ensure all transmission and generation protection systems affecting the reliability of the bulk power system are maintained and tested to support reliable operation performance when responding to abnormal system conditions. Please use this comment form to submit comments on this SAR.

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: None
   Comments:

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: No
   Comments:

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: Development of intercompany short circuit modeling should be cover in a separte MOD standard. Maintaining one large overall regional short circuit model is neither practical nor necessary. Standard methods to exchange short circuit data of tie-line plus one breakered bus into the neighboring systems should be adeqaute and be developed. Otherwise Ameren agrees with SPCTF recommendations.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☐ Yes

   ☒ No

   Comments: There might not be a directly reliability driver for improving this standard, but the standard should be improved to better clarify responsibilities.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: None
   Comments: None

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: Possibly
   Comments: AEP and other utilities, with many years of experience serving customers and supporting the electric grid, have voluntarily integrated protection coordination processes into the core of their work practices . AEP fully supports improvements if they truly foster reliability and availability benefits to bulk power transfers. More Standards, Requirements, and Business Practices are not always better. If Standards create burdens on a utility's physical resources and budgets, then some mechanism must be available to allow for the needed changes.

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: For clarifying protective systems, the standard should not use the term Bulk Electric System, but should instead specify a voltage threshold for impacts to bulk system transfers - specifically; 'Facilites operated 200 kV and above and Regionally-defined, Operationally Significant facilities operated greater than 100 kv, but less than 199 kV'. The term 'affects' also needs to be clarified. Inclusion of all facilities greater than 100 kV does not benefit the reliability of national bulk power transfers. For example, the loss or misoperation of a 138 kV line serving a localized load center would not be detremental to bulk power transfers multiple busses away.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments: Standard has much room for improvement.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments: Moving R6 regarding SPS monitoring and status notification to more appropriate PRC SPS section makes sense.

   Have concern about NERC SPCTF recommendation of merging system short-circuit databases for perfoming wide-area fault studies. See additional comments below.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:
   Comments:

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: Data entry and maintenance procedures for proposed wide-area short circuit model would need to be developed.
   Comments: Creating and maintaining the proposed wide-area short-circuit database, although useful, might prove quite difficult to implement.

   Among our concerns:

Impedance units- Ohms or per unit? If per unit, using what common base?

CAPE to ASPEN & ASPEN to CAPE conversion issues?

Need for unique and consistent bus numbers for all busses in combined database.

If using CAPE, coordination and application of database categories.

Who would be responsible for merging the databases and then maintaining the common database? How often would the databases be remerged to reflect system changes?

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: Background Information Section on this comment sheet should read:

   Please e-mail your comments on this form to sarcomm@nerc.net with subject "Protection Coordination SAR" in subject line, not "Protection Maintenance SAR" as stated.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments:

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:
   Comments: No known variance

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☐ Yes

   ☒ No

   Comments: Under the section of Detailed Description it is stated:

   "This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination"

   It seems that it would be more effective to pull the PRC-001 standard from the scope of of the 2006-06 project which deals with mulitple standards and allow this SDT to focus on all aspects of the PRC-001. The SPCTF raised concerns with PRC-001 in both the planning and operations time-frame and it does not appear that the 2006-06 project is scoped to address the SPCTF items.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☐ Yes

   ☒ No

   Comments: FE agrees with the SPCTF that the TO, GO and DP should be added to the applicability section of this standard as many of the requirements will originate from these entities. However, it may be necessary to to add the Tranmission Planner (TP) entity for "planning" related requirements. For example, the existing R3 requires coordination of new or revised protections systems. It may be short-sighted to assume that the TO is the entity who would coordinate this work; there may be situations where a Transmission Planner performs this work and is best suited to share the information with neighboring system owners/planners as well as the Planning Coordinator.

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☒ No

   Comments: Incorporating assessments by subject matter experts such as this NERC SPCTF / Planning Committee assessment into the NERC Standards revision SAR project is an efficient way to supplement project SARs and allows for valuable input at the front-end of the standards process.

   Attachments A and C are not included in the SAR and Attachment B is identified as "Supporting Material". It may be clearer to include all applicable documents within the SAR including including relevant excerpts from any FERC assessmentss and requested changes to the standard.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☐ Yes

   ☐ No

   Comments: This question may be better addressed as the standard is drafted.

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance:

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the “Standard Review Guidelines.”

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject “Protection Maintenance SAR” by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments: No comments.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments: No comments.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments: No comments

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: None.
   Comments: No variance necessary.

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: None.
   Comments: No comments.

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: No comments.

Please use this form to submit comments on the proposed SAR for Project 2007-06 — System Protection Coordination. Comments must be submitted by **July 10, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "System Protection" in the subject line. If you have questions please contact Al Calafiore at al.calafiore@nerc.net or by telephone at 609-452-8060.

   Business Practice: None
   Comments:

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments:
   1. The MRO commends NERC and the SDT for taking the necessary steps to remove the vagueness and ambiguity in the requirements; as well as the need to have clarity and measurability now that the industry has transitioned to mandatory and enforceable standards.

2. The SPCTF Assessment of PRC-001-1 did not mention how they would address "Corrective Actions" listed in R2. The MRO requests that the SDT expand on what the scope of these "Corrective Actions" is meant to be (e.g. real-time, or after the fact repair or replacement of defective equipment).

   Comments: I am concerned with the language proposed by FERC and the comparison to reactions to IROL's. Will FERC's requirement apply to a single protection system that has a redundant protection system? Will FERC's requirement apply to a system that is in an "overexposed" state? Will FERC's requirement apply to a system that may be exposed to slow 30 cycle of less tripping. These conditions must be identified in detail as to what will need to meet the "returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes." FERC requirement

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments:

2. Do you agree with the proposed scope of this SAR?

   ☐ Yes

   ☒ No

   Comments: Consideration should be given to splitting this effort among 2 or 3 standards to address the operating, operations planning, and planning horizons. Consideration should also be given to moving the operating training requirements to another standard (if not already covered by an existing standard).

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments: The requirements for the PC, TO, GO, and DP (planning horizon) should be in a separate standard than those for the RC, BA, TOP, and GOP (operating and operations planning horizons).

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: none

Background Information

This SAR proposes to improve and expand upon the requirements in PRC-001 — System Protection Coordination. Note that some of the requirements in PRC-001 involve real-time control actions taken by entities other than the facility owners, and these requirements may be moved from PRC-001 into Project 2006-06 — Reliability Coordination.

The SAR proposes to address the FERC directives in Order 693 and to address a number of technical short comings identified by stakeholders and the System Protection and Control Task Force and to bring the standard into conformance with the "Standard Review Guidelines."

Please review the SAR and then answer the questions on the following page. Please e-mail your comments on this form to sarcomm@nerc.net with the subject "Protection Maintenance SAR" by **July 10, 2007**.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that there is a reliability-related need to improve the requirements in this standard?

   ☒ Yes

   ☐ No

   Comments: We agree that there is a need to improve the requirements of Standard PRC-001-0 and Standard MOD-011-0 as described in the supplemental document "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination". It is important to modify ambiguous statements such as "…corrective action needs to be taken…" and "must be done…as soon as possible…". By making the improvements described in the SAR, the standard will provide the applicable entities with more definitive requirements that will allow entities to provide specific responsibilities to internal work groups within the standard utility organization.

2. Do you agree with the proposed scope of this SAR?

   ☒ Yes

   ☐ No

   Comments: Another important change described in this SAR is the requirement to have an up-to-date accurate model of the transmission system for protection studies. It is extremely important to develop these accurate models to allow enhance the reliability of the bulk-electric system. There are efforts underway in the southwest that apply directly to the development of this type of model by late 2007.

3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?

   ☒ Yes

   ☐ No

   Comments: We agree that the applicable entities for this standard be modified to include the various "Owner" entities as described in the NERC Functional Model Version 3.

4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.

   Regional Variance: N/A
   Comments: Not aware of any Regional Variance requirements

5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.

   Business Practice: N/A
   Comments: Not aware of any Business Practice needs

6. If you have any other comments on this SAR that you haven't provided above, please provide them here.

   Comments: N/A

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Consideration of Comments on 1st Draft of System Protection Coordination SAR (Project 2007-06)

The System Protection Coordination SAR requesters thank all commenters who submitted comments on the first draft of SAR. This SAR was posted for a 30-day public comment period from June 11 through July 10, 2007. The requesters asked stakeholders to provide feedback on the standard through a special SAR Comment Form. There were 17 sets of comments, including comments from 72 different people from more than 48 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

The SAR drafting team made two changes to the SAR based on stakeholder comment:

- Added the Transmission Planner as a reliability function that may be assigned requirements in the revised standard
- Added a sentence to clarify that the monitoring requirements in PRC-001 will not be included in the scope of revisions addressed under this project as they are already being addressed under Project 2006-06 — Reliability Coordination.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving the SAR forward to the standard drafting stage of the standards development process.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/System_Protection_Project_2007-06.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

Index to Questions, Comments, and Responses

1. Do you agree that there is a reliability-related need to improve the requirements in this standard? 6
2. Do you agree with the proposed scope of this SAR? 8
3. Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)? 11
4. If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area. 14
5. If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us. 15
6. If you have any other comments on this SAR that you haven't provided above, please provide them here. 17

1. **Do you agree that there is a reliability-related need to improve the requirements in this standard?**

Summary Consideration: Most commenters agreed that there is a reliability-related need for this SAR. There were no changes made in response to these comments.

Question #1			
Commenter	**Yes**	**No**	**Comment**
AEP		☑	There might not be a directly reliability driver for improving this standard, but the standard should be improved to better clarify responsibilities.
Response: The SAR DT agrees with the comment that the standard should be improved to better clarify responsibilities, but the drafting team also believes that clarifying responsibilities is reliability related.			
SWTC	☑		We agree that there is a need to improve the requirements of Standard PRC-001-0 and Standard MOD-011-0 as described in the supplemental document "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination". It is important to modify ambiguous statements such as "...corrective action needs to be taken..." and "must be done...as soon as possible...". By making the improvements described in the SAR, the standard will provide the applicable entities with more definitive requirements that will allow entities to provide specific responsibilities to internal work groups within the standard utility organization.
Response: The SAR DT thanks you for your support.			
ATC	☑		Standard has much room for improvement.
Response: The SAR DT agrees with the comment.			
PSC SC	☑		
SERC EC PCS	☑		
BPA	☑		
Consumers Energy	☑

Question #1			
Commenter	**Yes**	**No**	**Comment**
HQTE	☑		
FRCC	☑		
IRC SRC	☑		
FirstEnergy	☑		

2. **Do you agree with the proposed scope of this SAR?**

Summary Consideration: Most commenters agreed with the proposed scope of the SAR. The SAR DT modified the SAR to clarify that it will coordinate with other DTs to ensure that all requirements in PRC-001will be addressed by one and only one drafting team. The monitoring requirements will be transferred to the DT working on Project 2006-06 for Reliability Coordination.

Question #2			
Commenter	**Yes**	**No**	**Comment**
SERC EC PCS		☑	Consideration should be given to splitting this effort among 2 or 3 standards to address the operating, operations planning, and planning horizons. Consideration should also be given to moving the operating training requirements to another standard (if not already covered by an existing standard).
Response: The SDT will coordinate with the Reliability Coordination standard drafting team working on Project 2006-06 to address these issues. The SAR DT believes that the monitoring requirements should be addressed by the Reliability Coordination SDT, however for coordination and understanding, the SAR DT believes the remaining requirements should be in one standard.			
FirstEnergy		☑	Under the section of Detailed Description it is stated: "This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled "NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination" It seems that it would be more effective to pull the PRC-001 standard from the scope of of the 2006-06 project which deals with mulitple standards and allow this SDT to focus on all aspects of the PRC-001. The SPCTF raised concerns with PRC-001 in both the planning and operations time-frame and it does not appear that the 2006-06 project is scoped to address the SPCTF items.
Response: The SAR DT modified the SAR to clarify that it will coordinate with other drafting teams to ensure that all requirements in PRC-001 will be addressed by one and only one drafting team. The monitoring requirements will be transferred to the DT working on project 2006-06 Reliability Coordination)			
FRCC	☑	☑	Incorporating assessments by subject matter experts such as this NERC SPCTF / Planning Committee assessment into the NERC Standards revision SAR project is an efficient way to supplement project SARs and allows for valuable input at the front-end of the standards process.

			Attachments A and C are not included in the SAR and Attachment B is identified as "Supporting Material". It may be clearer to include all applicable documents within the SAR including relevant excerpts from any FERC assessments and requested changes to the standard.
Response: The SAR DT will ensure that all attachments are clearly labeled and all pertinent documents are included in the final posting.			
SWTC	☑		Another important change described in this SAR is the requirement to have an up-to-date accurate model of the transmission system for protection studies. It is extremely important to develop these accurate models to allow enhance the reliability of the bulk-electric system. There are efforts underway in the southwest that apply directly to the development of this type of model by late 2007.
Response: The SAR DT agrees with your observation- please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a separate SAR to revise MOD-011.			
ATC	☑		Moving R6 regarding SPS monitoring and status notification to more appropriate PRC SPS section makes sense. Have concern about NERC SPCTF recommendation of merging system short-circuit databases for perfoming wide-area fault studies. See additional comments below.
Response: The SAR DT agrees that R6 should be addressed in another standard; however, the SAR DT believes it belongs in a standard that addresses a broader range of monitoring activities. Please see the summary consideration of comments

3. **Do you agree with the applicability of the proposed SAR (Reliability Coordinators, Balancing Authorities, Planning Coordinators, Transmission Operators, Transmission Owners, Generator Owners, Generator Operators and Distribution Providers)?**

Summary Consideration: Based on stakeholder comments, Transmission Planners have been added to the list of applicable entities.

Question #3			
Commenter	**Yes**	**No**	**Comment**
FRCC			This question may be better addressed as the standard is drafted.
Response: The SAR DT is required to identify the proposed applicability. The applicability will be finalized during standard drafting			
CP9 RSWG		☑	recommend that Transmission Planners be added
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
HQTE		☑	recommend that Transmission Planners be added
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
FirstEnergy		☑	FE agrees with the SPCTF that the TO, GO and DP should be added to the applicability section of this standard as many of the requirements will originate from these entities. However, it may be necessary to add the Transmission Planner (TP) entity for "planning" related requirements. For example, the existing R3 requires coordination of new or revised protections systems. It may be short-sighted to assume that the TO is the entity who would coordinate this work; there may be situations where a Transmission Planner performs this work and is best suited to share the information with neighboring system owners/planners as well as the Planning Coordinator.
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
IESO	☑	☑	It is not clear based on the information presented how all the functional entities are involved. As an example, no reference is noted in the documents for PC responsibility. Is it inferred that if a coordination model is developed on a wide area basis, the PC will be the responsible entity? Functional Model entity definitions, tasks, and obligations must be followed while developing applicability of the requirements.
Response: the SAR DT checked all the functional entities that are currently assigned responsibility for requirements in PRC-001 and also checked those functional entities that are expected to be assigned requirements based on the SPTCF analysis of PRC-001. Please see the SPTCF report posted as a supporting document on the website.			

Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in another SAR for modifications to MOD-011. As envisioned, a new requirement may need to be developed to support the orignial R1 which says: R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protection system schemes applied in its area. Although the original R1 is not written in a format that is easy to measure, the SAR DT believes the intent of R1 is to ensure that real-time operating personnel have information about protection schemes so they will know what actions to take when the protection schemes are not in service. The SAR DT believes the Planning Coordinator may be the best functional entity to provide this data to the real-time operating personnel. As envisioned, this discussion will take place with stakeholders during standard drafting. The standards process requires that DTs consider the Functional Model elements when developing standards.			
IRC SRC	☑	☑	It is not clear based on the information presented if all the functional entities involved are identified in the scope of the standard. As an example, no reference is noted in the documents for TP responsibility. It is inferred that if a coordination model is developed on a wide area basis, the PC will be the only responsible entity. However there may be requirements for the TP as well.
Response: The SAR DT agrees and Transmission Planners have been added to the applicability list.			
SERC EC PCS	☑		The requirements for the PC, TO, GO, and DP (planning horizon) should be in a separate standard than those for the RC, BA, TOP, and GOP (operating and operations planning horizons).
Response: While the SAR DT agrees that some requirements for entities providing real time operations should be transferred to other standards, for coordination and understanding the SAR DT believes the remaining requirements should be in one standard.			
SWTC	☑		We agree that the applicable entities for this standard be modified to include the various "Owner" entities as described in the NERC Functional Model Version 3.
Response: The SAR DT agrees - thank you for your comments.

4. **If you know of a Regional Variance that should be developed as part of this SAR, please identify that for us. If not, please explain in the comment area.**

Summary Consideration: The stakeholders who submitted comments did not identify any regional variances.

Question #4		
Commenter	**Regional Variance**	**Comment**
PSC SC	N/A	
SERC EC PCS	None.	
AEP	None.	None.
BPA		No known variance.
Consumers Energy	N/A	
SWTC	N/A	Not aware of any Regional Variance requirements.
ATC	N/A	
Manitoba Hydro	None	No variance necessary.
CP9 RSWG	N/A	No Regional Variance
Ameren	None	
MRO	None	
HQTE		No Regional Variance
FRCC	N/A	
FirstEnergy		Aware of none

5. **If you are aware of a Business Practice that needs to be developed to support the proposed SAR, please identify that for us.**

Summary Consideration: The stakeholders who submitted comments did not identify any specific business practice that need to be developed to support the modifications to PRC-001 proposed with this SAR.

Question #5		
Commenter	**Business Practice**	**Comment**
AEP	Possibly	AEP and other utilities, with many years of experience serving customers and supporting the electric grid, have voluntarily integrated protection coordination processes into the core of their work practices . AEP fully supports improvements if they truly foster reliability and availability benefits to bulk power transfers. More Standards, Requirements, and Business Practices are not always better. If Standards create burdens on a utility's physical resources and budgets, then some mechanism must be available to allow for the needed changes.
Response: Please monitor the work of the SDT and advise us if added burdens are created and advise us of the need for any business practice or other mechanism necessary.		
ATC	Data entry and maintenance procedures for proposed wide-area short circuit model would need to be developed.	Creating and maintaining the proposed wide-area short-circuit database, although useful, might prove quite difficult to implement. Among our concerns: Impedance units- Ohms or per unit? If per unit, using what common base? CAPE to ASPEN & ASPEN to CAPE conversion issues? Need for unique and consistent bus numbers for all busses in combined database. If using CAPE, coordination and application of database categories. Who would be responsible for merging the databases and then maintaining the common database? How often would the databases be remerged to reflect system changes?
Response: Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a SAR proposing changes to MOD-011.		
PSC SC		N/A
SERC EC PCS	None.	
Consumers Energy	N/A	
SWTC	N/A	Not aware of any Business Practice needs.
Manitoba Hydro	None	No comments
CP9 RSWG		No Business Practice

Question #5		
Commenter	**Business Practice**	**Comment**
Ameren	No	
MRO	None	
HQTE		No Business Practice
FirstEnergy		Aware of none

6. **If you have any other comments on this SAR that you haven't provided above, please provide them here.**

Summary Consideration: The SAR DT did not make any changes to the SAR based on modifications proposed by stakeholders in response to this question.

Question #6	
Commenter	**Comment**
AEP	For clarifying protective systems, the standard should not use the term Bulk Electric System, but should instead specify a voltage threshold for impacts to bulk system transfers - specifically; 'Facilites operated 200 kV and above and Regionally-defined, Operationally Significant facilities operated greater than 100 kv, but less than 199 kV'. The term 'affects' also needs to be clarified. Inclusion of all facilities greater than 100 kV does not benefit the reliability of national bulk power transfers. For example, the loss or misoperation of a 138 kV line serving a localized load center would not be detremental to bulk power transfers multiple busses away.
Response: The comment will be referred to the SDT when convened for consideration when drafting the standard.	
FRCC	The Drafting team should coordinate any system protection terminology introduced or re-defined within this standard with other system protection related SARs (i.e. Disturbance monitoring, System Protection Maintenance and Testing) to ensure common terminology is appropriately defined in the standards glossary.
Response: This coordination is required by the standards process. The comment will be referred to the SDT when convened for consideration when drafting the standard.	
SRP	I am concerned with the language proposed by FERC and the comparison to reactions to IROL's. Will FERC's requirement apply to a single protection system that has a redundant protection system? Will FERC's requirement apply to a system that is in an "overexposed" state? Will FERC's requirement apply to a system that may be exposed to slow 30 cycle of less tripping. These conditions must be identified in detail as to what will need to meet the "returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes." FERC requirement
Response: The comment will be referred to the SDT when convened for consideration when drafting the standard.	
ATC	Background Information Section on this comment sheet should read: Please e-mail your comments on this form to sarcomm@nerc.net with subject "Protection Coordination SAR" in subject line, not "Protection Maintenance SAR" as stated.
Response: Thank you for your comment	
Ameren	Development of inter-company short circuit modeling should be cover in a separate MOD standard. Maintaining one large overall regional short circuit model is neither practical nor necessary. Standard methods to exchange short circuit data of tie-line plus one breakered bus into the neighboring systems should be adequate and be developed. Otherwise Ameren agrees with SPCTF recommendations.
Response: Please note the SPCTF's proposed changes for modeling are not addressed in this SAR – they are expected to be addressed in a SAR proposing changes to MOD-011.	
MRO	The MRO commends NERC and the SDT for taking the necessary steps to remove the vagueness and ambiguity

	in the requirements; as well as the need to have clarity and measurability now that the industry has transitioned to mandatory and enforceable standards. The SPCTF Assessment of PRC-001-1 did not mention how they would address "Corrective Actions" listed in R2. The MRO requests that the SDT expand on what the scope of these "Corrective Actions" is meant to be (e.g. real-time, or after the fact repair or replacement of defective equipment).
Response: These issues are discussed in FERC Order 693 and will be considered by the SDT	
IESO	The IESO commends NERC, the SDT and the SPCTF (White Paper) for providing clarifications and improvements in the system protection areas.
Response: Thank you	
IRC SRC	The SRC commends NERC, the SDT and the SPCTF for providing this clarification and improvements in the system protection areas.
Response: Thank you	
PSC SC	N/A
SERC EC PCS	None.
Consumers Energy	None.
SWTC	N/A
Manitoba Hydro	No comments
CP9 RSWG	None
HQTE	None
FirstEnergy	none

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standard Authorization Request Form

Title of Proposed Standard	**PRC-001-1 — System Protection Coordination (Project 2007-06)**
Request Date	May 7, 2007
Revised Date	July 27, 2007

SAR Requestor Information		**SAR Type** (*Check a box for each one that applies.*)
Name NERC System Protection and Control Task Force (Attachment A)	☐	New Standard
Primary Contact Charles Rogers (SPCTF Chairman)	☒	Revision to existing Standard
Telephone 517-788-0027 Fax 517-788-0917	☐	Withdrawal of existing Standard
E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

The PRC 001 standards drafting team will coordinate the transfer of monitoring related requirements to appropriate other standards through coordination with the standards drafting teams associated with project 2006-06 (Reliability Coordination)

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled “NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination”

The drafting team will also make the improvements to the standard identified in Attachment C – “Reliability Standards Review Guidelines” to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Related Standards

Standard No.	Explanation
MOD-011-0	Modify to include the essential data for wide-area fault studies, as noted in the attached SPCTF report on PRC-001.

Appendices **8**

Appendix B — SYSTEM PROTECTION AND CONTROL TASK FORCE **9**

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities
4.2. Transmission Operators

4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

> **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
>
> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Not only new protective systems and changes to protective systems should be coordinated. A requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

> **R4.** Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

R5. A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others:

R5.1. Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems.

R5.2. Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

R6. Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures

Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately

apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

R1.2 – Generators
Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d'), sub transient reactance (X_d"), and the associated time constants (T_{do}, T_{do}', and T_{do}") for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.

R1.3 – Transmission Lines
Recommend specifying the positive and zero sequence impedance, including mutual impedances

R1.5 – Transformers
Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

"The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes."

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the "Draft Reliability Standards Development Plan: 2007–2009", which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, "System Protection Project (2009-01)", and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

> **High Risk Requirement**
> A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;
> or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.
>
> **Medium Risk Requirement**
> A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative

conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature; or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon
The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels
The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. (‘Violation severity levels’ replace existing ‘levels of non-compliance.’) The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more

significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.

- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, ‘Regional Reliability Organization’ with ‘Regional Entity’

Fill-in-the-blank Requirements
Do not include any ‘fill-in-the-blank’ requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, ‘Associated Documents’.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Standard Authorization Request Form

Title of Proposed Standard	**PRC-001-1 — System Protection Coordination (Project 2007-06)**
Request Date	May 7, 2007
Revised Date	July 27, 2007

SAR Requestor Information	**SAR Type** (*Check a box for each one that applies.*)	
Name NERC System Protection and Control Task Force (Attachment A)	☐	New Standard
Primary Contact Charles Rogers (SPCTF Chairman)	☒	Revision to existing Standard
Telephone 517-788-0027 Fax 517-788-0917	☐	Withdrawal of existing Standard
E-mail cwrogers@cmsenergy.com	☐	Urgent Action

Purpose (Describe the purpose of the standard — what the standard will achieve in support of reliability.)

The purpose of standard PRC-001-1 — System Protection Coordination should remain "To ensure system protection is coordinated among operating entities." The standard should be revised to:

1. Assure that Protection System application and performance issues are coordinated among all related entities.
2. Correct the applicable entities within the standard to reflect the actual functional responsibilities, as described in the NERC Functional Model.
3. Incorporate other general improvements described in the standards development work plan and from other sources.
4. Address directives received from ERO regulatory authorities.
5. Consider the observations and recommendations developed by the NERC SPCTF, which are detailed in the attached report (Attachment B), approved by the Planning Committee in December 2006.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

Protection system coordination is an absolute necessity for the North American electric system to operate properly. PRC-001 is a Version 0 standard, and was translated from an operating policy that was appropriate in an era of voluntary compliance.

The Version 0 standards and recent updates were put in place as a temporary starting point to start up the electric reliability organization and begin enforcement of mandatory standards. However, it is important to update those standards, incorporating improvements to make the standards more suitable for enforcement.

Both FERC (within Order 693) and the SPCTF (in their report on PRC-001) identified significant shortcomings in the existing standard.

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

The existing PRC-001 Standard has been identified in the Reliability Standards Development Plan as requiring revision, within the FERC Order 693 as requiring revisions, and by a SPCTF report (attached) which identified a number of issues with the existing standard (the SPCTF report, which precedes FERC Order 693, also includes observations from the preceding FERC NOPR on RM-06-16-000). This revision of PRC-001 should address concerns from these sources and should include the upgrades to the standard identified in Attachment C to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

The PRC 001 standards drafting team will coordinate the transfer of monitoring related requirements to appropriate other standards through coordination with the standards drafting teams associated with project 2006-06 (Reliability Coordination)

Detailed Description

This project will address the issues identified by the System Protection and Control Task Force for the planning-related requirements in PRC-001 as well as any planning-related concerns identified in FERC Order 693. (The operations-related requirements in PRC-001 are being addressed under Project 2006-06.) A detailed listing of the areas of the existing standard that need improvement is provided in Attachment B titled “NERC SPCTF Assessment of Standard PRC-001-0 – System Protection Coordination”

The drafting team will also make the improvements to the standard identified in Attachment C – “Reliability Standards Review Guidelines” to bring the revised standard into conformance with the latest version of the ERO Rules of Procedure.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies.)*		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time.
☐	Interchange Authority	Authorizes valid and balanced Interchange Schedules.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator Area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all the following Market Interface Principles? *(Select "yes" or "no" from the drop-down box.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes

5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Appendix B — SYSTEM PROTECTION AND CONTROL TASK FORCE **9**

This report was approved by the Planning Committee on December 7, 2006, for forwarding to the Standards Committee.

Introduction

When the original scope for the System Protection and Control Task Force was developed, one of the assigned items was to review all of the existing PRC-series Reliability Standards, to advise the Planning Committee of our assessment, and to develop Standards Authorization Requests, as appropriate, to address any perceived deficiencies.

This report presents the SPCTF's assessment of PRC-001-0 – System Protection Coordination. The report includes the SPCTF's understanding of the intent of this standard and contains specific observations relative to the existing standard.

This standard was developed by translating the requirements of an earlier Phase I Planning Standard; thus it has not been previously subjected to a critical review of the Requirements.

Executive Summary

This reliability standard is intended to assure that system protection is coordinated between multiple transmission entities and between generation entities and transmission entities. It appears that this standard is intended to address coordination of protection functions and capabilities in both the operating time frame and the planning time frame. These time frames, as they apply to protective functions, are discussed, as are the various responsibilities to assure the related coordination.

The SPCTF concludes that the list of applicable entities in the existing standard is incomplete and that the assigned responsibilities do not reflect the activities of the identified functions. Significantly, the existing standard disregards the significant responsibilities and roles of the equipment owners; specifically, the Transmission Owners and Generator Owners.

The SPCTF also concludes that the Requirements of the existing standard are vague and ambiguous, and that, while Measures and Levels of Non-Compliance are defined, these are essentially unenforceable because of fundamental flaws within the requirements.

Assessment of PRC-001-0

General Comments

The SPCTF offers the following general comments:

1. None of the requirements within PRC-001-0 specifically indicate what protective systems are being addressed.
2. The phrase "protective relay or equipment" is a recurring phrase, and generally should be revised to "protective system" or "protective system equipment."
3. The phrase "If a protective relay or equipment failure reduces system reliability" is ambiguous, and needs additional clarification. This phrase does not clearly state when failures must be reported.
4. Many of the requirements list the Balancing Authority as an applicable entity. It does not seem that the Balancing Authority has the direct responsibility for any of these activities, and only needs to respond to the various issues when directed by the Transmission Operator and/or Generator Operator.

Applicability

4.1. Balancing Authorities

4.2. Transmission Operators

4.3. Generator Operators

The remainder of the PRC-series standards rarely assigns any responsibility for protection systems to any of the above entities. Specifically, the responsibilities for disturbance monitoring (which includes some monitoring of protective systems) and for protective system maintenance apply to the equipment owners, specifically Transmission Owners and Generator Owners. The current applicable entities do, however, have a role in the functions of this standard. The SPCTF asserts that Transmission Owner, Generator Owner, and Distribution Provider should be added to the list of Applicable Entities.

R1

R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of protective system schemes applied it its area.

This requirement is a statement of a highly laudable goal, but this is not specific and enforceable. In fact, the drafting team that was providing missing Measures and Compliance Elements was unable to assign either to this requirement.

It may be possible to restate this requirement in such a way to be measurable and enforceable. The protective system equipment owners (Transmission Owners, Generator Owners, and Distribution Providers) should be responsible to provide the necessary information to the Transmission Operator and Generator Operator to facilitate their familiarity with the relevant protective systems.

R2

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.

R2.2. If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.

Requirement R2 addresses the operating horizon, but the equipment owner entities will be familiar with the condition of their protective system equipment.

Therefore, the responsibility for this requirement must originate with the owner entities: the Transmission Owner, Generator Owner, and Distribution Provider. These entities should inform the Transmission Operator, Generator Operator, and Balancing Authorities of equipment failures pertinent to this requirement. The Transmission Operators may need to have to coordinate with each other, similar to the existing requirement R4.

The requirement for corrective action, “as soon as possible”, is vague and ambiguous, and needs modification to be specific.

As evidenced by the lack of a related Measure (via the drafting team for missing Measures and Compliance Elements), this requirement is currently not measurable.

R3

> **R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.
>
> **R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.
>
> **R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.

Not only new protective systems and changes to protective systems should be coordinated. A requirement should be added to require coordination of all existing protective systems. Then, requirement R3 should require the coordination new protective systems and changes to protective systems with existing protective systems.

Requirement R3 addresses the planning horizon; therefore, this responsibility should be assigned to the Transmission Owner, Generator Owner, and Distribution Provider.

In addition, R3.1 should be bi-directional; the Transmission entity should provide similar coordination with the Generator entity.

R4

> **R4.** Each Transmission Operator shall coordinate protection systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.

It's unclear whether this requirement addresses the operations planning horizon or the planning horizon.

If Requirement R4 addresses the planning horizon, the responsibilities should be assigned similarly to the recommendations for R3, to the Transmission Owner, Generator Owner, and Distribution Provider. If Requirement R4 addresses the planning horizon, it seems to be redundant with R3 to some extent.

R5

> **R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the protection systems of others:
>
> **R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's protection systems.
>
> **R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' protection systems.

Requirement R5 addresses the both the planning horizon and operating planning horizon. It is essential to the reliability of the system that this activity occurs, and it must occur in advance of any changes to the system.

In the operations planning horizon, the Operator entities should coordinate these changes with the Owner entities, since the Owners have the tools to analyze the effects of these system changes on the protective systems and the access to the protective systems to make any needed changes to the protective system.

In the planning horizon, the owner entities should be responsible for this requirement, similarly to Requirement R3.

R6

> **R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.

Requirement R6 addresses the operating horizon. The Owners have to monitor the status of Special Protection Systems and provide the status to the Operators. The Operators then should coordinate the availability of Special Protection Systems between each other, and take any necessary operating actions to address issues with Special Protection Systems.

This requirement needs to better define "status of … Special Protection System…"

This requirement may be better moved to one of the PRC-series standards specifically addressing Special Protection Systems.

Related Standard
MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures

Also, while reviewing PRC-001, the SPCTF noted that no existing NERC Standard requires that a consistent model be maintained for protection studies, such as that required by MOD-011-0 — Regional Steady-State Data Requirements and Reporting Procedures, for other steady-state studies. Without such a model, various Transmission Owners, Generator Owners, and Distribution Providers cannot accurately

apply the protective relaying. To address this deficiency, the SPCTF recommends that MOD-011, Maintenance and Distribution of Steady-State Data Requirements and Reporting Procedures, be modified to include the essential data for wide-area fault studies. The specific MOD-011 requirements are listed below, together with suggested modifications.

R1.2 – Generators
Recommend including direct-axis synchronous reactance (X_d), transient reactance (X_d’), sub transient reactance (X_d”), and the associated time constants (T_{do}, T_{do}’, and T_{do}”) for synchronous generators. For induction and inverter generators, generically include the data necessary to model the equipment in short circuit models in the positive, negative, and zero sequence domains.

R1.3 – Transmission Lines
Recommend specifying the positive and zero sequence impedance, including mutual impedances

R1.5 – Transformers
Recommend specifying positive sequence and zero sequence impedance, including all grounding effects.

FERC Assessment of PRC-001-0

In the October 20, 2006, the Notice of Proposed Rulemaking for adoption of NERC Standards (Docket Number RM06-16-000), the Federal Energy Regulatory Commission, for the most part, considered the operating horizon impacts of PRC-001. FERC proposed that PRC-001-0 be approved as mandatory and enforceable. They did, however, propose that NERC be directed to make modifications to PRC-001. The modifications proposed in the NOPR are excerpted from the NOPR and repeated below:

“The Commission proposes to direct that NERC submit a modification to PRC-001-0 that: (1) includes Measures and Levels of Non-Compliance; (2) includes a requirement that relevant transmission operators and generator operators must be informed immediately upon the detection of failures in relays or protection system elements on the Bulk-Power System that would threaten reliable operation, so that these entities can carry out the appropriate corrective control actions consistent with those used in mitigating IROL violations; and (3) clarifies that, after being informed of failures in relays or protection system elements on the Bulk-Power System, transmission operators or generator operators shall carry out corrective control actions, i.e., returning the system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes.”

Other Activities related to PRC-001-0

The Standard Drafting Team on Missing Measures and Compliance Elements modified PRC-001-0 as a part of their work, but the requirements were not changed. As this report is being prepared, the modified Standard is being balloted.

A draft SAR for the revision of PRC-001-0 is included in the “Draft Reliability Standards Development Plan: 2007–2009”, which was presented to the NERC Board of Trustees for their approval on November 1, 2006. This draft SAR is entitled, “System Protection Project (2009-01)”, and discusses many of the same deficiencies in PRC-001-1 that were identified by the SPCTF.

Conclusion and Recommendation

As it exists today, enforcement of PRC-001-0 will be very difficult. The applicable entities in the existing Standard are incorrect for many of the requirements, and the requirements themselves are vague and not measurable. In addressing the "operating horizon," "operations planning horizon," and "planning horizon" protection coordination issues, the deficiencies in the current standard are magnified.

The SPCTF recommends that the existing draft Standards Authorization Request that is included in the "Draft Reliability Standards Development Plan: 2007–2009" be modified to include the observations from the SPCTF assessment of PRC-001-0 and also include the modifications directed in the FERC NOPR on RM06-16-000. The SPCTF also recommends that the requirements for the operating horizon and planning horizon be clearly delineated and warrants consideration of dividing this standard into two standards.

In addition, it is not possible to effectively coordinate protective systems without having accurate short circuit models of neighboring systems. To address these modeling issues related to data for short circuit calculations, the SPCTF recommends that a Standards Authorization Request be developed to modify Standard MOD-013-1 — RRO Dynamics Data Requirements and Reporting Procedures, to address these issues. Data for short circuit calculations, as noted in this report, should be considered as additional requirements within MOD-013-1.

Elequant, Inc.

Standard Review Guidelines

Applicability
Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose
Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements
Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability
Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations
Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness
Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance
In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language
Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality
Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements
In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.

Consistent Terminology
To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels must be applied for each requirement and may be combined to cover multiple requirements, as long as it is clear which requirements are included and that all requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: more than 95% but less than 100% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: more than 85% but less than or equal to 95% compliant.

- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: more than 70% but less than or equal to 85% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: 70% or less compliant.

Compliance Monitor
Replace, 'Regional Reliability Organization' with 'Regional Entity'

Fill-in-the-blank Requirements
Do not include any 'fill-in-the-blank' requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization
Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates
Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply. If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan. The effective date should be linked to the NERC BOT adoption date.

Associated Documents
If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.

Functional Model Version 3
Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Unofficial Nomination Form

Nominations Solicited For Four Review and Drafting Teams

Please complete the electronic nomination form as soon as possible, but no later than **January 20, 2015.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form. If you have any questions, please contact Ryan Stewart.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in the review or drafting team meetings if appointed by the Standards Committee. If appointed, you are expected to attend most of the face-to-face drafting team meetings as well as participate in all the team meetings held via conference calls. Failure to do so may result in your removal from the review or drafting team.

The time commitment for these projects is expected to be one face-to-face meeting a month (on average two full working days) with conference calls scheduled as needed to meet the agreed upon timeline the review or drafting team sets forth. Review and drafting teams also will have side projects, either individually or by subgroup, to present to the larger team for discussion and review. Lastly, an important component of the review and drafting team efforts is outreach. Members of the teams should be conducting outreach during development prior to posting to ensure all issues can be discussed and resolved.

Nominations are being sought for the following projects. Previous review or drafting team experience is beneficial but not required. A brief description of the desired qualifications and other pertinent information for each project is included below.

- Project 2015-02: Emergency Operations Periodic Review
    - *Expected 2015 August Board of Trustees presentation for adoption*
- Project 2015-03: Periodic Review of System Operating Limits Standards
    - *Expected 2015 November Board of Trustees presentation for adoption*
- Project 2015-04: Alignment of NERC Glossary of Terms and Definitions Used in the Rules of Procedure (Appendix 2 of the Rules of Procedure)
    - *Expected 2015 August Board of Trustees presentation for adoption*
- Project 2007-06.2: System Protection Coordination
    - *Expected 2015 November Board of Trustees presentation for adoption*

Project 2015-02 Emergency Operations Periodic Review

The purpose of this project is to conduct a periodic review of a subset of Emergency Operations (EOP) Standards. The periodic review comprehensively reviews EOP-004, EOP-005, EOP-006, and EOP-008 to evaluate, for example, whether the requirements are clear and unambiguous. The periodic review will include background information, along with any associated worksheets or reference documents, to guide a comprehensive review that results in a recommendation that the Reliability Standard should be: (1) reaffirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn. The four NERC Reliability Standards in this periodic review project concern methodologies for planning for, reporting, and communicating Emergencies.

Standards affected: EOP-004-2, EOP-005-2, EOP-006-2, and EOP-008-1

NERC is seeking a cross section of the industry to participate on the team, but in particular is seeking individuals who have experience and expertise with Emergency Operations program planning, reporting, and communicating across the United States and/or Canada.

Experience with developing standards inside or outside (e.g., IEEE, NAESB, ANSI, etc.) of the NERC process is beneficial, but is not required, and should be highlighted in the information submitted, if applicable.

Individuals who have facilitation skills and experience and/or legal or technical writing backgrounds are also strongly desired. Please include this in the description of qualifications as applicable.

Project 2015-03 Periodic Review of System Operating Limit Standards

The purpose of this project is to conduct a periodic review of a subset of Facilities Design, Connections, and Maintenance (FAC) Standards. The periodic review comprehensively reviews FAC-010, FAC-011, and FAC-014 to evaluate, for example, whether the requirements are clear and unambiguous. The three NERC Reliability Standards in this periodic review project concern methodologies for determining and communicating System Operating Limits. The periodic review will include background information, along with any associated worksheets or reference documents, to guide a comprehensive review that results in a recommendation that the Reliability Standard should be: (1) reaffirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn.

Standards affected: FAC-010-2.1, FAC-011-2, and FAC-014-2

NERC is seeking a cross section of the industry to participate on the team, but in particular are seeking individuals who have experience and expertise with System Operating Limits methodologies, Facility Ratings, and Interconnection Reliability Operating Limits and communicating the methodologies across the United States and/or Canada.

Experience with developing standards inside or outside (e.g., IEEE, NAESB, ANSI, etc.) of the NERC process is beneficial, but is not required, and should be highlighted in the information submitted, if applicable.

Individuals who have facilitation skills and experience and/or legal or technical writing backgrounds are also strongly desired. Please include this in the description of qualifications as applicable.

Project 2015-04 Alignment of NERC Glossary of Terms and Definitions Used in the Rules of Procedure (Appendix 2 of the Rules of Procedure)

The purpose of this project is to align the NERC Glossary of Terms (Glossary) and the Definitions Used in the Rules of Procedure (Appendix 2 of the Rules of Procedure). There are many inconsistencies between the defined terms contained in the Glossary and the NERC Rules of Procedure. The drafting team will be responsible for identifying inconsistencies in the defined terms, revising the defined term in order to address the inconsistencies, and posting for comment and ballot the proposed revisions to the defined terms.

The drafting team work and proposed revisions will be undertaken and in accordance with the processes outlined in the NERC Rules of Procedure, Section 1400 (“Amendments to the NERC Rules of Procedure”) and the Standard Processes Manual, Section 5 (“Process for Developing a Defined Term”).

Standards affected: None (definitions)

NERC is seeking a cross section of the industry to participate on the team, but in particular is seeking individuals who have experience with the technical nature of many of the NERC Reliability Standards across the United States and/or Canada, legal or technical writing backgrounds, and facilitation skills. Please include this in the description of qualifications as applicable.

Project 2007-06.2 System Protection Coordination

The proposed project is phase 2 of Project 2007-06 – System Protection Coordination is revising Reliability Standard PRC-001-1.1 (System Protection Coordination). Phase 1 is under the direction of the System Protection Coordination Standard Drafting Team (SPCSDT) which is proposing to incorporate PRC-001-1.1, Requirements R3 and R4 into a new Reliability Standard, PRC-027-1 (Coordination of Protection System Performance During Faults). Phase 2 will focus on revising PRC-001-1.1, Requirements R1, R2, R5, and R6 in accordance with the revisions occurring due to phase 1.

Standards affected: PRC-001-1.1

NERC is seeking a cross section of the industry to participate, but in particular is seeking industry stakeholders for participation on the standard drafting team (SDT) to revise PRC-001-1.1. The drafting team will identify the objectives required to revise PRC-001-1.1. Industry stakeholders with expertise in the communication of protection system changes in status or issues to other entities in an operating (e.g., BA, GOP, TOP, or RC) or planning role (e.g., PC or TP) and/or the instruction of operating personnel regarding the purpose and limitations of protection systems.

Please provide the following information for the nominee:	
Name:	
Title:	
Organization:	
Address:	
Telephone:	
Email:	

Select the Project(s) for which the nominee is volunteering. Nominees may check multiple projects but NERC will endeavor to place an individual on only one project if at all possible. If checking multiple projects, indicate in the space below first choice, second choice, and so on.

☐ Project 2015-02: Emergency Operations Periodic Review

☐ Project 2015-03: Periodic Review of System Operating Limit Standards

☐ Project 2015-04: Alignment of NERC Glossary of Terms (Definitions section of the Rules of Procedure)

☐ Project 2007-06.2: System Protection Coordination

Please briefly describe the nominee's experience and qualifications to serve on the selected project(s):

If you are currently a member of any NERC SAR or standard drafting team, please list each team here:

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any NERC SAR or standard drafting team, please identify the team(s):

☐ No prior NERC SAR or standard drafting team.

☐ Prior experience on the following SAR or standard drafting team(s):

Select each NERC Region in which you have experience relevant to Project 2010-02:		
☐ ERCOT ☐ FRCC ☐ MRO	☐ NPCC ☐ RF ☐ SERC	☐ SPP ☐ WECC ☐ NA – Not Applicable

Select each Industry Segment that you represent:	
☐	1 — Transmission Owners
☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function[1] in which you have current or prior expertise:	
☐ Balancing Authority ☐ Compliance Enforcement Authority ☐ Distribution Provider ☐ Generator Operator ☐ Generator Owner ☐ Interchange Authority ☐ Load-serving Entity ☐ Market Operator ☐ Planning Coordinator	☐ Transmission Operator ☐ Transmission Owner ☐ Transmission Planner ☐ Transmission Service Provider ☐ Purchasing-selling Entity ☐ Reliability Coordinator ☐ Reliability Assurer ☐ Resource Planner

[1] These functions are defined in the NERC Functional Model, which is available on the NERC web site.

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:

Standards Announcement

Solicitation for Drafting and Review Team Nominations

Nomination Period Open through January 20, 2015

Now Available

Nominations are being sought for the projects listed below. Previous drafting or review team experience is beneficial but not required. A brief description of the desired qualifications, expected commitment, and other pertinent information for each project is included below, and more detailed information is included on the unofficial Word version of the nomination form.

Project 2015-02 – Emergency Operations Periodic Review

The purpose of this project is to conduct a periodic review of a subset of Emergency Operations (EOP) Standards. The periodic review comprehensively reviews EOP-004, EOP-005, EOP-006, and EOP-008 to evaluate, for example, whether the requirements are clear and unambiguous. The periodic review will include background information, along with any associated worksheets or reference documents, to guide a comprehensive review that results in a recommendation that the Reliability Standard should be: (1) reaffirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn. The four NERC Reliability Standards in this periodic review project concern methodologies for planning for, reporting, and communicating Emergencies.

Project 2015-03 – Periodic Review of System Operating Limit Standards

The purpose of this project is to conduct a periodic review of a subset of Facilities Design, Connections, and Maintenance (FAC) Standards. The periodic review comprehensively reviews FAC-010, FAC-011, and FAC-014 to evaluate, for example, whether the requirements are clear and unambiguous. The three NERC Reliability Standards in this periodic review project concern methodologies for determining and communicating System Operating Limits. The periodic review will include background information, along with any associated worksheets or reference documents, to guide a comprehensive review that results in a recommendation that the Reliability Standard should be: (1) reaffirmed as is (i.e., no changes needed); (2) revised (which may include revising or retiring one or more requirements); or (3) withdrawn.

Project 2015-04 – Alignment of NERC Glossary of Terms (Definitions section of the Rules of Procedure)

The purpose of this project is to align the NERC Glossary of Terms (Glossary) and the Definitions Used in the Rules of Procedure (Appendix 2 of the Rules of Procedure). There are many inconsistencies between the defined terms contained in the Glossary and the NERC Rules of Procedure. The drafting team will be responsible for identifying inconsistencies in the defined terms, revising the defined term in order to address the inconsistencies, and posting for comment and ballot the proposed revisions to the defined terms.

The drafting team work and proposed revisions will be undertaken in accordance with the processes outlined in the NERC Rules of Procedure, Section 1400 ("Amendments to the NERC Rules of Procedure") and the Standard Processes Manual, Section 5 ("Process for Developing a Defined Term").

Project 2007-06.2 – System Protection Coordination

The proposed project is phase 2 of Project 2007-06 – System Protection Coordination is revising Reliability Standard PRC-001-1.1 (System Protection Coordination). Phase 1 is under the direction of the System Protection Coordination Standard Drafting Team (SPCSDT) which is proposing to incorporate PRC-001-1.1, Requirements R3 and R4 into a new Reliability Standard, PRC-027-1 (Coordination of Protection System Performance During Faults). Phase 2 will focus on revising PRC-001-1.1, Requirements R1, R2, R5, and R6 in accordance with the revisions occurring due to phase 1.

Instructions for Submitting Nominations

Please complete and submit the electronic nomination form. Please do not submit multiple forms; one nominee may volunteer for more than one project on a single form by indicating the order of preference within the form. An unofficial version of the nomination form is provided for convenience in compiling the necessary information.

Next Steps

The Standards Committee is expected to begin appointing drafting and review teams for these projects in January 2015. Nominees will be notified shortly after they have been appointed to a drafting or review team.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Ryan Stewart,
Manager of Standards Development, or at 404.446.9697.

Unofficial Nomination Form

Project 2007-06.2 Phase 2 of System Protection Coordination Standard Drafting Team

Do not use this form to submit nominations. Use the electronic form to submit nominations for additional members of the standard drafting team (SDT). The electronic form must be submitted by **8 p.m. Eastern, Tuesday, February 9, 2016.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form.

Documents and information about this project are available on the Project 2007-06.2 Phase 2 of System Protection Coordination page. If you have questions, contact Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in the review or drafting team meetings if appointed by the Standards Committee. If appointed, you are expected to attend most of the face-to-face drafting team meetings, as well as those held via conference calls.

The time commitment for these projects is expected to be up to two face-to-face meetings per quarter (on average two full working days each meeting) with conference calls scheduled as needed to meet the agreed-upon timeline the review or drafting team sets forth. Drafting teams will also have side projects, either individually or by subgroup, to present to the larger team for discussion and review. Lastly, an important component of the review and drafting team efforts is outreach. Members of the team should be conducting outreach during development prior to posting to ensure all issues can be discussed and resolved.

Previous drafting or review team experience is beneficial, but not required. A brief description of the desired qualifications, expected commitment, and other pertinent information is included below.

Background

This solicitation for nominations is to supplement the Phase 2 System Protection Coordination SDT with individuals experienced in training. The current SDT is addressing Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). The current SDT is considering addressing Requirement R1 of PRC-001-1.1(ii) through requirements to provide training. Therefore, NERC is supplementing the SDT with subject matter experts with experience in the Personnel, Performance, Training, and Qualifications (PER) standard.

NERC is seeking individuals from the United States and Canada who possess experience in one or more of the following areas:

- Systematic approach to training
- Operations and/or operations planning background
- Personnel Performance, Training, and Qualifications (“PER”) family of Reliability Standards

Name:	
Organization:	
Address:	
Telephone:	
E-mail:	

Briefly describe your experience and qualifications to serve on the requested Standard Drafting Team (Bio):

If you are currently a member of any NERC drafting team, list each team here:

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any NERC drafting team, identify the team(s):

☐ No prior NERC SAR or standard drafting team.

☐ Prior experience on the following team(s):

Select each NERC Region in which you have experience relevant to the Project for which you are volunteering:

☐ Texas RE	☐ NPCC	☐ SPP RE
☐ FRCC	☐ RF	☐ WECC
☐ MRO	☐ SERC	☐ NA – Not Applicable

Select each Industry Segment that you represent:	
☐	1 — Transmission Owners
☐	2 — RTOs and ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function[1] in which you have current or prior expertise:	
☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

[1] These functions are defined in the NERC Functional Model, which is available on the NERC web site.

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:			
Name:		Telephone:	
Organization:		E-mail:	
Name:		Telephone:	
Organization:		E-mail:	
Provide the names and contact information of your immediate supervisor or a member of your management who can confirm your organization's willingness to support your active participation.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2007-06.2 Phase 2 of System Protection Coordination

Nomination Period Open through February 9, 2016

Now Available

Nominations are being sought for additional standard drafting team (SDT) members, as explained below, through **8 p.m. Eastern, Tuesday, February 9, 2016**.

Use the electronic form to submit a nomination. If you experience any difficulties in using the electronic form, contact Wendy Muller. An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page and the project page.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in the SDT meetings if appointed by the Standards Committee. If appointed, you are expected to attend most of the face-to-face meetings, as well as those held via conference calls.

The time commitment for this project is expected to be up to two face-to-face meetings per quarter (on average three full working days each meeting) with conference calls scheduled as needed to meet the agreed upon timeline the SDT sets forth. Drafting teams also may have side projects, either individually or by subgroup, to present to the larger team for discussion and review. Lastly, an important component of the SDT effort is outreach. Members of the team should be conducting outreach during development prior to posting to ensure all issues can be addressed.

Background

This solicitation for nominations is to supplement the Phase 2 System Protection Coordination SDT with individuals experienced in training. The current SDT is addressing Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). The current SDT is considering addressing Requirement R1 of PRC-001-1.1(ii) through requirements to provide training. Therefore, NERC is supplementing the SDT with subject matter experts with experience in the Personnel, Performance, Training, and Qualifications (PER) standards.

NERC is seeking individuals from the United States and Canada who possess experience in one or more of the following areas:

- Systematic approach to training
- Operations and/or operations planning background
- Personnel Performance, Training, and Qualifications (“PER”) family of Reliability Standards

Next Steps

The Standards Committee may appoint members to the team as early as March 2016. Nominees will be notified shortly after they have been appointed.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Standards Developer, Scott Barfield-McGinnis (via email), or at (404) 446-9689.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination (Phase 2) Standard Drafting Team (SPCP2SDT) is addressing Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). The PER-006-1 Reliability Standard addresses the Generator Operator (GOP) that is applicable to Requirement R1 of PRC-001-1.1(ii).

Requirements R1, R2, and R5 applicable to the GOP are proposed for retirement as described below.

1. The PER-006-1, Requirement R1, applicable to the GOP, is proposing to replace PRC-001-1.1(ii), Requirement R1 to address the reliability objective of being “familiar with the purpose and limitations of Protection Systems” for the GOP’s plant operator personnel. The standard PER-005-2 already addresses centrally located dispatch center personnel.
2. The Personnel Performance, Training, and Qualifications (PER) set of Reliability Standards and Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards address the reliability objective of PRC-001-1.1(ii), Requirements R2 and R5.

Requirements R1 and R6 applicable to the Balancing Authority (BA) and Requirements R1, R2, R5, and R6 applicable to the Transmission Operator (TOP) are proposed for retirement on the following basis.

1. The TOP/IRO sets of Reliability Standards address the reliability objective of these requirements.
2. The revisions to the definitions of “Operational Planning Analysis” (OPA) and “Real-time Assessment” (RTA), that the TOP and the Reliability Coordinator perform, address the reliability objective of integrating the function and limits of Protection Systems and Remedial Action Schemes (RAS) into their OPA and RTA.

See the Project 2007-06.2 mapping document for explanation on how the PER and TOP/IRO sets Reliability Standards and the revision of the two definitions address the reliability objectives of PRC-001-1.1(ii), Requirements R1, R2, R5, and R6 for the BA and TOP. The PRC-027-1 (*Coordination of Protection System Performance During Faults*) Reliability Standard addresses Requirements R3 and R4 of PRC-001-1.1(ii).

The PER-006-1 Reliability Standard and revisions to the definitions of OPA and RTA are being posted for an initial 45-day formal comment period with a concurrent initial ballot to be held in the last ten days of the comment period.

Completed Actions	Date
Standard Authorization Request (SAR) posted for comment	June 11 – July 10, 2007
SAR approved by Standards Committee (SC)	August 13, 2007
SC authorized posting of TOP-009-1	July 28, 2015
Draft 1, TOP-009-1, posted for a 45-day formal comment period	July 29 – September 11, 2015
Draft 1, TOP-009-1, concurrent/parallel initial ballot in the last ten days of the comment period	September 2-11, 2015
Draft 2, TOP-009-1, posted for a 45-day formal comment period	October 6 – November 19, 2015
Draft 2, TOP-009-1, concurrent/parallel additional ballot in the last ten days of the comment period	November 10-19, 2015
Draft 2, TOP-009-1 withdrawn from development at SDT meeting	February 9, 2016
SC authorized posting of PER-006-1	March 9, 2016

Anticipated Actions	Date
Draft 1, PER-006-1, 45-day formal comment period with initial ballot	March 2016
10-day final ballot	May 2016
NERC Board (Board) adoption	August 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):
None.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material section of the standard.

A. Introduction

1. **Title:** **Specific Training for Personnel**
2. **Number:** **PER-006-1**
3. **Purpose:** To ensure that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the Bulk Electric System.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Generator Operator that has:
       - **4.1.1.1.** Plant personnel who are responsible for the Real-time control of a generator and receive Operating Instruction(s) from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center.
5. **Effective Date:** See Implementation Plan for Project 2007-06.2.

B. Requirements and Measures

Rationale for Requirement R1: Protection Systems and Remedial Action Schemes (RAS) are an integral part of reliable Bulk Electric System (BES) operation. This requirement addresses the reliability objective of ensuring that the Generator Operator (GOP) plant operating personnel understand the operational functionality of Protection Systems and RAS and their effects on generating Facilities.

R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M1. Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training. This evidence may be documents such as training records showing successful completion of training that includes training materials, the name of the person, and date of training.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Operator shall keep data or evidence of Requirement R1 for the current year and three previous calendar years.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

Project 2007-06.2 Implementation Plan[1]

[1]http://www.nerc.com/pa/Stand/Project200706_2SystemProtectionCoordinationDL/Project_2007_06_2_Imp_Plan_Draft_1_2016_03_10_Clean.pdf

Version History

Version	Date	Action	Change Tracking
1		Adopted by the NERC Board of Trustees	New standard developed under Project 2007-06.2

Guidelines and Technical Basis

Requirement R1

The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, plant personnel responsible for Real-time control and operation of a generating Facility must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility. This standard requires GOPs to train their plant personnel on these issues. The standard only applies to plant operating personnel associated with the specific Facility to which they have Real-time control. This does not include other plant personnel not responsible for Real-time control (e.g., fuel or coal handlers, electricians, machinists, or maintenance staff).

A periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel that have Real-time control and operation of a generator are trained in order to operate the plant. The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service. On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS.

The phrase “operational functionality” focuses the training on how Protection Systems operate and prevent possible damage to Elements. It also addresses how RAS detects pre-determined BES conditions and automatically takes corrective actions.

Considerations for operational functionality may include, but is not limited to the following:

- Purpose of protective relays and RAS
- Zones of protection
- Protection communication systems (e.g., line current differential, direct transfer trip, etc.)
- Voltage and current inputs
- Station dc supply associated with protective functions
- Resulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions

Requirement R1 focuses on the operational functionality of Protection Systems and Remedial Action Schemes specific to the generating plant and not the Bulk Electric System.

This requirement focuses on those systems that are related to the electrical output of the generator. Protective systems which trip breakers serving station auxiliary loads (e.g., such as pumps, fans, or fuel handling equipment) are not included in this training. Furthermore, protection of secondary unit substation (SUS) or low switchgear transformers and relays protecting other downstream plant electrical distribution system components are not in the scope of this training, even if a trip of these devices might eventually result in a trip of the generating unit.

~~A. Introduction~~

1. ~~**Title:** **System Protection Coordination**~~

2. ~~**Number:** PRC-001-1.1(ii)~~

3. ~~**Purpose:**~~

~~To ensure system protection is coordinated among operating entities.~~

4. ~~**Applicability**~~

~~**4.1.** Balancing Authorities~~

~~**4.2.** Transmission Operators~~

~~**4.3.** Generator Operators~~

5. ~~**Effective Date:**~~

~~See the Implementation Plan for PRC-001-1.1(ii).~~

ORANGE TEXT – Retirements of R1, R2, R5, and R6 occurring under Project 2007-06.2.

RED TEXT – Retirements of R3 and R4 occurring under Project 2007-06.

~~B. Requirements~~

~~**R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.~~

~~**R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:~~

~~**R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.~~

~~**R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.~~

~~**R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.~~

~~**R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.~~

- ~~Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.~~

~~**R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.~~

~~**R4.** Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.~~

~~**R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:~~

~~**R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.~~

~~**R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.~~

~~**R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.~~

~~C. Measures~~

~~**M1.** Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.~~

~~**M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Special Protection Systems in its area. (Requirement 6 Part 1)~~

~~**M3.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Special Protection Systems. (Requirement 6 Part 2)~~

~~D. Compliance~~

~~1. Compliance Monitoring Process~~

~~1.1. Compliance Monitoring Responsibility~~

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~

~~1.2. Compliance Monitoring and Reset Time Frame~~

~~One or more of the following methods will be used to assess compliance:~~

- ~~Self-certification (Conducted annually with submission according to schedule.)~~
- ~~Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~
- ~~Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance-Reset Period shall be 12 months from the last finding of non-compliance.~~

~~1.3. Data Retention~~

~~Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.~~

~~Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

~~1.4. Additional Compliance Information~~

~~None.~~

~~2. Levels of Non-Compliance for Generator Operators:~~

~~**2.1. Level 1:** Not applicable.~~

~~**2.2. Level 2**: Not applicable.~~

~~**2.3. Level 3**: Not applicable.~~

~~**2.4. Level 4:** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.~~

~~3. Levels of Non-Compliance for Transmission Operators:~~

~~**3.1. Level 1:** Not applicable.~~

~~**3.2. Level 2**: Not applicable.~~

~~**3.3. Level 3**: Not applicable.~~

~~**3.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**3.4.1** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.~~

~~**3.4.2** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~**4. Levels of Non-Compliance for Balancing Authorities:**~~

~~**4.1. Level 1:** Not applicable.~~

~~**4.2. Level 2**: Not applicable.~~

~~**4.3. Level 3**: Not applicable.~~

~~**4.4. Level 4:** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~E. Regional Differences~~

~~None identified.~~

~~Version History~~

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~

~~1.1(i)~~	~~November 13, 2014~~	~~Adopted by the NERC Board of Trustees~~	~~Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS~~
~~1.1(ii)~~	~~February 12, 2015~~	~~Adopted by the NERC Board of Trustees~~	~~Standard revised in Project 2014-01:~~ ~~Applicability revised to clarify application of requirements to BES dispersed power producing resources~~
~~2~~	~~May 9, 2012~~	~~Adopted by Board of Trustees~~	~~Deleted Requirements R2, R5, and R6.~~
~~1.1(ii)~~	~~May 29, 2015~~	~~FERC Letter Order in Docket No. RD15-3-000 approving PRC-001-1.1(ii)~~	~~Modifications to adjust the applicability to owners of dispersed generation resources.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for the Applicability Exclusion in Requirement R3.1~~

~~Coordination of new or changes to protective systems associated with dispersed power producing resources identified through Inclusion I4 of the BES definition are typically performed on the interconnecting facilities. New or changes to protective systems associated with these facilities should be coordinated with the TOP as these protective systems typically must be closely coordinated with the transmission protective systems to ensure the overall protection systems operates as designed. While the protective systems implemented on the individual generating units of dispersed power producing resources at these dispersed power producing facilities (i.e. individual wind turbines or solar panels/inverters) may in some cases need to be coordinated with other protective systems within the same dispersed power producing facility, new or changes to these protective systems do not need to be coordinated with the~~

~~transmission protective systems, as this coordination would not provide reliability benefits to the BES.~~

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Proposed Definitions

Project 2007-06.2 Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of Operational Planning Analysis (OPA) and Real-time Assessment (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective PRC-001-1.1(ii) – Protection System Coordination, Requirement R1 to be familiar with the limits of Protection System schemes, the two definitions are being modified to include the phrase "…functions, and limits…" to ensure the Transmission Operator (TOP), and Reliability Coordinator (RC) that is not applicable to PRC-001-1.1(ii), consider the functions and limits of Protection Systems and Remedial Action Schemes in their evaluations. The reliability objective is addressed by revising the definitions to require the RC and the TOP to integrate the functions and limits (i.e., purpose and limitations) into its OPA and RTA to ensure that the Bulk Electric System is operated within System Operating Limits and Interconnection Reliability Operating Limits.

Proposed Definitions

This section includes the two modified terms used in the Reliability Standards and requirements below that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms that are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard PER-006-1 – Specific Training for Personnel in order to completely retire PRC-001-1.1(ii).

Term(s):

These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions.

1. An administrative update to replace "Special Protection System" to "Remedial Action Scheme."
2. The addition of the phrase "…functions, and limits…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and limits" into these evaluations. The proposed definition revision also has an effect on the RC that is not applicable to PRC-001-1.1(ii). The bold text in the definitions below accentuate the proposed revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Operational Planning Analysis (OPA)
An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limits**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Real-time Assessment (RTA)
An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limits;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Implementation Plan

Project 2007-06.2 Phase 2 of System Protection Coordination

Requested Approvals

- PER-006-1 – Specific Training for Personnel
- Definition of "Operational Planning Analysis"
- Definition of "Real-time Assessment"

Requested Retirements

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Applicable Entities

- Generator Operator (applicable to PER-006-1 only)
- Reliability Coordinator (applicable to definitions only)
- Transmission Operator (applicable to definitions only)

General Considerations

There are a number of factors that influence the determination of the implementation period for the proposed standard and revised definitions. The following factors address the Balancing Authority, Generator Operator, and Transmission Operator:

1. The effort and resources by the Generator Operator to provide training to plant personnel to address the operational functionality of Protection Systems and Remedial Action Schemes at individual generating Facilities in PER-006-1 that the Generator Operator may not have been addressing under PRC-001-1.1(ii), Requirement R1.

2. Maintain consistency with the Implementation Plan of the approved Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards[2] that are applicable to the Balancing Authority and Transmission Operator. This

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and PER-006-1, and the proposed definitions for "Operational Planning Analysis" and "Real-time Assessment." NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and PER-006-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).
[2] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

project explains how the retirement of PRC-001-1.1(ii) Requirements R1, R2, R5, and R6 are addressed by the TOP/IRO sets standards.

3. Maintaining consistency with the Implementation Plan of the approved TOP/IRO standards[3] that are applicable to the Balancing Authority and Transmission Operator in the application of the revised definitions of “Operational Planning Analysis” and “Real-time Assessment” (effective January 1, 2017) in the *NERC Glossary of Term Used in NERC Reliability Standards*. See the Project 2007-06.2 Mapping Document for additional details.

4. The amount of time needed by the Transmission Operator in PRC-001-1.1(ii), Requirement R1 and Reliability Coordinator (not applicable to PRC-001-1.1(ii)) to train on Protection Systems and Remedial Action Schemes in order to be capable of integrating their functions and limits into their Operational Planning Analysis and Real-time Assessment.

Effective Dates

PER-006-1 – Specific Training for Personnel

Reliability Standard PER-006-1 – Specific Training for Personnel shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Operational Planning Analysis and Real-time Assessment

The definitions “Operational Planning Analysis” (OPA) and “Real-time Assessment” (RTA) shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the definitions are approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a definition to go into effect. Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirements

PRC-001-1.1(ii) – System Protection Coordination
Requirement R1

PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 shall be retired at midnight of the day immediately prior to the effective date of PER-006-1 (*Specific Training for Personnel*) and the revised definitions of “Operational Planning Analysis” (OPA) and “Real-time Assessment” (RTA), or as otherwise provided for by an applicable governmental authority.

[3] Id.

Requirement R2, R5, and R6

PRC-001-1.1(ii) – System Protection Coordination, Requirement R2, R5, and R6 shall be retired at midnight of March 31, 2017, or as otherwise provided for by an applicable governmental authority.

Requirements R3 and R4

See Project 2007-06 System Protection Coordination Implementation Plan.[4]

Retirement of Existing Standards and Definitions

The currently-approved definitions of "Operations Planning Analysis" and "Real-time Assessment" shall be retired at midnight of the day immediately prior to the effective date of the revised definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), or as otherwise provided for by an applicable governmental authority.

Unofficial Comment Form

Project 2007-06.2 Phase 2 of System Protection Coordination

Do not use this form for submitting comments. Use the electronic form to submit comments on **PER-006-1 – Specific Training for Personnel** and the two proposed modified definitions of **"Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA)**. The electronic form must be submitted by **8 p.m. Eastern, Monday, April 25, 2016.**

Documents and information about this project are available on the Project 2007-06.2 Phase 2 of System Protection Coordination project page. If you have questions, contact Senior Standards Developer, Scott Barfield-McGinnis (via email) or at 404-446-9689.

Background Information

In conjunction with Project 2007-06 System Protection Coordination (Phase 1), NERC is proposing the complete retirement of PRC-001-1.1(ii). Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination. See the Mapping Document for an explanation of how the reliability objectives of those requirements are addressed by other standards, the proposed PER-006-1 – Specific Training for Personnel, and the proposed modified definitions of OPA and RTA. The remaining two Requirements R3 and R4 of PRC-001-1.1(ii) are addressed by PRC-027-1 – Coordination of Protection Systems for Performance During Faults. Details for Phase 1 are found on the 2007-06 project page. The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of PRC-027-1 (under Phase 1) as well as the proposed Reliability Standard, PER-006-1 and the proposed definition modifications of OPA and RTA (under Phase 2). NERC is proposing the retirement of PRC-001-1.1(ii) in the implementation plans associated with both projects.

Phase 1 (2007-06)

The System Protection Coordination Standard Drafting Team developed a new Reliability Standard, PRC-027-1 to address coordination of Protection System performance during Faults. This standard incorporates and clarifies the Protection System coordination aspects of Requirements R3 and R4 contained in PRC-001-1.1 that is proposed for complete retirement.

Phase 2 (2007-06.2)

Phase 2 is addressing the remaining Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). See the Mapping Document for a complete explanation on how the reliability objectives of Requirements R1, R2, R5, and R6 are addressed by other standards, the modified definitions of OPA and RTA, and the proposed PER-006-1 Reliability Standard.

Standard(s) Affected – PER-006-1, Retirement of PRC-001-1.1 (ii)

Questions

1. **Generator Operator:** Do you agree that the proposed PER-006-1 – Specific Training for Personnel appropriately replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…")? If not, please explain and provide suggestions to improve the PER-006-1 requirement.

   ☐ Yes
   ☐ No

   Comments:

2. **Transmission Operator:** The reliability objective of PRC-001-1.1(ii), Requirement R1 for the Transmission Operator (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"), that is not already covered by the *Personnel Performance, Training, and Qualifications* (PER) Reliability Standards, is addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Transmission Operator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL). Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

   ☐ Yes
   ☐ No

   Comments:

3. **Reliability Coordinator:** During the progression of Project 2007-06.2, it was determined that the Reliability Coordinator, a function that is not applicable to PRC-001-1.1(ii) should, similarly, "…be familiar with the purpose and limitations of Protection Systems schemes…" as found in Requirement R1 of the standard. The reliability objective for the Reliability Coordinator that is not already covered by the PER Reliability Standards, is being addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Reliability Coordinator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within SOL and IROL. Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the proposed Violation Risk Factor (VRF) and Violation Severity Levels (VSLs) for the proposed PER-006-1 Requirement? If not, please provide a basis for revising the VRF and/or what would improve the clarity of the VSLs.

   ☐ Yes
   ☐ No

   Comments:

5. Do the PER-006-1, Application Guidelines provide sufficient guidance, basis for approach, and examples to support performance of the Requirement? If not, please provide specific detail that would improve the Application Guidelines.

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with implementation period (i.e., 12 months) of the proposed PER-006-1 Reliability Standard and the proposed definition modifications of OPA and RTA based on the considerations listed in the Implementation Plan? If not, please provide a justification for changing the proposed implementation periods.

   ☐ Yes
   ☐ No

   Comments:

7. Are you aware of any conflicts between the proposed PER-006-1 Reliability Standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement? If so, please identify the conflict here.

   ☐ Yes
   ☐ No

   Comments:

8. Are you aware of the need for a regional variance or business practice that should be considered with this project? If so, please identify it here.

   ☐ Yes
   ☐ No

   Comments:

9. If you have any other comments not previously mentioned above, please provide them here:

   Comments:

Violation Risk Factors and Violation Severity Level Justifications

Project 2007-06.2 Phase 2 of Protection System Coordination
PER-006-1 – Specific Training for Personnel

This document provides the Protection System Coordination Phase 2 Standard Drafting Team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for the proposed PER-006-1 – Specific Training for Personnel.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria – Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability

to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[1] *North American Electric Reliability Corp.*, 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] *Id*. at footnote 15.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria – Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels,[3] FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance[4]

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties[5]

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement[6]

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations[7]

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	In this requirement, each Generator Operator (GOP) is required to train its plant personnel on the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The PRC-001-1.1(ii), Requirement R1 that will be replaced by PER-006-1, Requirement R1 has a VRF of High. The VRF of High is associated with the performance of the Balancing Authority (BA) and Transmission Operator (TOP) as they have a greater responsibility for ensuring reliable operation of the bulk electric system. The requirement for these entities to be familiar with the purpose and limitations of Protection System schemes in its area is addressed by the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards and various requirements identified in the project mapping document. These requirements are appropriately assigned VRFs of Medium and High, therefore, does not require the GOP to also have a VRF of High. The Medium VRF is consistent with the training Requirements in the PER-005-2 (*System Personnel Training*) Reliability Standard, which includes the GOP, BA, TOP, and Reliability Coordinator.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This Requirement is consistent with the intent of Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The Requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The Requirement with a Medium VRF is consistent with the training Requirements in PER-005-1 and PER-005-2 that will become effective July 1, 2016.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: A VRF of Medium is consistent with the NERC VRF definition because GOP plant personnel could gain knowledge of the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility without specific training. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This Requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

Proposed VSL – PER-006-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • one applicable personnel at a single Facility, or • 5% or less of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • two applicable personnel at a single Facility, or • more than 5% and less than or equal to 10% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • three applicable personnel at a single Facility, or • more than 10% and less than or equal to 15% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • five or more applicable personnel at a single Facility, or • more than 15% of the total applicable personnel of the Generator Operator. **OR** The Generator Operator failed to provide training as described in Requirement R1 to its applicable personnel.

VSL Justifications – PER-006-1, Requirement R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is a gradated VSL for partial performance from a Lower to High VSL and a VSL of Severe for severe or complete failure of the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The currently effective PRC-001-1.1(ii) did not have VSLs assignments. The proposed VSLs do not lower the current level of compliance because they are consistent with the approved PER-005-2, Requirement R6 for which PER-006-1, Requirement R1 is based upon.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This Requirement has a binary component and utilizes a VSL of Severe for complete failure in addition to incremental VSLs for partial performance. The VSLs provide a non-preferential way to apply violation levels to both small and large entities. Violations may be assessed at the greater of the number of personnel at the plant level or a percentage of personnel at the entity level. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the corresponding Requirement, and is therefore consistent with the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Mapping Document

Project 2007-06.2 Phase 2 of System Protection Coordination

Revisions or Retirements to Already Approved Standards

This mapping document explains how each of the existing Requirements (R1, R2, R5, and R6) of PRC-001-1.1(ii) (*System Protection Coordination*)[1] are being revised or retired. If a requirement is being proposed for revision, the revised, new, and/or supporting requirement(s) will be identified in the center column. If a requirement is being proposed for retirement, the center column will describe the proposed action and any requirement(s) used to support the action. Revisions and retirements will be accompanied by an explanation or justification listed in the right column. Capitalized terms, unless otherwise noted, are those found in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary").[2] References to regulatory directives are specifically related to Order No. 693 ("Order").[3] Standards or definitions listed as "existing" are enforceable and those listed as "approved" have been adopted by the NERC Board of Trustees and approved by the Federal Energy Regulatory Commission ("FERC"). Check the NERC website for effective dates. The functional entities discussed in the mapping document are the Balancing Authority (BA), Generator Operator (GOP), Planning Coordinator (PC), Reliability Coordinator (RC), Transmission Operator (TOP), and Transmission Planner (TP). The term "TOP/IRO" refers to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) sets of Reliability Standards that were filed under NERC Project 2014-03 – Revisions to TOP and IRO Standards[4] and approved by FERC.[5] The explanation herein assumes that the term, "Special Protection

System"[6] (SPS) will be replaced by the term "Remedial Action Scheme"[7] (RAS). In the referenced Reliability Standards herein the term SPS may be replaced by RAS; therefore, the term RAS will be used in the "Comments" column throughout.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing)[8,9] **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of	PRC-001-1.1(ii), Requirement R1 is proposed for retirement. Being "familiar with the purpose and limitations of Protection System schemes"	**Introduction** The reliability objective of PRC-001-1.1(ii), Requirement R1 is to ensure that the BA, GOP, and TOP are "familiar with the purpose

[6] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Special Protection System is defined as "[a]n automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme."

[7] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), the proposed definition of Remedial Action Scheme is defined as "[a] scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as: Meet requirements identified in the NERC Reliability Standards; Maintain Bulk Electric System (BES) stability; Maintain acceptable BES voltages; Maintain acceptable BES power flows; Limit the impact of Cascading or extreme events." See definition for additional information on the definition of RAS.

[8] Order No. 693 at P 1418. "Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems."

[9] Order No. 693 at P 1435. "Protection systems on Bulk-Power System elements are an integral part of reliable operations. They are designed to detect and isolate faulty elements on a power system, thereby limiting the severity and spread of disturbances and preventing possible damage to protected elements. If a protection system can no longer perform as designed because of a failure of its relays, system reliability is reduced or threatened. In deriving SOLs and IROLs, moreover, the functions, settings, and limitations of protection systems are recognized and integrated. Systems are only reliable when protection systems perform as designed. This is what PRC-001-1 means in linking a reduction in system reliability with a protection relay failure or other equipment failure."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Protection System schemes applied in its area. **Operational Planning Analysis (Approved)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and	will be clarified as (1) being "familiar with their purpose," and (2) being "familiar with their limitations" as follows: • The phrase "Protection systems schemes" maps to the NERC Glossary terms of Protection Systems and Remedial Action Schemes. • Being "familiar with the purpose" is addresses by existing and proposed training standards. • Being "familiar with the limitations" together with the clarification found in Order No. 693 at P 1418 and P 1435 along with the revised definitions of NERC Glossary defined terms of Operational Planning	and limitations of Protection System[12] schemes applied in its area." The reliability objective of the phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 is also intended to include RAS. The function, settings and limitations of a Protection Systems and RAS are critical in establishing System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL) such that the Bulk Electric System[13] (BES) is operated within these limits. The following explains how being familiar with the purpose and limitations of Protection Systems and RAS will be

[12] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Protection System is defined as:
"Protection System -
- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."

[13] See *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015).

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Real-time Assessment (Approved)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	Analysis and Real-time Assessment address the reliability objective of PRC-001-1.1(ii), Requirement R1 as explained in the Comments column to the right. **PER-006-1 (New)** **4.** Applicability: **4.1.** Functional Entities: **4.1.1.** Generator Operator that have: **4.1.1.1.** Plant personnel who are responsible for the Real-time control of a generator and receive direction from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This does not include personnel at a centrally located dispatch center. **R1.** Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the	addressed according to issue beginning with "familiarity with their limitations" and then "familiarity with their purpose." **Familiar with their limitations** When the BA, GOP, and TOP are familiar with the settings and limits (i.e., limitations) of Protection Systems and RAS, the entities are able to operate the BES in such a manner that Protection Systems and RAS will be operated within their limits and be able to detect and isolate faulty Elements, thereby, limiting the severity and spread of system disturbances, and preventing possible damage to protected Elements. When the GOP is familiar with the limitations of Protection Systems and RAS by being trained on how Protection Systems operate and prevent possible damage to Elements, the GOP is capable of operating to its full capability within its area, meaning the output of its generation Facilities. When the BA is familiar with the limitations of Protection Systems and RAS, it is capable

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility. **PER-003-1 (Existing)** **R1.** Each Reliability Coordinator shall staff its Real-time operating positions performing Reliability Coordinator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining a valid NERC Reliability Operator certificate: **1.1.** Areas of Competency **1.1.1.** Resource and demand balancing **1.1.2.** Transmission operations **1.1.3.** Emergency preparedness and operations **1.1.4.** System operations **1.1.5.** Protection and control **1.1.6.** Voltage and reactive	of maintaining generation, Load, and Interchange balance. The BA ensures that RAS in its area are enabled when needed for system reliability. When the TOP is familiar with limitations of Protection Systems and RAS, it will be capable of identifying when system reliability is reduced or threatened. In operating to established SOLs and IROLs, it is important that the functions, settings, and limitations of Protection Systems and RAS are recognized and integrated by the TOP into operating the BES reliably. The BES is only reliable when Protection Systems and RAS perform within their limitations. **Familiarity with the Purpose** Familiarity with the purpose of Protection Systems and RAS is achieved through training as explained below according to each applicable entity. **Familiarity with the Purpose (GOP)**

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.1.7. Interchange scheduling and coordination **1.1.8.** Interconnection reliability operations and coordination **R2.** Each Transmission Operator shall staff its Real-time operating positions performing Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificates: **2.1.** Areas of Competency **2.1.1.** Transmission operations **2.1.2.** Emergency preparedness and operations **2.1.3.** System operations **2.1.4.** Protection and control **2.1.5.** Voltage and reactive **2.2.** Certificates • Reliability Operator	For the GOP, the Reliability Standard PER-006-1 (*Specific Training for Personnel*) proposes to replace PRC-001-1.1(ii), Requirement R1. The PER-006-1 standard identifies applicable GOP personnel that are responsible for the Real-time control of a generator and that receive Operating Instructions from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This applicability removes ambiguity over which personnel of the GOP are intended to be familiar with the purpose Protection Systems and RAS. Centrally located personnel are not included here because they are addressed by PER-005-2 (*Operations Personnel Training*). Personnel at centrally located dispatch centers will receive company-specific Protection System and RAS training, if identified, as a reliability-related task via the PER-005-2, Requirement R6. Here the GOP must use "...a systematic approach to develop and implement training to its personnel identified in Applicability

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	• Balancing, Interchange and Transmission Operator • Transmission Operator **R3.** Each Balancing Authority shall staff its Real-time operating positions performing Balancing Authority reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificate: **3.1.** Areas of Competency **3.1.1.** Resources and demand balancing **3.1.2.** Emergency preparedness and operations **3.1.3.** System operations **3.1.4.** Interchange scheduling and coordination **3.2.** Certificates • Reliability Operator	Section 4.1.5.1. of this standard, on how their job function(s) impact the reliable operations of the BES during normal and emergency operations.” Being trained using a systematic approach on the purpose (i.e., functions, including limits) Protection Systems and RAS will enable the GOP centrally located dispatch personnel to ensure reliable operation of its Facilities on the BES. The phrase “…purpose and limitations…” in PRC-001-1-1(ii), Requirement R1 is addressed in the proposed requirement through the use of “operational functionality.” The phrase “operational functionality” as described in the PER-006-1 – Application Guidelines describes that training is expected to cover how Protection Systems operate within their limits and prevent possible damage to Elements. It also addresses how RAS detect pre-determined BES conditions and automatically take corrective actions. The criteria that comprises operational functionality mirror

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	• Balancing, Interchange and Transmission Operator • Balancing and Interchange Operator **PER-005-2 (Approved)** **R1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use a systematic approach to develop and implement a training program for its System Operators as follows: **1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall create a list of Bulk Electric System (BES) company-specific Real-time reliability-related tasks based on a defined and documented methodology. **1.1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall review, and update if necessary, its list of BES company-specific Real-time reliability-related tasks identified in part 1.1 each calendar year.	the components listed under the NERC Glossary term "Protection System." By doing so, reduces the ambiguity of the phrase "purpose and limitations." The phrase "…applied in its area" is addressed by the PER-006-1 by using "…that affect output of a generating Facility." Lastly, the proposed PER-006-1 Requirement R1 includes both Protection Systems and RAS to eliminate confusion over the phrase "Protection System schemes." **Familiarity with the Purpose (BA)** For the BA, the PRC-001-1.1(ii), Requirement R1 is proposed for retirement on the basis that the BA obtains an appropriate level of familiarity with the purpose of Protection Systems and RAS under PER-003-1 (*Operating Personnel Credentials*), Requirement R3 and PER-005-2, Requirements R1, R3, R4, and R5 as explained below in detail.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall design and develop training materials according to its training program, based on the BES company-specific Real-time reliability-related task list created in part 1.1. **1.3.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver training to its System Operators according to its training program. **1.4.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation each calendar year of the training program established in Requirement R1 to identify any needed changes to the training program and shall implement the changes identified.	The BA is certified under PRC-003-1 as a System Operator.[14] Although there is no specific area of competency for protection and control similar to the Reliability Coordinator and Transmission Operator certifications, the NERC *Balancing and Interchange Operator Certification Exam Content Outline 2015*[15] (BI Exam) does contain the same five topics applicable to RC and less one topic applicable to the TOP. The topic that is not included is to "analyze relay targets, fault locaters and fault recorders to determine a proper restoration plan" and is not germane to BA operations. The job-task analyses (JTA) performed by entities are used to (1) develop the BI Exam topics that are evaluated by NERC and a NERC functional entity working group every three years, and (2) used to develop the training of

[14] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operator is defined as: An individual at a Control Center of a Balancing Authority, Transmission Operator, or Reliability Coordinator, who operates or directs the operation of the Bulk Electric System (BES) in Real-time.

[15] http://www.nerc.com/pa/Train/SysOpCert/System%20Operator%20Certification%20DL/Balancing%20and%20Interchange%20Operator%20Certification%20Exam%20Content%20Outline%202015.pdf (December 9, 2014).

		for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified by the entity pursuant to Requirement R1. Operations Support Personnel are among the personnel that perform Operational Planning Analyses (OPA) and Real-time Assessments (RTA). These reliability-related tasks include performing both an OPA and RTA and are proposed for modification to address the integration of Protection System and RAS limits to ensure the BES is operated within SOLs and IROLs. See the discussion below concerning the OPA and RTA for the explanation of how the revised definitions support the reliability object objective of PRC-001-1.1(ii), Requirement R1. **Operational Planning Analysis (OPA)** The TOP, applicable to PRC-001-1.1(ii), Requirement R1, is required have an OPA that will allow it to assess whether its

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		planned operations for the next day within its Transmission Operator Area will exceed any of its SOLs (TOP-002-4, Requirement R1). The TOP is required to have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified as a result of its OPA as required in Requirement R1 (TOP-002-4, Requirement R2) and notify others of their role in the Operating Plan(s) (TOP-002-4, Requirement R4). To accomplish this the TOP is required to maintain a documented data specification for the data necessary to perform its OPA that includes provisions for notification of current Protection System and RAS status or degradation (including failure) that impacts System reliability (TOP-003-3, Requirement R1, Part 1.2.). The RC is not applicable to PRC-001-1.1(ii) and is included here for additional support. The RC is required to perform an OPA that will allow it to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area (IRO-008-2,

R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing	respects system requirements…" This directive is addressed in the TOP/IRO standards that were developed since the Order was issued because the BA, RC, and TOP can issue Operating Instructions[22] to maintain the reliability of its respective area. The following describes how the TOP/IRO Reliability Standards achieve the reliability objective with regard to "corrective actions." **Corrective Action by the GOP – R2.1.** TOP-003-3 (*Operations Reliability Data*) Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the GOP because the TOP will be aware of current Protection System and SPS status (change in status is implied) or degradation (including failure) that impacts System reliability. See

[22] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Instruction is defined as "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the	Authority Area via its own actions or by issuing Operating Instructions. **TOP-003-3 (Approved)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data	the "shall notify" section(s) below for a full description of how the TOP receives such notification. TOP-001-3 (*Transmission Operations*) Furthermore, the TOP will act to maintain the reliability of its Transmission Operator Area[23] (TOP Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R1. TOP-003-3 (*Operations Reliability Data*) Similarly, TOP-003-3, Requirement R2 and part 2.2. that was developed since the Order was issued addresses corrective action by the GOP because the BA (i.e., Host BA[24]) will be aware of current Protection System and SPS status (change in status is implied) or

[23] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Transmission Operator Area is defined as "[t]he collection of Transmission assets over which the Transmission Operator is responsible for operating."

[24] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Host Balancing Authority is defined as:

1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries.
2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.

Standard: PRC-001-1.1(ii) – System Protection Coordination

entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**IRO-010-2 (Approved)** **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **IRO-001-4 (Approved)** **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions."	IRO-010-2 (*Reliability Coordinator Data Specification and Collection*) Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the RC because the RC will be aware of current Protection System and RAS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the RC receives such notification. IRO-001-4 (*Reliability Coordination - Responsibilities and Authorities*) Under Requirement R1, the RC will act to address the reliability of its Reliability Coordinator Area[26] (RC Area) by issuing Operating Instructions.

[26] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	PRC-001-1.1(ii), Requirements R2, R2.1, and R2.2. are proposed for retirement. The time frame for corrective action in Requirements R2, R2.1. and R2.2. is covered by:	**Introduction – Time frame for corrective actions** The directive at P 1441 directs the ERO to clarify the term "corrective action" consistent with the discussion in the Order when it modifies PRC-001-1 in the Reliability Standards development process. The reasoning for addressing a time frame for corrective actions is amplified in P 1443 of the Order, which states that: "As explained above *[in the previous paragraphs of the Order*], the requirement for system operators to take corrective control action when protective relay or equipment failure reduces system reliability should be treated the same as the requirement for returning a system to a secure and reliable state after an Interconnection Reliability Operating Limit (IROL) violation, i.e., as soon as possible, but no longer than 30 minutes after a violation. A longer time limit would place an entity in

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected		violation of relevant IROL or TOP Reliability Standards."[27] At P 1444 of the Order, FERC directed NERC to consider the comments of the California PUC regarding the term "as soon as possible" as applicable to the maximum time frame for corrective action through the Standards development process. At P 1445 of the Order, FERC directed NERC, through the Reliability Standards development process, to determine the appropriate amount of time after the detection of relay failures, in which relevant transmission operators must be informed of such failures. The Order at P 1449 (#3) directs NERC to clarify that, after being informed of failures in relays or protection system elements that threaten reliability of the Bulk-Power

[27] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Interconnection Reliability Operating Limit is defined as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.	System, transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes after they receive notice of the failure. **PRC-001-1.1(ii), R2.1. & R2.2. (time frame for corrective actions)** For the reasons explained below, a less than one-hour time frame criteria for corrective action will achieve the reliability objective directed in the Order at P 1441, 1444, 1445, and 1449 (#2 and #3). TOP-001-3 (*Transmission Operations*) Requirement R13 requires the TOP to ensure that a Real-time Assessment[28] ("RTA") is performed at least once every 30 minutes

[28] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Real-time Assessment is defined as "[a]n evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.	**R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.	and initiate its Operating Plan[29] to mitigate a System Operating Limit[30] (SOL) exceedance identified as part of its Real-time[31] monitoring or RTA in TOP-001-3, Requirement R14. The RTA requires inputs to include current Protection System and RAS status (change in status is implied) or degradation (including failure) from a BA, GOP, and/or TOP. Under TOP-003-3 notification of these inputs must occur within a 30 minute time frame; otherwise, an RTA cannot be performed once every 30 minutes.

[29] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Plan is defined as "[a] document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan."

[30] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operating Limit is defined as "The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings)
- Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)"

[31] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), Real-time is defined as "[p]resent time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)"

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. **PRC-001-1.1(ii) (Existing)** **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing	that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment. **R4.** Each Balancing Authority shall distribute its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring. **R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using: **5.1.** A mutually agreeable format	TOP-003-3 (*Operations Reliability Data*) TOP-003-3, Requirement R1 mandates the TOP have a documented specification for the data necessary for the TOP to perform an Operational Planning Analysis ("OPA"),[32] Real-time monitoring, and RTA. Both the OPA and RTA, by definition, require an evaluation that reflects inputs from known Protection System and RAS status (change in status is implied) or degradation (including failure). TOP-003-3, Requirement R3 mandates the TOP distribute its documented specification to those entities that have the required data, which includes the GOP. TOP-003-3, Requirement R2 mandates the BA have a documented specification for the data necessary for the BA to perform its analysis functions and Real-time monitoring that include inputs from Protection System

[32] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operational Planning Analysis is defined as "[a]n evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**5.2.** A mutually agreeable process for resolving data conflicts **5.3.** A mutually agreeable security protocol. **TOP-003-3 (Approved) (included again for reference)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis	and RAS status (change in status is implied) or degradation that are necessary to maintain generation-Load-Interchange balance. TOP-003-3, Requirement R4 mandates the BA to distribute its documented specification to those entities that have the required data, which includes the GOP. TOP-003-3, Requirement R5 builds upon the previous Requirements R1, R2, R3, and R4 described above. Requirement R5 mandates that any GOP that receives a data specification (pursuant to Requirement R3 or R4) to satisfy the obligations of the documented specifications using: a mutually agreeable format, a mutually agreeable process for resolving data conflicts, and a mutually agreeable security protocol. Therefore, the reliability objective of PRC-001-1.1(ii) Requirement R2, R2.1 that mandates the GOP notify its TOP and Host BA of protective relay and equipment failures is addressed by the documented

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment.	specification for the data required in TOP-003-3, Requirement R1, part 1.2. for TOP and Requirement R2, part 2.2. for the BA. The documented data specifications is required to be distributed by the TOP and BA and mandates the GOP per TOP-003-3, Requirement R5 provide current Protection System and RAS status (change in status is implied) or degradation that impacts System reliability. **PRC-001-1.1(ii), R2.2. (shall notify)** Based on the conclusions above (i.e., "time frame for corrective actions), notifications of the inputs of Protection Systems and RAS by the TOP must be provided on at least a 30-minute basis. The TOP/IRO set of standards that were developed since the Order was issued achieve the reliability objective of ensuring that the RC and the BA and TOP (i.e., the affected BA and TOP) are notified of protective relay and equipment failures. TOP-003-3 (*Operations Reliability Data*)

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	TOP-003-3 (Approved) (included again for reference) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection	TOP-003-3, Requirement R1, mandates the TOP have a documented specification for the data necessary for the TOP to perform an OPA, Real-time monitoring, and RTA. Both the OPA and RTA, by definition, require an evaluation to reflect inputs from known Protection System and RAS status (change in status is implied) or degradation (including failure). TOP-003-3, Requirement R3 mandates the TOP distribute its documented specification to those entities that have the required data, which includes the BA, RC, and TOP. TOP-003-3, Requirement R2 mandates the BA have a documented specification for the data necessary for the BA to perform its analysis functions and Real-time monitoring, which would include inputs from Protection System and RAS status (change in status is implied) or degradation that are necessary to maintain generation-Load-Interchange balance. TOP-003-3, Requirement R4 mandates the BA distribute its documented specification to those entities that have the

Standard: PRC-001-1.1(ii) – System Protection Coordination

RELIABILITY CORPORATION

Evaluation of Proposed Definitions

Project 2007-06.2 – Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of "Operating Planning Analysis" (OPA) and "Real-time Assessment" (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective PRC-001-1.1(ii) – Protection System Coordination, Requirement R1 to "be familiar with the purpose and limitations of Protection System schemes in its area," the two definitions are being modified to include the phrase "…functions, and limits…" to ensure the Transmission Operator (TOP), and Reliability Coordinator (RC) that is not applicable to PRC-001-1.1(ii), consider the functions and limits of Protection Systems and Remedial Action Schemes (RAS) in their OPA and RTA evaluations. Revising the definitions to require the RC and the TOP to integrate the functions and limits (i.e., purpose and limitations) into its OPA and RTA will ensure that the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL).

Proposed Definitions

This section includes the Reliability Standards and the associated requirements where the two modified terms are found. These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions, (1) an administrative update to replace "Special Protection System" to "Remedial Action Scheme" (RAS), and (2) the addition of the phrase "…functions, and limits…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and limits" into these evaluations. The proposed definition revision also has an effect on the Reliability Coordinator that is not applicable to PRC-001-1.1(ii). The bold text in the "Proposed Definitions" column accentuate the revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Definitions (Effective January 1, 2017)	Proposed Definitions
Operational Planning Analysis An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)	**Operational Planning Analysis (OPA)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limits**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	**Real-time Assessment (RTA)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limits;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Evaluation

The following is an evaluation of the potential impacts the modifications to the above definitions may have on the expected performance by the RC and TOP. The evaluation is limited to the Reliability Standards that will be or become in effect upon approval of the revised definitions.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	The OPA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the “functions and limits” of Protection Systems and RAS needed to perform an OPA.
IRO-008-2 - Reliability Coordinator Operational Analyses and Real-time Assessments (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall perform an *Operational Planning Analysis* that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its *Operational Planning Analysis* as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The RC must integrate the “functions and limits” of Protection Systems and RAS in order to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area. **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. This requirement references that the results of the OPA are used by the RC to have a coordinated Operating Plan(s) for next-day operations to address potential SOL and IROL exceedances.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limits" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its *Operational Planning Analyses* and Real-time Assessments. **1.5.** Provisions for periodic communications to support reliable operations.	The OPA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-002-4 – Operations Planning (Effective April 1, 2017) **R1.** Each Transmission Operator shall have an *Operational Planning Analysis* that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its *Operational Planning Analysis* as required in Requirement R1.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The TOP must integrate the "functions and limits" of Protection Systems and RAS in order to assess whether its planned operations for the next day within its TOP Area will exceed any of its SOLs. **Requirement R2** The OPA definition revision has no impact on the TOP in this requirement. The TOP is using information resulting from its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessment.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and limits" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

<table>
<tr><th colspan="2">Real-time Assessment (RTA)</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Description and Change Justification</th></tr>
<tr><td>IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017)
R1. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.</td><td>The RTA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the “functions and limits” of Protection Systems and RAS needed to perform an RTA.</td></tr>
<tr><td>IRO-008-2 – Reliability Coordinator Operational Analyses and Real-time (Effective April 1, 2017)
R4. Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.
R5. Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.</td><td>Requirement R4
The RTA definition revision has an impact on the RC in this requirement. The RC must include the “functions and limits” among other prescribed inputs from the definition of RTA.

Requirement R5
The RTA definition revision has no impact on the RC in this requirement. The RC is notifying others based on the results of its RTA that an actual or expected condition that results in, or could result in, a SOL or IROL exceedance within its Wide Area.</td></tr>
</table>

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-009-2 - Reliability Coordinator Actions to Operate Within IROLs (Effective January 1, 2016) **R2.** Each Reliability Coordinator shall initiate one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirement R1) that are intended to prevent an IROL exceedance, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*. **R3.** Each Reliability Coordinator shall act or direct others to act so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*.	**Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The RC will be taking an action to prevent an IROL exceedance, as identified in the RC's RTA. **Requirement R3** The RTA definition revision has no impact on the RC in this requirement. The RC will be acting or directing others so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the RC's RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	**Requirement R1** The RTA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limits" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and *Real-time Assessments*. **1.5.** Provisions for periodic communications to support reliable operations.	The RTA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-001-3 – Transmission Operations (Effective April 1, 2017) **R13.** Each Transmission Operator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or *Real-time Assessment*.	**Requirement R13** The RTA definition revision has an impact on the TOP in this requirement. The TOP must include the "functions and limits" among the other prescribed inputs from the definition of RTA. **Requirement R14** The RTA definition revision has no impact on the TOP in this requirement. The TOP will be initiating its Operating Plan to mitigate a SOL exceedance identified in its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessment*.	**Requirement R1** The RTA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and limits" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement Reminder

Project 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 and Two Proposed Modified Definitions

Formal Comment Period Open through April 25, 2016

Now Available

Initial Ballots for **PER-006-1 – Specific Training for Personnel** and the **proposed modified definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA)** as well as a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern, Monday, April 25, 2016.**

Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard, definition, and associated VRFs and VSLs by clicking here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and determine the next steps of the project.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.

Standards Announcement

Project 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 and Two Proposed Modified Definitions

Formal Comment Period Open through April 25, 2016

Now Available

A 45-day formal comment period for **PER-006-1 – Specific Training for Personnel** and the **proposed modified definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA)** is open through **8 p.m. Eastern, Monday, April 25, 2016.**

Commenting

Use the electronic form to submit comments on the standard and definitions. If you experience any difficulties in using the electronic form, contact Wendy Muller**.** An unofficial Word version of the comment form is posted on the project page.

Join the Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Friday, April 8, 2016**. Registered Ballot Body members may join the ballot pools here.

Note: If you had previously joined the ballot pools for this project, you **must** join these new ballot pools to cast votes. Ballot pool members of the previous ballots for 2007-06.2 **will not** be carried over to these ballot pools.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. – 8 p.m. Eastern).

Next Steps

Initial ballots for the standard and the two definitions as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **April 15-25, 2016.**

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.

Comment Report

Project Name:	2007-06.2 Phase 2 of System Protection Coordination | PER-006-1 and Modified Definitions of OPA and RTA
Comment Period Start Date:	3/10/2016
Comment Period End Date:	4/25/2016
Associated Ballots:	2007-06.2 Phase 2 of System Protection Coordination Modified Definitions of OPA and RTA IN 1 DEF 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 IN 1 ST 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 Non-binding Poll IN 1 NB

There were 54 sets of responses, including comments from approximately 53 different people from approximately 51 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. Generator Operator: Do you agree that the proposed PER-006-1 – Specific Training for Personnel appropriately replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…")? If not, please explain and provide suggestions to improve the PER-006-1 requirement.

2. Transmission Operator: The reliability objective of PRC-001-1.1(ii), Requirement R1 for the Transmission Operator (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"), that is not already covered by the *Personnel Performance, Training, and Qualifications* (PER) Reliability Standards, is addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Transmission Operator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL). Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

3. Reliability Coordinator: During the progression of Project 2007-06.2, it was determined that the Reliability Coordinator, a function that is not applicable to PRC-001-1.1(ii) should, similarly, "…be familiar with the purpose and limitations of Protection Systems schemes…" as found in Requirement R1 of the standard. The reliability objective for the Reliability Coordinator that is not already covered by the PER Reliability Standards, is being addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Reliability Coordinator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within SOL and IROL. Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

4. Do you agree with the proposed Violation Risk Factor (VRF) and Violation Severity Levels (VSLs) for the proposed PER-006-1 Requirement? If not, please provide a basis for revising the VRF and/or what would improve the clarity of the VSLs.

5. Do the PER-006-1, Application Guidelines provide sufficient guidance, basis for approach, and examples to support performance of the Requirement? If not, please provide specific detail that would improve the Application Guidelines.

6. Do you agree with implementation period (i.e., 12 months) of the proposed PER-006-1 Reliability Standard and the proposed definition modifications of OPA and RTA based on the considerations listed in the Implementation Plan? If not, please provide a justification for changing the proposed implementation periods.

7. Are you aware of any conflicts between the proposed PER-006-1 Reliability Standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement? If so, please identify the conflict here.

8. Are you aware of the need for a regional variance or business practice that should be considered with this project? If so, please identify it here.

9. If you have any other comments not previously mentioned above, please provide them here:

1. Generator Operator: Do you agree that the proposed PER-006-1 – Specific Training for Personnel appropriately replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…")? If not, please explain and provide suggestions to improve the PER-006-1 requirement.

Comment	
It does not require the Generator Operator (GOP) to perform any verification activities of retention of the training following the training, nor does it address training refreshment. The results of this omission diverges from the structure established in PER-005-2 R1, R2, and R3, and would put the RE examiner in the position of testing all plant operators and assess their abilities to properly assign a VSL. It also follows that the RE examiner would have to be familiar with the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility. This could be a stretch for most examiners, and, at the very least, lengthen the time of preparation for examination.

M. LeRoy Patterson System Operator Trainer Grant County PUD (GCPD) Ephrata, WA Work: 509.754.7205 Mobile: 406.490.4254	

Internal ext: 4165

Email: Lpatterson@gcpud.org

- The notion that PRC-001 R1 required training of Plant Operators is not supported historically or by plain reading of that requirement. While some personnel within GOPs had to be trained (i.e. “familiar with”), the requirement is silent regarding specific GOP personnel requiring such training. Oddly, the drafting team recognizes this and uses such an interpretation as it recommends changes to assessment definitions to bring PRC-001 requirements under PER-005 for BAs, TOPs, RCs, etc.

- GCPD supports training in general and Plant Operator training specifically. Further, GCPD recognizes value in providing training to its employees, including Plant Operators.

That said, GCPD does not support PER-006 because there is no direct causal relationship between requiring training of Plant Operators and enhancing BES reliability benefits associated with Protection Systems and Remedial Action Schemes (RAS) other than the vague notion that training is always beneficial.

BES Reliability is affected adversely when Protection Systems and RAS are designed, implemented, and/or operated improperly. Of these three aspects, Plant Operators may have a role in their operation, but only from the standpoint of allowing such systems to be in service as directed or agreed upon by GOPs. For Protection Systems and RAS, which operate to protect equipment other than the unit being relayed offline, the GOP should be required to take agreed upon actions to place such systems in service and to keep such systems functional as long as the agreed upon conditions persist. This is the manner used to enforce having AVR and PSS in service.

For Protection Systems and RAS, which operate to protect the unit, GOPs have a stake in operating such systems appropriately. In addition, GOPs are required under existing requirements to coordinate regarding such systems with TOPs et al.

In both cases, it is likely GOPs provide training for Plant Operators to ensure proper operation of Protection Systems and RAS. However, mandating such training is specifying “how” to achieve an outcome rather than requiring a necessary performance. In both cases, requirements should be in place to operate such systems within design and implementation criteria because requiring training of Plant Operators will not achieve the desired result. In addition, training Plant Operators does nothing to ensure appropriate design and implementation of such protection systems, which presumably is included in remaining PRC requirements.

Hence, PER-006 does not accomplish an appropriate reliability objective. • If approved, PER-006 requires development of training materials, training classes, tracking systems, creation of evidence, and other administrative efforts to demonstrate compliance with PER-006. These extra tasks incur additional costs without a direct causal justification explaining why these additional costs contribute to the reliability of the BES as stated previously. • The reliability objective is better addressed by requiring protective systems be kept in service and functional much the same way as requirements for AVRs and PSSs.

The PSEG Companies agree that PER-006-1 appropriately addresses the responsibilities of the Generator Operator, however we are concerned that the phrase "*affect the output of the generating Facility(ies) it operates*" could be interpreted to require the Generator Operator to have knowledge of Protection Systems or RAS several substations distant from its point of interconnection. In this case, the Generator Operator could be required to understand the operational functionality of protection systems that the Generator Operator has no knowledge of. PSEG does not believe that this is the intent of the Standard Development Team, and suggests revising Requirement 1 to state**: "**Each Generator Operator shall provide training to personnel	

identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that are *associated with the generator interconnection* and affect the output of the generating Facility(ies) it operates."

Talen Energy respectfully requests that the "Note to Auditor" on p.4 of the draft RSAW be changed as follows:

Present text: "The documentation provided, including training if provided, should be specific to the operational functionality of Protection Systems and Remedial Action Schemes that affect output of the Facility. Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies). See Application Guidelines for details on what protective systems are covered. Generally, the Requirement focuses on those systems that are related to the electrical output of the generator."

Revised text: The documentation provided, including training if provided, need not be Facility-specific. If Facility-specific training is provided, however, it should be updated if necessary to address changes or additions to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies). See Application Guidelines for details on what protective systems are covered. Generally, the Requirement focuses on those systems that are related to the electrical output of the generator.

Rationale: Changes or additions to Protection Systems or RASs would necessitate revisions to course materials and re-education of operators only if the training being given is Facility-specific, and PER-006-1 does not impose a requirement or even make a suggestion in this respect. The explanation of the term, "operational functionality," in the Guidelines and Technical Basis section of the standard does not include anything that would require training to be individualized for each plant, and the bullet points on p.9 of PER-006-list only topics of a general nature. The standard *permits* plant-specific training, but the Guidelines and Technical Basis material emphasizes the GOP's flexibility, which the RSAW as presently written seems to be taking away."

The adjustments as made extend the training to the Plant personnel which previously the training requirements were for the System Operators. This removes the training requirement from the Control Center Personnel who are more likely to need the understanding.

Kansas City Power and Light Company recommends withdrawal of PER-006-1 and its associated guideline, and offers an alternative to address GOP duties under proposed retired Standard PRC-001-1.1(ii). The recommendations are based on the following:

Generator Operator Not Equivalent to Plant Operators: PER-006-1 does not replace the responsibilities of the Generator Operator in PRC-001-1.1(ii). To replace one with the other would suggest parity between the two—an apple-to-apple change. Generator Operator in PRC-001-1.1(ii) applicability is at the entity level. The applicability under PER-006-1 is completely different, narrowly construed, creating a compliance duty on plant operators located at a generator's plant site and, as such, provides an apples-to-oranges change.

Generator Operator (GOP) is defined as, "The entity that operates generating Facility(ies) and performs the functions of supplying energy and Interconnected Operations Services [effective 07-01-2016]," referring to the responsibilities at the entity level. The Applicability for PER-006-1 establishes the compliance obligation at the operator—the individual person—level, with the effect of defining what a plant generator operator is and what an operator is not.

While establishing duties of system operators is not foreign in NERC Standard Requirements, in this particular case, we do not believe it is necessary.

GOP Already Responsible for Reliable Operation of Its System: The GOP and, in many situations, its delegates, carry a fundamental responsibility to supply energy in a manner that is not disruptive to the reliability of the Bulk Electric System (BES). If fulfilling that responsibility requires the GOP's lever-pullers, so to speak, at the generating plant to have awareness of Protection Systems and RAS, it is incumbent on the GOP to offer that awareness training whether a specific Standard exists or not. The GOP is in the best position to identify what training operators need to reliably manage their systems on the BES. This idea is reflected in soon to be enforceable, PER-005-2, Application Guidelines, Rationale for R6:

"The Commission acknowledged that the training for GOPs need not be as extensive as the training for TOPs and BAs. FERC also stated that the systematic approach to training methodology is flexible enough to build on existing training programs by validating and supplementing the existing training content, where necessary, using systematic methods."

PER-005-2 applies to GOP control room operators, specifically excluding the generation facility operators. However, if the GOP, as the expert in its system and using a systematic method as provided in the guidelines, believes the generation facility operator needs to have awareness of Protection Systems and RAS, the GOP is going to extend awareness training to the generation facility operator because of the GOP's overarching duty to operate its system reliably with or without the onus of PRC-001-1.1(ii) or the proposed PER-006-1.

Every System is Unique: Remedial Action Schemes (RAS) are not applicable to all generators. Establishing a compliance duty under a Standard with a single Requirement to address a potential system design is inefficient and creates a challenge for entities that do not have relevant generator related RAS. In such a case, the entity has to prove a negative to show compliance; such an effort is often overly burdensome and, frankly, does little to promote reliability of the BES.

PER-005-2 Already Establishes GOP Training Responsibilities: To address the retirement of PRC-001-1.1(ii), we believe additional language to PER-005-2 Applicability 4.1.5.1 can effectively provide for the awareness training sought under proposed PER-006-1.

KCP&L suggests the following:

1. Withdraw PER-006-1 and its associated Guidelines.

2. Add language along the lines of the following as a bullet point following PER-005-2, Applicability 4.1.5.1:

- While the specific training set forth in this Standard is not applicable to plant operators located at a generator plant site, should the GOP determine there are systems or facilities that may impact the reliable operation of the Bulk Electric System (BES) and are relevant to the performance of plant operators' duties located at a generator plant site, the applicability may be extended to include plant operators at a generator plant site for the narrow purpose--to incorporate awareness training of specific systems or facilities that impact the BES. Such awareness training shall be incorporatedd into the GOP's systematic training methodology.

Comment	

We have several concerns that the intents of the drafting team haven't been accurately captured after participating in the Webinar (April 5, 2016). In reference to the term 'plant personnel', a drafting team member stated on the webinar that the "term wasn't just applicable to the operator but all staff and this supporting data could be found in the Technical Materials". We agree that this topic of discussion can be found in the Technical Materials section (Page 9- Guidelines: last two sentence of the first paragraph). There are examples provided to show what personnel shouldn't be included however, there are not examples reflecting who should be included. We suggest the drafting team include some clarifying examples of what type of 'plant personnel' should be included somewhere in the Technical Documentation. Our suggested example list would consist of (Operators, Engineers, Analysis……etc). We feel that type of information provides value as well.

Our second concern would be related to the Webinar (April 5, 2016) slides related to 'avoiding conflict with PER-005-2'.   It is our understanding that PER-005-2 Standard addresses personnel at a centrally located dispatch center while PER-006 addresses GOP (plant personnel). However, our concern comes from the Applicability section 4.1.5.1 (last sentence) of PER-005-2. The language mentions the personnel who wouldn't be covered under the PER-005-2. The other personnel mentioned are those at a "centrally located dispatch center who relay dispatch instructions without making any modifications". If PER-006-1 is to cover all 'plant personnel', but PER-005-2 is to cover some 'plant personnel' it seems there is either overlap or a gap that needs to be clarified. We suggest the drafting team re-evaluate the second set of 'plant personnel' mentioned in the section above and determine of more clarity can be provided as to which personnel should and should not be included.

Finally, our last concern is related to the required periodicity of training for the 'plant personnel'. The Standard (PER-006-1) nor its Technical Documentation states how often this training should be conducted. From the webinar information (April 5, 2016) it appears that the intent of the Drafting Team is that as the reliability needs change, the training should be re-performed in order to stay consistent with those changes. We feel that this intent is not being conveyed in the Standard or its supporting documentation. Without further clarification, our interpretation is that only **one** training session needs to be conducted to meet the reliability and compliance needs. Either additional language specifying training conducted in relation to changes to the RAS function, or a period of time that training should be conducted needs to be added. Our review group suggests the drafting team use similar language implemented into Requirement R6 of PER-005-2. That language requires training conducted each calendar year and is listed as follows:

"Each Generator Operator shall conduct an evaluation each calendar year of the training established in Requirement R6 to identify and implement changes to the training".

The Bureau of Reclamation (Reclamation) supports PER-006-1 as an appropriate revision to the Generator Operator protection system training requirement in PRC-001-1 to address the reliability objective of operator familiarity with the “purpose and limitations of Protection Systems.” Reclamation believes that the proposed requirement includes meaningful clarification that training must address “the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of … generating Facility(ies).”

The main concern however is to contain the scope of "operational functionality" to that required to understand how the Protection System generally operates and affects the plant and not to necessarily require specific detailed knowledge of actual settings, etc. such that operators are expected to become system protection or relay experts.

Duke Energy agrees that the proposed PER-006-1 appropriately covers the responsibilities of the Generator Operator in PRC-001-1.1(ii). However, we feel that the proposed PER-006-1 goes far beyond what is necessary to cover the responsibilities of the Generator Operator in PRC-001-1.1(ii) and protect the reliability of the Bulk Electric System. We feel that a basic understanding of and familiarity with protection systems and Remedial Action Schemes, as currently required, is adequate for promoting the reliability of the BES. Duke Energy does not believe that having generator specific training increases stability of the BES, and believes that the administrative effort, especially on larger utilities with numerous generating facilities, would be especially burdensome.

Texas RE agrees the proposed PER-006-1 replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"). Texas RE suggest aligning the training with requirement with PER-005-2 R1.1.1 as to be done each calendar year. The Guidelines and Technical Basis document indicates that "[t]he structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service", but there is nothing indicating how often personnel should be trained.

We appreciate the SDT's efforts in developing this draft standard and thank the team for responding to our previous comments that recommended moving this requirement to the PER family of standards. We would like to point out that this standard is very specific with regard to the applicability section, and would hope that future standard projects do not attempt to consolidate other training standards and requirements to PER-006-1. There may be future unintended consequences if other training requirements were to be consolidated in this standard that is only applicable to a subset of plant personnel.

2. Transmission Operator: The reliability objective of PRC-001-1.1(ii), Requirement R1 for the Transmission Operator (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"), that is not already covered by the *Personnel Performance, Training, and Qualifications* (PER) Reliability Standards, is addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Transmission Operator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL). Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

Oshani Pathirane - Oshani Pathirane	
Answer	No
Document Name	
Comment	

While Hydro One Networks Inc. agrees that an evaluation may be performed for an OPA, an evaluation cannot be performed in real-time for an RTA. An OPA may be conducted over a longer period as next-day operations (as opposed to real-time operations) are considered. However, as the term implies, an RTA is conducted in real-time and therefore constitutes a quicker determination of conditions as opposed to a more time-consuming and comprehensive analysis. Therefore, Hydro One suggests that the definition of RTA start off with "*A determination of system conditions*…". The definition of OPA may be left as is if the definition of RTA is modified as suggested.

While Question #3 below pertains to the RC and does not pertain to Hydro One Networks Inc., Hydro One agrees with the NPCC that assurance that the BES is operated within SOLs and IROLs is separate from integrating the functions and limits of Protection Systems and Remedial Action Schemes into OPA an RTA. Further, Hydro One agrees with the NPCC that the term "limits" may imply SOLs and IROLs, which Protection Systems have little if not, any impact on. Therefore, the term "limitations" is a better substitute for the term "limits".

SRC does not agree with the modification of the OPA and RTA definitions. SRC believes that the existing PER standard covers the intended scope of PRC-001-1.1 and the change in the definitions of OPA and RTA goes beyond the original scope of PRC-001-1.1. Additionally, RCs have protection system and SPS knowledge and awareness requirements in the IRO standards.

However, if the SDT still believes the change in the definition of OPA and RTA is required, then there are better alternative phrases that will improve current proposal. The inclusion of the term “functions, and limits” in OPA and RTA can be misinterpreted. In the existing Glossary of Terms Used in NERC Reliability Standards (updated February 19, 2016) there are 21 references to “limit” or “Limit”, with vast majority of them referencing thermal, voltage, and stability limits and/or SOL and IROL.   SRC suggest SDT consider the following alternative phrases to "functions, and limits" that will eliminate future confusion: 1) operational functionality, 2) intended functions, and 3) functions and limitations.

Additionally, removing the word “schemes” from the phrase “protection system schemes” in translating this requirement from PRC-001-1.1 to the RTA and OPA definitions introduces confusion. Per the definition in the NERC Glossary of Terms, a protection system could be anything from a single protective relay to a set of relays designed to address a specific problem such as the exclusions identified in the RAS definition. The proposed language could be interpreted to mean that RCs/BAs/TOPs must be aware of the functions and limits of every single relay in its area, greatly expanding the scope of the requirements in the IRO and TOP standards that reference the RTA and OPA. SRC recommends the drafting team to use the defined term “Composite Protection System” instead of “Protection System”.

Texas RE is concerned there is no explicit training requirement for TOPs and RCs on operational functionality of Protection Systems and Remedial Action Schemes (RAS).   PER-005-2 requires TOPs and RCs to develop a list of “reliability-related tasks” but it does not specify these tasks include Protection Systems and RASes. Texas RE is concerned that adding the terms “functions and limits” to the definitions do not ensure that each TOP will be familiar with the functions and limitations of its Protections Systems and RASes as they need to be in PRC-001-1.1(ii).

Additionally, with regard to the proposed definitions, SOL and IROL exceedances are only one aspect of situational awareness necessary for reliable operation of the BES. In order to maintain situational awareness, a TOP should be aware of Protection Systems and RASs to operate the system regardless of whether it is within SOLs or IROLs. For example, TOPs might be aware of how a unit tripped due to operation of a RAS and how that would impact an SOL or IROL exceedance. But you might not necessarily understand the reason of the generator trip as a result of the RAS operation and therefore lack knowledge of the duration of generator outage and other pertinent information.   The need for situational awareness beyond SOL and IROL exceedances is more important for the RC, as RCs are responsible for coordination among TOPs.

As a best practice, ERCOT believes it is preferable to include requirements in the Reliability Standards rather than in definitions. Because requirements in definitions do not have associated measures or VRFs/VSLs, compliance and enforcement could be complicated.

ERCOT recognizes that the SDT's intent is to translate the requirement R1 of PRC-001-1.1 for the TOP and BA to "be familiar with the purpose and limitations of Protection System schemes applied in its area" to the RTA and OPA definitions used in the IRO/TOP standards. However, the change from the phrase "purpose and limitations of Protection System schemes" to the phrase "known Protection System and Remedial Action Scheme status or degradation, functions, and limits," is problematic for several reasons.

In the context of protection systems, SPSs, and RASs, the difference in meaning between "limits" and "limitations" is significant. The word "limits" in the proposed RTA and OPA definitions has the potential to be confused with system operating limits (SOLs). Requiring RCs and TOPs to consider SOLs for protection systems and RASs in RTAs and OPAs is unnecessary because GOs and TOs are already required to consider those SOLs for those facilities under FAC-008 R2.3 and R2.4.1 and FAC-008 R3.3 and R3.4.1. For this reason, ERCOT disagrees with Question 2's statement that the proposed definition changes "will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL)."

The word "limits" could also be misconstrued to mean limits on protection systems and RASs in the form of protection relay set points. Facility owners responsible for protection system maintenance and testing regularly collect and maintain relay set point information. However, this information has not been typically provided by facility owners to RCs and TOPs since Facility Ratings have been used to operate the system, and the set points for the majority of relays utilized to protect equipment are well beyond the Facility Ratings. Without guidance on which specific limit information is required, RCs and TOPs would potentially be required to consider an enormous number of relay set points, which are subject to constant change, making integration of this information into an RTA or OPA challenging and burdensome, without any meaningful reliability improvement. Furthermore, under the new IRO-008-2 Requirement R4, effective April 1, 2017, RCs are required to conduct an RTA every 30 minutes. Incorporating relay set point information into an RTA every 30 minutes means an RC would need to collect and incorporate large and constantly fluctuating data sets. This introduces a burdensome RC requirement without any discernible reliability benefit.

Introducing a “limit” to track under the RTA and OPA may also create confusion over the responsibility of the RC/TOP to respond to such a “limit” if reached or exceeded. If an RC/TOP is already operating to thermal limits, this additional limit is unnecessary and confusing. To avoid this confusion, ERCOT recommends the SDT replace the term “functions and limits,” with either (in order of preference): 1.) “operational functionality,” 2.) “intended functions,” or 3.) “functions and limitations.” ERCOT also recommends the SDT provide examples of how an RTA or OPA can be performed and documented to show evidence that “known Protection System and Remedial Action Scheme status or degradation and operational functionality” have been incorporated.

Additionally, removing the word “schemes” from the phrase “protection system schemes” in translating this requirement from PRC-001-1.1 to the RTA and OPA definitions introduces confusion. Per the definition in the NERC Glossary of Terms, a protection system could be anything from a single protective relay to a set of relays designed to address a specific problem such as the exclusions identified in the RAS definition. The proposed language could be interpreted to mean that RCs/BAs/TOPs must be aware of the functions and limits of every single relay in its area, greatly expanding the scope of the requirements in the IRO and TOP standards that reference the RTA and OPA. SRC recommends the drafting team to use the defined term “Composite Protection System” instead of “Protection System”.

ERCOT also recommends the SDT provide industry with guidance on distinguishing between “protection system schemes” and “protective relays” so as to avoid future confusion.

While we support the proposed revision to the two terms to achieve the intended purpose, we do not agree with the words “and limits”. The word “limits” lends itself to be interpreted as the system operating limits or interconnection system operating limits on which the Protection Systems, etc. have little bearing on. We suggest to reword the above to “functions and limitations” or “functions, limitations” to more accurately reflect the intent of the training on composite protection systems and RASs.

PER-005-2 requires a Systematic Approach to training for the Transmission Operator and Balancing Authority which includes the documented methodology of reliability related tasks addresses the PRC-001-1.1(ii) R1 requirement to "be familiar with the purpose and limitations of Protection System Schemes." The modification to these terms is NOT needed to achieve this reliability objective, since the training is already required as part of the PER-005 standard. Please explain how entities reading these definitions can relate that training on relays is needed by added the words "functions and limitations" to OPA and RTA.

BPA supports PER-006-1 applicability solely to Generator Operators. However, BPA does not support the revised Operational Planning Analysis (OPA) and Real-Time Assessment (RTA) definitions as part of this project. BPA's concern is the compliance and reliability ambiguity presented by including "functions and limits" without specific guidance and/or requirements for the implementation of those terms. BPA desires to have the revised definitions excluded from project 2007-06.2. BPA suggests including the language in new or revised Standard(s) requirements, with specific guidance that would allow entities to meet the requirements and implementation of "functions and limits", such as TOP-001 and/or TOP-002.

Vectren supports a more clear use of “functions and limits” with respect to the transmission operators knowledge of Protection Systems. The transmission operators should have a clear understanding of the impacts of a Protections System on electrical facilities. Specifically, the operators should know and plan for the resulting state of facilities that would be outaged for a typical fault. Generally, most facilities will clear from breaker to breaker, but a SPS or RAS may energize or change state of other non-coincidental facilities. The transmission operator should know the “functions and limits” in the context of planning the extent of the outage. However, with the newer technology programmable relays, there are “function” statements inside of the relay that a system protection technician would know, but a transmission operator would not need to know. The same could be stated about limits. The programmable relays have many “limits” and timers inside the relay “functions” that the transmission operator does not need to know. Vectren agrees that limits, as it pertains to SOL’s and IROL’s, need to be used by the transmission operator. These limits are not in the same context as internal protection system “functions and limits” within a programmable relay.

The proposal is to revise the RTA and OPA definitions to cover “RAS”, “functions” and “limits”. However, per these definitions a third party can perform the RTA and OPA for the TOP, and the BA is not even necessarily involved per future TOP standards. It is not clear that this proposal ensures the BA/TOP familiarity with Protection Systems related to “RAS”, “functions” and “limits”. Also, we have had an ongoing challenge determining who performs the GOP function; is it the folks at the “centrally located dispatch center” per PER-005-2 or is it the “plant personnel” per PER-006? Maybe in Functional Model these could be split into separate roles/registrations. Specific to PER-006, not requiring familiarity of Protection Systems for the GOP centrally located dispatch center folks may be a gap. NIPSCO presently complies with PRC-001-0 R1 with an approach that we believe will cover the requirement and revised definitions of Project 2007-06.2 Phase 2 and therefore is voting Affirmative, however we would like to see our concerns addressed. We appreciate the efforts of this SDT, especially the extensive outreach to stakeholders on this project.

In our interpretation of the proposed changes to the definitions, the intent is that the TOP needs to be familiar with the 'functions and limits' of the Protection System and RAS so they can Identify and understand how those systems will impact system reliability and/or if that system reliability is reduced or threatened. Additionally, the operators must include this knowledge into their everyday process of analyzing and operating their portion of the system in reference to the (BES) SOL and IROL. Based on the presentations from the webinar (April 5, 2016), we interpret that the proposed changes are intended to ensure the Analysis Performance under PER-005-2 includes both the Protection System and RAS. If that is the case, we feel that the message may not be conveyed adequately in the mapping document. We suggest adding some footnotes or other language to the document stating why the Requirements are mentioned, however we're not sure that the end goal is sufficiently communicated in order to help the industry understand the proposed changes.

Additionally we suggest the drafting team consider whether the proposed changes to the definitions should be conducted independent of this project. There are already many moving pieces in this project and this only adds more confusion. Technically, there are five proposed Standards associated with this project and all depends on the retirement of PRC-001 and its Requirements. Adding two definitions from the previous TOP/IRO Project warrants its own attention.

Comment	
ATC supports the proposed revisions because NERC’s explanation matches ATC's expectation regarding the correct understanding of the new, undefined terms “functions” and “limits”. For example, ATC correlates “functions” with “purpose” of Protection Systems and Remedial Action Schemes, which would mean understanding that there are different functions implemented by relaying such as undervoltage protection, overcurrent protection, impedance relaying, etc. Additionally, ATC understands “limits” to correlate with current PRC-001-1.1(ii) term “limitations”, which would mean understanding the limitations of relaying such as overspeed generator protection will not clear a fault by design, a bus differential will not clear a fault outside of its zone of protection, pulling relay trips means a breaker won’t trip if the relay sends a signal to trip, etc. This corresponds to ATC's understanding that "limits" does **not** refer to defining System Operating Limits due to relay settings, in cases where the relay setting produces a lower facility rating than the other connected equipment, because facility limits due to relay settings (or other equipment) are covered by NERC Standard FAC-008-3 R3.4.1 and the NERC Glossary of Terms definition for "System Operating Limit".

3. Reliability Coordinator: During the progression of Project 2007-06.2, it was determined that the Reliability Coordinator, a function that is not applicable to PRC-001-1.1(ii) should, similarly, "…be familiar with the purpose and limitations of Protection Systems schemes…" as found in Requirement R1 of the standard. The reliability objective for the Reliability Coordinator that is not already covered by the PER Reliability Standards, is being addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Reliability Coordinator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within SOL and IROL. Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.

Leonard Kula - Independent Electricity System Operator - 2

I don't think RCs will ever be familiar with the purpose and limitations of PS schemes in their footprint; it is too vast an area. However this is not a "show stopper" for us since we are not an RC.

Answer	No
Document Name	
Comment	

Dominion supports PJM on the following comment:

PJM agrees with the intention of the drafting team but believes there are better alternative phrases that will improve current proposal. The inclusion of the term “functions, and limits” in Operational Planning Analysis (OPA) and Real-time Assessment (RTA) can be misinterpreted. In the existing Glossary of Terms Used in NERC Reliability Standards (updated February 19, 2016) there are 21 references to “limit” or “Limit”, with vast majority of them referencing thermal, voltage, and stability limits and/or SOL and IROL.   SRC suggest SDT consider the following alternative phrases to "functions, and limits" that will eliminate future confusion: 1) operational functionality, 2) intended functions, and 3) functions and limitations.

While we support the proposed revision to the two terms to achieve the intended purpose, we do not agree with the words “and limits”. The word “limits” lends itself to be interpreted as the system operating limits or interconnection system operating limits on which the Protection Systems, etc. have little bearing on. We suggest to reword the above to “functions and limitations” or “functions, limitations” to more accurately reflect the intent of the training on composite protection systems and RASs.

Texas RE is concerned there is no explicit training requirement for and RCs on operational functionality of Protection Systems and Remedial Action Schemes (RAS). PER-005-2 requires TOPs and RCs to develop a list of “reliability-related tasks” but it does not specify these tasks include Protection Systems and RASes.

Additionally, with regard to the proposed definitions, SOL and IROL exceedances are only one aspect of situational awareness necessary for reliable operation of the BES. In order to maintain situational awareness, the RC should be aware of Protection Systems and RASs to operate the system regardless of whether it is within SOLs or IROLs. For example, the RC might be aware of how a unit tripped due to operation of a RAS and how that would impact an SOL or IROL exceedance. But you might not necessarily understand the reason of the generator trip as a result of the RAS operation

and therefore lack knowledge of the duration of generator outage and other pertinent information. The need for situational awareness beyond SOL and IROL exceedances is more important for the RC, as RCs are responsible for coordination among TOPs.

In our interpretation of the proposed changes to the definitions, the intent is that the RC needs to be familiar with the 'functions and limits' of the Protection System and RAS so they can Identify and understand how those systems will impact system reliability and/or if that system reliability is reduced or threatened. Additionally, the operators must include this knowledge into their everyday process of analyzing and operating their portion of the system in reference to the (BES) SOL and IROL. Based on the presentations from the webinar (April 5, 2016), we interpret that the proposed changes are intended to ensure the Analysis Performance under PER-005-2 includes both the Protection System and RAS. If that is the case, we feel that the message may not be conveyed adequately in the mapping document. We suggest adding some footnotes or other language to the document stating why the Requirements are mentioned, however we're not sure that the end goal is sufficiently communicated in order to help the industry understand the proposed changes.

Additionally we suggest the drafting team consider whether the proposed changes to the definitions should be conducted independent of this project. There are already many moving pieces in this project and this only adds more confusion. Technically, there are five proposed Standards associated with this project and all depends on the retirement of PRC-001 and its Requirements. Adding two definitions from the previous TOP/IRO Project warrants its own attention.

Violation Severity Levels (VSL) are based on the number of applicable personnel that the GOp failed to train. While TVA understands that NERC and the SDT assigns more risk to non-compliance to these training requirements than was represented in PRC-001-1.1b, TVA believes the drafted thresholds escalate too aggressively. Also, the VSL for failing to train 4 individuals at a single site should be explicit. Given that the greater of the two thresholds for each VSL will apply to any non-compliance, TVA suggests changes to the drafted thresholds as follows.

- **Lower VSL**: (no change).
- **Moderate VSL**: 2 applicable personnel at a single site; or more than 5% and less than 15% of the total applicable personnel of the GOp.
- **High VSL**: 3 or 4 applicable personnel at a single site; or more than 15% and less than 25% of the total applicable personnel of the GOp.
- **Severe VSL**: 5 or more applicable personnel at a single site; or more than 25% of the total applicable personnel of the GOp.

Violation Risk Factor

The Violation Risk Factor (VRF) of Medium related to a failure to provide evidence of training for plant operators does not seem to meet the criteria for a Medium Risk factor unless the lack of that training causes an event to occur. A Medium Risk factor is defined as follows:

"A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. "

It would seem more appropriate for this to be considered a Low Risk factor as a lack of being able to provide evidence of training is administrative and is defined as:

"A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature."

Violation Severity Level	
The Violation Severity Levels (VSLs) should be enhanced to be explicit in the minimum elements of the training. If an entity provided any training at all it is conceivable that training (regardless of content) would be considered compliant. Exelon does not believe that is the intent of the SDT. Consider revising the technical basis to provide the minimum expectations for the content of the training and revising the VSL to be more specific to the lack of the training containing those elements.

The VSL for missing one operator at a facility with a large staff might mean missing less than 5% of the operators while at a small peaking or black start unit missing one operator could be 50% to 100% of the people at the site. We propose that he VSL would make more sense if the criteria for a single facility was a percentage of operators at that site missing training, rather than the number of personnel missing the training.

Although PGE appreciates the flexibility that the Standard Drafting Team wrote into this standard, it is difficult to measure compliance as it is written. The current version of PER-006 does not indicate how the VSL will be used to measure compliance beyond the initial training specified by the implementation plan.

It does not require the Generator Operator (GOP) to perform any verification activities of retention of the training following the training, nor does it address training refreshment. The results of this omission diverges from the structure established in PER-005-2 R1, R2, and R3, and would put the RE examiner in the position of testing all plant operators and assess their abilities to properly assign a VSL. It also follows that the RE examiner would have to be familiar with the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility. This could be a stretch for most examiners, and, at the very least, lengthen the time of preparation for examination.

Guidance and Technical Basis Section R1:

- “plant personnel” and “GOP” are used interchangeably throughout this Guidance and Technical Basis section. As identified on the commenting sessions with the drafting team, the drafting team identified that the control function may occur in various “entity configurations”. Example given was that a central GOP dispatch center may be the function that controls the generator and not the plant itself. Suggest you change the use of "plant" to "GOP" and/or provide a qualifier for understanding.
- Paragraph 1: Sentence 2 that reads “To accomplish this, **plant personnel responsible for Real-time control and operation of a generating Facility** must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility". Remove **“and operation”,** as this causes confusion as to whom is to be trained. Explanations during commmenting sessions was very confusing on whom this Standard applies. We do understand that there are different functional applications through the utility industry, however it would seem that the use of “Real-time” [a NERC defined term] indeed makes it clear that it is the “first responders” (first responders, a term used by the SDT in clarifying their position on this Standard). Note: remove “and operation” in subsequent paragraphs also.

- Paragraph 1, sentence 2 that reads: "To accomplish this, plant personnel responsible for Real-time control and operation of a generating Facility **must understand** how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility." Delete **“must understand”** and insert **“must be trained on**”. There is no testing associated with this Standard, only training. “must understand” implies a testing measurement function. This change lines up with the Requirment 1.

- Paragraph 2. Sentence that states "A periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel that have Real-time control and operation of a generator are trained in order to operate the plant" . You are correct a periodocity is not specified and is also not a part of the Standard. The Requirement and its mesurement do not even imply retraining. Only the Guidance and Technical Basis and the RSAW address re-training. Please see the proposed addition in #1 of the ‘Additional Comments’ at the end of the commenting form for proposed addition to the Requirement 1. In addition the RSAW, in the ‘Evidence Requested” section asks the auditor to verify documentation of changes or additions or Protection Systems and RAS during the compliance monitoring period (this RSAW requirement comes from language in the Guidelines and Technical Basis section). This is not called out in the Standard and should be added to the R1- Mesurements or elsewhere in the Requirment.

- Paragraph 2, Second sentence that states “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service". Delete this sentence as training frequency is already covered in the sentence following the proposed deleted sentence. The two sentences contradict each other.

- Paragraph 2 Sentence that states “On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS". The RSAW ‘Note to Auditor’ section is explicit that Training should be updated for additions and changes. This does not meet the intent of the SDT (as noted in the sentence identified above "the GOP has the flexibility…"). As written this will lead to different audit practices throughout the industry. If the training is not updated, as the current RSAW language is written, this could be a violation in audit application. See #2 of the ‘Additional Comments’ section at the bottom of this commenting form for proposed RSAW change and in addition the already provided #1 in the ‘Additional Comments’ section below.

Recommend the addition within Guidance and Technical Basis to align with the Section 4.1 of this Standard:

Requirement R1

The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, applicable plant personnel responsible for Real-time control and operation of a generating Facility must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility.

The Application Guidelines should be revised to preclude the RSAW conflict discussed above, i.e. directly stating that Facility-specific course materials are not obligatory.

Answer	No
Document Name	
Comment	

Exelon requests that the SDT be more specific regarding the applicable systems that would fall within the scope of PER-006-1. The current draft provides an exclusion for those protective systems which trip breakers serving station auxiliary loads, secondary unit substations or low switchgear transformers and relays protecting other downstream plant electrical distribution system components (even if a trip of these devices might result in a trip of the unit); however it, does not address the following:

1. Protection systems associated with station auxiliary transformers that supply the station and are fed by external power IF the protection system would open breakers that affect the Bulk Electric System (BES) (e.g., the breakers feed into a ring bus). [Note this does not include a transformer fed from a radial line]. Trip of these transformers may or may not trip the unit depending on the plant design.

2. Protection systems associated with unit auxiliary transformers that supply the station and are fed by the generating unit. In this case the trip of the auxiliary transformer would directly trip the generating unit.

Furthermore, the considerations for operational functionality should list the minimum training elements required – not provide the latitude for an auditor or entity to interpret what should be considered.

No "Application Guidelines" were found in the standard. This answer is based on the assumption that the question intended to reference the " Guidelines and Technical Basis."

The second sentence of the second paragraph of the Guidelines and Technical Basis states,

“The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service.”

While the interpretation provided here is appreciated, TVA does not agree with the premise of the statement. If the intention of the SDT is to require GOP personnel receive training before a Protection System or RAS is placed into service, then R1 or a sub-requirement should state this explicitly, which would comport with maintaining Reliability of the BES.

Further, the next sentence states,

"On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e .g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS."

The “flexibility” given the GOP in this sentence “concerning new systems” is inconsistent with the previous sentence and creates ambiguity regarding when training for new systems is required. The phrase “ongoing basis” would imply the statement is addressing training after a Protection System or RAS has been placed into service, but the parenthetical “concerning new systems” creates the inconsistency.

Guidance and Technical Basis Section R1:

- “plant personnel” and “GOP” are used interchangeably throughout this Guidance and Technical Basis section. As identified on the commenting sessions with the drafting team, the drafting team identified that the control function may occur in various “entity configurations”. Example given was that a central GOP dispatch center may be the function that controls the generator and not the plant itself. Suggest you change the use of "plant" to "GOP" and/or provide a qualifier for understanding.

- Paragraph 1: Sentence 2 that reads “To accomplish this, **plant personnel responsible for Real-time control and operation of a generating Facility** must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility". Remove **“and operation”,** as this causes confusion as to whom is to be trained. Explanations during commmenting sessions was very confusing on whom this Standard applies. We do understand that there are different functional applications through the utility industry, however it would seem that the use of “Real-time” [a NERC defined term] indeed makes it clear that it is the “first responders” (first responders, a term used by the SDT in clarifying their position on this Standard). Note: remove “and operation” in subsequent paragraphs also.

- Paragraph 1, sentence 2 that reads: "To accomplish this, plant personnel responsible for Real-time control and operation of a generating Facility **must understand** how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility." Delete **“must understand”** and insert **“must be trained on**”. There is no testing associated with this Standard, only training. “must understand” implies a testing measurement function. This change lines up with the Requirment 1.

- Paragraph 2. Sentence that states "A periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel that have Real-time control and operation of a generator are trained in order to operate the plant" . You are correct a periodocity is not specified and is also not a part of the Standard. The Requirement and its mesurement do not even imply retraining. Only the Guidance and Technical Basis and the RSAW address re-training. Please see the proposed addition in #1 of the ‘Additional Comments’ at the end of the commenting form for proposed addition to the Requirement 1. In addition the RSAW, in the ‘Evidence Requested” section asks the auditor to verify documentation of changes or additions or Protection Systems and RAS during the compliance monitoring period (this RSAW requirement comes from language in the Guidelines and Technical Basis section). This is not called out in the Standard and should be added to the R1- Mesurements or elsewhere in the Requirment.

- Paragraph 2, Second sentence that states “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service". Delete this sentence as training frequency is already covered in the sentence following the proposed deleted sentence. The two sentences contradict each other.

- Paragraph 2 Sentence that states “On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS". The RSAW ‘Note to Auditor’ section is explicit that Training should be updated for additions and changes. This does not meet the intent of the SDT (as noted in the sentence identified above "the GOP has the flexibility…"). As written this will lead to different audit practices throughout the industry. If the training is not updated, as the current RSAW language is written, this could be a

violation in audit application. See #2 of the 'Additional Comments' section at the bottom of this commenting form for proposed RSAW change and in addition the already provided #1 in the 'Additional Comments' section below.

The application guidelines lack a true description of who the standard applies to. The NERC Functional Model defines Generator Operator as: "The functional entity that operates generating unit(s) and performs the functions of supplying energy and reliability related services." Question arises does this apply only to registered entities of the "Generator Operator" regardless of their voltage level, generation capacity and point of interconnection with the BES?

We recommend that the drafting team clarify in the Application Guidelines for Requirement R1 that one-time training is required for applicable plant personnel. There is nothing in the language of the requirement to require additional, continuing, and/or retraining to occur. The RSAW has made an assumption that retraining is required, which needs to be corrected to align with the requirement. If the SDT does intend for additional, continuing and/or retraining, this would be a substantive change and would require another posting of the revised requirement for industry comment and ballot.

FirstEnergy Comments

PER-006-1 – Specific Training for Personnel

Draft 1 – Ballot Ending April 25, 2016

The following comments are offered to the NERC Standard Draft Team (SDT) to support why FirstEnergy (FE) has voted NEGATIVE on the 1st Draft version of PER-006-1. Our comments also offered suggested revisions in order for FE to support the standard.

1. The 2nd paragraph of the Guidelines and Technical Basis section includes the statement *"The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service."* FE recommends the text be deleted as it is inconsistent with the R1 requirement as presented in Draft 1. This statement adds additional obligations not within the standard. Nowhere in the requirement language is this "dictated" or required. Additionally, this could raise questions to when training is needed for revised Protection Systems that may only include minor setting changes for coordination improvement but no material change in the intended outcome of the protection scheme.

2. The Guidelines and Technical Basis section offers 6 bullet listed items/topics for consideration for training intended to cover the "operational functionality" of a Protection System or RAS. FE offers a re-write of this area to place greater emphasis on the first and last bulleted items which we believe are the most appropriate areas to cover with generation plant operators. The other four items are more technical and design/engineering details that should be more clearly optional.

3. As a minor note, FE suggests adding the word "Operations" in the standard title to read "Specific Training for Operations Personnel". Doing so would better compliment the PER-005-2 standard which is titled "Operations Personnel Training" which focuses on a systematic approach to training for reliability related tasks.

The attached file includes an excerpt of the Draft 1 PER-006-1 standard with suggested red-line edits to the Guidelines and Technical Basis section.

If the SDT wishes to discuss FE's comments please contact Doug Hohlbaugh, Manager, Reliability Compliance at 330-384-4698.

6. Do you agree with implementation period (i.e., 12 months) of the proposed PER-006-1 Reliability Standard and the proposed definition modifications of OPA and RTA based on the considerations listed in the Implementation Plan? If not, please provide a justification for changing the proposed implementation periods.	
Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy	
Answer	No
Document Name	
Comment	
Duke Energy does not believe that an Implementation Plan of 12 months is appropriate for the amount of work that would be involved for larger utilities with numerous generating facilities. An entity would need time to develop additional training materials (in addition to what is already in use for compliance with PRC-001-1.1(ii)) with specificity for each of its generating facilities, and then administer said training to all applicable operators within a 12 month timeframe. A significant amount of time would need to be allotted to accomplish develop and distribute the additional required tasks, much more than the proposed 12 months.

Comments: As currently worded, the modification of OPA and RTA may require entities to collect and include a large, voluminous set of data in their RTAs and OPAs. This would require entities to make modeling and Energy Management System changes to accommodate all the relay information, which would require time to upgrade technology. Taking into account budgeting, design, and implementation, the time necessary to upgrade this technology could run 24 to 36 months.

A period of 12 months is too short to generate operator lists, identify the "Set of Protection Systems and Remedial Action Schemes" and to create and roll out a new training program. Suggest at least a 24 month period.

Tim Kucey - PSEG - PSEG Fossil LLC - 5

Answer	No
Document Name	
Comment	

PSEG thanks the drafting team for its efforts and appreciates having the opportunity to comment on the proposed OPA and RTA definitions. PSEG is in general agreement with the intent of the proposed OPA and RTA definitions as it applies to the inclusion of Protection Systems and RASs in evaluations and assessments (that would be conducted by operations personnel). The wording of the current version of each definition states that OPA evaluations and RTA assessments "…shall reflect applicable inputs including… known Protection System and Remedial Action Scheme status or degradation, functions, and limits…". PSEG agrees that OPAs and RTAs should include the status or degradation of known protection systems and RASs. Additionally, we believe that inclusion of the "functions and limits" of RASs in OPAs and RTAs would improve reliability. However, it is requested that the requirement to include the "functions and limits" of [all] known Protection Systems be removed from the OPA and RTA definitions. As they are currently written, the definitions imply that the (operations) personnel who perform OPAs and RTAs would require detailed information regarding the settings for all protection systems (or schemes) that are within their scope of operations in order to complete OPAs and RTAs. PSEG does not believe that this level of detail regarding [all] protection systems is necessary in OPAs and RTAs in order to maintain reliability of the BES. PSEG therefore proposes that the definitions be revised as follows:

Operational Planning Analysis (OPA)

An evaluation of projected system conditions to assess anticipated (pre Contingency) and for next -day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System status or degradation; and **Remedial Action Scheme** status or degradation**, functions, and limits**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third -party services.)

Real -time Assessment (RTA) An evaluation of system conditions using Real time data to assess existing (pre- Contingency) and potential (post - The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System status or degradation; and **Remedial Action Scheme** status or degradation**, functions, and limits;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real -time A third party services.) PSEG, Segment(s) 5, 6, 1, 3, 3/10/2016

An implementation plan of 12 months is insufficient, as it may not allow larger entities adequate time to improve the existing training program under PRC-001 R1. This shortened duration may force large entities to continue utilizing PRC-001 training processes for PER-006-1, which may not meet the auditor's intent. Instead, AEP recommends that a 4 year phased implementation period for the Standard be incorporated as follows: specific training	

of personnel would consist of 40% within 12 months, 60% within 24 months, 80% within 36 months, and 100% within 48 months following the effective date of the Standard.

Within the province of Ontario, many Ontario Market Rules published by Ontario’s Independent Electricity System Operator (IESO) contain requirements that mandate adequate knowledge of system operating staff. Hence, in Ontario, the IESO Market Rules already encompass many of the requirements in this standard for Generator Operators. Similarly, other ISOs may also have pre-defined requirements for operators within their jurisdictions to hold their system operating staff accountable for prior to issuing a transmission or generating license.

Reclamation supports the drafting team's effort to move the GOP Protection System training requirement to a Personnel Performance, Training, and Qualification (PER) standard. Reclamation suggests that in the future, PER-006 could be revised to include other one-off GOP training requirements, like the minimum of two hours of GOP blackstart training required every two calendar years in EOP-005 R17. Reclamation appreciates the drafting team's industry outreach and approach to relying on the existing PER-005-2 Systematic Approach to Training standard to replace PRC-001 R1 for BAs, RCs, TOPs, and GOP centrally located dispatch centers, rather than creating duplicative requirements.

PER-006-1; Top of Page 4 says; "When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material section of the standard."	

Is this the most updated NERC template, from other standards we have reviewed, we thought that the Rationale boxes were going to stay with the Requirements after approved. Please advise.

- The RSAW requests documentation of Protection System and RAS changes, but there is no mention of how the auditors will use this list to measure compliance if there is no frequency for training. As the standard is written, there is no timeframe for training operators on these changes.
- Without any requirement in this standard for the TOP to notify the GOP of changes to the Protection Systems and RAS, PGE sees a gap in the compliance monitoring for this when the TOP for several plants is a different entity.

ADDITIONAL COMMENTS:

#1: Suggessted sub-requirement for this Standard under R1

R1.1: the Generator Operator shall determine when its plant personnel need to receive additional training, such as new systems, replacements, technology and operational functionality, of Protection Systems and RAS.

Add the following to Measurement 1: Documentation of changes or additions during the compliance monitoring period that effect the output of the generating facility(ies). #2: Within the proposed PER-006-1 RSAW in relation to R1, there is a note to the auditor (page 5), which states that “Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility”. The Guidelines and Technical Basis within the Standard, under R1, (page 9 of 10, second paragraph) states “On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS”. To maintain the intent of the drafting team we propose that the *note to the auditor* reflect the drafting teams intent from the Guidelines and Technical Basis section.We recommend the following wording that reflects the SDT’s intent: NOTE TO AUDITOR: Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility; however the Generator Operator has the flexibility to determine when its personnel need to receive additional training (new systems, replacements, technology, and operational functionality) on the operational functionality of Protection Systems and RAS.

Comment	

Even though the PER-006-1 draft standard aids in ensuring that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the BES, ReliabilityFirst believes the requirement fall short as there is no periodicity of training noted in the requirement. ReliabilityFirst provides the following comments for consideration:

1. Requirement R1

    i. Even though the “Guidelines and Technical Basis” states “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service.”, the actual requirement has no periodicity requirements. If the true intent of the SDT is to have the GOP personnel receive training before the Protection Systems or RAS is placed into service, ReliabilityFirst believes this language should be added to the Requirement. ReliabilityFirst also seeks clarification on the timing of when new personal are required to receive this training (e.g., is it required prior to going on shift for the first time). Also is it the expectation of the SDT that existing personal are required to receive this training by the time this standard becomes effective? If this is the case, the SDT may want to consider including this in the Implementation Plan. ReliabilityFirst offers the following for consideration:

        a. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1., on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates, [either prior to new personnel going on shift for the first time or prior to Protection Systems or RAS placed into service].

With regard to the structure of PER-006-1: In this case, a new standard, containing a single requirement, is proposed to require GOPs train on "operational functionality specific to Protection Systems and Remedial Action Schemes and their effects on generating Facilities." This is a deviation from past practice whereby prior GOP training requirements, such as that for system restoration from Blackstart Resources (EOP-005-2, R17) and communication (COM-002-4, R3), have been included with the subject matter material as opposed to a Personnel Performance, Training and Qualifications (PER) standard. APS recommends NERC consider (as part of a future effort and assuming PER-006-1 is adopted) whether it would make sense to migrate all GOP training requirements under PER-006-1. Alternatively, this training requirement could be placed within an appropriate Protection and Control (PRC) standard, although with the retirement of PRC-001-1(ii), there does not appear to be an ideal location for this requirement.

The SDT needs to ensure that the RSAW aligns with PER-006-1 intent. Currently the draft RSAW for PER-006-1 specifies the following evidence requested to demonstrate compliance. "Documentation of changes or additions during the compliance monitoring period to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies)." This requested evidence does not align with the current version of PER-006-1. Per the "Guidelines and Technical Basis" the "periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel … … are trained in order to operate the plant." And further states that "the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.)" Although it would seem entirely reasonable for a functional change to warrant additional training, the evidence request in the RSAW could be broadly interpreted that ALL changes, regardless of impact or non-impact to the functionality of the Protection System, would require training prior to implementation. This is an unnecessary burden on the GOP and in Exelon's opinion was not the intent of the SDT.

The purpose of the standard as drafted in section A.3, "topics essential to Reliability to perform or support," is worded awkwardly. The topics are not directly essential to Reliability. Performance and support of Real-Time operations should be the subject of the topics. The standard should apply to training on topics regarding only those Real-time operations that are essential to Reliability of the BES. Accordingly, TVA suggests the purpose should state, "To ensure that personnel are trained on specific topics regarding performance or support of Real-time operations essential to reliability of the Bulk Electric System." The RSAW requires the following evidence: • Identification of responsible personnel • Identification of the set of Protection Systems and Remedial Action Schemes that affect the output of the generating facility(ies). • Evidence that the identified personnel completed the training	

- Documentation of changes or additions to the identified Protection Systems and Remedial Action Schemes

This expectation is presented in both the “Evidence Requested,” and in the “Assessment Approach” sections of the RSAW. However, this seems to introduce new requirements and measurements in the RSAW beyond what is stated in the draft standard. The measurement of compliance as stated in the standard is simply that,

“Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training.”

TVA acknowledges that maintaining a list of applicable personnel is essential to meeting the stated measure. However, the RSAW expectation to provide a list of Protection Systems and Remedial Action Schemes, as well as documentation of changes or additions to these systems, expands the scope of required evidence to include the adequacy of the training content, which is not addressed in either in the Requirement or the Measure as drafted. At first blush, these new requirements appear to be supported by the statement in the "Guidelines and Technical Basis" section of the standard which states,

"The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service."

However, it is immediately refuted by the next sentence which states,

"On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e .g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS."

TVA respectfully requests that the drafted standard (Measure and Guidelines/Basis) and the RSAW be aligned to remove the ambiguity, 1) between statements in the Guidelines and Technical Basis as previously described, and 2) between the RSAW and the standard Measure. The RSAW should be revised to remove expectations for maintaining documentation of the set of Protection Systems and Remedial Action Schemes and changes or additions to these systems and schemes.

ADDITIONAL COMMENTS:

#1: Suggessted sub-requirement for this Standard under R1

R1.1: the Generator Operator shall determine when its plant personnel need to receive additional training, such as new systems, replacements, technology and operational functionality, of Protection Systems and RAS.

Add the following to Measurement 1: Documentation of changes or additions during the compliance monitoring period that effect the output of the generating facility(ies). #2: Within the proposed PER-006-1 RSAW in relation to R1, there is a note to the auditor (page 5), which states that "Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility". The Guidelines and Technical Basis within the Standard, under R1, (page 9 of 10, second paragraph) states "On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS". To maintain the intent of the drafting team we propose that the *note to the auditor* reflect the drafting teams intent from the Guidelines and Technical Basis section.We recommend the following wording that reflects the SDT's intent: NOTE TO AUDITOR: Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility; however the Generator Operator has the flexibility to determine when its personnel need to receive additional training (new systems, replacements, technology, and operational functionality) on the operational functionality of Protection Systems and RAS.

PacifiCorp believes that a new standard, PER-006, would be superfluous to PER-005. An entirely new standard only increases compliance documentation burden without any incremental increase in reliability to the BES. The proposed changes could be made in a new version of PER-005-2, identified as PER-005-3. Both PER-005-2 and the current PER-006 address the same issue. As standards are rewritten, training requirements need to be consolidated not only within the PER section but within the same standard. This would provide consistent approach and reduce the possibility of conflicting terms and applications.

Texas RE noticed there is no explanation for the term “calendar year” in the Evidence Retention section of PER-006-1. Footnote #3 of Table 1-1 in PRC-005-6 explains how to apply the term calendar year in PRC-005-6. Is the intent that the term calendar year in PER-006-1 be applied the same as it is applied in PRC-005-6?

SRC would like to recognize the willingness of the project team to move away from the initial TOP-009 proposed standard based on the majority comments received from the industry. In addition, the numerous outreach efforts by the project team was instrumental in understanding the industry comments and arriving at the right solution at the end. This is a good example of how the existing iterative process will yield the right results when given the opportunity. Thank you.

Comment	

According to the accompanying RSAW “Documentation of changes or additions during the compliance monitoring period to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies)” will be requested as evidence for PER-006-1 R1. Tri-State believes there is no corresponding requirement in the current draft of PRC-006-1 that suggests this information is necessary. If it was the SDT’s intentions that there be additional training prior to implementing any changes to the Protection Systems or RAS that affect the output of the Facility, then there should be a requirement that explicitly states that. Tri-State suggests that the SDT create a requirement or sub-requirement to require entities to provide new or additional training to its plant personnel prior to the change in the Protection Systems and RAS being made, so that they are aware of the operational functionality.

We heard in one of the Q&A sessions that the operators at a dispatch center could be included if they have direct control, in Real-time, of an unmanned plant via remote access capabilities. While we don't disagree with this inclusion, the applicability section does not convey this. We would suggest that the SDT include this scenario within the applicability section.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Project Name: 2007-06.2 Phase 2 of System Protection Coordination | PER-006-1 and Modified Definitions of OPA and RTA

Comment Period Start Date: 3/10/2016

Comment Period End Date: 4/25/2016

Associated Ballots: 2007-06.2 Phase 2 of System Protection Coordination Modified Definitions of OPA and RTA IN 1 DEF, 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 IN 1 ST, and 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 Non-binding Poll IN 1 NB

There were 54 responses, including comments from approximately 126 different people from approximately 93 different companies representing 8 of the 10 Industry Segments as shown on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards Development, Steve Noess (via email) or at (404) 446-9691.

Summary

There were two significant themes regarding the proposed PER-006-1 (*Specific Training for Personnel*) Reliability Standard that were submitted by industry. The first theme was a concern that the PER-006-1 did not have a periodicity requirement. The second theme was expansion of the periodicity concepts discussed in the Guidelines and Technical Basis of the PER-006-1 Supplemental Material section. These same concepts were carried over to the Reliability Standard Audit Worksheet (RSAW) and did not align with the Requirement R1 language. To address these two themes, the drafting team revised the Guidelines and Technical Basis to improve clarity on the intent and proposed revisions to the RSAW, a NERC Compliance document.

There was one significant theme regarding the proposed modifications to the definitions of “Operating Planning Analysis” (OPA) and “Real-time Assessment” (RTA) concerning “functions and limits.” The drafting team agreed with comments about using the term “limits” and has replaced it with “limitations” because it more clearly articulates the drafting team’s intent of the proposed modification to the definitions. The term “limitations” reflects that there may be various “limits” given the circumstances and inputs into the OPA and RTA.

There were a small number of comments concerning the Implementation Plan time frame, the drafting team increased the implementation period of PER-006-1 from 12 months to 24 months following applicable regulatory approval. Based on the Implementation Plan, the Generator Operator will have 24 months to implement PER-006-1 upon the applicable approval before Requirement R1 of PRC-001-1.1(ii) (*System Protection Coordination*) is retired. This also means that the modifications to the definitions of OPA and RTA implementation will be increased to 24 months and not become effective until the retirement of PRC-001-1.1(ii) to avoid a gap in reliability. The remaining PRC-001-1.1(ii) Requirements R2, R5, and R6 could retire as earlier as March 31, 2017 or a later date provided by the regulatory authority. Earlier retirement is allowed because the drafting team explains how Requirements R2, R5, and R6 are covered by other standards that will become effective in 2017. Requirements R3 and R4 that were revised and moved to the NERC Board adopted PRC-027-1 (*Coordination of Protection Systems for Performance During Faults*) will retire 24 months following applicable regulatory approval.

There were a number of varying comments about the Guidelines and Technical Basis. The drafting team made modifications based on the comments to improve clarity and alignment with the PER-006-1 RSAW. Other comments were individual in nature and the responses to those along with the comments summarized here will be found with each entity comment.

Questions

1. **Generator Operator: Do you agree that the proposed PER-006-1 – Specific Training for Personnel appropriately replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…")? If not, please explain and provide suggestions to improve the PER-006-1 requirement.**

2. **Transmission Operator: The reliability objective of PRC-001-1.1(ii), Requirement R1 for the Transmission Operator (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"), that is not already covered by the *Personnel Performance, Training, and Qualifications* (PER) Reliability Standards, is addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Transmission Operator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL). Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.**

3. **Reliability Coordinator: During the progression of Project 2007-06.2, it was determined that the Reliability Coordinator, a function that is not applicable to PRC-001-1.1(ii) should, similarly, "…be familiar with the purpose and limitations of Protection Systems schemes…" as found in Requirement R1 of the standard. The reliability objective for the Reliability Coordinator that is not already covered by the PER Reliability Standards, is being addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Reliability Coordinator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within SOL and IROL. Do you agree that the proposed modification of these terms as defined by the *Glossary of Terms Used in NERC Reliability Standards* achieves this reliability objective? If not, please explain and provide suggestions.**

4. **Do you agree with the proposed Violation Risk Factor (VRF) and Violation Severity Levels (VSLs) for the proposed PER-006-1 Requirement? If not, please provide a basis for revising the VRF and/or what would improve the clarity of the VSLs.**

5. **Do the PER-006-1, Application Guidelines provide sufficient guidance, basis for approach, and examples to support performance of the Requirement? If not, please provide specific detail that would improve the Application Guidelines.**

6. **Do you agree with implementation period (i.e., 12 months) of the proposed PER-006-1 Reliability Standard and the proposed definition modifications of OPA and RTA based on the considerations listed in the Implementation Plan? If not, please provide a justification for changing the proposed implementation periods.**

7. **Are you aware of any conflicts between the proposed PER-006-1 Reliability Standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement? If so, please identify the conflict here.**
8. **Are you aware of the need for a regional variance or business practice that should be considered with this project? If so, please identify it here.**
9. **If you have any other comments not previously mentioned above, please provide them here:**

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

Comment	
It does not require the Generator Operator (GOP) to perform any verification activities of retention of the training following the training, nor does it address training refreshment. The results of this omission diverges from the structure established in PER-005-2 R1, R2, and R3, and would put the RE examiner in the position of testing all plant operators and assess their abilities to properly assign a VSL. It also follows that the RE examiner would have to be familiar with the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility. This could be a stretch for most examiners, and, at the very least, lengthen the time of preparation for examination.

Dislikes 0	
Response	
The drafting team thanks you for your comments. Requirement R1 does not require refreshment and is not intended to align with the systematic approach to training in PER-005-2 (*Operations Personnel Training*). The performance of the requirement is to provide training and not test the plant operator's retention of the training. Content of the operational functionality of the Protection Systems and Remedial Action Schemes (RAS) are the areas of focus and it is not intended for the auditor to question the depth of the content.

System Operator Trainer

Grant County PUD (GCPD)

Ephrata, WA

Work: 509.754.7205

Mobile: 406.490.4254

Internal ext: 4165

Email: Lpatterson@gcpud.org

- The notion that PRC-001 R1 required training of Plant Operators is not supported historically or by plain reading of that requirement. While some personnel within GOPs had to be trained (i.e. "familiar with"), the requirement is silent regarding specific GOP personnel requiring such training. Oddly, the drafting team recognizes this and uses such an interpretation as it recommends changes to assessment definitions to bring PRC-001 requirements under PER-005 for BAs, TOPs, RCs, etc.

GCPD supports training in general and Plant Operator training specifically. Further, GCPD recognizes value in providing training to its employees, including Plant Operators.

That said, GCPD does not support PER-006 because there is no direct causal relationship between requiring training of Plant Operators and enhancing BES reliability benefits associated with Protection Systems and Remedial Action Schemes (RAS) other than the vague notion that training is always beneficial.

BES Reliability is affected adversely when Protection Systems and RAS are designed, implemented, and/or operated improperly. Of these three aspects, Plant Operators may have a role in their operation, but only from the standpoint of allowing such systems to be in service as directed or agreed upon by GOPs. For Protection Systems and RAS, which operate to protect equipment other than the unit being relayed offline, the GOP should be required to take agreed upon actions to place such systems in service and to keep such systems functional as long as the agreed upon conditions persist. This is the manner used to enforce having AVR and PSS in service.

For Protection Systems and RAS, which operate to protect the unit, GOPs have a stake in operating such systems appropriately. In addition, GOPs are required under existing requirements to coordinate regarding such systems with TOPs et al.

In both cases, it is likely GOPs provide training for Plant Operators to ensure proper operation of Protection Systems and RAS. However, mandating such training is specifying "how" to achieve an outcome rather than requiring a necessary performance. In both cases, requirements should be in place to operate such systems within design and implementation criteria because requiring training of Plant Operators will not achieve the desired result. In addition, training Plant Operators does nothing to ensure appropriate design and implementation of such protection systems, which presumably is included in remaining PRC requirements.

Hence, PER-006 does not accomplish an appropriate reliability objective.

- If approved, PER-006 requires development of training materials, training classes, tracking systems, creation of evidence, and other administrative efforts to demonstrate compliance with PER-006. These extra tasks incur additional costs without a direct causal justification explaining why these additional costs contribute to the reliability of the BES as stated previously.

- The reliability objective is better addressed by requiring protective systems be kept in service and functional much the same way as requirements for AVRs and PSSs.

Response

The drafting team thanks you for your comments. The drafting team believes that PER-006-1 (*Specific Training for Personnel*) provides clarity over PRC-001-1.1(ii) (*System Protection Coordination*), Requirement R1 to identify the appropriate personnel who must receive training (be familiar with). Not having PER-006-1 and its associated Guidelines would result in a reliability gap in the absence of PRC-001-1.1(ii). The Generator Operator personnel at a centrally located dispatch center is addressed by PER-005-2 (*Operations Personnel Training*) and does not address plant personnel as expected by PER-006-1. The PER-005-2 standard is based on a systematic approach

to training and would not ensure that training on Protection Systems and Remedial Action Schemes (RAS) is provided for plant personnel, which are not applicable to PER-005-2. A technical conference held by the drafting team revealed that stakeholders did not want the burden of a systematic approach to training to be applied to plant personnel.

The PSEG Companies agree that PER-006-1 appropriately addresses the responsibilities of the Generator Operator, however we are concerned that the phrase “affect the output of the generating Facility(ies) it operates” could be interpreted to require the Generator Operator to have knowledge of Protection Systems or RAS several substations distant from its point of interconnection. In this case, the Generator Operator could be required to understand the operational functionality of protection systems that the Generator Operator has no knowledge of. PSEG does not believe that this is the intent of the Standard Development Team, and suggests revising	

Requirement 1 to state**: "**Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that are associated with the generator interconnection and affect the output of the generating Facility(ies) it operates."	
Likes 1	PSEG - Public Service Electric and Gas Co., 1, Smith Joseph

Response	
The drafting team thanks you for your comments. The drafting team notes that Requirement R1 of PER-006-1 (*Specific Training for Personnel*) specifically references "it operates" to delineate the Protection Systems and Remedial Action Schemes (RAS) that are in purview for those identified personnel. The Guidelines and Technical Basis (Supplement Material section of PER-006-1) explains that the considerations of operational functionality could include "[r]esulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions."

Talen Energy respectfully requests that the "Note to Auditor" on p.4 of the draft RSAW be changed as follows: Present text: "The documentation provided, including training if provided, should be specific to the operational functionality of Protection Systems and Remedial Action Schemes that affect output of the Facility. Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies). See Application Guidelines for details on what protective systems are covered. Generally, the Requirement focuses on those systems that are related to the electrical output of the generator." Revised text: The documentation provided, including training if provided, need not be Facility-specific. If Facility-specific training is provided, however, it should be updated if necessary to address changes or additions to Protection Systems and Remedial Action	

Schemes (RAS) that affect the output of the generating Facility(ies). See Application Guidelines for details on what protective systems are covered. Generally, the Requirement focuses on those systems that are related to the electrical output of the generator. Rationale: Changes or additions to Protection Systems or RASs would necessitate revisions to course materials and re-education of operators only if the training being given is Facility-specific, and PER-006-1 does not impose a requirement or even make a suggestion in this respect. The explanation of the term, "operational functionality," in the Guidelines and Technical Basis section of the standard does not include anything that would require training to be individualized for each plant, and the bullet points on p.9 of PER-006-list only topics of a general nature. The standard permits plant-specific training, but the Guidelines and Technical Basis material emphasizes the GOP's flexibility, which the RSAW as presently written seems to be taking away."

Answer	No
Document Name	
Comment	
The adjustments as made extend the training to the Plant personnel which previously the training requirements were for the System Operators. This removes the training requirement from the Control Center Personnel who are more likely to need the understanding.

Response	

The drafting team thanks you for your comments. The drafting team notes that PER-006-1 (*Specific Training for Personnel*) applies to the plant personnel and PER-005-2 (*Operations Personnel Training*) applies to the centrally located dispatch personnel. Control center personnel in PER-005-2 has remained unchanged by this project.	
Tim Kucey - PSEG - PSEG Fossil LLC - 5	
Answer	No
Document Name	
Comment	
The PSEG Companies agree that PER-006-1 appropriately addresses the responsibilities of the Generator Operator, however we are concerned that the phrase “affect the output of the generating Facility(ies) it operates” could be interpreted to require the Generator Operator to have knowledge of Protection Systems or RAS several substations distant from its point of interconnection. In this case, the Generator Operator could be required to understand the operational functionality of protection systems that the Generator Operator has no knowledge of. PSEG does not believe that this is the intent of the Standard Development Team, and suggests revising Requirement 1 to state**: “**Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that are associated with the generator interconnection and affect the output of the generating Facility(ies) it operates.” PSEG, Segment(s) 5, 6, 1, 3, 3/10/2016

Comment	

Kansas City Power and Light Company recommends withdrawal of PER-006-1 and its associated guideline, and offers an alternative to address GOP duties under proposed retired Standard PRC-001-1.1(ii). The recommendations are based on the following:

Generator Operator Not Equivalent to Plant Operators: PER-006-1 does not replace the responsibilities of the Generator Operator in PRC-001-1.1(ii). To replace one with the other would suggest parity between the two—an apple-to-apple change. Generator Operator in PRC-001-1.1(ii) applicability is at the entity level. The applicability under PER-006-1 is completely different, narrowly construed, creating a compliance duty on plant operators located at a generator's plant site and, as such, provides an apples-to-oranges change.

Generator Operator (GOP) is defined as, "The entity that operates generating Facility(ies) and performs the functions of supplying energy and Interconnected Operations Services [effective 07-01-2016]," referring to the responsibilities at the entity level. The Applicability for PER-006-1 establishes the compliance obligation at the operator—the individual person—level, with the effect of defining what a plant generator operator is and what an operator is not.

While establishing duties of system operators is not foreign in NERC Standard Requirements, in this particular case, we do not believe it is necessary.

GOP Already Responsible for Reliable Operation of Its System: The GOP and, in many situations, its delegates, carry a fundamental responsibility to supply energy in a manner that is not disruptive to the reliability of the Bulk Electric System (BES). If fulfilling that responsibility requires the GOP's lever-pullers, so to speak, at the generating plant to have awareness of Protection Systems and RAS, it is incumbent on the GOP to offer that awareness training whether a specific Standard exists or not. The GOP is in the best position to identify what training operators need to reliably manage their systems on the BES. This idea is reflected in soon to be enforceable, PER-005-2, Application Guidelines, Rationale for R6:

"The Commission acknowledged that the training for GOPs need not be as extensive as the training for TOPs and BAs. FERC also stated that the systematic approach to training methodology is flexible enough to build on existing training programs by validating and supplementing the existing training content, where necessary, using systematic methods."

PER-005-2 applies to GOP control room operators, specifically excluding the generation facility operators. However, if the GOP, as the expert in its system and using a systematic method as provided in the guidelines, believes the generation facility operator needs to have awareness of Protection Systems and RAS, the GOP is going to extend awareness training to the generation facility operator because of the GOP's overarching duty to operate its system reliably with or without the onus of PRC-001-1.1(ii) or the proposed PER-006-1.

Every System is Unique: Remedial Action Schemes (RAS) are not applicable to all generators. Establishing a compliance duty under a Standard with a single Requirement to address a potential system design is inefficient and creates a challenge for entities that do not have relevant generator related RAS. In such a case, the entity has to prove a negative to show compliance; such an effort is often overly burdensome and, frankly, does little to promote reliability of the BES.

PER-005-2 Already Establishes GOP Training Responsibilities: To address the retirement of PRC-001-1.1(ii), we believe additional language to PER-005-2 Applicability 4.1.5.1 can effectively provide for the awareness training sought under proposed PER-006-1.

KCP&L suggests the following:

1. Withdraw PER-006-1 and its associated Guidelines.

2. Add language along the lines of the following as a bullet point following PER-005-2, Applicability 4.1.5.1:

- While the specific training set forth in this Standard is not applicable to plant operators located at a generator plant site, should the GOP determine there are systems or facilities that may impact the reliable operation of the Bulk Electric System (BES) and are relevant to the performance of plant operators' duties located at a generator plant site, the applicability may be extended

to include plant operators at a generator plant site for the narrow purpose--to incorporate awareness training of specific systems or facilities that impact the BES. Such awareness training shall be incorporatedd into the GOP's systematic training methodology.

The drafting team thanks you for your comments. The drafting team believes that PER-006-1 (*Specific Training for Personnel*) provides clarity over PRC-001-1.1(ii) (*System Protection Coordination*), Requirement R1 to identify the appropriate personnel who must receive training (be familiar with). (1) Withdrawing PER-006-1 and its associated Guidelines and Technical Basis (Supplemental Material section of PER-006-1) would result in a reliability gap in the absence of PRC-001-1.1(ii). The Generator Operator personnel at a centrally located dispatch center is addressed by PER-005-2 (*Operations Personnel Training*) and does not address plant personnel as expected by PER-006-1. (2) The PER-005-2 standard is based on a systematic approach to training and would not ensure that training on Protection Systems and Remedial Action Schemes (RAS) is provided for plant personnel, which are not applicable to PER-005-2. A technical conference held by the drafting team revealed that stakeholders did not want the burden of a systematic approach to training to be applied to plant personnel. It is not the intent of the drafting team to have the Generator Operator provide training on Remedial Action Schemes if they do not that affect the output of the generating Facility(ies) it operates.

We have several concerns that the intents of the drafting team haven't been accurately captured after participating in the Webinar (April 5, 2016). In reference to the term 'plant personnel', a drafting team member stated on the webinar that the "term wasn't just applicable to the operator but all staff and this supporting data could be found in the Technical Materials". We agree that this topic of discussion can be found in the Technical Materials section (Page 9- Guidelines: last two sentence of the first paragraph). There are	

examples provided to show what personnel shouldn't be included however, there are not examples reflecting who should be included. We suggest the drafting team include some clarifying examples of what type of 'plant personnel' should be included somewhere in the Technical Documentation. Our suggested example list would consist of (Operators, Engineers, Analysis……etc). We feel that type of information provides value as well. Our second concern would be related to the Webinar (April 5, 2016) slides related to 'avoiding conflict with PER-005-2'. It is our understanding that PER-005-2 Standard addresses personnel at a centrally located dispatch center while PER-006 addresses GOP (plant personnel). However, our concern comes from the Applicability section 4.1.5.1 (last sentence) of PER-005-2. The language mentions the personnel who wouldn't be covered under the PER-005-2. The other personnel mentioned are those at a "centrally located dispatch center who relay dispatch instructions without making any modifications". If PER-006-1 is to cover all 'plant personnel', but PER-005-2 is to cover some 'plant personnel' it seems there is either overlap or a gap that needs to be clarified. We suggest the drafting team re-evaluate the second set of 'plant personnel' mentioned in the section above and determine of more clarity can be provided as to which personnel should and should not be included. Finally, our last concern is related to the required periodicity of training for the 'plant personnel'. The Standard (PER-006-1) nor its Technical Documentation states how often this training should be conducted. From the webinar information (April 5, 2016) it appears that the intent of the Drafting Team is that as the reliability needs change, the training should be re-performed in order to stay consistent with those changes. We feel that this intent is not being conveyed in the Standard or its supporting documentation. Without further clarification, our interpretation is that only **one** training session needs to be conducted to meet the reliability and compliance needs. Either additional language specifying training conducted in relation to changes to the RAS function, or a period of time that training should be conducted needs to be added. Our review group suggests the drafting team use similar language implemented into Requirement R6 of PER-005-2. That language requires training conducted each calendar year and is listed as follows: "Each Generator Operator shall conduct an evaluation each calendar year of the training established in Requirement R6 to identify and implement changes to the training".

The drafting team thanks you for your comments. The personnel that are applicable to the PER-006-1 (*Specific Training for Personnel*) Reliability Standard is clear by the use of the word "and" in Applicability 4.1.1.1: "Plant personnel who are responsible for the Real-time control of a generator 'and' receive Operating Instruction(s)…" The drafting team believes that including additional examples are not necessary for clarity. Requirement R1 does not require refresher training and is not intended to align with the systematic approach to training in PER-005-2 (*Operations Personnel Training*).

The main concern however is to contain the scope of "operational functionality" to that required to understand how the Protection System generally operates and affects the plant and not to necessarily require specific detailed knowledge of actual settings, etc. such that operators are expected to become system protection or relay experts.

The drafting team thanks you for your comments. The drafting team notes that the PER-006-1 (*Specific Training for Personnel*) Guidelines and Technical Basis (see Supplemental Material section of PER-006-1) explains that the considerations of operational functionality could include "[r]esulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions." Actual settings are not intended to be included in operational functionality.	
Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy	
Answer	Yes
Document Name	
Comment	
Duke Energy agrees that the proposed PER-006-1 appropriately covers the responsibilities of the Generator Operator in PRC-001-1.1(ii). However, we feel that the proposed PER-006-1 goes far beyond what is necessary to cover the responsibilities of the Generator Operator in PRC-001-1.1(ii) and protect the reliability of the Bulk Electric System. We feel that a basic understanding of and familiarity with protection systems and Remedial Action Schemes, as currently required, is adequate for promoting the reliability of the BES. Duke Energy does not believe that having generator specific training increases stability of the BES, and believes that the administrative effort, especially on larger utilities with numerous generating facilities, would be especially burdensome.

The drafting team thanks you for your comments. The drafting team has addressed this concern by appending the PER-006-1 (*Specific Training for Personnel*) Guidelines and Technical Basis (see Supplemental Material section of PER-006-1) to note that Facility-specific (i.e., generator specific) training is not intended.	
Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	Yes
Document Name	
Comment	
Texas RE agrees the proposed PER-006-1 replaces the responsibilities of the Generator Operator in PRC-001-1.1(ii) (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"). Texas RE suggest aligning the training with requirement with PER-005-2 R1.1.1 as to be done each calendar year. The Guidelines and Technical Basis document indicates that "[t]he structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service", but there is nothing indicating how often personnel should be trained.

Response	
The drafting team thanks you for your comments. Requirement R1 of PER-006-1 (*Specific Training for Personnel*) does not require refresher training and is not intended to align with the systematic approach to training in PER-005-2 (*Operations Personnel Training*). The performance of the requirement is to provide training and not test the plant operator's retention of the training. Content of the operational functionality of the Protection Systems and Remedial Action Schemes are the areas of focus and it is not intended for the auditor to question the depth of the content.	

The Guidelines and Technical Basis (Supplemental Material section of PER-006-1) has been revised to remove the sentence "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service."	
Ben Engelby - ACES Power Marketing – 6	
Answer	Yes
Document Name	
Comment	
We appreciate the SDT's efforts in developing this draft standard and thank the team for responding to our previous comments that recommended moving this requirement to the PER family of standards. We would like to point out that this standard is very specific with regard to the applicability section, and would hope that future standard projects do not attempt to consolidate other training standards and requirements to PER-006-1. There may be future unintended consequences if other training requirements were to be consolidated in this standard that is only applicable to a subset of plant personnel.

2. *Transmission Operator: The reliability objective of PRC-001-1.1(ii), Requirement R1 for the Transmission Operator (i.e., "…be familiar with the purpose and limitations of Protection Systems schemes…"), that is not already covered by the Personnel Performance, Training, and Qualifications (PER) Reliability Standards, is addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Transmission Operator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL). Do you agree that the proposed modification of these terms as defined by the Glossary of Terms Used in NERC Reliability Standards achieves this reliability objective? If not, please explain and provide suggestions.*	
Oshani Pathirane on Behalf of: Payam Farahbakhsh, Hydro One Networks, Inc., 1, 3	
Answer	No
Document Name	
Comment	
While Hydro One Networks Inc. agrees that an evaluation may be performed for an OPA, an evaluation cannot be performed in real-time for an RTA. An OPA may be conducted over a longer period as next-day operations (as opposed to real-time operations) are considered. However, as the term implies, an RTA is conducted in real-time and therefore constitutes a quicker determination of conditions as opposed to a more time-consuming and comprehensive analysis. Therefore, Hydro One suggests that the definition of RTA start off with "*A determination of system conditions*…". The definition of OPA may be left as is if the definition of RTA is modified as suggested. While Question #3 below pertains to the RC and does not pertain to Hydro One Networks Inc., Hydro One agrees with the NPCC that assurance that the BES is operated within SOLs and IROLs is separate from integrating the functions and limits of Protection Systems and Remedial Action Schemes into OPA an RTA. Further, Hydro One agrees with the NPCC that the term "limits" may imply SOLs and IROLs, which Protection Systems have little if not, any impact on. Therefore, the term "limitations" is a better substitute for the term "limits".

Response	
The drafting team thanks you for your comments. The suggested changes are out of scope of this project. Thank you for your suggestion. The drafting team changed the term “limits” to “limitations” in both definitions. The term “limitations” was chosen based on comments and more clearly articulates the drafting team’s intent of the proposed modification to the definitions. The term “limitations” reflects that there may be additional circumstances and inputs into the Operational Planning Analysis (OPA) and Real-time Assessment (RTA). See also NPPC responses in question 3.	
Richard Vine - California ISO - 2, Group Name ISO/RTO Council Standards Review Committee	
Answer	No
Document Name	
Comment	
SRC does not agree with the modification of the OPA and RTA definitions. SRC believes that the existing PER standard covers the intended scope of PRC-001-1.1 and the change in the definitions of OPA and RTA goes beyond the original scope of PRC-001-1.1. Additionally, RCs have protection system and SPS knowledge and awareness requirements in the IRO standards. However, if the SDT still believes the change in the definition of OPA and RTA is required, then there are better alternative phrases that will improve current proposal. The inclusion of the term “functions, and limits” in OPA and RTA can be misinterpreted. In the existing Glossary of Terms Used in NERC Reliability Standards (updated February 19, 2016) there are 21 references to “limit” or “Limit”, with vast majority of them referencing thermal, voltage, and stability limits and/or SOL and IROL. SRC suggest SDT consider the following alternative phrases to "functions, and limits" that will eliminate future confusion: 1) operational functionality, 2) intended functions, and 3) functions and limitations. Additionally, removing the word “schemes” from the phrase “protection system schemes” in translating this requirement from PRC-001-1.1 to the RTA and OPA definitions introduces confusion. Per the definition in the NERC Glossary of Terms, a protection system could be anything from a single protective relay to a set of relays designed to address a specific problem such as the exclusions identified in the RAS definition. The proposed language could be interpreted to mean that RCs/BAs/TOPs must be aware of the functions and limits of every single relay in its area, greatly expanding the scope of the requirements in the IRO and TOP standards that	

reference the RTA and OPA. SRC recommends the drafting team to use the defined term "Composite Protection System" instead of "Protection System".

Response	
The drafting team thanks you for your comments. The technical conference in February 2016 concluded that Protection Systems and Remedial Action Schemes (RAS) would be addressed through the reliability–related tasks analysis by the Reliability Coordinator or Transmission Operator under PER-005-2 (*Operations Personnel Training*). Revisions to defined terms of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) were made to ensure that Reliability Coordinators and Transmission Operators would incorporate Protection Systems and Remedial Action Schemes into these evaluations. The drafting team changed the term "limits" to "limitations" in both definitions. The term "limitations" was chosen based on comments and more clearly articulates the drafting team's intent of the proposed modification to the definitions. The term "limitations" reflects that there may be additional circumstances and inputs into the Operational Planning Analysis (OPA) and Real-time Assessment (RTA). The drafting team notes that the definitions of RTA and OPA are approved and include the terms Protection Systems and Remedial Action Schemes. This project proposes modifying the definitions to address the reliability objective that the Reliability Coordinator and Transmission Operator integrate the functions and limits of Protection Systems and Remedial Action Schemes to ensure the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL). The drafting team discontinued the approach of using the term "Composite Protection System" based on stakeholder comments from previous postings during this project.	
Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	No

Comment	

Texas RE is concerned there is no explicit training requirement for TOPs and RCs on operational functionality of Protection Systems and Remedial Action Schemes (RAS). PER-005-2 requires TOPs and RCs to develop a list of "reliability-related tasks" but it does not specify these tasks include Protection Systems and RASes. Texas RE is concerned that adding the terms "functions and limits" to the definitions do not ensure that each TOP will be familiar with the functions and limitations of its Protections Systems and RASes as they need to be in PRC-001-1.1(ii). Additionally, with regard to the proposed definitions, SOL and IROL exceedances are only one aspect of situational awareness necessary for reliable operation of the BES. In order to maintain situational awareness, a TOP should be aware of Protection Systems and RASs to operate the system regardless of whether it is within SOLs or IROLs. For example, TOPs might be aware of how a unit tripped due to operation of a RAS and how that would impact an SOL or IROL exceedance. But you might not necessarily understand the reason of the generator trip as a result of the RAS operation and therefore lack knowledge of the duration of generator outage and other pertinent information. The need for situational awareness beyond SOL and IROL exceedances is more important for the RC, as RCs are responsible for coordination among TOPs.

The drafting team thanks you for your comments. A technical conference held by the drafting team in February 2016 concluded that Protection Systems and Remedial Action Schemes (RAS) would be addressed through the reliability–related tasks analysis by the Reliability Coordinator or Transmission Operator under PER-005-2 (*Operations Personnel Training*). Revisions to defined terms of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) were made to ensure that Reliability Coordinators and Transmission Operators would incorporate Protection Systems and Remedial Action Schemes into these evaluations.

Comment	

As a best practice, ERCOT believes it is preferable to include requirements in the Reliability Standards rather than in definitions. Because requirements in definitions do not have associated measures or VRFs/VSLs, compliance and enforcement could be complicated.

ERCOT recognizes that the SDT's intent is to translate the requirement R1 of PRC-001-1.1 for the TOP and BA to "be familiar with the purpose and limitations of Protection System schemes applied in its area" to the RTA and OPA definitions used in the IRO/TOP standards. However, the change from the phrase "purpose and limitations of Protection System schemes" to the phrase "known Protection System and Remedial Action Scheme status or degradation, functions, and limits," is problematic for several reasons.

In the context of protection systems, SPSs, and RASs, the difference in meaning between "limits" and "limitations" is significant. The word "limits" in the proposed RTA and OPA definitions has the potential to be confused with system operating limits (SOLs). Requiring RCs and TOPs to consider SOLs for protection systems and RASs in RTAs and OPAs is unnecessary because GOs and TOs are already required to consider those SOLs for those facilities under FAC-008 R2.3 and R2.4.1 and FAC-008 R3.3 and R3.4.1. For this reason, ERCOT disagrees with Question 2's statement that the proposed definition changes "will ensure that the Bulk Electric System is operated within System Operating Limits (SOL) and Interconnection System Operating Limits (IROL)."

The word "limits" could also be misconstrued to mean limits on protection systems and RASs in the form of protection relay set points. Facility owners responsible for protection system maintenance and testing regularly collect and maintain relay set point information. However, this information has not been typically provided by facility owners to RCs and TOPs since Facility Ratings have been used to operate the system, and the set points for the majority of relays utilized to protect equipment are well beyond the Facility Ratings. Without guidance on which specific limit information is required, RCs and TOPs would potentially be required to consider an enormous number of relay set points, which are subject to constant change, making integration of this information into an RTA or OPA challenging and burdensome, without any meaningful reliability improvement. Furthermore, under the new IRO-008-2 Requirement R4, effective April 1, 2017, RCs are required to conduct an RTA every 30 minutes. Incorporating relay set point information into an RTA every 30 minutes means an RC would need to collect and incorporate large and constantly fluctuating data sets. This introduces a burdensome RC requirement without any discernible reliability benefit.

Introducing a "limit" to track under the RTA and OPA may also create confusion over the responsibility of the RC/TOP to respond to such a "limit" if reached or exceeded. If an RC/TOP is already operating to thermal limits, this additional limit is unnecessary and confusing. To avoid this confusion, ERCOT recommends the SDT replace the term "functions and limits," with either (in order of preference): 1.) "operational functionality," 2.) "intended functions," or 3.) "functions and limitations." ERCOT also recommends the

SDT provide examples of how an RTA or OPA can be performed and documented to show evidence that "known Protection System and Remedial Action Scheme status or degradation and operational functionality" have been incorporated.

Additionally, removing the word "schemes" from the phrase "protection system schemes" in translating this requirement from PRC-001-1.1 to the RTA and OPA definitions introduces confusion. Per the definition in the NERC Glossary of Terms, a protection system could be anything from a single protective relay to a set of relays designed to address a specific problem such as the exclusions identified in the RAS definition. The proposed language could be interpreted to mean that RCs/BAs/TOPs must be aware of the functions and limits of every single relay in its area, greatly expanding the scope of the requirements in the IRO and TOP standards that reference the RTA and OPA. SRC recommends the drafting team to use the defined term "Composite Protection System" instead of "Protection System".

ERCOT also recommends the SDT provide industry with guidance on distinguishing between "protection system schemes" and "protective relays" so as to avoid future confusion.

Response

Thank you for your suggestion. The drafting team changed the term "limits" to "limitations" in both definitions. The term "limitations" was chosen based on comments and more clearly articulates the drafting team's intent of the proposed modification to the definitions. The term "limitations" reflects that there may be additional circumstances and inputs into the Operational Planning Analysis (OPA) and Real-time Assessment (RTA).

The drafting team notes that the definitions of "Operating Planning Analysis" (OPA) and "Real-time Assessment" (RTA) are approved and include the terms Protection Systems and Remedial Action Schemes (RAS). This project proposes modifying the definitions to address the reliability objective that the Reliability Coordinator and Transmission Operator integrate the functions and limits of Protection Systems and Remedial Action Schemes to ensure the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL). The drafting team discontinued the approach of using the term "Composite Protection System" based on stakeholder comments from previous postings during this project.

While we support the proposed revision to the two terms to achieve the intended purpose, we do not agree with the words “and limits”. The word “limits” lends itself to be interpreted as the system operating limits or interconnection system operating limits on which the Protection Systems, etc. have little bearing on. We suggest to reword the above to “functions and limitations” or “functions, limitations” to more accurately reflect the intent of the training on composite protection systems and RASs.

PER-005-2 requires a Systematic Approach to training for the Transmission Operator and Balancing Authority which includes the documented methodology of reliability related tasks addresses the PRC-001-1.1(ii) R1 requirement to "be familiar with the purpose and limitations of Protection System Schemes." The modification to these terms is NOT needed to achieve this reliability objective,	

since the training is already required as part of the PER-005 standard. Please explain how entities reading these definitions can relate that training on relays is needed by added the words "functions and limitations" to OPA and RTA.

BPA supports PER-006-1 applicability solely to Generator Operators. However, BPA does not support the revised Operational Planning Analysis (OPA) and Real-Time Assessment (RTA) definitions as part of this project. BPA's concern is the compliance and reliability ambiguity presented by including "functions and limits" without specific guidance and/or requirements for the implementation of those terms. BPA desires to have the revised definitions excluded from project 2007-06.2. BPA suggests including the language in new or revised Standard(s) requirements, with specific guidance that would allow entities to meet the requirements and implementation of "functions and limits", such as TOP-001 and/or TOP-002.

The drafting team thanks you for your comments. The drafting team considered the approach of revising multiple Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) standards to address the "functions and limits" of Protection Systems and Remedial Action Schemes. However, the team along with outreach to industry, determined that a surgical modification to the definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) over changing multiple standards was the best approach. The team did revise the proposed changes slightly by replacing "limits" with "limitations."

Vectren supports a more clear use of "functions and limits" with respect to the transmission operators knowledge of Protection Systems. The transmission operators should have a clear understanding of the impacts of a Protections System on electrical facilities. Specifically, the operators should know and plan for the resulting state of facilities that would be outaged for a typical fault. Generally, most facilities will clear from breaker to breaker, but a SPS or RAS may energize or change state of other non-coincidental facilities. The transmission operator should know the "functions and limits" in the context of planning the extent of the outage. However, with the newer technology programmable relays, there are "function" statements inside of the relay that a system protection technician would know, but a transmission operator would not need to know. The same could be stated about limits. The programmable relays have many "limits" and timers inside the relay "functions" that the transmission operator does not need to know. Vectren agrees that limits, as it pertains to SOL's and IROL's, need to be used by the transmission operator. These limits are not in the same context as internal protection system "functions and limits" within a programmable relay.

The proposal is to revise the RTA and OPA definitions to cover “RAS”, “functions” and “limits”. However, per these definitions a third party can perform the RTA and OPA for the TOP, and the BA is not even necessarily involved per future TOP standards. It is not clear that this proposal ensures the BA/TOP familiarity with Protection Systems related to “RAS”, “functions” and “limits”. Also, we have had an ongoing challenge determining who performs the GOP function; is it the folks at the “centrally located dispatch center” per PER-005-2 or is it the “plant personnel” per PER-006? Maybe in Functional Model these could be split into separate roles/registrations. Specific to PER-006, not requiring familiarity of Protection Systems for the GOP centrally located dispatch center folks may be a gap. NIPSCO presently complies with PRC-001-0 R1 with an approach that we believe will cover the requirement and revised definitions of Project 2007-06.2 Phase 2 and therefore is voting Affirmative, however we would like to see our concerns addressed. We appreciate the efforts of this SDT, especially the extensive outreach to stakeholders on this project.

In our interpretation of the proposed changes to the definitions, the intent is that the TOP needs to be familiar with the 'functions and limits' of the Protection System and RAS so they can Identify and understand how those systems will impact system reliability and/or if that system reliability is reduced or threatened. Additionally, the operators must include this knowledge into their everyday process of analyzing and operating their portion of the system in reference to the (BES) SOL and IROL. Based on the presentations from the webinar (April 5, 2016), we interpret that the proposed changes are intended to ensure the Analysis Performance under PER-005-2 includes both the Protection System and RAS. If that is the case, we feel that the message may not be conveyed adequately in the	

mapping document. We suggest adding some footnotes or other language to the document stating why the Requirements are mentioned, however we're not sure that the end goal is sufficiently communicated in order to help the industry understand the proposed changes.

Additionally we suggest the drafting team consider whether the proposed changes to the definitions should be conducted independent of this project. There are already many moving pieces in this project and this only adds more confusion. Technically, there are five proposed Standards associated with this project and all depends on the retirement of PRC-001 and its Requirements. Adding two definitions from the previous TOP/IRO Project warrants its own attention.

Response

Operational Planning Analysis (OPA) and Real-time Assessment (RTA).The mapping document explains how the current PRC-001-1.1(ii) (*System Protection Coordination*), Requirements R1, R2, R5, and R6 are addressed by other Transmission Operations and Interconnection Reliability Operations, and Coordinator (TOP/IRO) Reliability Standards. This along with the proposed PER-006-1 (*Specific Training for Personnel*) and the revised definitions of OPA and RTA facilitates the complete retirement of PRC-001-1.1(ii). The mapping document is not intended to explain how an entity will incorporate Protection Systems and Remedial Action Schemes (RAS) into their OPA and RTA evaluations. The systematic approach to training under PER-005-2 (*Operations Personnel Training*) is the process by which the Reliability Coordinator and Transmission Operator will determine what training its personnel will receive on how these Protection Systems and Remedial Action Schemes are integrated into the evaluations.

The standard and definitions are proposed together because both are integral to the reliability objectives being maintained with the retirement of PRC-001-1.1(ii). Separating them into two different projects would prevent the project from advancing with the recent approval of PRC-027-1 (*Coordination of Protection Systems for Performance During Faults*) onto a filing with regulators.

ATC supports the proposed revisions because NERC's explanation matches ATC's expectation regarding the correct understanding of the new, undefined terms "functions" and "limits". For example, ATC correlates "functions" with "purpose" of Protection Systems and Remedial Action Schemes, which would mean understanding that there are different functions implemented by relaying such as undervoltage protection, overcurrent protection, impedance relaying, etc. Additionally, ATC understands "limits" to correlate with current PRC-001-1.1(ii) term "limitations", which would mean understanding the limitations of relaying such as overspeed generator protection will not clear a fault by design, a bus differential will not clear a fault outside of its zone of protection, pulling relay trips means a breaker won't trip if the relay sends a signal to trip, etc. This corresponds to ATC's understanding that "limits" does **not** refer to defining System Operating Limits due to relay settings, in cases where the relay setting produces a lower facility rating than the other connected equipment, because facility limits due to relay settings (or other equipment) are covered by NERC Standard FAC-008-3 R3.4.1 and the NERC Glossary of Terms definition for "System Operating Limit".

***3.** Reliability Coordinator: During the progression of Project 2007-06.2, it was determined that the Reliability Coordinator, a function that is not applicable to PRC-001-1.1(ii) should, similarly, "…be familiar with the purpose and limitations of Protection Systems schemes…" as found in Requirement R1 of the standard. The reliability objective for the Reliability Coordinator that is not already covered by the PER Reliability Standards, is being addressed by inserting the phrase "functions, and limits" into the proposed modified definitions of OPA and RTA. The Reliability Coordinator, by integrating the "functions and limits" of Protection Systems and Remedial Action Schemes into its OPA and RTA, will ensure that the Bulk Electric System is operated within SOL and IROL. Do you agree that the proposed modification of these terms as defined by the Glossary of Terms Used in NERC Reliability Standards achieves this reliability objective? If not, please explain and provide suggestions.*

Dominion supports PJM on the following comment: PJM agrees with the intention of the drafting team but believes there are better alternative phrases that will improve current proposal. The inclusion of the term “functions, and limits” in Operational Planning Analysis (OPA) and Real-time Assessment (RTA) can be misinterpreted. In the existing Glossary of Terms Used in NERC Reliability Standards (updated February 19, 2016) there are 21 references to “limit” or “Limit”, with vast majority of them referencing thermal, voltage, and stability limits and/or SOL and IROL. SRC suggest SDT consider the following alternative phrases to "functions, and limits" that will eliminate future confusion: 1) operational functionality, 2) intended functions, and 3) functions and limitations.

While we support the proposed revision to the two terms to achieve the intended purpose, we do not agree with the words “and limits”. The word “limits” lends itself to be interpreted as the system operating limits or interconnection system operating limits on which the Protection Systems, etc. have little bearing on. We suggest to reword the above to “functions and limitations” or “functions, limitations” to more accurately reflect the intent of the training on composite protection systems and RASs.

Dislikes 0	
Response	
Thank you for your suggestion. The drafting team changed the term “limits” to “limitations” in both definitions. The term “limitations” was chosen based on comments and more clearly articulates the drafting team’s intent of the proposed modification to the definitions. The term “limitations” reflects that there may be additional circumstances and inputs into the Operational Planning Analysis (OPA) and Real-time Assessment (RTA).

Texas RE is concerned there is no explicit training requirement for and RCs on operational functionality of Protection Systems and Remedial Action Schemes (RAS). PER-005-2 requires TOPs and RCs to develop a list of "reliability-related tasks" but it does not specify these tasks include Protection Systems and RASes. Additionally, with regard to the proposed definitions, SOL and IROL exceedances are only one aspect of situational awareness necessary for reliable operation of the BES. In order to maintain situational awareness, the RC should be aware of Protection Systems and RASs to operate the system regardless of whether it is within SOLs or IROLs. For example, the RC might be aware of how a unit tripped due to operation of a RAS and how that would impact an SOL or IROL exceedance. But you might not necessarily understand the reason of the generator trip as a result of the RAS operation and therefore lack knowledge of the duration of generator outage and other pertinent information. The need for situational awareness beyond SOL and IROL exceedances is more important for the RC, as RCs are responsible for coordination among TOPs.

Response

The drafting team thanks you for your comment. A technical conference by the drafting team in February 2016 concluded that Protection Systems and Remedial Action Schemes (RAS) would be addressed through the reliability–related tasks analysis by the Reliability Coordinator or Transmission Operator under PER-005-2 (*Operations Personnel Training*). Revisions to defined terms of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) were made to ensure that Reliability Coordinators and Transmission Operators would incorporate Protection Systems and Remedial Action Schemes into these evaluations.

In our interpretation of the proposed changes to the definitions, the intent is that the RC needs to be familiar with the 'functions and limits' of the Protection System and RAS so they can Identify and understand how those systems will impact system reliability and/or if that system reliability is reduced or threatened. Additionally, the operators must include this knowledge into their everyday process of analyzing and operating their portion of the system in reference to the (BES) SOL and IROL. Based on the presentations from the webinar (April 5, 2016), we interpret that the proposed changes are intended to ensure the Analysis Performance under PER-005-2 includes both the Protection System and RAS. If that is the case, we feel that the message may not be conveyed adequately in the mapping document. We suggest adding some footnotes or other language to the document stating why the Requirements are mentioned, however we're not sure that the end goal is sufficiently communicated in order to help the industry understand the proposed changes.

Additionally we suggest the drafting team consider whether the proposed changes to the definitions should be conducted independent of this project. There are already many moving pieces in this project and this only adds more confusion. Technically, there are five proposed Standards associated with this project and all depends on the retirement of PRC-001 and its Requirements. Adding two definitions from the previous TOP/IRO Project warrants its own attention.

Likes 0	
Dislikes 0	
Response	
The drafting team thanks you for your comment. The mapping document explains how the current PRC-001-1.1(ii) (*System Protection Coordination*), Requirements R1, R2, R5, and R6 are addressed by other Transmission Operations and Interconnection Reliability Operations, and Coordination (TOP/IRO) Reliability Standards. This along with the proposed PER-006-1 (*Specific Training for Personnel*) and the revised definitions of Operating Planning Analysis (OPA) and Real-time Assessment (RTA) facilitates the complete retirement of PRC-001-1.1(ii). The mapping document is not intended to explain how an entity will incorporate Protection Systems and Remedial Action Schemes (RAS) into their OPA and RTA evaluations. The systematic approach to training under PER-005-2 (*Operations Personnel Training*) is the process by which the Reliability Coordinator and Transmission Operator will determine what training its personnel will receive on how these Protection Systems and Remedial Action Schemes are integrated into the evaluations. The standard and definitions are proposed together because both are integral to the reliability objectives being maintained with the retirement of PRC-001-1.1(ii). Separating them into two different projects would prevent the project from advancing with the recent approval of PRC-027-1 (*Coordination of Protection Systems for Performance During Faults*) onto a filing with regulators.

Violation Severity Levels (VSL) are based on the number of applicable personnel that the GOp failed to train. While TVA understands that NERC and the SDT assigns more risk to non-compliance to these training requirements than was represented in PRC-001-1.1b, TVA believes the drafted thresholds escalate too aggressively. Also, the VSL for failing to train 4 individuals at a single site should be explicit. Given that the greater of the two thresholds for each VSL will apply to any non-compliance, TVA suggests changes to the drafted thresholds as follows.

- **Lower VSL**: (no change).
- **Moderate VSL**: 2 applicable personnel at a single site; or more than 5% and less than 15% of the total applicable personnel of the GOp.
- **High VSL**: 3 or 4 applicable personnel at a single site; or more than 15% and less than 25% of the total applicable personnel of the GOp.
- **Severe VSL**: 5 or more applicable personnel at a single site; or more than 25% of the total applicable personnel of the GOp.

Response	

The drafting team thanks you for your comment. The drafting team utilized a combination of percentages and individual personnel thresholds to provide a level of equity between all entities. The proposed Violation Severity Levels (VSL) in the PER-006-1 (*Specific Training for Personnel*) Reliability Standard align with the VSL Guideline published by NERC. The drafting team concluded that the VSLs thresholds did not need to be revised as suggested above.

Violation Risk Factor

The Violation Risk Factor (VRF) of Medium related to a failure to provide evidence of training for plant operators does not seem to meet the criteria for a Medium Risk factor unless the lack of that training causes an event to occur. A Medium Risk factor is defined as follows:

"A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. "

It would seem more appropriate for this to be considered a Low Risk factor as a lack of being able to provide evidence of training is administrative and is defined as:

"A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature."

Violation Severity Level

The Violation Severity Levels (VSLs) should be enhanced to be explicit in the minimum elements of the training. If an entity provided any training at all it is conceivable that training (regardless of content) would be considered compliant. Exelon does not believe that is the intent of the SDT. Consider revising the technical basis to provide the minimum expectations for the content of the training and revising the VSL to be more specific to the lack of the training containing those elements.

Response

The drafting team thanks you for your comment. The drafting team notes the Violation Risk Factor / Violation Severity Level Justification document explains that the Violation Risk Factor of Medium is consistent with the training Requirements in the PER-005-2 (*Operations Personnel Training*) Reliability Standard, which includes the Balancing Authority, Generator Operator, Reliability Coordinator, and Transmission Operator.

The content (i.e., operational functionality) of the training is determined by the entity. If the training is not in place, the violation would be binary (i.e., Severe); therefore, the VSLs are additionally gradated to have multiple levels of non-compliance based on percentage or number of individuals that did not receive training. The proposed VSLs in the PER-006-1 (*Specific Training for Personnel*) Reliability Standard align with the VSL Guideline published by NERC.

Amy Casuscelli on Behalf of: Peter Colussy, Xcel Energy, Inc. , 6

Answer	No
Document Name	

Comment	
The VSL for missing one operator at a facility with a large staff might mean missing less than 5% of the operators while at a small peaking or black start unit missing one operator could be 50% to 100% of the people at the site. We propose that he VSL would make more sense if the criteria for a single facility was a percentage of operators at that site missing training, rather than the number of personnel missing the training.

Although PGE appreciates the flexibility that the Standard Drafting Team wrote into this standard, it is difficult to measure compliance as it is written. The current version of PER-006 does not indicate how the VSL will be used to measure compliance beyond the initial training specified by the implementation plan.

Dislikes 0	

Response	
The drafting team thanks you for your comment. The drafting team notes that compliance with the standard is based on the Generator Operator providing training to the applicable personnel. Subsequent to the initial training, the Generator Operator will determine when refresher or additional training is required.	
Catrina Martin - Utility System Efficiencies, Inc. (USE) - 5	
Answer	No
Document Name	
Comment	
It does not require the Generator Operator (GOP) to perform any verification activities of retention of the training following the training, nor does it address training refreshment. The results of this omission diverges from the structure established in PER-005-2 R1, R2, and R3, and would put the RE examiner in the position of testing all plant operators and assess their abilities to properly assign a VSL. It also follows that the RE examiner would have to be familiar with the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility. This could be a stretch for most examiners, and, at the very least, lengthen the time of preparation for examination.

Don Schmit - Nebraska Public Power District - 5	
Answer	No

Document Name	
Comment	

Guidance and Technical Basis Section R1:

- "plant personnel" and "GOP" are used interchangeably throughout this Guidance and Technical Basis section. As identified on the commenting sessions with the drafting team, the drafting team identified that the control function may occur in various "entity configurations". Example given was that a central GOP dispatch center may be the function that controls the generator and not the plant itself. Suggest you change the use of "plant" to "GOP" and/or provide a qualifier for understanding.
- Paragraph 1: Sentence 2 that reads "To accomplish this, **plant personnel responsible for Real-time control and operation of a generating Facility** must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility". Remove **"and operation",** as this causes confusion as to whom is to be trained. Explanations during commmenting sessions was very confusing on whom this Standard applies. We do understand that there are different functional applications through the utility industry, however it would seem that the use of "Real-time" [a NERC defined term] indeed makes it clear that it is the "first responders" (first responders, a term used by the SDT in clarifying their position on this Standard). Note: remove "and operation" in subsequent paragraphs also.
- Paragraph 1, sentence 2 that reads: "To accomplish this, plant personnel responsible for Real-time control and operation of a generating Facility **must understand** how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility." Delete **"must understand"** and insert **"must be trained on**". There is no testing associated with this Standard, only training. "must understand" implies a testing measurement function. This change lines up with the Requirment 1.
- Paragraph 2. Sentence that states "A periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel that have Real-time control and operation of a generator are trained in order to operate the plant". You are correct a periodocity is not specified and is also not a part of the Standard. The Requirement and its mesurement do not even imply retraining. Only the Guidance and Technical Basis and the RSAW address re-training. Please see the proposed addition in #1 of the 'Additional Comments' at the end of the commenting form for proposed addition to the Requirement 1. In addition the RSAW, in the 'Evidence Requested" section asks the auditor to verify documentation of changes or additions or Protection Systems and RAS during the compliance monitoring period (this RSAW requirement comes from

language in the Guidelines and Technical Basis section). This is not called out in the Standard and should be added to the R1-Mesurements or elsewhere in the Requirment. • Paragraph 2, Second sentence that states "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service". Delete this sentence as training frequency is already covered in the sentence following the proposed deleted sentence. The two sentences contradict each other. • Paragraph 2 Sentence that states "On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS". The RSAW 'Note to Auditor' section is explicit that Training should be updated for additions and changes. This does not meet the intent of the SDT (as noted in the sentence identified above "the GOP has the flexibility…"). As written this will lead to different audit practices throughout the industry. If the training is not updated, as the current RSAW language is written, this could be a violation in audit application. See #2 of the 'Additional Comments' section at the bottom of this commenting form for proposed RSAW change and in addition the already provided #1 in the 'Additional Comments' section below.

Response

The drafting team thanks you for your comment. The drafting team modified the second paragraph of the PER-006-1 (*Specific Training for Personnel*)Guidelines and Technical Basis (Supplemental Material Section of PER-006-1) to eliminate the confusion.

The phrase "and operation" has been deleted as it does not add any additional clarity.

The drafting team revised the Guidelines and Technical Basis to remove "understand" and replaced it with "be trained on how the operational functionality of" for clarity. The rationale box was not changed as it communicates the intent of the standard.

The Guidelines and Technical Basis has been revised to remove the sentence "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or Remedial Action Scheme (RAS) is placed into service" as noted in the above comment.

The drafting team has proposed to NERC Compliance to remove the sentence "Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies)" from the Reliability Standard Audit Worksheet (RSAW) to address this concern.

Answer	No
Document Name	
Comment	
Recommend the addition within Guidance and Technical Basis to align with the Section 4.1 of this Standard: **Requirement R1** The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, applicable plant personnel responsible for Real-time control and operation of a generating Facility must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility.

The drafting team thanks you for your comment. The drafting team has proposed edits to the Reliability Standard Audit Worksheet (RSAW), a NERC Compliance document, to address the perceived inconsistency between Guidelines and Technical Basis (Supplemental Material section of PER-006-1) and the RSAW.	

Chris Scanlon - Exelon - 1, Group Name Exelon Generation

Answer	No
Document Name	

Comment

Exelon requests that the SDT be more specific regarding the applicable systems that would fall within the scope of PER-006-1. The current draft provides an exclusion for those protective systems which trip breakers serving station auxiliary loads, secondary unit substations or low switchgear transformers and relays protecting other downstream plant electrical distribution system components (even if a trip of these devices might result in a trip of the unit); however it, does not address the following:

1. Protection systems associated with station auxiliary transformers that supply the station and are fed by external power IF the protection system would open breakers that affect the Bulk Electric System (BES) (e.g., the breakers feed into a ring bus). [Note this does not include a transformer fed from a radial line]. Trip of these transformers may or may not trip the unit depending on the plant design.

2. Protection systems associated with unit auxiliary transformers that supply the station and are fed by the generating unit. In this case the trip of the auxiliary transformer would directly trip the generating unit.

Furthermore, the considerations for operational functionality should list the minimum training elements required – not provide the latitude for an auditor or entity to interpret what should be considered.

Response

The drafting team thanks you for your comment. The drafting team notes that Requirement R1 of PER-006-1 (*Specific Training for Personnel*) only includes the Protection Systems and Remedial Action Schemes (RAS) that "affect the output" (i.e., generator to BES) of the generating Facility and not those systems associated with the unit auxiliary transformer, whether fed locally or remotely. The drafting team feels that entities are most qualified to develop training content for plant personnel. The Guidelines and Technical Basis (Supplemental Material section of PER-006-1) provides a suggested list of elements to consider when training on the operational functionality.

M Lee Thomas - Tennessee Valley Authority - 5

Answer	No
Document Name	

Comment

No "Application Guidelines" were found in the standard. This answer is based on the assumption that the question intended to reference the "Guidelines and Technical Basis."

The second sentence of the second paragraph of the Guidelines and Technical Basis states,

"The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service."

While the interpretation provided here is appreciated, TVA does not agree with the premise of the statement. If the intention of the SDT is to require GOP personnel receive training before a Protection System or RAS is placed into service, then R1 or a sub-requirement should state this explicitly, which would comport with maintaining Reliability of the BES. Further, the next sentence states, "On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e .g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS." The “flexibility” given the GOP in this sentence “concerning new systems” is inconsistent with the previous sentence and creates ambiguity regarding when training for new systems is required. The phrase “ongoing basis” would imply the statement is addressing training after a Protection System or RAS has been placed into service, but the parenthetical “concerning new systems” creates the inconsistency.

Comment	

Guidance and Technical Basis Section R1:

- “plant personnel” and “GOP” are used interchangeably throughout this Guidance and Technical Basis section. As identified on the commenting sessions with the drafting team, the drafting team identified that the control function may occur in various “entity configurations”. Example given was that a central GOP dispatch center may be the function that controls the generator and not the plant itself. Suggest you change the use of "plant" to "GOP" and/or provide a qualifier for understanding.
- Paragraph 1: Sentence 2 that reads “To accomplish this, **plant personnel responsible for Real-time control and operation of a generating Facility** must understand how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility". Remove **“and operation”,** as this causes confusion as to whom is to be trained. Explanations during commmenting sessions was very confusing on whom this Standard applies. We do understand that there are different functional applications through the utility industry, however it would seem that the use of “Real-time” [a NERC defined term] indeed makes it clear that it is the “first responders” (first responders, a term used by the SDT in clarifying their position on this Standard). Note: remove “and operation” in subsequent paragraphs also.
- Paragraph 1, sentence 2 that reads: "To accomplish this, plant personnel responsible for Real-time control and operation of a generating Facility **must understand** how Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility." Delete **“must understand”** and insert **“must be trained on”**. There is no testing associated with this Standard, only training. “must understand” implies a testing measurement function. This change lines up with the Requirment 1.
- Paragraph 2. Sentence that states "A periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel that have Real-time control and operation of a generator are trained in order to operate the plant" . You are correct a periodocity is not specified and is also not a part of the Standard. The Requirement and its mesurement do not even imply retraining. Only the Guidance and Technical Basis and the RSAW address re-training. Please see the proposed addition in #1 of the ‘Additional Comments’ at the end of the commenting form for proposed addition to the Requirement 1. In addition the RSAW, in the ‘Evidence Requested” section asks the auditor to verify documentation of changes or additions or Protection Systems and RAS during the compliance monitoring period (this RSAW requirement comes from language in the Guidelines and Technical Basis section). This is not called out in the Standard and should be added to the R1-Mesurements or elsewhere in the Requirment.

- Paragraph 2, Second sentence that states “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service". Delete this sentence as training frequency is already covered in the sentence following the proposed deleted sentence. The two sentences contradict each other.
- Paragraph 2 Sentence that states “On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS". The RSAW ‘Note to Auditor’ section is explicit that Training should be updated for additions and changes. This does not meet the intent of the SDT (as noted in the sentence identified above "the GOP has the flexibility…"). As written this will lead to different audit practices throughout the industry. If the training is not updated, as the current RSAW language is written, this could be a violation in audit application. See #2 of the ‘Additional Comments’ section at the bottom of this commenting form for proposed RSAW change and in addition the already provided #1 in the ‘Additional Comments’ section below.

Response

The drafting team thanks you for your comment. The drafting team modified the second paragraph of the Guidelines and Technical Basis (Supplemental Material section of PER-006-1) to eliminate the confusion.

The phrase “and operation” has been deleted as it does not add any additional clarity.

The drafting team thanks you for your suggestions. Requirement R1 of PER-006-1 (*Specific Training for Personnel*) does not require refresher training and is not intended to align with the systematic approach to training in PER-005-2 (*Operations Personnel Training*).

The Guidelines and Technical Basis has been revised to remove the sentence “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service” as noted in the above comment.

The drafting team has proposed edits to the Reliability Standard Audit Worksheet (RSAW), a NERC Compliance document, to address the inconsistency between PER-006-1, Requirement R1 and the RSAW.

Comment	
The application guidelines lack a true description of who the standard applies to. The NERC Functional Model defines Generator Operator as: "The functional entity that operates generating unit(s) and performs the functions of supplying energy and reliability related services." Question arises does this apply only to registered entities of the "Generator Operator" regardless of their voltage level, generation capacity and point of interconnection with the BES?	
Likes 0	
Dislikes 0	
Response	
The drafting team thanks you for your comment. The PER-006-1 (*Specific Training for Personnel*) Reliability Standard is applicable to registered Generator Operators regardless of voltage, generating capacity, or point of interconnection. The standard further applies to Facilities that meet the definition of "Bulk Electric System" (BES).

We recommend that the drafting team clarify in the Application Guidelines for Requirement R1 that one-time training is required for applicable plant personnel. There is nothing in the language of the requirement to require additional, continuing, and/or retraining to occur. The RSAW has made an assumption that retraining is required, which needs to be corrected to align with the requirement. If the SDT does intend for additional, continuing and/or retraining, this would be a substantive change and would require another posting of the revised requirement for industry comment and ballot.

FirstEnergy Comments

PER-006-1 – Specific Training for Personnel

Draft 1 – Ballot Ending April 25, 2016

The following comments are offered to the NERC Standard Draft Team (SDT) to support why FirstEnergy (FE) has voted NEGATIVE on the 1st Draft version of PER-006-1. Our comments also offered suggested revisions in order for FE to support the standard.

1. The 2nd paragraph of the Guidelines and Technical Basis section includes the statement *"The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service."* FE recommends the text be deleted as it is inconsistent with the R1 requirement as presented in Draft 1. This statement adds additional obligations not within the standard. Nowhere in the requirement language is this "dictated" or required. Additionally, this could raise questions to when training is needed for revised Protection Systems that may only include minor setting changes for coordination improvement but no material change in the intended outcome of the protection scheme.

2. The Guidelines and Technical Basis section offers 6 bullet listed items/topics for consideration for training intended to cover the "operational functionality" of a Protection System or RAS. FE offers a re-write of this area to place greater emphasis on the first and last bulleted items which we believe are the most appropriate areas to cover with generation plant operators. The other four items are more technical and design/engineering details that should be more clearly optional.

3. As a minor note, FE suggests adding the word "Operations" in the standard title to read "Specific Training for Operations Personnel". Doing so would better compliment the PER-005-2 standard which is titled "Operations Personnel Training" which focuses on a systematic approach to training for reliability related tasks.

The attached file includes an excerpt of the Draft 1 PER-006-1 standard with suggested red-line edits to the Guidelines and Technical Basis section.

If the SDT wishes to discuss FE's comments please contact Doug Hohlbaugh, Manager, Reliability Compliance at 330-384-4698.

The drafting team thanks you for your comment. The PER-006-1 (*Specific Training for Personnel*) Guidelines and Technical Basis (see Supplemental Material section of PER-006-1) has been revised to remove the sentence "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service" as noted in the above comment. The drafting team notes that the considerations of operational functionality are examples and are provided for guidance. The drafting team avoided the term "operations" in the title because PER-005-2 (*Operations Personnel Training*) already uses this to define the personnel and that PER-006-1 could potentially be used for other specific training requirements.

6. ***Do you agree with implementation period (i.e., 12 months) of the proposed PER-006-1 Reliability Standard and the proposed definition modifications of OPA and RTA based on the considerations listed in the Implementation Plan? If not, please provide a justification for changing the proposed implementation periods.***	
Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy	
Answer	No
Document Name	
Comment	
Duke Energy does not believe that an Implementation Plan of 12 months is appropriate for the amount of work that would be involved for larger utilities with numerous generating facilities. An entity would need time to develop additional training materials (in addition to what is already in use for compliance with PRC-001-1.1(ii)) with specificity for each of its generating facilities, and then administer said training to all applicable operators within a 12 month timeframe. A significant amount of time would need to be allotted to accomplish develop and distribute the additional required tasks, much more than the proposed 12 months.	
Likes 0

Response	
The drafting team thanks you for your comment and has increased the implementation period to 24 months.	
Elizabeth Axson - Electric Reliability Council of Texas, Inc. - 2	
Answer	No
Document Name	
Comment	

Comments: As currently worded, the modification of OPA and RTA may require entities to collect and include a large, voluminous set of data in their RTAs and OPAs. This would require entities to make modeling and Energy Management System changes to accommodate all the relay information, which would require time to upgrade technology. Taking into account budgeting, design, and implementation, the time necessary to upgrade this technology could run 24 to 36 months.

Response	
The drafting team thanks you for your comment and has increased the implementation period to 24 months. The drafting team has also proposed the removal of the "Set of Protection Systems and Remedial Action Schemes from the evidence section of the RSAW, a NERC Compliance document.	

Tim Kucey - PSEG - PSEG Fossil LLC - 5	
Answer	No
Document Name	
Comment	

PSEG thanks the drafting team for its efforts and appreciates having the opportunity to comment on the proposed OPA and RTA definitions. PSEG is in general agreement with the intent of the proposed OPA and RTA definitions as it applies to the inclusion of Protection Systems and RASs in evaluations and assessments (that would be conducted by operations personnel). The wording of the current version of each definition states that OPA evaluations and RTA assessments "…shall reflect applicable inputs including… known Protection System and Remedial Action Scheme status or degradation, functions, and limits…". PSEG agrees that OPAs and RTAs should include the status or degradation of known protection systems and RASs. Additionally, we believe that inclusion of the "functions and limits" of RASs in OPAs and RTAs would improve reliability. However, it is requested that the requirement to include the "functions and limits" of [all] known Protection Systems be removed from the OPA and RTA definitions. As they are currently written, the definitions imply that the (operations) personnel who perform OPAs and RTAs would require detailed information regarding the settings for all protection systems (or schemes) that are within their scope of operations in order to complete OPAs and RTAs. PSEG does not believe that this level of detail regarding [all] protection systems is necessary in OPAs and RTAs in order to maintain reliability of the BES. PSEG therefore proposes that the definitions be revised as follows:

Operational Planning Analysis (OPA)

An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System status or degradation; and **Remedial Action Scheme** status or degradation**, functions, and limits**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Real-time Assessment (RTA)

An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known

Protection System status or degradation; and **Remedial Action Scheme** status or degradation**, functions, and limits;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.) PSEG, Segment(s) 5, 6, 1, 3, 3/10/2016	
Likes 0

The drafting team thanks you for your comment and notes that Reliability Standards IRO-010-2 (*Reliability Coordinator Data Specification and Collection*) for the Reliability Coordinator and TOP-003-3 (*Operational Reliability Data*) for the Transmission Operator, Requirements R1, Parts 1.2 are one method in which Protection Systems and Remedial Action Schemes become inputs into the Operational Planning Analysis and Real-time Assessment. However, the Reliability Coordinator and Transmission Operator may have additional Protection Systems and Remedial Action Schemes included as inputs and those too would be in purview. The limits and functions pertain to these Protection Systems and Remedial Action Schemes within its documented data specification; therefore, the suggested modification would further narrow the intent and does not address the reliability objective in PRC-001-1.1(ii) (*System Protection Coordination*), Requirement R1 that includes Protection Systems.	
Diana McMahon - Salt River Project - 1,3,5,6 - WECC

The limits and functions pertain to these Protection Systems and Remedial Action Schemes within its documented data specification; therefore, the suggested modification would further narrow the intent and does not address the reliability objective in PRC-001-1.1(ii) (*System Protection Coordination*), Requirement R1 that includes Protection Systems.	
Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

An implementation plan of 12 months is insufficient, as it may not allow larger entities adequate time to improve the existing training program under PRC-001 R1. This shortened duration may force large entities to continue utilizing PRC-001 training processes for PER-006-1, which may not meet the auditor's intent. Instead, AEP recommends that a 4 year phased implementation period for the Standard be incorporated as follows: specific training of personnel would consist of 40% within 12 months, 60% within 24 months, 80% within 36 months, and 100% within 48 months following the effective date of the Standard.

Within the province of Ontario, many Ontario Market Rules published by Ontario's Independent Electricity System Operator (IESO) contain requirements that mandate adequate knowledge of system operating staff. Hence, in Ontario, the IESO Market Rules already encompass many of the requirements in this standard for Generator Operators. Similarly, other ISOs may also have pre-defined requirements for operators within their jurisdictions to hold their system operating staff accountable for prior to issuing a transmission or generating license.

Erika Doot - U.S. Bureau of Reclamation - 5	
Answer	
Document Name	
Comment	
Reclamation supports the drafting team's effort to move the GOP Protection System training requirement to a Personnel Performance, Training, and Qualification (PER) standard. Reclamation suggests that in the future, PER-006 could be revised to include other one-off GOP training requirements, like the minimum of two hours of GOP blackstart training required every two calendar years in EOP-005 R17. Reclamation appreciates the drafting team's industry outreach and approach to relying on the existing PER-005-2 Systematic Approach to Training standard to replace PRC-001 R1 for BAs, RCs, TOPs, and GOP centrally located dispatch centers, rather than creating duplicative requirements.

PER-006-1; Top of Page 4 says; "When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material section of the standard." Is this the most updated NERC template, from other standards we have reviewed, we thought that the Rationale boxes were going to stay with the Requirements after approved. Please advise.

Thank you for your comments. The rationale boxes are moved to the "Supplemental Material" section of the standard. In some cases, the rational information for a previous version of the standard may be removed by the drafting team revising said standard.

Comment	

- The RSAW requests documentation of Protection System and RAS changes, but there is no mention of how the auditors will use this list to measure compliance if there is no frequency for training. As the standard is written, there is no timeframe for training operators on these changes.
- Without any requirement in this standard for the TOP to notify the GOP of changes to the Protection Systems and RAS, PGE sees a gap in the compliance monitoring for this when the TOP for several plants is a different entity.

Response

The drafting team thanks you for your comments. The drafting team has proposed edits to the Reliability Standard Audit Worksheet (RSAW), a NERC Compliance document, to address the inconsistency between Requirement R1 and the RSAW.

The drafting team notes that how the Generator Operator becomes informed of Protection System and Remedial Action Scheme changes are not within scope of this project.

Don Schmit - Nebraska Public Power District - 5

ADDITIONAL COMMENTS:

#1: Suggessted sub-requirement for this Standard under R1

R1.1: the Generator Operator shall determine when its plant personnel need to receive additional training, such as new systems, replacements, technology and operational functionality, of Protection Systems and RAS.

Add the following to Measurement 1: Documentation of changes or additions during the compliance monitoring period that effect the output of the generating facility(ies).

#2:

Within the proposed PER-006-1 RSAW in relation to R1, there is a note to the auditor (page 5), which states that "Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility".

The Guidelines and Technical Basis within the Standard, under R1, (page 9 of 10, second paragraph) states "On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS".

To maintain the intent of the drafting team we propose that the *note to the auditor* reflect the drafting teams intent from the Guidelines and Technical Basis section. We recommend the following wording that reflects the SDT's intent:

NOTE TO AUDITOR: Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility; however the Generator Operator has the flexibility to determine when its personnel need to receive additional training (new systems, replacements, technology, and operational functionality) on the operational functionality of Protection Systems and RAS.

Response

The drafting team thanks you for your suggestions. Requirement R1 does not require refresher training and allows the Generator Operator to determine if or when to perform refresher or additional training.

The drafting team has proposed edits to the RSAW, a NERC Compliance document, to address the inconsistency between Requirement R1 and the RSAW. The Guidelines and Technical Basis has been revised to remove the sentence “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service” as noted in the above comment.

Even though the PER-006-1 draft standard aids in ensuring that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the BES, ReliabilityFirst believes the requirement fall short as there is no periodicity of training noted in the requirement. ReliabilityFirst provides the following comments for consideration:

1. Requirement R1

    i. Even though the "Guidelines and Technical Basis" states "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service.", the actual requirement has no periodicity requirements. If the true intent of the SDT is to have the GOP personnel receive training before the Protection Systems or RAS is placed into service, ReliabilityFirst believes this language should be added to the Requirement. ReliabilityFirst also seeks clarification on the timing of when new personal are required to receive this training (e.g., is it required prior to going on shift for the first time). Also is it the expectation of the SDT that existing personal are required to receive this training by the time this standard becomes effective? If this is the case, the SDT may want to consider including this in the Implementation Plan. ReliabilityFirst offers the following for consideration:

        a. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1., on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates, [either prior to new personnel going on shift for the first time or prior to Protection Systems or RAS placed into service].

Response	
The drafting team thanks you for your comments. Requirement R1 does not require refresher training and is not intended to align with the systematic approach to training in PER-005 (*Operations Personnel Training*). The performance of the requirement is to provide training and not test the plant operator's retention of the training. Content of the operational functionality of the Protection Systems and Remedial Action Schemes are the areas of focus and it is not intended for the auditor to question the depth of the content. The Guidelines and Technical Basis has been revised to remove the sentence "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service" as noted in the above comment.

With regard to the structure of PER-006-1: In this case, a new standard, containing a single requirement, is proposed to require GOPs train on “operational functionality specific to Protection Systems and Remedial Action Schemes and their effects on generating Facilities.” This is a deviation from past practice whereby prior GOP training requirements, such as that for system restoration from Blackstart Resources (EOP-005-2, R17) and communication (COM-002-4, R3), have been included with the subject matter material as opposed to a Personnel Performance, Training and Qualifications (PER) standard. APS recommends NERC consider (as part of a future effort and assuming PER-006-1 is adopted) whether it would make sense to migrate all GOP training requirements under PER-006-1. Alternatively, this training requirement could be placed within an appropriate Protection and Control (PRC) standard, although with the retirement of PRC-001-1(ii), there does not appear to be an ideal location for this requirement.

Comment

The SDT needs to ensure that the RSAW aligns with PER-006-1 intent. Currently the draft RSAW for PER-006-1 specifies the following evidence requested to demonstrate compliance.

"Documentation of changes or additions during the compliance monitoring period to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies)."

This requested evidence does not align with the current version of PER-006-1. Per the "Guidelines and Technical Basis" the "periodicity for training is not specified in Requirement R1 because it is incumbent upon the GOP to ensure its plant personnel … … are trained in order to operate the plant." And further states that "the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.)"

Although it would seem entirely reasonable for a functional change to warrant additional training, the evidence request in the RSAW could be broadly interpreted that ALL changes, regardless of impact or non-impact to the functionality of the Protection System, would require training prior to implementation. This is an unnecessary burden on the GOP and in Exelon's opinion was not the intent of the SDT.

The purpose of the standard as drafted in section A.3, "topics essential to Reliability to perform or support," is worded awkwardly. The topics are not directly essential to Reliability. Performance and support of Real-Time operations should be the subject of the topics. The standard should apply to training on topics regarding only those Real-time operations that are essential to Reliability of the BES. Accordingly, TVA suggests the purpose should state, "To ensure that personnel are trained on specific topics regarding performance or support of Real-time operations essential to reliability of the Bulk Electric System."

The RSAW requires the following evidence:

- Identification of responsible personnel
- Identification of the set of Protection Systems and Remedial Action Schemes that affect the output of the generating facility(ies).
- Evidence that the identified personnel completed the training
- Documentation of changes or additions to the identified Protection Systems and Remedial Action Schemes

This expectation is presented in both the “Evidence Requested,” and in the “Assessment Approach” sections of the RSAW. However, this seems to introduce new requirements and measurements in the RSAW beyond what is stated in the draft standard. The measurement of compliance as stated in the standard is simply that, “Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training.” TVA acknowledges that maintaining a list of applicable personnel is essential to meeting the stated measure. However, the RSAW expectation to provide a list of Protection Systems and Remedial Action Schemes, as well as documentation of changes or additions to these systems, expands the scope of required evidence to include the adequacy of the training content, which is not addressed in either in the Requirement or the Measure as drafted. At first blush, these new requirements appear to be supported by the statement in the "Guidelines and Technical Basis" section of the standard which states, "The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service." However, it is immediately refuted by the next sentence which states, "On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e .g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS." TVA respectfully requests that the drafted standard (Measure and Guidelines/Basis) and the RSAW be aligned to remove the ambiguity, 1) between statements in the Guidelines and Technical Basis as previously described, and 2) between the RSAW and the standard Measure. The RSAW should be revised to remove expectations for maintaining documentation of the set of Protection Systems and Remedial Action Schemes and changes or additions to these systems and schemes.

The drafting team thanks you for your comments and believes the purpose statement in its current form provides sufficient clarity. The purpose statement is meant to be general enough to allow future requirements to be incorporated into PER-006-1 (*Specific Training for Personnel*). The drafting team has proposed edits to the RSAW, a NERC Compliance document, to address the inconsistency between Measure M1 and the RSAW. The Guidelines and Technical Basis has been revised to remove the sentence “The structure of the requirement dictates that the GOP personnel receive training before the Protection Systems or RAS is placed into service” as noted in the above comment.

ADDITIONAL COMMENTS:

#1: Suggessted sub-requirement for this Standard under R1

R1.1: the Generator Operator shall determine when its plant personnel need to receive additional training, such as new systems, replacements, technology and operational functionality, of Protection Systems and RAS.

Add the following to Measurement 1: Documentation of changes or additions during the compliance monitoring period that effect the output of the generating facility(ies).

#2:

Within the proposed PER-006-1 RSAW in relation to R1, there is a note to the auditor (page 5), which states that “Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility”.

The Guidelines and Technical Basis within the Standard, under R1, (page 9 of 10, second paragraph) states “On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and operational functionality changes, etc.) on the operational functionality of Protection Systems and RAS”.

To maintain the intent of the drafting team we propose that the *note to the auditor* reflect the drafting teams intent from the Guidelines and Technical Basis section. We recommend the following wording that reflects the SDT’s intent:

NOTE TO AUDITOR: Training should be updated to include changes or additions to Protection Systems and Remedial Action Schemes that affect the output of the Facility; however the Generator Operator has the flexibility to determine when its personnel need to receive additional training (new systems, replacements, technology, and operational functionality) on the operational functionality of Protection Systems and RAS.

PacifiCorp believes that a new standard, PER-006, would be superfluous to PER-005. An entirely new standard only increases compliance documentation burden without any incremental increase in reliability to the BES. The proposed changes could be made in a new version of PER-005-2, identified as PER-005-3. Both PER-005-2 and the current PER-006 address the same issue. As standards are rewritten, training requirements need to be consolidated not only within the PER section but within the same standard. This would provide consistent approach and reduce the possibility of conflicting terms and applications.

Response	
The drafting team thanks you for your comments and believes that PER-006-1 (Specific Training for Personnel) provides clarity over PRC-001-1.1(ii) (System Protection Coordination), Requirement R1 to identify the appropriate personnel who must receive training (be familiar with). Withdrawing PER-006-1 and its associated Guidelines would result in a reliability gap in the absence of PRC-001-1.1(ii). The Generator Operator personnel at a centrally located dispatch center is addressed by PER-005-2 (Operations Personnel Training) and does not address plant personnel as expected by PER-006-1. The PER-005-2 standard is based on a systematic approach to training and would not ensure that training on Protection Systems and Remedial Action Schemes is provided for plant personnel, which are not applicable to PER-005-2. A technical conference held by the drafting team revealed that stakeholders did not want the burden of a systematic approach to training to be applied to plant personnel.

According to the accompanying RSAW "Documentation of changes or additions during the compliance monitoring period to Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies)" will be requested as evidence for PER-006-1 R1. Tri-State believes there is no corresponding requirement in the current draft of PRC-006-1 that suggests this information is necessary. If it was the SDT's intentions that there be additional training prior to implementing any changes to the Protection Systems or RAS that affect the output of the Facility, then there should be a requirement that explicitly states that. Tri-State suggests that the SDT create a requirement or sub-requirement to require entities to provide new or additional training to its plant personnel prior to the change in the Protection Systems and RAS being made, so that they are aware of the operational functionality.	

We heard in one of the Q&A sessions that the operators at a dispatch center could be included if they have direct control, in Real-time, of an unmanned plant via remote access capabilities. While we don't disagree with this inclusion, the applicability section does not convey this. We would suggest that the SDT include this scenario within the applicability section.

End of Report

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination (Phase 2) Standard Drafting Team (SPCP2SDT) is addressing Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). The PER-006-1 Reliability Standard addresses the Generator Operator (GOP) that is applicable to Requirement R1 of PRC-001-1.1(ii).

Requirements R1, R2, and R5 applicable to the GOP are proposed for retirement as described below.

1. The PER-006-1, Requirement R1, applicable to the GOP, is proposing to replace PRC-001-1.1(ii), Requirement R1 to address the reliability objective of ensuring GOP plant operating personnel are "familiar with the purpose and limitations of Protection Systems." The standard PER-005-2 already addresses centrally located dispatch center personnel.
2. The Personnel Performance, Training, and Qualifications (PER) set of Reliability Standards and Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards address the reliability objective of PRC-001-1.1(ii), Requirements R2 and R5.

Requirements R1 and R6 applicable to the Balancing Authority (BA) and Requirements R1, R2, R5, and R6 applicable to the Transmission Operator (TOP) are proposed for retirement on the following basis.

1. The TOP/IRO sets of Reliability Standards address the reliability objective of these requirements.
2. The revisions to the definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), that the TOP and the Reliability Coordinator perform, address the reliability objective of integrating the function and limits of Protection Systems and Remedial Action Schemes (RAS) into their OPA and RTA.

See the Project 2007-06.2 mapping document for further explanation on how the PER and TOP/IRO sets Reliability Standards and the revision of the two definitions address the reliability objectives of PRC-001-1.1(ii), Requirements R1, R2, R5, and R6 for the BA and TOP. The PRC-027-1 (*Coordination of Protection System Performance During Faults*) Reliability Standard addresses Requirements R3 and R4 of PRC-001-1.1(ii).

The PER-006-1 Reliability Standard and revisions to the definitions of OPA and RTA are being posted for an initial 45-day formal comment period with a concurrent initial ballot to be held in the last ten days of the comment period.

Completed Actions	Date
Standard Authorization Request (SAR) posted for comment	June 11 – July 10, 2007
SAR approved by Standards Committee (SC)	August 13, 2007
SC authorized posting of TOP-009-1	July 28, 2015
Draft 1, TOP-009-1, posted for a 45-day formal comment period	July 29 – September 11, 2015
Draft 1, TOP-009-1, concurrent/parallel initial ballot in the last ten days of the comment period	September 2-11, 2015
Draft 2, TOP-009-1, posted for a 45-day formal comment period	October 6 – November 19, 2015
Draft 2, TOP-009-1, concurrent/parallel additional ballot in the last ten days of the comment period	November 10-19, 2015
Draft 2, TOP-009-1 withdrawn from development at SDT meeting	February 9, 2016
SC authorized posting of PER-006-1	March 9, 2016

Anticipated Actions	Date
Draft 1, PER-006-1, 45-day formal comment period with initial ballot	March 10 – April 25, 2016
10-day final ballot	May 2016
NERC Board (Board) adoption	August 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material section of the standard.

A. Introduction

1. **Title:** **Specific Training for Personnel**
2. **Number:** **PER-006-1**
3. **Purpose:** To ensure that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the Bulk Electric System.
4. **Applicability:**

    4.1. Functional Entities:

    4.1.1. Generator Operator that has:

    4.1.1.1. Plant personnel who are responsible for the Real-time control of a generator and receive Operating Instruction(s) from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center.

5. **Effective Date:** See Implementation Plan for Project 2007-06.2.

B. Requirements and Measures

Rationale for Requirement R1: Protection Systems and Remedial Action Schemes (RAS) are an integral part of reliable Bulk Electric System (BES) operation. This requirement addresses the reliability objective of ensuring that Generator Operator (GOP) plant operating personnel understand the operational functionality of Protection Systems and RAS and their effects on generating Facilities.

R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M1. Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training. This evidence may be documents such as training records showing successful completion of training that includes training materials, the name of the person, and date of training.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:**

   "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

   1.2. **Evidence Retention:**

   The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - The Generator Operator shall keep data or evidence of Requirement R1 for the current year and three previous calendar years.

   1.3. **Compliance Monitoring and Enforcement Program**

   As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • one applicable personnel at a single Facility, or • 5% or less of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • two applicable personnel at a single Facility, or • more than 5% and less than or equal to 10% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • three applicable personnel at a single Facility, or • more than 10% and less than or equal to 15% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • five or more applicable personnel at a single Facility, or • more than 15% of the total applicable personnel of the Generator Operator. **OR** The Generator Operator failed to provide training as described in Requirement R1 to its applicable personnel.

D. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1		Adopted by the NERC Board of Trustees	New standard developed under Project 2007-06.2

Guidelines and Technical Basis

Requirement R1

The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, applicable plant personnel responsible for Real-time control of a generating Facility must be trained on how the operational functionality of Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility. Although, training does not have to be Facility-specific, the standard applies to plant operating personnel associated with the specific Facility to which they have Real-time control. This does not include plant personnel not responsible for Real-time control (e.g., fuel or coal handlers, electricians, machinists, or maintenance staff).

A periodicity for training is not specified in Requirement R1 because the GOP must ensure its plant personnel who have Real-time control of a generator are trained. The Generator Operator must also ensure it provides applicable training that results from changes to the operational functionality of the Protection Systems and Remedial Action Schemes that affect the output of the generation Facility(ies).

The phrase "operational functionality" focuses the training on how Protection Systems operate and prevent possible damage to Elements. It also addresses how RAS detects pre-determined BES conditions and automatically takes corrective actions.

Considerations for operational functionality may include, but are not limited to the following:

- Purpose of protective relays and RAS
- Zones of protection
- Protection communication systems (e.g., line current differential, direct transfer trip, etc.)
- Voltage and current inputs
- Station dc supply associated with protective functions
- Resulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions

Requirement R1 focuses on the operational functionality of Protection Systems and Remedial Action Schemes specific to the generating plant and not the Bulk Electric System.

This requirement focuses on those systems that are related to the electrical output of the generator. Protective systems which trip breakers serving station auxiliary loads (e.g., such as pumps, fans, or fuel handling equipment) are not included in the scope of this training. Furthermore, protection of secondary unit substation (SUS) or low voltage switchgear transformers and relays protecting other downstream plant electrical distribution system components are not in the scope of this training, even if a trip of these devices might eventually result in a trip of the generating unit.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Description of Current Draft

The System Protection Coordination (Phase 2) Standard Drafting Team (SPCP2SDT) is addressing Requirements R1, R2, R5, and R6 of PRC-001-1.1(ii). The PER-006-1 Reliability Standard addresses the Generator Operator (GOP) that is applicable to Requirement R1 of PRC-001-1.1(ii).

Requirements R1, R2, and R5 applicable to the GOP are proposed for retirement as described below.

1. The PER-006-1, Requirement R1, applicable to the GOP, is proposing to replace PRC-001-1.1(ii), Requirement R1 to address the reliability objective of ~~being~~ensuring GOP plant operating personnel are "familiar with the purpose and limitations of Protection Systems~~" for the GOP's plant operator personnel.~~." The standard PER-005-2 already addresses centrally located dispatch center personnel.
2. The Personnel Performance, Training, and Qualifications (PER) set of Reliability Standards and Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards address the reliability objective of PRC-001-1.1(ii), Requirements R2 and R5.

Requirements R1 and R6 applicable to the Balancing Authority (BA) and Requirements R1, R2, R5, and R6 applicable to the Transmission Operator (TOP) are proposed for retirement on the following basis.

1. The TOP/IRO sets of Reliability Standards address the reliability objective of these requirements.
2. The revisions to the definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), that the TOP and the Reliability Coordinator perform, address the reliability objective of integrating the function and limits of Protection Systems and Remedial Action Schemes (RAS) into their OPA and RTA.

See the Project 2007-06.2 mapping document for further explanation on how the PER and TOP/IRO sets Reliability Standards and the revision of the two definitions address the reliability objectives of PRC-001-1.1(ii), Requirements R1, R2, R5, and R6 for the BA and TOP. The PRC-027-1 (*Coordination of Protection System Performance During Faults*) Reliability Standard addresses Requirements R3 and R4 of PRC-001-1.1(ii).

The PER-006-1 Reliability Standard and revisions to the definitions of OPA and RTA are being posted for an initial 45-day formal comment period with a concurrent initial ballot to be held in the last ten days of the comment period.

Completed Actions	Date
Standard Authorization Request (SAR) posted for comment	June 11 – July 10, 2007
SAR approved by Standards Committee (SC)	August 13, 2007
SC authorized posting of TOP-009-1	July 28, 2015
Draft 1, TOP-009-1, posted for a 45-day formal comment period	July 29 – September 11, 2015
Draft 1, TOP-009-1, concurrent/parallel initial ballot in the last ten days of the comment period	September 2-11, 2015
Draft 2, TOP-009-1, posted for a 45-day formal comment period	October 6 – November 19, 2015
Draft 2, TOP-009-1, concurrent/parallel additional ballot in the last ten days of the comment period	November 10-19, 2015
Draft 2, TOP-009-1 withdrawn from development at SDT meeting	February 9, 2016
SC authorized posting of PER-006-1	March 9, 2016

Anticipated Actions	Date
Draft 1, PER-006-1, 45-day formal comment period with initial ballot	March 10 – April 25, 2016
10-day final ballot	May 2016
NERC Board (Board) adoption	August 2016

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None.

When this standard receives Board adoption, the rationale boxes will be moved to the Supplemental Material section of the standard.

A. Introduction

1. **Title:** **Specific Training for Personnel**
2. **Number:** **PER-006-1**
3. **Purpose:** To ensure that personnel are trained on specific topics essential to reliability to perform or support Real-time operations of the Bulk Electric System.
4. **Applicability:**
   - **4.1. Functional Entities:**
     - **4.1.1.** Generator Operator that has:
       - **4.1.1.1.** Plant personnel who are responsible for the Real-time control of a generator and receive Operating Instruction(s) from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center.
5. **Effective Date:** See Implementation Plan for Project 2007-06.2.

B. Requirements and Measures

Rationale for Requirement R1: Protection Systems and Remedial Action Schemes (RAS) are an integral part of reliable Bulk Electric System (BES) operation. This requirement addresses the reliability objective of ensuring that ~~the~~ Generator Operator (GOP) plant operating personnel understand the operational functionality of Protection Systems and RAS and their effects on generating Facilities.

R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M1. Each Generator Operator shall have available for inspection, evidence that the applicable personnel completed training. This evidence may be documents such as training records showing successful completion of training that includes training materials, the name of the person, and date of training.

C. Compliance

1. **Compliance Monitoring Process**

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Operator shall keep data or evidence of Requirement R1 for the current year and three previous calendar years.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	**Moderate VSL**	**High VSL**	**Severe VSL**
R1.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • one applicable personnel at a single Facility, or • 5% or less of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • two applicable personnel at a single Facility, or • more than 5% and less than or equal to 10% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • three applicable personnel at a single Facility, or • more than 10% and less than or equal to 15% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • five or more applicable personnel at a single Facility, or • more than 15% of the total applicable personnel of the Generator Operator. **OR** The Generator Operator failed to provide training as described in Requirement R1 to its applicable personnel.

D. Regional Variances

None.

Version	Date	Action	Change Tracking
1		Adopted by the NERC Board of Trustees	New standard developed under Project 2007-06.2

Guidelines and Technical Basis

Requirement R1

The Generator Operator (GOP) monitors and controls its generating Facilities in Real-time to maintain reliability. To accomplish this, applicable plant personnel responsible for Real-time control ~~and operation~~ of a generating Facility must ~~understand~~be trained on how the operational functionality of Protection Systems and Remedial Action Schemes (RAS) are applied and the affects they may have on a generating Facility. ~~This standard requires GOPs to train their plant personnel on these issues. The standard only~~Although, training does not have to be Facility-specific, the standard applies to plant operating personnel associated with the specific Facility to which they have Real-time control. This does not include ~~other~~ plant personnel not responsible for Real-time control (e.g., fuel or coal handlers, electricians, machinists, or maintenance staff).

A periodicity for training is not specified in Requirement R1 because ~~it is incumbent upon~~ the GOP ~~to~~must ensure its plant personnel ~~that~~who have Real-time control ~~and operation~~ of a generator are trained~~ in order to operate the plant.~~. The ~~structure of the requirement dictates that the GOP personnel receive~~Generator Operator must also ensure it provides applicable training ~~before the Protection Systems or RAS is placed into service. On an ongoing basis, the GOP has the flexibility to determine when its plant personnel need to receive additional training (e.g., concerning new systems, replacements, technology and~~ that results from changes to the operational functionality ~~changes, etc.) on the operational functionality~~of the Protection Systems and Remedial Action Schemes that affect the output of ~~Protection Systems and RAS.~~the generation Facility(ies).

The phrase “operational functionality” focuses the training on how Protection Systems operate and prevent possible damage to Elements. It also addresses how RAS detects pre-determined BES conditions and automatically takes corrective actions.

Considerations for operational functionality may include, but ~~is~~are not limited to the following:

- Purpose of protective relays and RAS
- Zones of protection
- Protection communication systems (e.g., line current differential, direct transfer trip, etc.)
- Voltage and current inputs
- Station dc supply associated with protective functions
- Resulting actions – tripping/closing of breakers; tripping of a generator step-up (GSU) transformer; or generator ramping/tripping control functions

Requirement R1 focuses on the operational functionality of Protection Systems and Remedial Action Schemes specific to the generating plant and not the Bulk Electric System.

This requirement focuses on those systems that are related to the electrical output of the generator. Protective systems which trip breakers serving station auxiliary loads (e.g., such as pumps, fans, or fuel handling equipment) are not included in the scope of this training. Furthermore, protection of secondary unit substation (SUS) or low voltage switchgear transformers and relays protecting other downstream plant electrical distribution system components are not in the scope of this training, even if a trip of these devices might eventually result in a trip of the generating unit.

~~A. Introduction~~

~~**1. Title: System Protection Coordination**~~

~~**2. Number:** PRC-001-1.1(ii)~~

~~**3. Purpose:**~~

~~To ensure system protection is coordinated among operating entities.~~

~~**4. Applicability**~~

~~**4.1.** Balancing Authorities~~

~~**4.2.** Transmission Operators~~

~~**4.3.** Generator Operators~~

~~**5. Effective Date:**~~

~~See the Implementation Plan for PRC-001-1.1(ii).~~

ORANGE TEXT – Retirements of R1, R2, R5, and R6 occurring under Project 2007-06.2.

RED TEXT – Retirements of R3 and R4 occurring under Project 2007-06.

~~B. Requirements~~

~~**R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be familiar with the purpose and limitations of Protection System schemes applied in its area.~~

~~**R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:~~

~~**R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible.~~

~~**R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.~~

~~**R3.** A Generator Operator or Transmission Operator shall coordinate new protective systems and changes as follows.~~

~~**R3.1.** Each Generator Operator shall coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority.~~

- ~~Requirement R3.1 is not applicable to the individual generating units of dispersed power producing resources identified through Inclusion I4 of the Bulk Electric System definition.~~

~~**R3.2.** Each Transmission Operator shall coordinate all new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities.~~

~~**R4.** Each Transmission Operator shall coordinate Protection Systems on major transmission lines and interconnections with neighboring Generator Operators, Transmission Operators, and Balancing Authorities.~~

~~**R5.** A Generator Operator or Transmission Operator shall coordinate changes in generation, transmission, load or operating conditions that could require changes in the Protection Systems of others:~~

~~**R5.1.** Each Generator Operator shall notify its Transmission Operator in advance of changes in generation or operating conditions that could require changes in the Transmission Operator's Protection Systems.~~

~~**R5.2.** Each Transmission Operator shall notify neighboring Transmission Operators in advance of changes in generation, transmission, load, or operating conditions that could require changes in the other Transmission Operators' Protection Systems.~~

~~**R6.** Each Transmission Operator and Balancing Authority shall monitor the status of each Special Protection System in their area, and shall notify affected Transmission Operators and Balancing Authorities of each change in status.~~

~~C. Measures~~

~~**M1.** Each Generator Operator and Transmission Operator shall have and provide upon request evidence that could include but is not limited to, revised fault analysis study, letters of agreement on settings, notifications of changes, or other equivalent evidence that will be used to confirm that there was coordination of new protective systems or changes as noted in Requirements 3, 3.1, and 3.2.~~

~~**M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, documentation, electronic logs, computer printouts, or computer demonstration or other equivalent evidence that will be used to confirm that it monitors the Special Protection Systems in its area. (Requirement 6 Part 1)~~

~~**M3.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, phone records, electronic-notifications or other equivalent evidence that will be used to confirm that it notified affected Transmission Operator and Balancing Authorities of changes in status of one of its Special Protection Systems. (Requirement 6 Part 2)~~

~~D. Compliance~~

~~1. Compliance Monitoring Process~~

~~1.1. Compliance Monitoring Responsibility~~

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~

~~1.2. Compliance Monitoring and Reset Time Frame~~

~~One or more of the following methods will be used to assess compliance:~~

- ~~Self-certification (Conducted annually with submission according to schedule.)~~
- ~~Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~
- ~~Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance-Reset Period shall be 12 months from the last finding of non-compliance.~~

~~1.3. Data Retention~~

~~Each Generator Operator and Transmission Operator shall have current, in-force documents available as evidence of compliance for Measure 1.~~

~~Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measures 2 and 3.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

~~1.4. Additional Compliance Information~~

~~None.~~

~~2. Levels of Non-Compliance for Generator Operators:~~

~~**2.1. Level 1:** Not applicable.~~

~~**2.2. Level 2**: Not applicable.~~

~~**2.3. Level 3**: Not applicable.~~

~~**2.4. Level 4:** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority as specified in R3.1.~~

~~3. Levels of Non-Compliance for Transmission Operators:~~

~~**3.1. Level 1:** Not applicable.~~

~~**3.2. Level 2**: Not applicable.~~

~~**3.3. Level 3**: Not applicable.~~

~~**3.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**3.4.1** Failed to provide evidence of coordination when installing new protective systems and all protective system changes with neighboring Transmission Operators and Balancing Authorities as specified in R3.2.~~

~~**3.4.2** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~**4. Levels of Non-Compliance for Balancing Authorities:**~~

~~**4.1. Level 1:** Not applicable.~~

~~**4.2. Level 2**: Not applicable.~~

~~**4.3. Level 3**: Not applicable.~~

~~**4.4. Level 4:** Did not monitor the status of each Special Protection System, or did not notify affected Transmission Operators, Balancing Authorities of changes in special protection status as specified in R6.~~

~~E. Regional Differences~~

~~None identified.~~

~~Version History~~

~~Version~~	~~Date~~	~~Action~~	~~Change Tracking~~

~~1.1(ii)~~	~~February 12, 2015~~	~~Adopted by the NERC Board of Trustees~~	~~Standard revised in Project 2014-01:~~ ~~Applicability revised to clarify application of requirements to BES dispersed power producing resources~~
~~2~~	~~May 9, 2012~~	~~Adopted by Board of Trustees~~	~~Deleted Requirements R2, R5, and R6.~~
~~1.1(ii)~~	~~May 29, 2015~~	~~FERC Letter Order in Docket No. RD15-3-000 approving PRC-001-1.1(ii)~~	~~Modifications to adjust the applicability to owners of dispersed generation resources.~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for the Applicability Exclusion in Requirement R3.1~~

~~Coordination of new or changes to protective systems associated with dispersed power producing resources identified through Inclusion I4 of the BES definition are typically performed on the interconnecting facilities. New or changes to protective systems associated with these facilities should be coordinated with the TOP as these protective systems typically must be closely coordinated with the transmission protective systems to ensure the overall protection systems operates as designed. While the protective systems implemented on the individual generating units of dispersed power producing resources at these dispersed power producing facilities (i.e. individual wind turbines or solar panels/inverters) may in some cases need to be coordinated with other protective systems within the same dispersed power producing facility, new or changes to these protective systems do not need to be coordinated with the~~

~~transmission protective systems, as this coordination would not provide reliability benefits to the BES.~~

Proposed Definitions

Project 2007-06.2 Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of Operational Planning Analysis (OPA) and Real-time Assessment (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective of PRC-001-1.1(ii) – *System Protection Coordination*, Requirement R1 to be familiar with the limitations of Protection System schemes, the two definitions are being modified to include the phrase "…functions, and limitations…" to ensure the Transmission Operator (TOP), consider the functions and limitations of Protection Systems and Remedial Action Schemes in their evaluations. The PRC-001-1(ii) standard is not applicable to the Reliability Coordinator (RC), however, the modifications to the definitions affect this entity. The reliability objective is addressed by revising the definitions to require the RC and the TOP to integrate the functions and limitations (i.e., purpose and limitations) into its OPA and RTA to ensure that the Bulk Electric System is operated within System Operating Limits and Interconnection Reliability Operating Limits.

Proposed Definitions

This section includes the two proposed modified definitions that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval, in accordance with the associated implementation plan. Terms that are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard PER-006-1 – *Specific Training for Personnel* in order to completely retire PRC-001-1.1(ii).

These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions:

1. An administrative update to replace "Special Protection System" to "Remedial Action Scheme."
2. The addition of the phrase "…functions, and limitations…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and limitations" into these evaluations. The proposed definition revision also has an effect on the RC that is not applicable to PRC-001-1.1(ii). The bold text in the definitions below accentuate the proposed revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Operational Planning Analysis (OPA)

An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Real-time Assessment (RTA)

An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Proposed Definitions

Project 2007-06.2 Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of Operational Planning Analysis (OPA) and Real-time Assessment (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective of PRC-001-1.1(ii) – *System Protection ~~System~~ Coordination*, Requirement R1 to be familiar with the ~~limits~~limitations of Protection System schemes, the two definitions are being modified to include the phrase "…functions, and ~~limits~~limitations…" to ensure the Transmission Operator (TOP), ~~and Reliability Coordinator (RC) that is not applicable to PRC-001-1.1(ii),~~ consider the functions and ~~limits~~limitations of Protection Systems and Remedial Action Schemes in their evaluations. The PRC-001-1(ii) standard is not applicable to the Reliability Coordinator (RC), however, the modifications to the definitions affect this entity. The reliability objective is addressed by revising the definitions to require the RC and the TOP to integrate the functions and ~~limits~~limitations (i.e., purpose and limitations) into its OPA and RTA to ensure that the Bulk Electric System is operated within System Operating Limits and Interconnection Reliability Operating Limits.

Proposed Definitions

This section includes the two ~~modified terms used in the Reliability Standards and requirements below~~proposed modified definitions that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval~~.~~, in accordance with the associated implementation plan. Terms that are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard PER-006-1 – *Specific Training for Personnel* in order to completely retire PRC-001-1.1(ii).

~~**Term(s):**~~

These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions~~.~~:

1. An administrative update to replace "Special Protection System" to "Remedial Action Scheme."
2. The addition of the phrase "…functions, and ~~limits~~limitations…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and ~~limits~~limitations" into these evaluations. The proposed definition revision also has an effect on the RC that is not applicable to PRC-001-1.1(ii). The bold text in the definitions below accentuate the proposed revisions.

---

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Operational Planning Analysis (OPA)
An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and** ~~limits~~limitations; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)

Real-time Assessment (RTA)
An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and** ~~limits~~limitations**;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Implementation Plan

Project 2007-06.2 Phase 2 of System Protection Coordination

Requested Approvals

- PER-006-1 – Specific Training for Personnel
- Definition of "Operational Planning Analysis"
- Definition of "Real-time Assessment"

Requested Retirements

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Applicable Entities

- Generator Operator (applicable to PER-006-1 only)
- Reliability Coordinator (applicable to definitions only)
- Transmission Operator (applicable to definitions only)

General Considerations

There are a number of factors that influence the determination of the implementation period for the proposed standard and revised definitions. The following factors address the Balancing Authority, Generator Operator, and Transmission Operator:

1. The effort and resources by the Generator Operator to provide training to plant personnel to address the operational functionality of Protection Systems and Remedial Action Schemes at individual generating Facilities in PER-006-1 that the Generator Operator may not have been addressing under PRC-001-1.1(ii), Requirement R1.

2. Maintain consistency with the Implementation Plan of the approved Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards[2] that are applicable to the Balancing Authority and Transmission Operator. This

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and PER-006-1, and the proposed definitions for "Operational Planning Analysis" and "Real-time Assessment." NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and PER-006-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).

[2] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

project explains how the retirement of PRC-001-1.1(ii) Requirements R1, R2, R5, and R6 are addressed by the TOP/IRO sets standards.

3. Maintaining consistency with the Implementation Plan of the approved TOP/IRO standards[3] that are applicable to the Balancing Authority and Transmission Operator in the application of the revised definitions of "Operational Planning Analysis" and "Real-time Assessment" (effective January 1, 2017) in the *NERC Glossary of Term Used in NERC Reliability Standards*. See the Project 2007-06.2 Mapping Document for additional details.

4. The amount of time needed by the Transmission Operator in PRC-001-1.1(ii), Requirement R1 and Reliability Coordinator (not applicable to PRC-001-1.1(ii)) to train on Protection Systems and Remedial Action Schemes in order to be capable of integrating their functions and limits into their Operational Planning Analysis and Real-time Assessment.

Effective Dates

PER-006-1 – Specific Training for Personnel

Where approval by an applicable governmental authority is required, Reliability Standard PER-006-1 – Specific Training for Personnel shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Operational Planning Analysis and Real-time Assessment

Where approval by an applicable governmental authority is required, the definitions "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) in the NERC Glossary of Terms Used in NERC Reliability Standards shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the definition, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

Requirement R1

PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 shall be retired immediately prior to the effective date of PER-006-1 (*Specific Training for Personnel*) and the revised definitions of

[3] Id.

“Operational Planning Analysis” (OPA) and “Real-time Assessment” (RTA), or as otherwise provided for by an applicable governmental authority.

Requirement R2, R5, and R6

PRC-001-1.1(ii) – System Protection Coordination, Requirement R2, R5, and R6 shall be retired at midnight of March 31, 2017, or as otherwise provided for by an applicable governmental authority.

Requirements R3 and R4

See Project 2007-06 System Protection Coordination Implementation Plan.[4]

Retirement of Existing Standards and Definitions

The currently-approved definitions of “Operations Planning Analysis” and “Real-time Assessment” shall be retired immediately prior to the effective date of the revised definitions of “Operational Planning Analysis” (OPA) and “Real-time Assessment” (RTA), or as otherwise provided for by an applicable governmental authority.

[4] http://www.nerc.com/pa/Stand/Project%20200706%20System%20Protection%20Coordination%20DL/Implementation_Plan_PRC-027-1_clean_10012015.pdf

Implementation Plan

Project 2007-06.2 Phase 2 of System Protection Coordination

Requested Approvals

- PER-006-1 – Specific Training for Personnel
- Definition of "Operational Planning Analysis"
- Definition of "Real-time Assessment"

Requested Retirements

- PRC-001-1.1(ii) – System Protection Coordination[1]

Prerequisite Approvals

- PRC-027-1 – Coordination of Protection Systems for Performance During Faults

Applicable Entities

- Generator Operator (applicable to PER-006-1 only)
- Reliability Coordinator (applicable to definitions only)
- Transmission Operator (applicable to definitions only)

General Considerations

There are a number of factors that influence the determination of the implementation period for the proposed standard and revised definitions. The following factors address the Balancing Authority, Generator Operator, and Transmission Operator:

1. The effort and resources by the Generator Operator to provide training to plant personnel to address the operational functionality of Protection Systems and Remedial Action Schemes at individual generating Facilities in PER-006-1 that the Generator Operator may not have been addressing under PRC-001-1.1(ii), Requirement R1.

2. Maintain consistency with the Implementation Plan of the approved Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards[2] that are applicable to the Balancing Authority and Transmission Operator. This

[1] The complete retirement of PRC-001-1.1(ii) is contingent upon the approval of both proposed Reliability Standards PRC-027-1 and PER-006-1, and the proposed definitions for "Operational Planning Analysis" and "Real-time Assessment." NERC is proposing the complete retirement of PRC-001-1.1(ii) in the implementation plans associated with both PRC-027-1 and PER-006-1. The Project 2007-06 System Protection Coordination Mapping Document shows how PRC-027-1 addresses requirements R3 and R4 of PRC-001-1.1(ii). The remaining requirements of PRC-001-1.1(ii) – Requirements R1, R2, R5, and R6 are proposed for retirement in Project 2007-6.2 Phase 2 of System Protection Coordination (see the Mapping Document for Project 2007-06.2 Phase 2 of System Protection Coordination).

[2] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

project explains how the retirement of PRC-001-1.1(ii) Requirements R1, R2, R5, and R6 are addressed by the TOP/IRO sets standards.

3. Maintaining consistency with the Implementation Plan of the approved TOP/IRO standards[3] that are applicable to the Balancing Authority and Transmission Operator in the application of the revised definitions of "Operational Planning Analysis" and "Real-time Assessment" (effective January 1, 2017) in the *NERC Glossary of Term Used in NERC Reliability Standards*. See the Project 2007-06.2 Mapping Document for additional details.

4. The amount of time needed by the Transmission Operator in PRC-001-1.1(ii), Requirement R1 and Reliability Coordinator (not applicable to PRC-001-1.1(ii)) to train on Protection Systems and Remedial Action Schemes in order to be capable of integrating their functions and limits into their Operational Planning Analysis and Real-time Assessment.

Effective Dates

PER-006-1 – Specific Training for Personnel

Where approval by an applicable governmental authority is required, Reliability Standard PER-006-1 – Specific Training for Personnel shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~twenty-four (24) months after the effective date ~~that~~of the applicable governmental authority's order approving the standard~~ is approved ~~, or as otherwise provided by ~~an~~the applicable governmental authority~~ or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. ~~.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Operational Planning Analysis and Real-time Assessment

~~The~~Where approval by an applicable governmental authority is required, the definitions "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA) in the NERC Glossary of Terms Used in NERC Reliability Standards shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~twenty-four (24) months after the effective date ~~that~~of the ~~definitions are approved by an~~ applicable governmental ~~authority~~authority's order approving the definition, or as otherwise provided for ~~in a jurisdiction where approval ~~by ~~an~~the applicable governmental authority~~ is required for a definition to go into effect. ~~.

Where approval by an applicable governmental authority is not required, the definitions shall become effective on the first day of the first calendar quarter that is ~~twelve (12~~twenty-four (24) months after the date the definitions are adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

---

[3] Id.

Retirements

PRC-001-1.1(ii) – System Protection Coordination

Requirement R1

PRC-001-1.1(ii) – System Protection Coordination, Requirement R1 shall be retired ~~at midnight of the day~~ immediately prior to the effective date of PER-006-1 (*Specific Training for Personnel*) and the revised definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), or as otherwise provided for by an applicable governmental authority.

Requirement R2, R5, and R6

PRC-001-1.1(ii) – System Protection Coordination, Requirement R2, R5, and R6 shall be retired at midnight of March 31, 2017, or as otherwise provided for by an applicable governmental authority.

Requirements R3 and R4

See Project 2007-06 System Protection Coordination Implementation Plan.[4]

Retirement of Existing Standards and Definitions

The currently-approved definitions of "Operations Planning Analysis" and "Real-time Assessment" shall be retired ~~at midnight of the day~~ immediately prior to the effective date of the revised definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA), or as otherwise provided for by an applicable governmental authority.

[4] http://www.nerc.com/pa/Stand/Project%20200706%20System%20Protection%20Coordination%20DL/Implementation_Plan_PRC-027-1_clean_10012015.pdf

Mapping Document

Project 2007-06.2 Phase 2 of System Protection Coordination

Revisions or Retirements to Already Approved Standards

This mapping document explains how each of the existing Requirements (R1, R2, R5, and R6) of PRC-001-1.1(ii) (*System Protection Coordination*)[1] are being revised or retired. If a requirement is being proposed for revision, the revised, new, and/or supporting requirement(s) will be identified in the center column. If a requirement is being proposed for retirement, the center column will describe the proposed action and any requirement(s) used to support the action. Revisions and retirements will be accompanied by an explanation or justification listed in the right column. Capitalized terms, unless otherwise noted, are those found in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary").[2] References to regulatory directives are specifically related to Order No. 693 ("Order").[3] Standards or definitions listed as "existing" are enforceable and those listed as "approved" have been adopted by the NERC Board of Trustees and approved by the Federal Energy Regulatory Commission ("FERC"). Check the NERC website for effective dates. The functional entities discussed in the mapping document are the Balancing Authority (BA), Generator Operator (GOP), Planning Coordinator (PC), Reliability Coordinator (RC), Transmission Operator (TOP), and Transmission Planner (TP). The term "TOP/IRO" refers to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) sets of Reliability Standards that were filed under NERC Project 2014-03 – Revisions to TOP and IRO Standards[4] and approved by FERC.[5] The explanation herein assumes that the term, "Special Protection

---

[1] Federal Energy Regulatory Commission (FERC) approved PRC-001-1.1(ii), effective May 29, 2015.

System"[6] (SPS) will be replaced by the term "Remedial Action Scheme"[7] (RAS). In the referenced Reliability Standards herein the term SPS may be replaced by RAS; therefore, the term RAS will be used in the "Comments" column throughout.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing)[8,9] **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be	PRC-001-1.1(ii), Requirement R1 is proposed for retirement.	**Introduction** The reliability objective of PRC-001-1.1(ii), Requirement R1 is to ensure that the BA,

[6] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Special Protection System is defined as "[a]n automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme."

[7] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), the proposed definition of Remedial Action Scheme is defined as "[a] scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as: Meet requirements identified in the NERC Reliability Standards; Maintain Bulk Electric System (BES) stability; Maintain acceptable BES voltages; Maintain acceptable BES power flows; Limit the impact of Cascading or extreme events." See definition for additional information on the definition of RAS.

[8] Order No. 693 at P 1418. "Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems."

[9] Order No. 693 at P 1435. "Protection systems on Bulk-Power System elements are an integral part of reliable operations. They are designed to detect and isolate faulty elements on a power system, thereby limiting the severity and spread of disturbances and preventing possible damage to protected elements. If a protection system can no longer perform as designed because of a failure of its relays, system reliability is reduced or threatened. In deriving SOLs and IROLs, moreover, the functions, settings, and limitations of protection systems are recognized and integrated. Systems are only reliable when protection systems perform as designed. This is what PRC-001-1 means in linking a reduction in system reliability with a protection relay failure or other equipment failure."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
familiar with the purpose and limitations of Protection System schemes applied in its area. **Operational Planning Analysis (Approved)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages;	Being "familiar with the purpose and limitations of Protection System schemes" will be clarified as (1) being "familiar with their purpose," and (2) being "familiar with their limitations" as follows: • The phrase "Protection systems schemes" maps to the NERC Glossary terms of Protection Systems and Remedial Action Schemes. • Being "familiar with the purpose" is addresses by existing and proposed training standards. • Being "familiar with the limitations" together with the clarification found in Order No. 693 at P 1418 and P 1435 along with the revised	GOP, and TOP are "familiar with the purpose and limitations of Protection System[12] schemes applied in its area." The reliability objective of the phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 is also intended to include RAS. The functions and limitations of a Protection Systems and RAS are critical in establishing System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL) such that the Bulk Electric System[13] (BES) is operated within these limits. The following explains how being familiar with the purpose and limitations of Protection Systems and RAS will be addressed according to issue beginning with

[12] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Protection System is defined as:
"Protection System -

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."

[13] See Glossary of Terms Used in NERC Reliability Standards (updated December 7, 2015).

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.) **Real-time Assessment (Approved)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	definitions of NERC Glossary defined terms of Operational Planning Analysis and Real-time Assessment address the reliability objective of PRC-001-1.1(ii), Requirement R1 as explained in the Comments column to the right. **PER-006-1 (New)** **4.** Applicability: **4.1.** Functional Entities: **4.1.1.** Generator Operator that have: **4.1.1.1.** Plant personnel who are responsible for the Real-time control of a generator and receive direction from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This does not include personnel at a centrally located dispatch center.	"familiarity with their limitations" and then "familiarity with their purpose." **Familiar with their limitations** When the BA, GOP, and TOP are familiar with the limitations of Protection Systems and RAS, the entities are able to operate the BES in such a manner that Protection Systems and RAS will be operated within their limits and be able to detect and isolate faulty Elements, thereby, limiting the severity and spread of system disturbances, and preventing possible damage to protected Elements. When the GOP is familiar with the operational functionality of Protection Systems and RAS by being trained on how Protection Systems operate and prevent possible damage to Elements, the GOP is capable of operating to its full capability within its area, meaning the output of its generation Facilities. When the BA is familiar with the limitations of Protection Systems and RAS, it is capable

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	R1. Each Generator Operator shall provide training to personnel identified in Applicability section 4.1.1.1. on the operational functionality of Protection Systems and Remedial Action Schemes (RAS) that affect the output of the generating Facility(ies) it operates. **PER-003-1 (Existing)** **R1.** Each Reliability Coordinator shall staff its Real-time operating positions performing Reliability Coordinator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining a valid NERC Reliability Operator certificate: **1.1.** Areas of Competency **1.1.1.** Resource and demand balancing **1.1.2.** Transmission operations **1.1.3.** Emergency preparedness and operations	of maintaining generation, Load, and Interchange balance. The BA ensures that RAS in its area are enabled when needed for system reliability. When the TOP is familiar with limitations of Protection Systems and RAS, it will be capable of identifying when system reliability is reduced or threatened. In operating to established SOLs and IROLs, it is important that the functions and limitations of Protection Systems and RAS are recognized and integrated by the TOP into operating the BES reliably. The BES is only reliable when Protection Systems and RAS perform within their limitations. **Familiarity with the Purpose** Familiarity with the purpose of Protection Systems and RAS is achieved through training, as explained below, according to each applicable entity (BA, GOP, and TOP) in PRC-001-1.1(ii) and the RC that is not applicable to this standard, but has been

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.1.4. System operations **1.1.5.** Protection and control **1.1.6.** Voltage and reactive **1.1.7.** Interchange scheduling and coordination **1.1.8.** Interconnection reliability operations and coordination **R2.** Each Transmission Operator shall staff its Real-time operating positions performing Transmission Operator reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificates: **2.1.** Areas of Competency **2.1.1.** Transmission operations **2.1.2.** Emergency preparedness and operations **2.1.3.** System operations **2.1.4.** Protection and control	included to address a potential gap in reliability. **Familiarity with the Purpose (GOP)** For the GOP, the Reliability Standard PER-006-1 (*Specific Training for Personnel*) proposes to replace PRC-001-1.1(ii), Requirement R1. The PER-006-1 standard identifies applicable GOP personnel that are responsible for the Real-time control of a generator and that receive Operating Instructions from the Generator Operator's Reliability Coordinator, Balancing Authority, Transmission Operator, or centrally located dispatch center. This applicability removes ambiguity over which personnel of the GOP are intended to be familiar with the purpose Protection Systems and RAS. Centrally located personnel are not included here because they are addressed by PER-005-2 (*Operations Personnel Training*). Personnel at centrally located dispatch centers will receive company-specific Protection System and RAS training, if identified, as a reliability-

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	2.1.5. Voltage and reactive **2.2.** Certificates • Reliability Operator • Balancing, Interchange and Transmission Operator • Transmission Operator **R3.** Each Balancing Authority shall staff its Real-time operating positions performing Balancing Authority reliability-related tasks with System Operators who have demonstrated minimum competency in the areas listed by obtaining and maintaining one of the following valid NERC certificate: **3.1.** Areas of Competency **3.1.1.** Resources and demand balancing **3.1.2.** Emergency preparedness and operations **3.1.3.** System operations **3.1.4.** Interchange scheduling and coordination	related task via the PER-005-2, Requirement R6. Here the GOP must use "…a systematic approach to develop and implement training to its personnel identified in Applicability Section 4.1.5.1. of this standard, on how their job function(s) impact the reliable operations of the BES during normal and emergency operations." Being trained using a systematic approach on the purpose (i.e., functions, including limitations) Protection Systems and RAS will enable the GOP centrally located dispatch personnel to ensure reliable operation of its Facilities on the BES. The phrase "…purpose and limitations…" in PRC-001-1-1(ii), Requirement R1 is addressed in the proposed Requirement R1 through the use of "operational functionality." The phrase "operational functionality" as described in the PER-006-1 – Supplemental Material describes that training is expected to cover how Protection Systems operate within their limitations and prevent possible damage to Elements. It also

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	3.2. Certificates • Reliability Operator • Balancing, Interchange and Transmission Operator • Balancing and Interchange Operator **PER-005-2 (Approved)** **R1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use a systematic approach to develop and implement a training program for its System Operators as follows: **1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall create a list of Bulk Electric System (BES) company-specific Real-time reliability-related tasks based on a defined and documented methodology. **1.1.1.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall review, and update if necessary, its list of BES company-specific Real-time reliability-	addresses how RAS detect pre-determined BES conditions and automatically take corrective actions. The criteria that comprises operational functionality mirror the components listed under the NERC Glossary term "Protection System." By doing so, reduces the ambiguity of the phrase "purpose and limitations." The phrase "…applied in its area" is addressed by the PER-006-1 by using "…that affect the output of the generating Facility it operates." Lastly, the proposed PER-006-1 Requirement R1 includes both Protection Systems and RAS to eliminate confusion over the phrase "Protection System schemes." **Familiarity with the Purpose (BA)** For the BA, the PRC-001-1.1(ii), Requirement R1 is proposed for retirement on the basis that the BA obtains an appropriate level of familiarity with the purpose of Protection

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	related tasks identified in part 1.1 each calendar year. **1.2.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall design and develop training materials according to its training program, based on the BES company-specific Real-time reliability-related task list created in part 1.1. **1.3.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver training to its System Operators according to its training program. **1.4.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation each calendar year of the training program established in Requirement R1 to identify any needed changes to the training program and shall	Systems and RAS under PER-003-1 (*Operating Personnel Credentials*), Requirement R3 and PER-005-2, Requirements R1, R3, R4, and R5 as explained below in detail. The BA is certified under PRC-003-1 as a System Operator.[14] Although there is no specific area of competency for protection and control similar to the Reliability Coordinator and Transmission Operator certifications, the NERC *Balancing and Interchange Operator Certification Exam Content Outline 2015*[15] (BI Exam) does contain the same five topics applicable to RC and less one topic applicable to the TOP. The topic that is not included is to "analyze relay targets, fault locaters and fault recorders to determine a proper restoration plan" and is not germane to BA operations. The job-task

[14] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operator is defined as: An individual at a Control Center of a Balancing Authority, Transmission Operator, or Reliability Coordinator, who operates or directs the operation of the Bulk Electric System (BES) in Real-time.
[15] http://www.nerc.com/pa/Train/SysOpCert/System%20Operator%20Certification%20DL/Balancing%20and%20Interchange%20Operator%20Certification%20Exam%20Content%20Outline%202015.pdf (December 9, 2014).

	meet the criteria of Requirement R4, shall comply with Requirement R4 within 12 months of meeting the criteria. **R5.** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use a systematic approach to develop and implement training for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified by the entity pursuant to Requirement R1 part 1.1. **5.1** Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation each calendar year of the training established in Requirement R5 to identify and implement changes to the training. **R6.** Each Generator Operator shall use a systematic approach to develop and	with the purpose and limitations of Protection System schemes applied in its area," the BA uses its JTA to develop a list of its reliability-related tasks. Using its documented methodology, the BA must develop and implement training materials according to its training program (R1) using a systematic approach to training. The BA is required to verify the capabilities of its System Operators under Requirement R3. Under Requirement R4, the BA "that (1) has operational authority or control over Facilities with established IROLs, or (2) has established protection systems or operating guides to mitigate IROL violations, shall provide its personnel identified in Requirement R1[17] with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that

[17] Requirement R2 is omitted here because it is applicable to the Transmission Owner and is not within the scope of this project.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	implement training to its personnel identified in Applicability Section 4.1.5.1. of this standard, on how their job function(s) impact the reliable operations of the BES during normal and emergency operations. **6.1.** Each Generator Operator shall conduct an evaluation each calendar year of the training established in Requirement R6 to identify and implement changes to the training. **Operational Planning Analysis (OPA) (Revised)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to: load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or	replicates the operational behavior of the BES." Requirement R5 addresses the Operations Support Personnel of the BA, which requires the BA to use a systematic approach to develop and implement training for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified by the entity pursuant to Requirement R1 that are applicable to System Operators. **Familiarity with the Purpose (TOP)** The TOP will ensure that the BES is operated within SOLs and IROLs by integrating the "functions and limitations" of Protection Systems and RAS into its OPA and RTA as proposed by the revisions to the definitions of OPA and RTA. For the TOP, the PRC-001-1.1(ii), Requirement R1 is proposed for retirement

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	degradation, **functions, and limitations**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)[10] **Real-time Assessment (RTA) (Revised)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load; generation output levels; known Protection System and **Remedial Action Scheme** status or degradation, **functions, and limitations**; Transmission outages; generator outages;	on the basis that the TOP obtains a sufficient level of knowledge (i.e. be familiar with the purpose of Protection System schemes applied in its area) under PER-003-1 (*Operating Personnel Credentials*), Requirement R1 and PER-005-2, Requirements R1, R3, R4, and R5, as explained below in detail. The TOP is certified as a System Operator, and has an "area of competency" for "protection and control" as shown in the NERC *Transmission Operator Certification Exam Content Outline 2015*.[18] This represents a minimum competency in the area of protection and control. However, certified System Operators will receive company-specific training on Protection Systems and RAS through PER-005-2, Requirements. The job-task analyses (JTA) performed by entities are used to (1)

[10] Bolded text identifies the proposed revisions.

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	Interchange; Facility Ratings; and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)[11] **IRO-008-2 (Approved)** **R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its	develop the TO Exam topics that are evaluated by NERC and a NERC functional entity working group every three years, and (2) used to develop the training of personnel on company-specific reliability-related tasks under PER-005-2. Under PER-005-2, System Operator and Operation Support Personnel of the TOP are identified in the requirements. To address the reliability objective of "shall be familiar with the purpose and limitations of Protection System schemes applied in its area," the TOP uses its JTA to develop a list of its reliability-related tasks. Using its documented methodology, the TOP must develop and implement training materials according to its training program (R1) using a systematic approach to training. The TOP is required to verify the capabilities of its System Operators under Requirement R3. Under Requirement R4, the TOP "that (1)

[11] Bolded text identifies the proposed revisions.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.	has operational authority or control over Facilities with established IROLs, or (2) has established protection systems or operating guides to mitigate IROL violations, shall provide its personnel identified in Requirement R1[19] with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES." Requirement R5 addresses the Operations Support Personnel of the TOP, which requires the TOP to use a systematic approach to develop and implement training for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified by the entity pursuant to Requirement R1. Operations Support Personnel are among the personnel that perform Operational

[19] Requirement R2 is omitted here because it is applicable to the Transmission Owner and is not within the scope of this project.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	IRO-010-2 (Approved) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data.	Planning Analyses (OPA) and Real-time Assessments (RTA). These reliability-related-tasks, include performing both an OPA and RTA and are proposed for modification to address the integration of Protection System and RAS functions and limitations to ensure the BES is operated within SOLs and IROLs. See the discussion below concerning the OPA and RTA for the explanation of how the revised definitions support the reliability objective of PRC-001-1.1(ii), Requirement R1. **Reliability Coordinator (RC)** The standard PRC-001-1.1(ii) did not include the RC as an applicable functional entity; however, the RC is included here to further support the explanation on how the RC, along with the TOP, ensures the BES is operated within SOLs and IROLs by integrating the functions and limitations of

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.4. The deadline by which the respondent is to provide the indicated data. **TOP-001-3 (Approved)** **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **TOP-002-4 (Approved)** **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its	Protection Systems and RAS into its OPA and RTA. The RC obtains a sufficient level of knowledge (i.e. be familiar with the purpose and limitations of Protection System schemes applied in its area) under PER-003-1 (*Operating Personnel Credentials*), Requirement R1 and PER-005-2, Requirements R1, R3, R4, and R5. The RC is certified as a System Operator, and has an "area of competency" for "protection and control" as shown in the NERC *Reliability Coordinator Certification Exam Content Outline 2015*.[20] This represents a minimum competency in the area of protection and control. However, certified System Operators will receive company-specific training on Protection Systems and RAS through PER-005-2, Requirements.

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing	PRC-001-1.1(ii), Requirements R2, R2.1., and R2.2. are proposed for retirement. Corrective action in Requirements R2, R2.1. and R2.2. is covered by: **TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission	**Introduction – Corrective Action** The directive at P 1449 (#3) of the Order states that: "…transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements…" This directive is addressed in the TOP/IRO standards that were developed since the Order was issued because the BA, RC, and TOP can issue Operating Instructions[22] to maintain the reliability of its respective area. The following describes how the TOP/IRO Reliability Standards achieve the reliability objective with regard to "corrective actions." **Corrective Action by the GOP – R2.1.** TOP-003-3 (*Operations Reliability Data*)

[22] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Instruction is defined as "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement / Term in Standard	**Translation to Standard or Other Action**	**Comments**
Authorities. The Transmission Operator shall take corrective action as soon as possible. **PRC-001-1.1(ii) (Existing)**	Operator Area via its own actions or by issuing Operating Instructions. **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. **TOP-003-3 (Approved)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the GOP because the TOP will be aware of current Protection System and SPS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the TOP receives such notification. TOP-001-3 (*Transmission Operations*) Furthermore, the TOP will act to maintain the reliability of its Transmission Operator Area[23] (TOP Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R1. TOP-003-3 (*Operations Reliability Data*)

[23] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Transmission Operator Area is defined as "[t]he collection of Transmission assets over which the Transmission Operator is responsible for operating."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement / Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Similarly, TOP-003-3, Requirement R2 and part 2.2. that was developed since the Order was issued, addresses corrective action by the GOP because the BA (i.e., Host BA[24]) will be aware of current Protection System and RAS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the BA receives such notification. The BA will act to maintain the reliability of its Balancing Authority Area[25] (BA Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R2. **Corrective Action by the TOP – R2.2.** TOP-003-3 (*Operations Reliability Data*)

[24] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Host Balancing Authority is defined as:

1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries.
2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.

[25] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.		Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the TOP because the TOP will be aware of current Protection System and RAS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the TOP receives such notification. TOP-001-3 (*Transmission Operations*) The TOP will act to maintain the reliability of its TOP Area by issuing Operating Instructions under TOP-001-3, Requirement R2. TOP-003-3 (*Operations Reliability Data*) Similarly, TOP-003-3, Requirement R2 and part 2.2. that was developed since the Order was issued addresses corrective action by the BA because the BA will be aware of current Protection System and RAS status (change in status is implied) or degradation (including failure) that impacts System

		Coordinator Area[26] (RC Area) by issuing Operating Instructions.
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing	PRC-001-1.1(ii), Requirements R2, R2.1, and R2.2. are proposed for retirement. The time frame for corrective action in Requirements R2, R2.1. and R2.2. is covered by:	**Introduction – Time frame for corrective actions** The directive at P 1441 directs the ERO to clarify the term "corrective action" consistent with the discussion in the Order when it modifies PRC-001-1 in the Reliability Standards development process. The reasoning for addressing a time frame for corrective actions is amplified in P 1443 of the Order, which states that: "As explained above *[in the previous paragraphs of the Order*], the requirement for system operators to take corrective control action when protective relay or equipment failure reduces system reliability should be treated the same as the requirement for returning a system to a secure and reliable state after an

[26] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Authorities. The Transmission Operator shall take corrective action as soon as possible. **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its		Interconnection Reliability Operating Limit (IROL) violation, i.e., as soon as possible, but no longer than 30 minutes after a violation. A longer time limit would place an entity in violation of relevant IROL or TOP Reliability Standards."[27] At P 1444 of the Order, FERC directed NERC to consider the comments of the California PUC regarding the term "as soon as possible" as applicable to the maximum time frame for corrective action through the Standards development process. At P 1445 of the Order, FERC directed NERC, through the Reliability Standards development process, to determine the appropriate amount of time after the detection of relay failures, in which relevant transmission operators must be informed of such failures.

[27] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Interconnection Reliability Operating Limit is defined as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.	The Order at P 1449 (#3) directs NERC to clarify that, after being informed of failures in relays or protection system elements that threaten reliability of the Bulk-Power System, transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes after they receive notice of the failure. **PRC-001-1.1(ii), R2.1. & R2.2. (time frame for corrective actions)** For the reasons explained below, a less than one-hour time frame criteria for corrective action will achieve the reliability objective directed in the Order at P 1441, 1444, 1445, and 1449 (#2 and #3). TOP-001-3 (*Transmission Operations*)

Standard: PRC-001-1.1(ii) – System Protection Coordination

R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the	**R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.	Requirement R13 requires the TOP to ensure that a Real-time Assessment[28] ("RTA") is performed at least once every 30 minutes and initiate its Operating Plan[29] to mitigate a System Operating Limit[30] (SOL) exceedance identified as part of its Real-time[31] monitoring or RTA in TOP-001-3, Requirement R14. The RTA requires inputs to include current Protection System and RAS status (change in status is implied) or

[28] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Real-time Assessment is defined as "[a]n evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"

[29] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Plan is defined as "[a] document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan."

[30] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operating Limit is defined as "The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings)
- Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)"

[31] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), Real-time is defined as "[p]resent time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)"

	TOP-003-3 (approved) included by reference. See the section called, “shall notify.”	

Mapping Document

Project 2007-06.2 Phase 2 of System Protection Coordination

Revisions or Retirements to Already Approved Standards

This mapping document explains how each of the existing Requirements (R1, R2, R5, and R6) of PRC-001-1.1(ii) (*System Protection Coordination*)[1] are being revised or retired. If a requirement is being proposed for revision, the revised, new, and/or supporting requirement(s) will be identified in the center column. If a requirement is being proposed for retirement, the center column will describe the proposed action and any requirement(s) used to support the action. Revisions and retirements will be accompanied by an explanation or justification listed in the right column. Capitalized terms, unless otherwise noted, are those found in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary").[2] References to regulatory directives are specifically related to Order No. 693 ("Order").[3] Standards or definitions listed as "existing" are enforceable and those listed as "approved" have been adopted by the NERC Board of Trustees and approved by the Federal Energy Regulatory Commission ("FERC"). Check the NERC website for effective dates. The functional entities discussed in the mapping document are the Balancing Authority (BA), Generator Operator (GOP), Planning Coordinator (PC), Reliability Coordinator (RC), Transmission Operator (TOP), and Transmission Planner (TP). The term "TOP/IRO" refers to the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) sets of Reliability Standards that were filed under NERC Project 2014-03 – Revisions to TOP and IRO Standards[4] and approved by FERC.[5] The explanation herein assumes that the term, "Special Protection

[1] Federal Energy Regulatory Commission (FERC) approved PRC-001-1.1(ii), effective May 29, 2015.

System"[6] (SPS) will be replaced by the term "Remedial Action Scheme"[7] (RAS). In the referenced Reliability Standards herein the term SPS may be replaced by RAS; therefore, the term RAS will be used in the "Comments" column throughout.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing)[8,9] **R1.** Each Transmission Operator, Balancing Authority, and Generator Operator shall be	PRC-001-1.1(ii), Requirement R1 is proposed for retirement.	**Introduction** The reliability objective of PRC-001-1.1(ii), Requirement R1 is to ensure that the BA,

[6] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Special Protection System is defined as "[a]n automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme."

[7] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), the proposed definition of Remedial Action Scheme is defined as "[a] scheme designed to detect predetermined System conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and Mvar), tripping load, or reconfiguring a System(s). RAS accomplish objectives such as: Meet requirements identified in the NERC Reliability Standards; Maintain Bulk Electric System (BES) stability; Maintain acceptable BES voltages; Maintain acceptable BES power flows; Limit the impact of Cascading or extreme events." See definition for additional information on the definition of RAS.

[8] Order No. 693 at P 1418. "Protection and Control systems (PRC) on Bulk-Power System elements are an integral part of reliable grid operation. Protection systems are designed to detect and isolate faulty elements on a system, thereby limiting the severity and spread of system disturbances, and preventing possible damage to protected elements. The function, settings and limitations of a protection system are critical in establishing SOLs and IROLs. The PRC Reliability Standards apply to transmission operators, transmission owners, generator operators, generator owners, distribution providers and regional reliability organizations and cover a wide range of topics related to the protection and control of power systems."

[9] Order No. 693 at P 1435. "Protection systems on Bulk-Power System elements are an integral part of reliable operations. They are designed to detect and isolate faulty elements on a power system, thereby limiting the severity and spread of disturbances and preventing possible damage to protected elements. If a protection system can no longer perform as designed because of a failure of its relays, system reliability is reduced or threatened. In deriving SOLs and IROLs, moreover, the functions, settings, and limitations of protection systems are recognized and integrated. Systems are only reliable when protection systems perform as designed. This is what PRC-001-1 means in linking a reduction in system reliability with a protection relay failure or other equipment failure."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
familiar with the purpose and limitations of Protection System schemes applied in its area. **Operational Planning Analysis (Approved)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages;	Being "familiar with the purpose and limitations of Protection System schemes" will be clarified as (1) being "familiar with their purpose," and (2) being "familiar with their limitations" as follows: • The phrase "Protection systems schemes" maps to the NERC Glossary terms of Protection Systems and Remedial Action Schemes. • Being "familiar with the purpose" is addresses by existing and proposed training standards. • Being "familiar with the limitations" together with the clarification found in Order No. 693 at P 1418 and P 1435 along with the revised	GOP, and TOP are "familiar with the purpose and limitations of Protection System[12] schemes applied in its area." The reliability objective of the phrase "Protection System schemes" in PRC-001-1.1(ii), Requirement R1 is also intended to include RAS. The ~~function, settings~~functions and limitations of a Protection Systems and RAS are critical in establishing System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL) such that the Bulk Electric System[13] (BES) is operated within these limits. The following explains how being familiar with the purpose and

[12] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Protection System is defined as:
"Protection System -

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices."

[13] See Glossary of Terms Used in NERC Reliability Standards (updated December 7, 2015).

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	IRO-010-2 (Approved) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	the personnel that perform Operational Planning Analyses (OPA) and Real-time Assessments (RTA). These reliability-related-tasks, include performing both an OPA and RTA and are proposed for modification to address the integration of Protection System and RAS ~~limits~~functions and limitations to ensure the BES is operated within SOLs and IROLs. See the discussion below concerning the OPA and RTA for the explanation of how the revised definitions support the reliability ~~object~~ objective of PRC-001-1.1(ii), Requirement R1. **Reliability Coordinator (RC)** The standard PRC-001-1.1(ii) did not include the RC as an applicable functional entity; however, the RC is included here to further support the explanation on how the RC, along with the TOP, ensures the BES is operated within SOLs and IROLs by integrating the ~~limits~~functions and

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	1.3. A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **TOP-001-3 (Approved)** **R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **TOP-002-4 (Approved)** **R1.** Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its	limitations of Protection Systems and RAS into its OPA and RTA. The RC obtains a sufficient level of knowledge (i.e. be familiar with the purpose and limitations of Protection System schemes applied in its area) under PER-003-1 (*Operating Personnel Credentials*), Requirement R1 and PER-005-2, Requirements R1, R3, R4, and R5. The RC is certified as a System Operator, and has an "area of competency" for "protection and control" as shown in the NERC *Reliability Coordinator Certification Exam Content Outline 2015*.[20] This represents a minimum competency in the area of protection and control. However, certified System Operators will receive company-specific training on Protection Systems and RAS through PER-005-2, Requirements.

[20] http://www.nerc.com/pa/Train/SysOpCert/System%20Operator%20Certification%20DL/Reliability%20Coordinator%20Certification%20Exam%20Content%20Outline%202015.pdf (December 9, 2014).

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. **R3.** Each Transmission Operator shall notify entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s).	Under PER-005-2, System Operator and Operation Support Personnel of the RC are identified in the requirements. To similarly address the reliability objective of "shall be familiar with the purpose and limitations of Protection System schemes applied in its area" in PRC-001-1.1(ii), Requirement R1, the RC uses its JTA to develop a list of its reliability-related tasks. Using its documented methodology, the RC must develop and implement training materials according to its training program (R1) using a systematic approach to training. The RC is required to verify the capabilities of its System Operators under Requirement R3. Under Requirement R4, the RC that (1) has operational authority or control over Facilities with established IROLs, or (2) has established protection systems or operating guides to mitigate IROL violations, shall provide its personnel identified in Requirement R1[21] with emergency

[21] Requirement R2 is omitted because it is applicable to the Transmission Owner and is not within the scope of this project.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES." Requirement R5 addresses the Operations Support Personnel of the RC, which requires the RC to use a systematic approach to develop and implement training for its identified Operations Support Personnel on how their job function(s) impact those BES company-specific Real-time reliability-related tasks identified by the entity pursuant to Requirement R1. Operations Support Personnel are among the personnel that perform Operational Planning Analyses (OPA) and Real-time Assessments (RTA). These reliability-related tasks include performing both an OPA and RTA and are proposed for modification to address the integration of Protection System and RAS ~~limits~~functions and limitations to ensure the BES is operated within SOLs and IROLs. See the discussion below concerning the OPA

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		and RTA for the explanation of how the revised definitions support the reliability ~~object~~ objective of PRC-001-1.1(ii), Requirement R1. **Operational Planning Analysis (OPA)** The TOP, applicable to PRC-001-1.1(ii), Requirement R1, is required have an OPA that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its SOLs (TOP-002-4, Requirement R1). The TOP is required to have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified as a result of its OPA as required in Requirement R1 (TOP-002-4, Requirement R2) and notify others of their role in the Operating Plan(s) (TOP-002-4, Requirement R4). To accomplish this, the TOP is required to maintain a documented data specification for the data necessary to perform its OPA that includes provisions for notification of current Protection System and RAS status or

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		degradation (including failure) that impacts System reliability (TOP-003-3, Requirement R1, Part 1.2.). The RC is not applicable to PRC-001-1.1(ii) and is included here for additional support. The RC is required to perform an OPA that will allow it to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area (IRO-008-2, Requirement R1). The RC is required to have a coordinated Operating Plan(s) for next-day operations to address potential SOL and IROL exceedances identified as a result of its OPA as performed in Requirement R1 (IRO-008-2) while considering the Operating Plans for the next-day provided by its TOPs and BAs (IRO-008-2, Requirement R2). To accomplish this the RC is required to maintain a documented data specification for the data necessary to perform its OPA that includes provisions for notification of current Protection System and RAS status or degradation (including failure) that impacts

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		System reliability (IRO-010-2, Requirement R1, Part 1.2.). **Real-time Assessment (RTA)** The TOP, applicable to PRC-001-1.1(ii), Requirement R1, is required to ensure that an RTA is performed at least once every 30 minutes (TOP-001-3, Requirement R13). The TOP is required to initiate its Operating Plan to mitigate a SOL exceedance identified as part of its RTA (TOP-001-3, Requirement R14). To accomplish this the TOP is required to maintain a documented data specification for the data necessary to perform its RTA that includes provisions for notification of current Protection System and RAS status or degradation (including failure) that impacts System reliability (TOP-003-3, Requirement R1, Part 1.2.). The RC is not applicable to PRC-001-1.1(ii) and is included here for additional support. The RC is required to ensure that a RTA is performed at least once every 30 minutes (IRO-008-4, Requirement R4). The RC is

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		required to notify impacted Transmission Operators and Balancing Authorities within its RC Area, and other impacted RCs as indicated in its Operating Plan, when the results of a RTA indicate an actual or expected condition that results in, or could result in, a SOL or IROL exceedance within its Wide Area (IRO-008-2, Requirement R5). To accomplish this the RC is required to maintain a documented data specification for the data necessary to perform its RTA that includes provisions for notification of current Protection System and RAS status or degradation (including failure) that impacts System reliability (IRO-010-2, Requirement R1, Part 1.2.).
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:	PRC-001-1.1(ii), Requirements R2, R2.1., and R2.2. are proposed for retirement. The subsequent sections are organized in the following manner: • Corrective Action,	**Introduction** **Requirement PRC-001-1.1(ii), Requirement R2** The reliability objective of Requirement R2 and its sub-requirements ensure that the

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
		of the defined NERC Glossary term, "Protection System" and "RAS."
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected	PRC-001-1.1(ii), Requirements R2, R2.1., and R2.2. are proposed for retirement. Corrective action in Requirements R2, R2.1. and R2.2. is covered by:	**Introduction – Corrective Action** The directive at P 1449 (#3) of the Order states that: "…transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements…" This directive is addressed in the TOP/IRO standards that were developed since the Order was issued because the BA, RC, and TOP can issue Operating Instructions[22] to maintain the reliability of its respective area. The following describes how the TOP/IRO Reliability Standards achieve the reliability objective with regard to "corrective actions." **Corrective Action by the GOP – R2.1.**

[22] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Instruction is defined as "[a] command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. **PRC-001-1.1(ii) (Existing)**	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. **R2.** Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. **TOP-003-3 (Approved)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to:	TOP-003-3 (*Operations Reliability Data*) Requirement R1 and part 1.2. that was developed since the Order was issued addresses corrective action by the GOP because the TOP will be aware of current Protection System and SPS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the TOP receives such notification. TOP-001-3 (*Transmission Operations*) Furthermore, the TOP will act to maintain the reliability of its Transmission Operator Area[23] (TOP Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R1. TOP-003-3 (*Operations Reliability Data*)

[23] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Transmission Operator Area is defined as "[t]he collection of Transmission assets over which the Transmission Operator is responsible for operating."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.	Similarly, TOP-003-3, Requirement R2 and part 2.2. that was developed since the Order was issued, addresses corrective action by the GOP because the BA (i.e., Host BA[24]) will be aware of current Protection System and ~~SPS~~RAS status (change in status is implied) or degradation (including failure) that impacts System reliability. See the "shall notify" section(s) below for a full description of how the BA receives such notification. The BA will act to maintain the reliability of its Balancing Authority Area[25] (BA Area) by issuing Operating Instructions to the GOP under TOP-001-3, Requirement R2. **Corrective Action by the TOP – R2.2.** TOP-003-3 (*Operations Reliability Data*)

[24] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Host Balancing Authority is defined as:

1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries.
2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.

[25] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area."

Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
	R1. Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions."	Coordinator Area[26] (RC Area) by issuing Operating Instructions.
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its	PRC-001-1.1(ii), Requirements R2, R2.1, and R2.2. are proposed for retirement. The time frame for corrective action in Requirements R2, R2.1. and R2.2. is covered by:	**Introduction – Time frame for corrective actions** The directive at P 1441 directs the ERO to clarify the term "corrective action" consistent with the discussion in the Order when it modifies PRC-001-1 in the Reliability Standards development process. The reasoning for addressing a time frame for corrective actions is amplified in P 1443 of the Order, which states that: "As explained above *[in the previous paragraphs of the Order*], the requirement for system operators to take corrective control action when protective relay or equipment failure reduces system reliability should be treated

[26] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Balancing Authority Area is defined as "[t]he collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:		the same as the requirement for returning a system to a secure and reliable state after an Interconnection Reliability Operating Limit (IROL) violation, i.e., as soon as possible, but no longer than 30 minutes after a violation. A longer time limit would place an entity in violation of relevant IROL or TOP Reliability Standards."[27] At P 1444 of the Order, FERC directed NERC to consider the comments of the California PUC regarding the term "as soon as possible" as applicable to the maximum time frame for corrective action through the Standards development process. At P 1445 of the Order, FERC directed NERC, through the Reliability Standards development process, to determine the appropriate amount of time after the detection of relay failures, in which relevant

[27] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Interconnection Reliability Operating Limit is defined as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**TOP-001-3 (Approved)** **R1.** Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.	transmission operators must be informed of such failures. The Order at P 1449 (#3) directs NERC to clarify that, after being informed of failures in relays or protection system elements that threaten reliability of the Bulk-Power System, transmission operators must carry out corrective control actions, i.e., return a system to a stable state that respects system requirements as soon as possible and no longer than 30 minutes after they receive notice of the failure. **PRC-001-1.1(ii), R2.1. & R2.2. (time frame for corrective actions)** For the reasons explained below, a less than one-hour time frame criteria for corrective action will achieve the reliability objective directed in the Order at P 1441, 1444, 1445, and 1449 (#2 and #3). TOP-001-3 (*Transmission Operations*)

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability	**R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.	Requirement R13 requires the TOP to ensure that a Real-time Assessment[28] ("RTA") is performed at least once every 30 minutes and initiate its Operating Plan[29] to mitigate a System Operating Limit[30] (SOL) exceedance identified as part of its Real-time[31] monitoring or RTA in TOP-001-3, Requirement R14. The RTA requires inputs to include current Protection System and RAS status (change in status is implied) or

[28] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a Real-time Assessment is defined as "[a]n evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"
[29] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operating Plan is defined as "[a] document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan."
[30] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), a System Operating Limit is defined as "The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:

- Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings)
- Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits)
- Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability)
- System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)"

[31] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), Real-time is defined as "[p]resent time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**IRO-008-2 (Approved)** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes.	degradation (including failure) from a BA, GOP, and/or TOP. Under TOP-003-3 notification of these inputs must occur within a 30 minute time frame; otherwise, ~~an~~a valid RTA cannot be performed once every 30 minutes. Given the periodicity for obtaining the data and performing the RTA, the exposure (i.e., time frame) for taking corrective action "as soon as possible" is expected to be less than ~~an~~one hour. The TOP may issue Operating Instructions to maintain reliability upon the notification of Protection System or RAS status (change in status is implied) or degradation (including failure) because the exposure is not expected to exceed ~~an~~one hour. The TOP must act under TOP-001-3, Requirement R1 to maintain the reliability of its TOP Area via its own actions or by issuing Operating Instructions. IRO-008-2 (*Reliability Coordinator Operational Analyses and Real-time Assessments*), Requirement R4 requires the

	IRO-001-4 (Approved) **R1.** Each Reliability Coordinator shall act to address the reliability of its Reliability Coordinator Area via direct actions or by issuing Operating Instructions.	IRO-001-4 (*Reliability Coordination - Responsibilities and Authorities*) The RC must act under IRO-001-4, Requirement R1 to maintain the reliability of its RC Area via its own actions or by issuing Operating Instructions.

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	PRC-001-1.1(ii), Requirements R2, R2.1., and R2.2 are proposed for retirement. The time frame for notification in Requirements R2, R2.1. and R2.2. is covered by: **IRO-008-2 (Approved)** **R4.** Each Reliability Coordinator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **TOP-001-3 (Approved)**	**Introduction – Time frame for notifications and shall notify** The directive at P 1444 of the Order directed NERC to consider the comments of FirstEnergy about the time frame between actual failure and its discovery (i.e., notification) in relation to the maximum time frame for corrective action through the Standards development process. The Order at P 1445 and 1449 (#2) directed NERC to determine an appropriate amount of time after the detection of relay failures and the time in which relevant generation and transmission operators must be informed of such failure. **PRC-001-1.1(ii), R2.1. & R2.2. (time frame for notifications)** TOP-001-3 (*Transmission Operations*) For the reasons explained below concerning notification, it is inferred that the timeframe for notification must occur on at least a 30

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
PRC-001-1.1(ii) (Existing) **R2.** Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows:	**R13.** Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. **TOP-003-3 (Approved)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R2.** Each Balancing Authority shall maintain a documented specification for the data necessary for it to perform its analysis	minute interval because the ~~a~~ RTA performed by the RC (IRO-008-2) and TOP (TOP-001-3) once every 30 minutes requires the data to be ~~availability~~available on at least a 30 minute basis such that the exposure is less than one hour. TOP-003-3 (*Operations Reliability Data*) Notification in PRC-001-1.1(ii), Requirement R2.1. and R2.2. is addressed by TOP-003-3, Requirement R1, part 1.2. for TOP and Requirement R2, part 2.2. for BA that were developed since the Order was issued. Requirements R1 and R2 mandate that the TOP and BA ~~to~~ have provisions (i.e., inputs) for notification of Protection System and RAS status (change in status is implied) or degradation (including failures) that impacts System reliability. **PRC-001-1.1(ii), R2.1. (shall notify)** Based on the conclusions above (i.e., "time frame for corrective actions"), notifications

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2.1. If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible. **PRC-001-1.1(ii) (Existing)**	functions and Real-time monitoring. The data specification shall include, but not be limited to: **2.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessment. **R4.** Each Balancing Authority shall distribute its data specification to entities that have data required by the Balancing Authority's analysis functions and Real-time monitoring.	of the inputs of Protection Systems and RAS by the GOP must be provided on at least a 30-minute basis. The TOP/IRO set of standards that were developed since the Order was issued achieve the reliability objective of ensuring that the BA (i.e., Host BA) and TOP are notified of protective relay and equipment failures. TOP-003-3 (*Operations Reliability Data*) TOP-003-3, Requirement R1 mandates the TOP have a documented specification for the data necessary for the TOP to perform an Operational Planning Analysis ("OPA"),[32] Real-time monitoring, and RTA. Both the OPA and RTA, by definition, require an evaluation that reflects inputs from known Protection System and RAS status (change in status is implied) or degradation (including failure). TOP-003-3, Requirement R3

[32] Per the *Glossary of Terms Used in NERC Reliability Standards* (updated December 7, 2015), an Operational Planning Analysis is defined as "[a]n evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)"

Standard: PRC-001-1.1(ii) – System Protection Coordination		
Requirement/Term in Standard	**Translation to Standard or Other Action**	**Comments**
R2. Each Generator Operator and Transmission Operator shall notify reliability entities of relay or equipment failures as follows: **R2.1.** If a protective relay or equipment failure reduces system reliability, the Generator Operator shall notify its Transmission Operator and Host Balancing Authority. The Generator Operator shall take corrective action as soon as possible. **R2.2.** If a protective relay or equipment failure reduces system reliability, the Transmission Operator shall notify its Reliability Coordinator and affected Transmission Operators and Balancing Authorities. The Transmission Operator shall take corrective action as soon as possible.	**R5.** Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Transmission Owner, and Distribution Provider receiving a data specification in Requirement R3 or R4 shall satisfy the obligations of the documented specifications using: **5.1.** A mutually agreeable format **5.2.** A mutually agreeable process for resolving data conflicts **5.3.** A mutually agreeable security protocol. **TOP-003-3 (Approved) (included again for reference)** **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The	mandates the TOP distribute its documented specification to those entities that have the required data, which includes the GOP. TOP-003-3, Requirement R2 mandates the BA have a documented specification for the data necessary for the BA to perform its analysis functions and Real-time monitoring that include inputs from Protection System and RAS status (change in status is implied) or degradation that are necessary to maintain generation-Load-Interchange balance. TOP-003-3, Requirement R4 mandates the BA to distribute its documented specification to those entities that have the required data, which includes the GOP. TOP-003-3, Requirement R5 builds upon the previous Requirements R1, R2, R3, and R4 described above. Requirement R5 mandates that any GOP that receives a data specification (pursuant to Requirement R3 or R4) ~~to~~ satisfy the obligations of the documented specifications using: a mutually

	TOP-003-3 (approved) included by reference. See the section called, "shall notify."	

Violation Risk Factors and Violation Severity Level Justifications

Project 2007-06.2 Phase 2 of Protection System Coordination
PER-006-1 – Specific Training for Personnel

This document provides the Protection System Coordination Phase 2 Standard Drafting Team (SDT) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for the proposed PER-006-1 – Specific Training for Personnel.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The SDT applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

NERC Criteria – Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability

to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System: [2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[1] *North American Electric Reliability Corp.*, 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] *Id*. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria – Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels,[3] FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance[4]

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties[5]

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement[6]

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations[7]

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
NERC VRF Discussion	In this requirement, each Generator Operator (GOP) is required to train its plant personnel on the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The PRC-001-1.1(ii), Requirement R1 that will be replaced by PER-006-1, Requirement R1 has a VRF of High. The VRF of High is associated with the performance of the Balancing Authority (BA) and Transmission Operator (TOP) as they have a greater responsibility for ensuring reliable operation of the bulk electric system. The requirement for these entities to be familiar with the purpose and limitations of Protection System schemes in its area is addressed by the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards and various requirements identified in the project mapping document. These requirements are appropriately assigned VRFs of Medium and High, therefore, does not require the GOP to also have a VRF of High. The Medium VRF is consistent with the training Requirements in the PER-005-2 (*System Personnel Training*) Reliability Standard, which includes the GOP, BA, TOP, and Reliability Coordinator.
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: This Requirement is consistent with the intent of Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.

VRF Justifications – PER-006-1, Requirement R1	
Proposed VRF	**Medium**
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: The Requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: The Requirement with a Medium VRF is consistent with the training Requirements in PER-005-1 and PER-005-2 that will become effective July 1, 2016.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: A VRF of Medium is consistent with the NERC VRF definition because GOP plant personnel could gain knowledge of the operational functionality of Protection Systems and Remedial Action Schemes that affect output of a generating Facility without specific training. It is unlikely that this requirement in the planning time frame, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, a violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This Requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

Proposed VSL – PER-006-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • one applicable personnel at a single Facility, or • 5% or less of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • two applicable personnel at a single Facility, or • more than 5% and less than or equal to 10% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • three applicable personnel at a single Facility, or • more than 10% and less than or equal to 15% of the total applicable personnel of the Generator Operator.	The Generator Operator failed to provide training as described in Requirement R1 to the greater of: • five or more applicable personnel at a single Facility, or • more than 15% of the total applicable personnel of the Generator Operator. **OR** The Generator Operator failed to provide training as described in Requirement R1 to its applicable personnel.

VSL Justifications – PER-006-1, Requirement R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is a gradated VSL for partial performance from a Lower to High VSL and a VSL of Severe for severe or complete failure of the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The currently effective PRC-001-1.1(ii) did not have VSLs assignments. The proposed VSLs do not lower the current level of compliance because they are consistent with the approved PER-005-2, Requirement R6 for which PER-006-1, Requirement R1 is based upon.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: This Requirement has a binary component and utilizes a VSL of Severe for complete failure in addition to incremental VSLs for partial performance. The VSLs provide a non-preferential way to apply violation levels to both small and large entities. Violations may be assessed at the greater of the number of personnel at the plant level or a percentage of personnel at the entity level. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the corresponding Requirement, and is therefore consistent with the Requirement.

VSL Justifications – PER-006-1, Requirement R1	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

Evaluation of Proposed Definitions

Project 2007-06.2 – Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of "Operating Planning Analysis" (OPA) and "Real-time Assessment" (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective of PRC-001-1.1(ii) – *Protection System Coordination*, Requirement R1 to "be familiar with the purpose and limitations of Protection System schemes in its area," the two definitions are being modified to include the phrase "…functions, and limitations…" to ensure the Transmission Operator (TOP), consider the functions and limitations of Protection Systems and Remedial Action Schemes (RAS) in their OPA and RTA evaluations. The PRC-001-1(ii) standard is not applicable to the Reliability Coordinator (RC), however, the modifications to the definitions affect this entity. Revising the definitions to require the RC and the TOP to integrate the functions and limitations (i.e., purpose and limitations) into its OPA and RTA will ensure that the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL).

Proposed Definitions

This section includes the Reliability Standards and the associated requirements where the two modified terms are found. These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions, (1) an administrative update to replace "Special Protection System" to "Remedial Action Scheme" (RAS), and (2) the addition of the phrase "…functions, and limitations…" to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the "functions and limitations" into these evaluations. The proposed definition revisions also have an effect on the Reliability Coordinator that is not applicable to PRC-001-1.1(ii). The bold text in the "Proposed Definitions" column accentuate the revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Definitions (Effective January 1, 2017)	Proposed Definitions
Operational Planning Analysis An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)	**Operational Planning Analysis (OPA)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations**; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	**Real-time Assessment (RTA)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and limitations;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Evaluation

The following is an evaluation of the potential impacts the modifications to the above definitions may have on the expected performance by the RC and TOP. The evaluation is limited to the Reliability Standards that will be or become in effect upon approval of the revised definitions.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	The OPA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and limitations" of Protection Systems and RAS needed to perform an OPA.
IRO-008-2 - Reliability Coordinator Operational Analyses and Real-time Assessments (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall perform an *Operational Planning Analysis* that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its *Operational Planning Analysis* as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The RC must integrate the "functions and limitations" of Protection Systems and RAS in order to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area. **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. This requirement references that the results of the OPA are used by the RC to have a coordinated Operating Plan(s) for next-day operations to address potential SOL and IROL exceedances.

<table>
<tr><th colspan="2">Operational Planning Analysis (OPA)</th></tr>
<tr><th>Requirement in Approved Standard</th><th>Description and Change Justification</th></tr>
<tr><td>IRO-010-2 – Reliability Coordinator Data Specification and Collection
(Effective April 1, 2017)
R1. The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to:
1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator.
1.2. Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability.
1.3. A periodicity for providing data.
1.4. The deadline by which the respondent is to provide the indicated data.
R2. The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.</td><td>Requirement R1
The OPA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2).

Requirement R2
The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.</td></tr>
</table>

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its *Operational Planning Analyses* and Real-time Assessments. **1.5.** Provisions for periodic communications to support reliable operations.	The OPA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-002-4 – Operations Planning (Effective April 1, 2017) **R1.** Each Transmission Operator shall have an *Operational Planning Analysis* that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its *Operational Planning Analysis* as required in Requirement R1.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The TOP must integrate the "functions and limitations" of Protection Systems and RAS in order to assess whether its planned operations for the next day within its TOP Area will exceed any of its SOLs. **Requirement R2** The OPA definition revision has no impact on the TOP in this requirement. The TOP is using information resulting from its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessment.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	The RTA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and limitations" of Protection Systems and RAS needed to perform an RTA.
IRO-008-2 – Reliability Coordinator Operational Analyses and Real-time (Effective April 1, 2017) **R4.** Each Reliability Coordinator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a *Real-time Assessment* indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.	**Requirement R4** The RTA definition revision has an impact on the RC in this requirement. The RC must include the "functions and limitations" among other prescribed inputs from the definition of RTA. **Requirement R5** The RTA definition revision has no impact on the RC in this requirement. The RC is notifying others based on the results of its RTA that an actual or expected condition that results in, or could result in, a SOL or IROL exceedance within its Wide Area.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-009-2 - Reliability Coordinator Actions to Operate Within IROLs (Effective January 1, 2016) **R2.** Each Reliability Coordinator shall initiate one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirement R1) that are intended to prevent an IROL exceedance, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*. **R3.** Each Reliability Coordinator shall act or direct others to act so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*.	**Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The RC will be taking an action to prevent an IROL exceedance, as identified in the RC's RTA. **Requirement R3** The RTA definition revision has no impact on the RC in this requirement. The RC will be acting or directing others so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the RC's RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	**Requirement R1** The RTA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and limitations" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

The requirement performance is to distribute the data specification that is associated with the RTA to others.

Evaluation of Proposed Definitions

Project 2007-06.2 – Phase 2 of System Protection Coordination

Introduction

The following definitions are proposed for revision under the Project 2007-06.2 – Phase 2 of System Protection Coordination. The definitions of “Operating Planning Analysis” (OPA) and “Real-time Assessment” (RTA) are used in the Transmission Operations and Interconnection Reliability Operations and Coordination (TOP/IRO) sets of Reliability Standards.[1] To address the reliability objective of PRC-001-1.1(ii) – *Protection System Coordination*, Requirement R1 to “be familiar with the purpose and limitations of Protection System schemes in its area,” the two definitions are being modified to include the phrase “…functions, and ~~limits~~limitations…” to ensure the Transmission Operator (TOP), ~~and Reliability Coordinator (RC) that is not applicable to PRC-001-1.1(ii),~~ consider the functions and ~~limits~~limitations of Protection Systems and Remedial Action Schemes (RAS) in their OPA and RTA evaluations. The PRC-001-1(ii) standard is not applicable to the Reliability Coordinator (RC), however, the modifications to the definitions affect this entity. Revising the definitions to require the RC and the TOP to integrate the functions and ~~limits~~limitations (i.e., purpose and limitations) into its OPA and RTA will ensure that the Bulk Electric System (BES) is operated within System Operating Limits (SOL) and Interconnection Reliability Operating Limits (IROL).

Proposed Definitions

This section includes the Reliability Standards and the associated requirements where the two modified terms are found. These two terms are not found within the proposed PER-006-1 standard, but are an integral part of the basis for the retirement of PRC-001-1.1(ii), Requirement R1. There are two significant revisions, (1) an administrative update to replace “Special Protection System” to “Remedial Action Scheme” (RAS), and (2) the addition of the phrase “…functions, and ~~limits~~limitations…” to address the reliability objective of PRC-001-1.1(ii), Requirement R1 for the applicable TOP that must integrate the “functions and ~~limits~~limitations” into these evaluations. The proposed definition ~~revision~~revisions also ~~has~~have an effect on the Reliability Coordinator that is not applicable to PRC-001-1.1(ii). The bold text in the “Proposed Definitions” column accentuate the revisions.

[1] Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards, Order No. 817, 153 FERC ¶ 61,178 (2015).

Definitions (Effective January 1, 2017)	Proposed Definitions
Operational Planning Analysis An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)	**Operational Planning Analysis (OPA)** An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to**:** load forecasts; generation output levels; Interchange; known Protection System and **Remedial Action Scheme** status or degradation**, functions, and** ~~limits~~limitations; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)
Real-time Assessment An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)	**Real-time Assessment (RTA)** An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load**;** generation output levels**;** known Protection System and **Remedial Action Scheme** status or degradation**, functions, and** ~~limits~~limitations**;** Transmission outages**;** generator outages**;** Interchange**;** Facility Ratings**;** and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)

Evaluation

The following is an evaluation of the potential impacts the modifications to the above definitions may have on the expected performance by the RC and TOP. The evaluation is limited to the Reliability Standards that will be or become in effect upon approval of the revised definitions.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	The OPA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and ~~limits~~limitations" of Protection Systems and RAS needed to perform an OPA.
IRO-008-2 - Reliability Coordinator Operational Analyses and Real-time Assessments (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall perform an *Operational Planning Analysis* that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. **R2.** Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its *Operational Planning Analysis* as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The RC must integrate the "functions and ~~limits~~limitations" of Protection Systems and RAS in order to assess whether the planned operations for the next-day will exceed SOLs and IROLs within its Wide Area. **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. This requirement references that the results of the OPA are used by the RC to have a coordinated Operating Plan(s) for next-day operations to address potential SOL and IROL exceedances.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments.	**Requirement R1** The OPA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and ~~limits~~limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its *Operational Planning Analyses* and Real-time Assessments. **1.5.** Provisions for periodic communications to support reliable operations.	The OPA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-002-4 – Operations Planning (Effective April 1, 2017) **R1.** Each Transmission Operator shall have an *Operational Planning Analysis* that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). **R2.** Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its *Operational Planning Analysis* as required in Requirement R1.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The TOP must integrate the "functions and ~~limits~~limitations" of Protection Systems and RAS in order to assess whether its planned operations for the next day within its TOP Area will exceed any of its SOLs. **Requirement R2** The OPA definition revision has no impact on the TOP in this requirement. The TOP is using information resulting from its OPA.

Operational Planning Analysis (OPA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessments including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's *Operational Planning Analyses*, Real-time monitoring, and Real-time Assessment.	**Requirement R1** The OPA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and ~~limits~~limitations" of Protection Systems and RAS to support performing an OPA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of OPA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The OPA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the OPA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-002-4 – Reliability Coordination – Monitoring and Analysis (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	The RTA definition revision has an impact on the RC in this requirement. The RC must include in its data exchange capability the "functions and ~~limits~~limitations" of Protection Systems and RAS needed to perform an RTA.
IRO-008-2 – Reliability Coordinator Operational Analyses and Real-time (Effective April 1, 2017) **R4.** Each Reliability Coordinator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R5.** Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a *Real-time Assessment* indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.	**Requirement R4** The RTA definition revision has an impact on the RC in this requirement. The RC must include the "functions and ~~limits~~limitations" among other prescribed inputs from the definition of RTA. **Requirement R5** The RTA definition revision has no impact on the RC in this requirement. The RC is notifying others based on the results of its RTA that an actual or expected condition that results in, or could result in, a SOL or IROL exceedance within its Wide Area.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-009-2 - Reliability Coordinator Actions to Operate Within IROLs (Effective January 1, 2016) **R2.** Each Reliability Coordinator shall initiate one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirement R1) that are intended to prevent an IROL exceedance, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*. **R3.** Each Reliability Coordinator shall act or direct others to act so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the Reliability Coordinator's Real-time monitoring or *Real-time Assessment*.	**Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The RC will be taking an action to prevent an IROL exceedance, as identified in the RC's RTA. **Requirement R3** The RTA definition revision has no impact on the RC in this requirement. The RC will be acting or directing others so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the RC's RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-010-2 – Reliability Coordinator Data Specification and Collection (Effective April 1, 2017) **R1.** The Reliability Coordinator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include but not be limited to: **1.1.** A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data, as deemed necessary by the Reliability Coordinator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R2.** The Reliability Coordinator shall distribute its data specification to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*.	**Requirement R1** The RTA definition revision has an impact on the RC in this requirement. The data needed by the RC regarding the "functions and ~~limits~~limitations" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
IRO-014-3 - Coordination Among Reliability Coordinators (Effective April 1, 2017) **R1.** Each Reliability Coordinator shall have and implement Operating Procedures, Operating Processes, or Operating Plans, for activities that require notification or coordination of actions that may impact adjacent Reliability Coordinator Areas, to support Interconnection reliability. These Operating Procedures, Operating Processes, or Operating Plans shall include, but are not limited to, the following: **1.1.** Criteria and processes for notifications. **1.2.** Energy and capacity shortages. **1.3.** Control of voltage, including the coordination of reactive resources. **1.4.** Exchange of information including planned and unplanned outage information to support its Operational Planning Analyses and *Real-time Assessments*. **1.5.** Provisions for periodic communications to support reliable operations.	The RTA definition revision has no impact on the RC in this requirement. Part 1.4 references that the RC must include information about planned and unplanned outages that support its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-001-3 – Transmission Operations (Effective April 1, 2017) **R13.** Each Transmission Operator shall ensure that a *Real-time Assessment* is performed at least once every 30 minutes. **R14.** Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or *Real-time Assessment*.	**Requirement R13** The RTA definition revision has an impact on the TOP in this requirement. The TOP must include the "functions and ~~limits~~limitations" among the other prescribed inputs from the definition of RTA. **Requirement R14** The RTA definition revision has no impact on the TOP in this requirement. The TOP will be initiating its Operating Plan to mitigate a SOL exceedance identified in its RTA.

Real-time Assessment (RTA)	
Requirement in Approved Standard	**Description and Change Justification**
TOP-003-3 – Operational Reliability Data (Effective April 1, 2017) **R1.** Each Transmission Operator shall maintain a documented specification for the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments*. The data specification shall include, but not be limited to: **1.1.** A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and *Real-time Assessments* including non-BES data and external network data as deemed necessary by the Transmission Operator. **1.2.** Provisions for notification of current Protection System and Special Protection System status or degradation that impacts System reliability. **1.3.** A periodicity for providing data. **1.4.** The deadline by which the respondent is to provide the indicated data. **R3.** Each Transmission Operator shall distribute its data specification to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and *Real-time Assessment*.	**Requirement R1** The RTA definition revision has an impact on the TOP in this requirement. The data needed by the TOP regarding the "functions and ~~limits~~limitations" of Protection Systems and RAS to support performing an RTA would be included within Requirement R1, Part 1.1. Similarly in the most recent definition of RTA, the "status or degradation" of Protection Systems and Special Protection Systems (i.e., RAS) is addressed in its own requirement part (1.2.). **Requirement R2** The RTA definition revision has no impact on the RC in this requirement. The requirement performance is to distribute the data specification that is associated with the RTA to others.

Standards Announcement

Project 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 and Two Proposed Modified Definitions

Final Ballots Open through May 26, 2016

Now Available

Final ballots for **PER-006-1 – Specific Training for Personnel** and the proposed modified definitions of **"Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA)** are open through **8 p.m. Eastern, Thursday, May 26, 2016.**

Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pools may cast a vote. All ballot pool members may change their previously cast vote. A ballot pool member who failed to vote during the previous ballot period may vote in the final ballot period. If a ballot pool member does not participate in the final ballot, the member's vote from the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pools associated with this project may log in and submit their votes for the standard and definitions here. If you experience any difficulties using the Standards Balloting & Commenting System (SBS), contact Wendy Muller.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 8 p.m. Eastern).

Next Steps

The voting results for the standard and definitions will be posted and announced after the ballots close. If approved, the standard and definitions will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.

Standards Announcement

Project 2007-06.2 Phase 2 of System Protection Coordination PER-006-1 and Two Modified Definitions

Final Ballot Results

Now Available

Final ballots for **PER-006-1 – Specific Training for Personnel** and the modified definitions of **"Operational Planning Analysis" (OPA)** and **"Real-time Assessment" (RTA)** concluded **8 p.m. Eastern, Thursday, May 26, 2016.**

The voting statistics are listed below, and the Ballot Results page provides detailed results for the ballots.

	Quorum / Approval
PER-006-1	88.96% / 82.52%
Definitions of "Operational Planning Analysis" (OPA) and "Real-time Assessment" (RTA)	88.36% / 83.37%

Next Steps

The standard and definitions will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Development Process

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Scott Barfield-McGinnis (via email) or at (404) 446-9689.
